Part of the problem is that so much information about him is missing. There is no record of his Oxford career, (which may be because the alumni lists of Gloucester Hall are missing) which has led to the assumption that he left without a degree. This is curious, since the record of his brother Thomas's Oxford sojourn is unproblematic, and Thomas matriculated at Jesus College in 1582. The myth of Kelley's alias as Talbot is linked to the absence of Oxford records, and since there appear to have been several Irishmen named Talbot whose dates could have fitted in the Gloucester Hall lists and a Talbot appears in Dee's diary in 1582 shortly before the initials E.K. start to recur in that text, the assumption that Kelley used this alias

S. Clucas (ed.), John Dee: Interdisciplinary Studies in English Renaissance Thought, 285–294.

gained credence.[6] Like the rest of Kelley's biography, though, there are conflicting versions. There are two Edward Kelleys listed in the Worcestershire records, Edward son of Patrick Kelley, christened on 2 August 1555 at St Swithin's, Worcester, and another Edward, also son of Patrick, christened on 5 October 1561 at St Helen's, Worcester.[7] Thomas, the brother who accompanied him to Prague was born in 1564. Dee's diary gives Kelley's date of birth as 1 August 1555, which would appear to fit with the first Edward listed.[8]

The circumstances of his death are equally unclear. Dee's diary records news of Kelley's death on 25 November 1595, which is at least two years too early.[9] Karel Hrdina and R.J.W. Evans record Kelley as having been imprisoned at Krivoklat in Bohemia between 1591-1594 for killing Jiri Hunckler, an imperial official in a duel, but on his release in 1594 he was pardoned and his lands restored (he had been knighted by the Emperor Rudolph II in 1589, taking the title of Sir Edward of Imany).[10] In 1596 he was imprisoned again, this time at Most (Brux) in northern Bohemia where he held lands. His property was confiscated and sold to the imperial vice-chancellor, Krystof Zelinsky of Sebuzin (a Protestant who fell from grace in 1599 and was dismissed). In 1597, apparently following an unsuccessful escape attempt, he died.[11]

The relationship between Dee and Kelley, according to Dee's diary, began in 1582. The two men travelled to Poland in 1583, moving on to Prague and thence to Trebon in Southern Bohemia in 1586, where they were under the protection of Vilem Rosemberk.[12] In 1589 Dee returned to England, Kelley moved back to Prague and their lives diverged. Kelley's decision to remain in Bohemia has sometimes been interpreted, by such partisan biographers as Charlotte Fell-Smith, as his fear of returning to England to be exposed as a fraud, but this somewhat xenophobic interpretation that sees Rudolph and the powerful Rozemberk as Kelley's gulls does not have much substance. Kelley did impress the Emperor, as his lands and title show, but he was also taken very seriously by prominent figures in the court of Elizabeth. When Kelley's relations with the Emperor deteriorated in 1591, a letter from an English agent in Frankfurt to Edward Wotton records that his household had been arrested and tortured, and "a great gard had been placed over the Lady Kelley and Mr Dyar."[13]

Sir Edward Dyer is recorded as having been a client and friend of John Dee's as early as 1566. Dyer visited Dee at Mortlake along with Sidney and Leicester in 1577 and was godfather to Dee's son Arthur in 1579.[14] In 1588 Dyer visited Trebon, accompanied by Francis Garland (whom Kelley thought was a spy) and Edmund Cooper, Kelley's brother-in-law. He appears to have been sent by Lord Burghley to persuade Kelley and Dee to return to England, though he seems to have angered Dee who noted on 22 July (in Greek) that "Mr Edwarde Dier did injure me unkindly."[15] Next day there was a reconciliation between the two men, thanks to the mediation of Kelley. Dyer spent several months with Kelley in Prague in 1591, acting upon his instructions from Burghley of 1588:

> if you cannot obtain Sir Edwd. Kellie's return personally, yet that you would for maintenance of your credit, procure some small portion of the powder, to make a

> demonstration in her majesty's own sight of this very perfection of his knowledge. But if I might have my wish, next to his coming home, I wish he would, in some secret box, send to her majesty for a token some such portion, as might be to her a sum reasonable to defer her charges for this summer for her navy, which we are now preparing to the sea, to withstand the strong navy of Spain, discovered upon the coasts between Britain and Cornwall within these two days.[16]

To Kelley directly, when the first appeals failed, Burghley wrote in 1589 in more forthright terms:

> I would not have you ignorant that sundry men, being not acquainted with these your faithful offers and purposes [the messages of good intent Kelley had sent through Dyer], let it not in some sort, (since you came not with Mr Dyer) to divine variously of your stay. Some saying, that you do forbear to come because you cannot perform that indeed which hath been reported of you. Some, that you are inticed by such as bear not the queen nor this realm any good will, (not to come to benefit her majesty). Some allege, that your own profession of religion doth not agree with ours here. Yea, some, that are maliciously disposed, say that you are an imposter with your sophistications, as many heretofore, both here and in other countries, have been proved; and that you would fear to be proved such an one here, because of usurers severe punishment.[17]

The correspondence, and the use of Dyer as emissary to Kelley, would seem to imply that Burghley at least took Kelley's scientific claims seriously, or that he preferred to have him on English soil instead of in the open city of Prague, able to confer with a whole range of contacts from all over Europe. Moreover, once the relationship with Dee ended, so too do accounts of Kelley's contacts with spirits disappear, to be replaced with more overtly political intrigue. Burghley and Dyer were interested in Kelley's alchemical skills, not in his spiritual ones, and the amount of property he amassed in Bohemia (including a goldmine that was purchased by the Polish alchemist, Sendivogius) bears witness to the extent to which he had integrated himself into the life of the imperial court. His brother Thomas was married in 1587 to Ludmilla z Pisnice, daughter of a Bohemian knight and sister to Jinrich z Piznice who rose to become deputy Chancellor of the realm. Kelley had family connections to the emergent figures of the new Bohemian middle class.

The picture of Kelley starts to shift if we look at it from the Czech perspective and not through Dee's eyes. The picture painted by Dee is full of ambiguities and uneasiness, and perhaps nowhere more obviously than in the story of the exchange of wives. As detailed in *A True & Faithful Relation*, on 18 April 1587, Madimi proposed that the two men should have, as Dee puts it, "had our two wives in such sort, as we might use them in common", though he declares himself unsure as whether the "sense were of carnal use."[18] Dee's notes tell us that when he broke the news to his wife, Jane Dee, "she fell a weeping and a trembling for a quarter of an hour".[19] Nevertheless, a contract between the four was drawn up, dated 21 April 1587. What Joanna Kelley thought of the arrangement is never recorded, though there is an exhortation for her to be granted children with Kelley, following a statement by one of the spirits to Kelley on 4 April 1587 that "barrenness dwelleth with thee, because thou didst neglect me and take a wife contrary to my commandments." Kelley's wife disappears from Dee's narrative on 17 Oct 1588, riding away from Trebon to Prague.

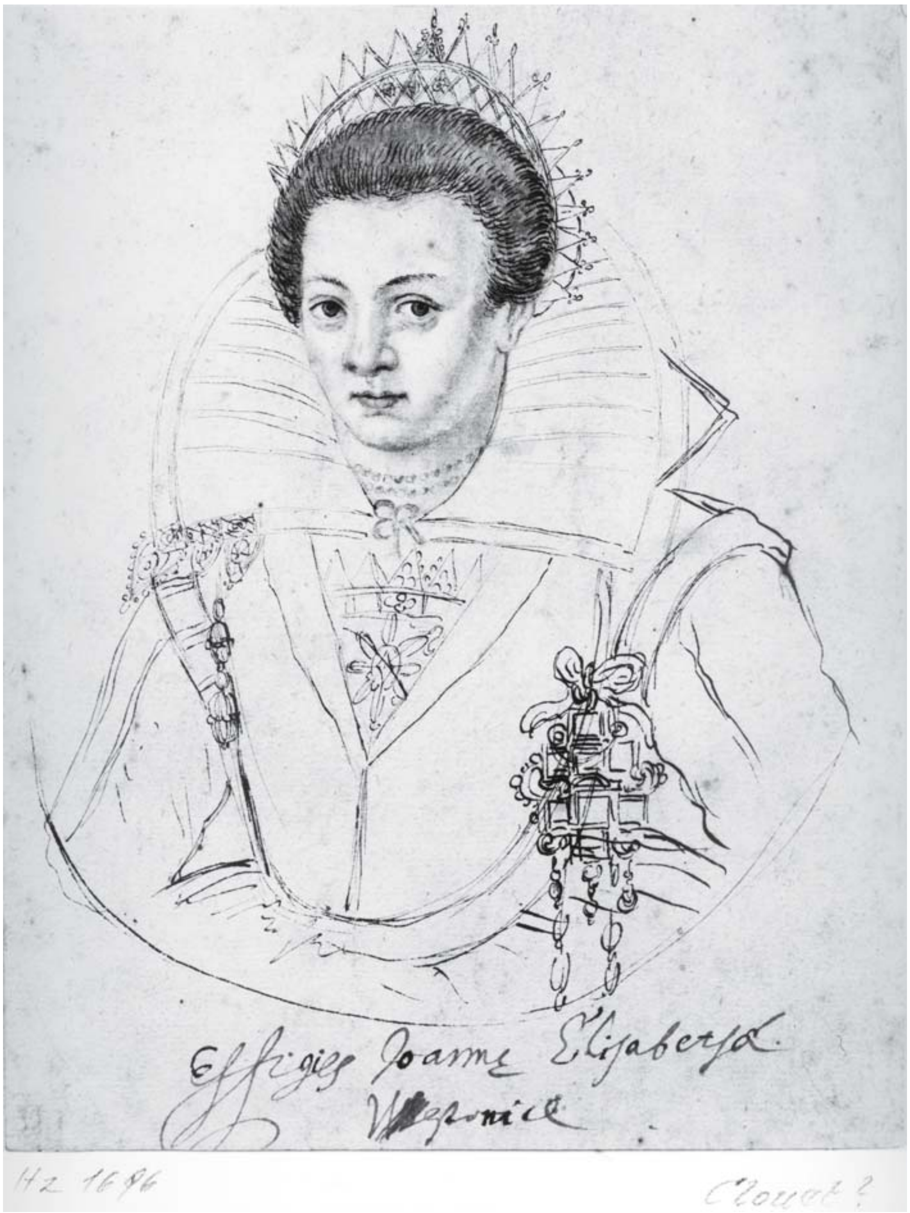
Charlotte Fell-Smith, much given to expressing unsubstantiated opinions (she describes Father Pucci as "an anglicised Italian pervert")[20] describes Joanna Kelley as follows:

> Had it not been for the Dee's kindness to her, and especially Jane's, poor neglected Joan Kelley would have had but a sorry time. She was only twenty-four; lively and docile, she seemed to please everyone but her husband. Pucci, with perhaps a little flattery, calls her a "rarum exemplum juvenilis sanctitatis, castitatis, atque omnium virtutem."[21]

Joanna Kelley first appears in Dee's diary in the entry for 7 July 1583. She is mentioned again on 18 August, when Dee notes "A great tempest of wind at midnight. Maxima erat E.K. cum uxore eius."[22] He is more explicit about the disharmony between Kelley and his wife in *A True & Faithful Relation*. On 4 July 1583 he records Kelley as saying "I cannot abide my wife, I love her not, nay I abhor her; and there in the house I am misliked because I favour her no better." Dee records his own conversation with Jane: "Jane, this man is marvellous out of quiet against his wife for her friends their bitter reports against him behind his back, and her silence thereat."[23] In *A True & Faithful Relation* Dee records that on 5 June 1583 Kelley was in a rage after hearing from his brother Thomas that his wife "was gone from Mistress Freeman's house at Blockley [...] and was at home with her mother at Chipping Norton."[24]

There is no evidence of when Kelley married Joanna Cooper. Fell-Smith, who is extremely unreliable, confidently relates how the spirits told Kelley to take a wife in April 1583, but that he was reluctant to do so, and quotes a non-existent reference that she claims is recorded in *A True & Faithful Relation*.[25] Many of the references to Kelley's relationship with his wife in Dee's writings appear to indicate that the marriage was problematic. It is interesting to speculate, given Kelley's rebelliousness as depicted in Dee's writings and his ability to outmanoeuvre the combined pressures of Dyer and Burghley a few years later, on the reasons why he married Joanna Cooper from Chipping Norton, whose date of birth Dee records as 23 June 1563 and who appears to have had neither money nor influence to bring as a dowry.

Let us leave that question in the air, and turn instead to a completely different narrative. In the cloisters of St Thomas Church, Prague there is an engraved tombstone to Elizabeth Jane Weston, which describes her as a noble Englishwoman, flower of Minerva, delight of the Muses, paragon of women.[26] Elizabeth Weston is best known as Westonia, author of *The Parthenicon,* an autobiographical collection of poems and letters written in Latin, first published in 1606,[27] who died at the age of 30, after giving birth to seven children, only three of whom survived. During her brief life she was highly regarded as an intellectual prodigy, respected by Humanist scholars and thinkers across Europe. She married Johannes Leo, a lawyer at the imperial court and the one extant portrait of her, in the Hessisches Museum, Darmstadt (Plate 16) shows a patrician figure, richly dressed, with dark hair and an intense, serious gaze.[28] Her poetry is equally serious: throughout her work there is strong line of grievance, and the influence of Ovid's *Tristia* is marked. This elegiac note of loss, linked to the theme of exile, has been used by biographers in their attempts to trace her origins: a noble Englishwoman whose poetry recounts how she



Effigies Joanne Elisabethe
Westonie

Clouet?

Plate 16: Portrait of Elizabeth Jane Weston by an anonymous Dutch artist. Reproduced by courtesy of the Hessisches Landesmuseum, Darmstadt.

lost her father and was sent into exile in Bohemia, the land where she grew up. The generally agreed account of her family gives her a recusant background. Fuller in his *Worthies* places her in Surrey, where there was a family of eminent Westons, and subsequent biographers have followed this suggestion.[29]

But Fuller merely guesses where she might have come from. He comments that her fame was "more known in foreign parts than at home", and adds:

> I am ashamed that for the honour of her sex and our Nation I can give no better account of her. However, that her memory may not be harbourless, I have lodged her in this County (Surrey) – where I find an ancient and worshippful family of the Westons flourishing at Sutton, ready to remove her at the first information of the certain place of her Nativity.[30]

From the work of Czech scholars such as Hrdina, Ryba and Petrú it is clear that Westonia was not connected to the Westons of Sutton.[31] Tracing the lines through her poetry, making connections between dates, the suggestion was first posited by Hrdina in 1928 that Westonia may have been associated in some way with Edward Kelley. The dates fitted: Kelley's death in 1597 coincided with the dramatic rush of poetry and letters by Westonia pleading the case for restitution of her family property from the emperor. Clearly something significant triggered this flood of appeals to powerful allies. Elizabeth Weston was not someone to keep silent when need arose: the edition of her *Parthenicon* held in the British Library contains a handwritten poem, assumed to be by the author, complaining about the treachery of editors who omitted some of her best work and inserted their own instead.[32] When James I came to the throne in 1603, Westonia wrote a letter, included in the *Parthenicon*, demanding justice.[33] Johannes Leo, her husband (who was also an agent for Anhalt) fought her case through the courts.

The hints of a link between Westonia and Kelley become clear in a small collection of poems published on the occasion of her mother's death in 1606, *In obitum nobilis et generosae foeminae, dominae Ioannae p[ost] m[ortem] magnifici et generosi domini Edovardi Kellei de Imany, equitis aurati sacraeque Caesare Maiestatis consiliarii, derelicta viduae, matris suae honorandissimae charissimaeque, lachrymaebunda effudit filia.*[34] In her long poem, Westonia relates how her father died when she was only six months old; then both her grandmothers died, followed some time after by the man she loved as a second father. After that great loss came the death of her brother, of her two infant sons and finally of her mother. Her poem is a great cry of grief, as the poet recalls the mother who made the sign of the cross on her daughter's forehead at night, the bitterness of hopes constantly raised and then cruelly destroyed. The manuscript also contains poems in praise of Joanna Kelley by Carolides of Karlsberg and Nicholas Maius.[35] All establish beyond any doubt that Westonia's mother was Joanna Kelley, widow of the late Edward Kelley, revered as a loving stepfather who carefully cultivated the education of the woman who turned out to be a Renaissance prodigy.

Accepting this narrative causes several problems. Louise Schleiner, who agrees with my linking of Kelley and Westonia through Joanna Cooper, nevertheless rejects the hypothesis that Joanna Weston and Joanna Cooper might have been the same woman. She argues that Kelley must have met and married for a second time in the late 1580s, and she notes that there is no mention of Elizabeth or her brother John Francis in Dee's writings, which is correct.[36] But the Oxfordshire county records confirm the Joanna Weston-Joanna Kelley connection: on 28 June 1563 Joanna, daughter of Thomas Cooper was baptized at the Parish Church of St Mary the Virgin in Chipping Norton. The same register records the marriage of Joanna Cooper to John Wesson [*sic*] on 27 June 1579, the baptism of their son John on 23 July 1580 and of their daughter Elizabeth at some point between the legible entries of 4 March and 31 October 1581.[37] On 6 May 1582, with timing that confirms Westonia's version of events, the burial of John Weston, clerk, is recorded at Chipping Norton. Whether significant or not, the mysterious Mr Talbot vanished from Dee's diary on 4 May 1582, and reappeared on 13 July.[38] He is not mentioned again, though E.K. enters the narrative on 22 November 1582.[39]

What then are we left with? The evidence for Kelley only having one wife is overwhelming, but we now know that she had two children by one John Weston, who lived for a short time with their grandmothers. There is a prayer for Joanna Kelley to have children recorded by Dee, but it is oddly phrased, with emphasis in the Latin that suggests that what she is asking for is to have children with her present husband, i.e. with Kelley.[40] Westonia's affection for her stepfather as manifested in her poetry and her letters (particularly those to her brother who was studying at Ingoldstadt) shines out from her writings.[41] Moreover, the attention paid to the education of the two children of the unknown John Weston and Joanna Cooper-Kelley reveals a high degree of commitment and expense on the part of Edward Kelley. Westonia's learning was deemed unusual in such a young woman, as witnessed by many contemporaries, and she probably shared her stepfather's interests in alchemy. The prefatory poem to Oswald Croll's *Basilica Chymica* of 1609 was written by Westonia.[42]

The most curious aspect of the Westonia-Kelley story is the striking absence in Dee's writings of any reference to Kelley's stepchildren. This led me at first to speculate that he had deliberately concealed them from Dee, but this seems unlikely given the network of connections Kelley and his family had in Prague, and given also that Dee's diary confirms that both Kelley's brother Thomas and Joanna's brother Edward were regularly in Bohemia with them.

It is also the case that Dee's diary and *A True & Faithful Relation* are not straightforward linear narratives. Whatever else they are, they are not texts that can be read as historical accounts; they are full of omissions, contradictions, discrepancies, gaps. They raise more questions than they answer. Reading Dee's texts looking for clues to the Kelley-Westonia relationship has proved tantalizingly frustrating. The high level of education received by Westonia and her brother leads me to feel that these two children must have been educated along with Dee's own children, and there is one tenuous clue that might bear out such an hypothesis. In the Diary entry for 7 August 1588 Dee notes:

> Aug 7th, this day I covenanted and hyred John Hammond, jentleman, to serve me in his honest servyces for one yere, and to have 30 dolers for his full and all manner of wages.[43]

The entry for 21 August 1589 notes: "John Hammond to Stade", and after this he disappears from Dee's narrative.[44]

In Westonia's *Poemata* there is a poem addressed to the noble and educated man, Johannes Hammonius, described as her good friend and previously her most assiduous Master.[45] It is a short piece, heavily reliant on Ovid, but praises the skills of John Hammond who taught her all she knows about her art. This John Hammond may well be the same man who was a fellow at Trinity College Cambridge in 1579 and who then qualified as Doctor of medicine in 1605, moving on to become physician to James I and to Prince Henry.[46] The coincidence of Westonia's master having the same name as the tutor employed by Dee to teach his children cannot be ignored.

In the absence of certain information, one drifts inevitably towards speculation. The stories are full of holes, and there is strong temptation to fill in the gaps. The point I have now reached, however, is to treat the negative accounts of Kelley with some scepticism and to view the Kelley-Dee connection more critically in the light of the Bohemian materials. A vital link in the chain would be provided if we knew who John Weston was, for then we might find answers to other questions, such as why Kelley felt compelled to marry his wife when he seems to have had such negative feelings about her, why he chose to educate her children to such a high level, why there is such silence about Kelley's children in Dee's writings. I find myself moving toward a reading of Dee's version of his relationship with Kelley that is not altogether favourable to Dee – perhaps Kelley's successes in Bohemia and his rapid upward social movement brought out feelings of resentment in Dee. Certainly all of them, Dee, Kelley and Westonia were obsessed with money and had constantly to compromise and to conceal in order to ensure survival and remain in favour with their patrons. It is the rediscovery of those processes of concealment that make this task of tracing patterns so difficult and yet so compelling.

JAN BÄCKLUND

IN THE FOOTSTEPS OF EDWARD KELLEY

Some Manuscript References at the Royal Library in Copenhagen Concerning an Alchemical Circle around John Dee and Edward Kelley.[*]

My primary aim in this paper is to present a group of manuscripts in The Royal Library in Copenhagen which in one way or another are intimately related to the alchemical quest of a group of historically little-known persons associated with Edward Kelley and John Dee. My secondary aim will be to question the established opinion that Edward Kelley's alchemical and allegedly fraudulent career at the court of Rudolph II in Prague was so chaotic and adventurous that it led to his imprisonment and subsequent death in 1595 from injuries he is said to have suffered whilst attempting to escape. This is the common story, given for instance by Elias Ashmole, Anthony à Wood, and in the *Dictionary of National Biography*.[1] Let us first address the matter of Kelley's career in Prague.

I

We know that between 1583 and 1589, John Dee and Edward Kelley were travelling in Poland and Bohemia, occasionally staying at the court of Emperor Rudolph II in Prague. They both settled in Trebona in Bohemia, though Kelley seems to have been less sedentary than Dee. In the published edition of Dee's diary, Kelley's and other persons' travels to Prague are recorded, while Dee does not mention going there himself.[2] Instead Dee left Trebona for Nürnberg, Frankfurt am Main, Bremen, and finally England. Though Dee visited Prague and Rudolph at least once in 1584 during his stay in Bohemia,[3] it is nevertheless obvious that it was mainly Kelley who undertook alchemical activities in Prague. To my knowledge, information about Kelley's activities from 1589 onward can be extracted solely from sources who were themselves "alchemically-initiated", and thus – if not unreliable – then at least far from informative. Ashmole, who seems to have had access to more information than we have at present, states therefore that "Whiles they lived at *Trebona, Sir Edward Kelley* went divers times to *Prague,* and the 15. *of Ian.* 1587, he went into *Poland,* but returned the 9 of *Febr.* after. And 'tis probable these *Iourneys* were made in quest after some famous *Chemists*",[4] but

---

[*] I am greatly indebted to Dr Stephen Clucas for his scrupulous proof-reading of my transcriptions in the descriptive part of this essay against the original manuscripts in Copenhagen, without which many errors would have passed. For any remaining errors and interpretations, however, the sole responsibility is mine.

even Ashmole seems to be uninformed about what Kelley, Carpio and Garland (names which are mentioned in Dee's diaries) actually did in Prague and Poland. However, Ashmole does recount a transmutation – though without revealing his source: "I also finde this *Note* of *Doctor Dee's,* Jan. 5. 1586. *Donum Dei* 2. ounces. *E. K.* Moreover, for neerer and later *Testimony,* I have received it from a credible *Person,* that one *Broomfield* and *Alexander Roberts*[5] [both of whom are mentioned in Dee's diaries], told him they had often seen *Sir Ed: Kelly* make *Projection,* and in particular upon a piece of *Metall* cut out of a *Warming pan*," and Ashmole continues shortly after: "The aforesaid *Person* hath likewise seen in the hands of one *Master Frye* and *Scroope, Rings* of *Sir Edward Kellyes Gold,* the fashion of which was onely *Gold wyre,* twisted thrice about the *Finger:* and of these fashioned *Rings,* he gave away, to the value of 4000l. at the *Marriage* of one of his *Servant Maides*."[6]

There is, however, another source which seems to have some information about Kelley's alchemical activities. Unfortunately for us, this source is as "initiated" and discreet as Ashmole. I am referring to the American alchemist John Winthrop Jr. (1606–1676), who is the subject of a very informative study by Ronald Sterne Wilkinson.[7] Winthrop took issue with Samuel Hartlib against Gabriel Platt's *Caveat for Alchymists,* and, in a letter to Hartlib, he wrote:

> One thing that mr. Gabriell Platt in one of those little treatises brands Sir Edward Kelly with as the grand imposter of the world I cannot but take notice of, and inform your selfe (to whom I perceive mr. Plat hath addressed that relation, as per the title of the booke appeares) that I can give many very probable reasons to envince that Sir Edward Kellyes projections were not cousening projections but reall [...]. I shall only mention one particular which I had from one who was very intimate with Rudolphus the Emperour who had it from the Emperours owne mouth. That the said Rudolphus with his owne hands and all materialls and instruments for fusion provided by his apointment (*Inscio Kelleo*) transmuted nine pounds of quicksilver into pure gold with so little of the powder taken upon the point of his knife with his owne the Emperours hand out of a paper opened by Sir Edward Kelly at the further end of the room, he the said Kelly not coming neere the place where the fire was.[8]

The person "very intimate with Rudolphus the Emperour" could very well have been the "philosopher and naturalist Cornel[ius] Drebell",[9] whose son-in-law, Dr. Kufler (1595–1677), was a close friend of Winthrop's. Cornelius Drebbel lived between 1572 and 1634, and from 1610 until Rudolph's death in 1612 was in Prague, where he conducted alchemical experiments before the Emperor, who then probably told him of the transmutations of Edward Kelley. This hypothesis is confirmed by a note by Samuel Hartlib, commenting on Winthrop's previous letter, saying that "Sir Edward Kelly is better known to many other judicious men, what he hath performed than Gabr. Plat. [...]. Dr Kuffler confirms your judgement about the truth in Kelly".[10] What makes Drebbel interesting in connection with our manuscripts, however, is that he wrote in Dutch and died in London. But these few anonymous sources are almost the only ones we possess regarding Kelley's late career at the court of Rudolph.

The uncertainty is further emphasized by the accounts of the date and circumstances of Kelley's death. I have found three or four different versions of his death, but I am convinced that a few more could be found. The most frequently quoted account, given by Wood, in his *Athenæ Oxoniensis,* states that Kelley died in October 1595,[11] and this fits relatively well with Dee's entry at the bottom of the page for November that same year: "25 – Newes, that Sir Edward Kelley was slayne".[12] Ashmole's version is the story which, with some variations, is the most widely known: "he was clapt up againe into *Prison,* and attempting to make his *Escape* out of a high *Window,* by the teering of his *Sheetes,* which were tyed together to let him downe, he (being a weighty Man) fell and broke his *Legg,* and thereof *dyed*".[13] Unlike Wood, Arthur Edward Waite gives the death date of Kelley as 1597, "when he attempted to escape by a rope, but, falling from a considerable height, sustained such injuries as resulted in his death at the age of forty-two",[14] according to Waite, his second imprisonment was "in the castle of Zerner". Wood relates: "John Weever says that Queen Elizabeth sent, very secretly, Captain Peter Gwinne, with some others, to persuade Kelly to return to his native country. It is then said that attempting to escape from a wall *of his own house* at Prague, he fell, etc. […] His house is said to bear his name to this day, and was once an old sanctuary."[15]

All these stories of Kelley's death are curious indeed, as we now know from the study of Evans, who bases his accounts mainly on Czech sources, that Kelley, was, in all considerable probability, alive as late as 1597 or 1598; and the document to which Evans refers makes no mention of Kelley's death or imprisonment, but quite to the contrary identifies Kelley as "dem Gestrengen Edlen Ernnesten Ritter unndt Herrn Edwardo Kelleo von Imanij undt auff New Lüben, [...] auffm Brüxner (= Most) Schloss".[16] There are several things that simply do not fit: first, from whom does Dee receive the (probably) false news of Kelley's death? As is apparent from his diaries, Dee was rather well-informed about Kelley's activities on the continent, and, in addition to Edward himself, he also corresponded with his brother, Thomas Kelley, as well as Francis Garland, Albert Laski, one Rowley, and certainly some others (such as Dyer and Burleigh), who were in personal contact with Edward Kelley during these crucial years 1589-1595.[17]

It seems unlikely that Kelley's career was as fraudulent as is usually believed, since in 1589 or shortly thereafter he seems to have been knighted by Rudolph;[18] in his diaries, Dee from that time onward consistently mentions Edward Kelley as "Sir Edward Kelley". Furthermore, from the years 1594 and 1595 there are, at least to my knowledge, no contemporary or near contemporary records of any imprisonment or arrest, either in his own house or in any castle, which of course does not mean that this did not occur;[19] and even if Kelley was in prison or had been arrested by order of the Emperor, as a note in Dee's diaries of 4 October 1593 unambiguously states: "Libertie E: K:", and on top of the same page: "4. Sir Edward Keley set at liberty by the emperor",[20] he must nevertheless have regained the confidence of the Emperor rather quickly, as Dee notes on the 12 August the following year: "I receyued Sir Edw: Kellyes letters of the Emperor inviting me to his servyce again".[21] Finally, we should pay attention to the fact that the only records of Kelley's death come from England, i.e. from Dee, Wood, and Ashmole, all of whom had to rely on other sources, unknown to us, while no other known record makes any mention of that occurrence. In view of this, I would not take for granted the commonly accepted account of the date and the circumstances of Kelley's death. First, we do not have the slightest idea as to where the information on Kelley's death actually originates. Probably, the source was one or several of Kelley's colleagues, perhaps the Garland brothers, Dyer or Burleigh, or one of his alchemical friends not known to us, but: it could also be Kelley himself, as he had previously done something similar when he is said to have disguised himself as "Edward Talbot" due to some troubles with the authorities for counterfeiting money and digging up corpses before his association with Dee.[22] Considering the lack of evidence, further speculations on this matter hardly seem justified, but it should however be kept in mind that fictitious and metaphorical "deaths" (not to mention "identities") are far from uncommon in the history and literature of alchemy.

II

Let us now take a look at the manuscripts in the Royal Library in Copenhagen which seem to have a connection to either Edward Kelley himself or to an English alchemical circle around him and John Dee. Even though they may not shed any new light on our obscure subject, they will, however, pose some new questions of relevance to the crucial years in Prague from 1589 until the death of the Emperor in 1612.

I would like to start with Old Royal Coll. 240 fol., written by 6–9 different English hands.[23] This manuscript seems to be made up of nine different books, written between 1550 and 1600, and bound together immediately after 1600. On the spine is written with a contemporary hand: "Liber Christopheri Taylour" and the "Monas hieroglyphica"-figure, which links this manuscript to a Dee-influenced circle. It is also interesting to note that this is a much earlier, and previously unknown, use of this mark of ownership, with which the aforementioned John Winthrop jr. later used to mark his books.[24] On the back cover a provenance signature: "Mr Powell" (most likely Griffith Powell, who lived between 1561 and 1620, and who seems to be the Powell jr. who made acquaintance with Dee and Walsingham around 1582).[25] The latest tracts, bound in the beginning of the manuscript, start with an English translation of Isaac Hollandus, with the date: "ffinis. / 22 maij / 1600 /". This is followed by an anonymous tract, possibly by the same author as the previous one: "Axiomata Philosophica Rules of Philosophers", fols. 69-70. Thereafter follows – on fols. 70-71^{v} – "The Physycall chemyck of Trythemius". On fols. 71v-74v, there is another Isaac Hollandus tract, with the title: "A Fragment of Isaach Holland concerning the Philosophers stone". On fols. 74v-75v: "23 A Portu St. Maria Aquitanus: Questiones & Answers Philosophicall by 23 of St. Mary Port in Aquitan", with the signature: "Pænotus A Portu Aquitanus | .V.M.D." after the explicit. On top of several of the tracts – throughout the whole manuscript – we find the annotation "Liber Christopheri Taylour", maybe referring to either the source of the material or a later provenance.[26] In any case, they are signatures of provenance and not of "scripsit", as one of the tracts with the "Liber Christopheri Taylour" signature is written and dated by Thomas

Newton. Though the contents seem to indicate a continental origin, this manuscript was obviously bought in England, as inferred by a note on the inside of the front cover "sum Habrechti qui me emit Londini 1616· 10 Martij pro ·4· Coronichi ·2· s 6[d]".[27]

Closely connected with the previous manuscript (with regard to provenance as well as to content) is Old Royal Coll. 1727 4°, written – according to the dates given in the manuscript – during the years 1593 to 1595 and bound in contemporary vellum. On the inside of the front board is a provenance signature: "Lond. Js. Habrechtt 1613". This manuscript contains 27 items, all in English, beginning with Benedict Figuli [Benedict Töpfer] *Auriga benedictus* (fols. 1r-8v), and followed by twenty tracts, mainly from English philosophers (Thomas Charnock, George Ripley, and Roger Bacon among others) and, among other anonymous tracts and translations of Arnold Villanova, an English translation of Isaac Hollandus's *Septem condiciones huius Materiæ* (fols. 99-100v). But the most interesting feature of this manuscript is not the tracts but the long passages of notes, recipes, booklists and other memoranda and idle scribblings, i.e. items 2, 4–7, and 27. These parts of the manuscript contain a number of names, unfortunately often erased or crossed out so that they are practically illegible,[28] and when not illegible seemingly written in code. I have found no biographical information on several of the names that I have been able to read, e.g.: "Tisdale", "Kessler", "Turpin", "Fouler", "Smith", "Edgcome", "Bartholomeus", and "Poole". Other "names", always following determined cancellations, for instance "of mr [percivale] kogpiavno", "of captayne [davltre] Tvandgo", "of mr [poole] keeno", "of mr [dickenson] Tippolfel" or "of mr [miller] Minnog" are obviously written in code.[29] But other names, like "Garland", "Digges", "Hill", and of course "Dee" on fol. 132, do suggest that this manuscript stands in some relation to English alchemists active in Europe. It is well within the bounds of possibility that the "Garland" mentioned mainly on fols. 15v-18 is identical with the friend of Kelley and Dee whose name frequently appears in Dee's diaries (or with his brother). If so, then the "Nicolas Hill" mentioned on several occasions between fols. 21v-29v, would be Nicholas Hill, the English philosopher, about whom very little is known.[30] Hill was born in 1570 or 71 and died in 1621; in 1578 he entered Merchant Taylor's School and matriculated as a scholar of St. John's College Oxford in June 1587, and on 30 June 1590 he was elected a Fellow of his college, but was removed before 1592, apparently because he entertained Lullian ideas and perhaps for being too explicitly Catholic in his religious leanings.[31] Of Hill's whereabouts and activities the following years up until his death almost nothing is known apart from undocumented rumours. Evidently he did not travel abroad in the 1570s and function as secretary for Edward de Vere, the Earl of Oxford, as often said,[32] but he seems to have lived under the patronage of Henry, the Earl of Northumberland in the 1590s and might very well have travelled on the Continent in the early 1600s, either to publish his work in Paris in 1601, or leave England due to some involvement in the conspiracy of Sir Robert Basset.[33] After his death, Hill left a number of texts about the essence of God, eternity, the infinity of matter and the like to his widow,[34] but only one of his works was published in his lifetime: *Philosophia Epicurea, Democritiana, Theophrastica proposita simpliciter non edocta* (Paris, 1601). Being influenced by Lullian and Brunian ideas as well as hermeticism, and his connection with the Northumberland circle, the identification of Nicholas Hill with the one in this manuscript seems tenable.

If these conjunctions and conjectures are reasonable it would suggest that the "Mr. Digges" mentioned on fols. 18v and 21, could be identical with the Thomas Digges who died in 1595 and who was one of the more celebrated mathematicians of his time as well as a close friend of Dee's.[35] It is interesting, then, that the notes in which his name occurs both date from precisely 1595, the year of his death; and the notes relating to his name also seem to be listings of his belongings, as on fol. 21: "the bookes of mr digges", or, on fol. 18^v: "A note of mr digges his worke, after his preparatione of his two Materials Sol and Mercury". Like the aforementioned manuscript this one is also signed "Christopheri Taylour" at the top of some of the tracts.[36] As to the provenance of this manuscript, my guess would be that it was written in England, like the aforementioned one, but we should carefully consider the fact, known from Dee's diaries, that at least one of the Garlands was in Prague around these years (1593–1595), and that the manuscripts could very well have been written by an Englishman on the continent and brought to London at the time of Emperor Rudolph's death.

The name of Garland also figures in another manuscript, Old Royal Collection 1749 4°, in one hand, signed and dated on fol. 40v: "[…] Here endeth the practise of mr John Englishman deacon, and coppied by me J: Metcalfe on the 11· & 12 daie of October· 1594·", and which on the front cover says: "mr garland the 12th Aprill 1595 | the 2d | of John Englyshman & ye later end, ye questions | of Henry tyler | of John Englyshe". This manuscript only consists of two tracts, the first signed at the top by the intriguing "Liber Christopheri Taylour" (as manuscript 240) in another hand, the second, on pp.41^v-43, with an "ex libris" added later by the same hand who wrote the "Christopheri Taylor" signatures, but here it says: "Out of mr Garlandes book of ye Earle of Trevisan./".

Another manuscript, Old Royal Coll. 242 fol., dated 1579 and 1589, has a similarly interesting though uncertain provenance. After the explicit of the first tract, "Opus Isaaci Hollandi Vegetabil", we read "a copie followinge the exemplaire cominge from coullongne / de / D / Brickman 1575 a londres le ix^{th} of april 1579". "Brickman", is the English spelling for "Birckmann", and a reference to Birckmann's in Cologne,[37] the book-dealer from whom Dee bought many of his books from 1564 onward.[38] This first tract could therefore very well have been copied from a book belonging to Dee. The manuscript also includes "Isaac Hollandus, Septem conditiones huius materie" (with the signature "Liber Christopheri Taylour"), "A correctory made by Richard the Englishe man How Arte followeth nature"), and a text of Edward Kelley's, here with the title: "The praise of vniti for friendships sake made by astranger to furder his frende his conceyts. 1589", with the incipit "The heavenly cope hath in him natures foure | To hidden but the rest to sight apeare [...]", and after the explicit, we read: "Sir Edward Kelle. Finis" (Plate 17). This text was included in Ashmole's *Theatrum chemicum britannicum,* which was published in 1652, with the following title, and a dedication which is absent in our version: "Sir Ed: Kelley concerning the Philo-

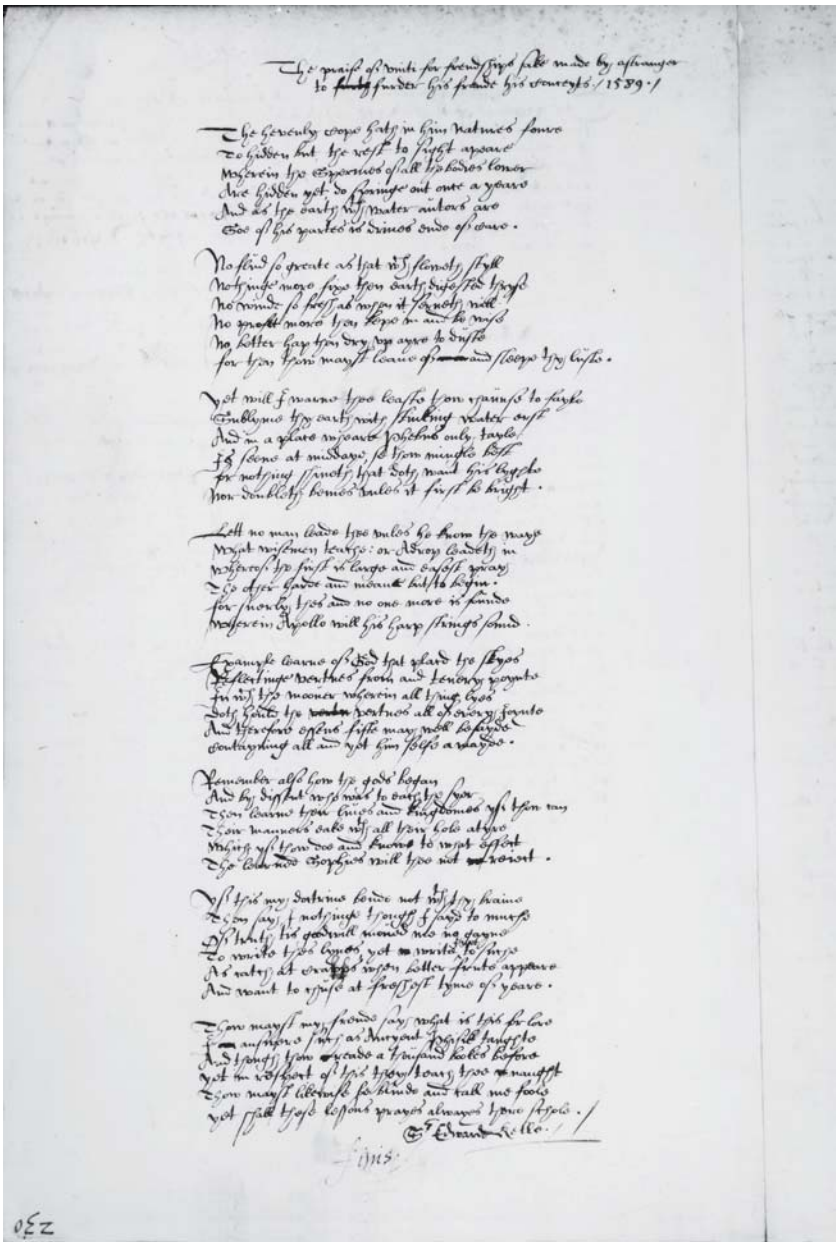

Plate 17: Edward Kelley's 'The praise of vniti for frendships sake' (dated, 1589). Copenhagen, Royal Library MS, GKS 242, fol. 37^{v}. Reproduced by permission of the Royal Library, Copenhagen (Det Kongelige Bibliotek).

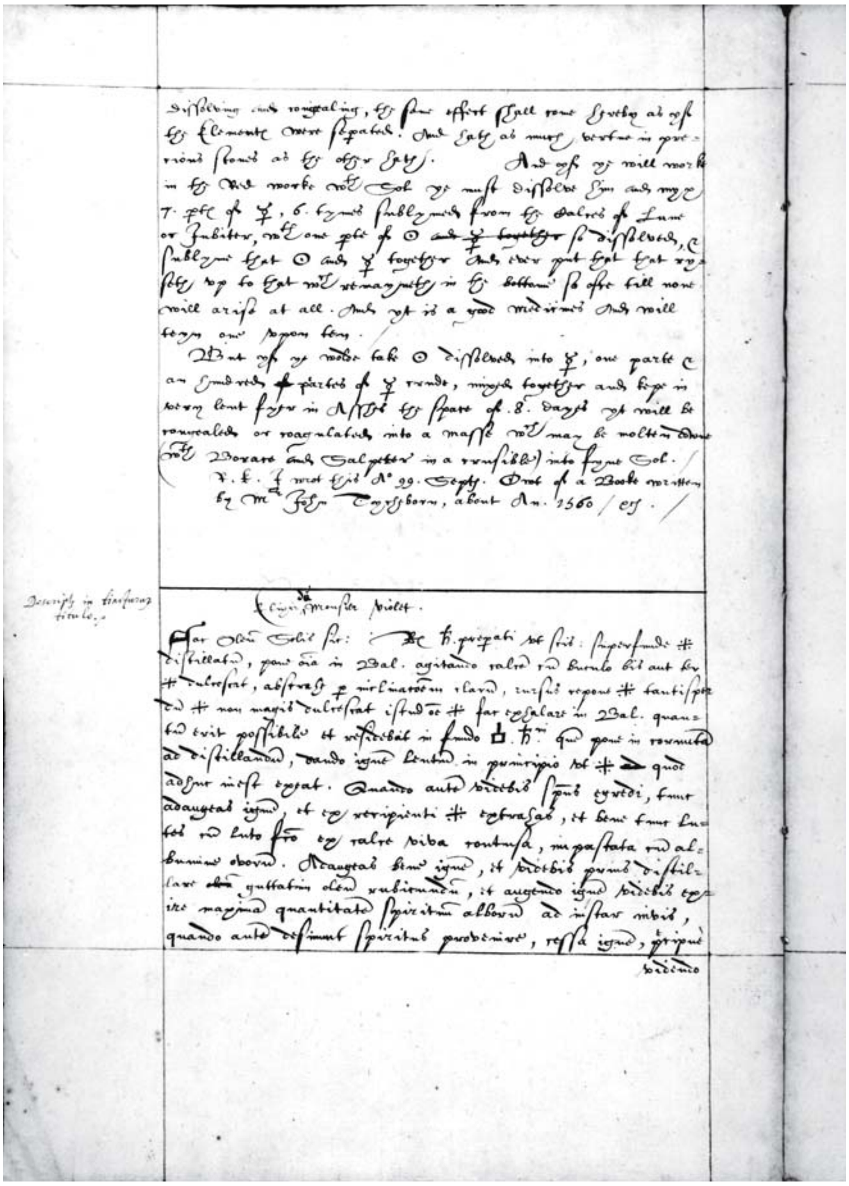
sophers Stone written to his especiall good Freind, G. S. Gent".[39] Even though published, this manuscript text of Kelley's metrical tract is of particular interest, as it is dated 1589, the year that Kelley definitively left Trebona for Prague and Dee returned to England. Accordingly, I find it not unreasonable to assume that the first part of this manuscript was written in England and the last part, dated 1589, was written in Bohemia. This assumption is made pending a more thorough examination of the paper and other physical evidence which might either corroborate or invalidate this hypothesis. Apart from the final parting of Kelley and Dee in 1589, this year is important in Kelley's career in another respect as well, as it was presumably sometime between February 1589 and January 1590 that Kelley was knighted by the Emperor. If then this dating and signature on fol. 37^v is not added later (which the hand and the rest of the material in the codex does not suggest), then this could very well be a holograph of Edward Kelley himself, and, equally important: if *not* a holograph of Edward Kelley, then (still if the hand is contemporary with the date) it must have been written by someone rather close to him in Prague (i.e. knowing his recently acquired title and having access to his papers). Nevertheless, to me the signature "Sir Edward Kelle" looks like an autograph and not like an author's name given by a scribe, in which case it would be more natural to place it by the title as is usually done.[40]

As will be shown later, the next manuscript, Old Royal Coll. 246 fol., was definitely written in Prague. It contains four tracts written and signed by one hand: "A Discours of the Quintessence (or rather the Mercury of Lune) / owt of a booke written by Mr. John Tychborn", "Elixir de Monsier Violet", "In nomine Domini nostri JESU CHRISTI Amen" (in Italian), and the same in an English translation. This tract (as the Italian original preceding it) is written with the explicit address to the Emperor: "I have thought good to shew only with briefnes of hart to your Imperiall Ma*yes*ty the true way …" (fol. 6). Three of the tracts are signed, the first, "R. K. I wrot this A° 99 Sept[embr]is. Owt of a Booke written by Mr John Tychborn, about an. 1560" (Plate 18), the second: "A° 99. Oct[obr]is 12 finis huius Tractatus Ex chartis Sir Edw. K.", and finally: "Ex chartis Sir Ed. K" (Plate 19). Due to the identical manner of the signatures it would be tempting to regard this manuscript as a holograph by Edward Kelley from 1599, and the first signature "R. K. I wrot this", as a mere misspelling; and even though the signature "R.K." occurs only once, and never in connection with the more unambiguous Edward Kelley-signatures, I find it safer to assume that this manuscript was written in 1599, by a person in Prague (the same hand has signed the Old Royal Coll. 1723 4° in Prague, as will be shown later) with the initials R. K.,[41] and that the other two tracts in this manuscript are thus copied from "the papers of Edward Kelly". It is clear, however, that the unidentified scribe R. K. must have been in relatively close contact with Edward Kelley or the alchemical circle around him in Prague, as he has obviously had access to Kelley's papers.

As far as I can see, what appears to be the same hand has also written part of Old Royal Coll. 1723 4°, dated 1612 and 1613, with the signatures "Ex libro Johannis Carpionis de Kaprstein / Martis 28 Anno 1612" (Plate 20) and "Reliqua verò antecedentia ex manuscripto libro magna vetustissimo (et omnio de rebus vel



dissolving and congealing, the same effect shall come thereby as yf the Elements were separated. And hath as much vertue in precious stones as the other hath. And yf ye will worke in the Red worke wt Sol ye must dissolve him and myxe 7. ptes of ☿, 6. tymes sublymed from the Salts of Lune or Jubiter, wt one pte of ☉ ~~and ☿ together~~ so dissolved, & sublyme that ☉ and ☿ together And ever put that that ryseth up to that wch remayneth in the bottom so ofte till none will arise at all. And yt is a good medicine And will tyng one upon ten.

But yf ye wolde take ☉ dissolved into ☿, one parte & an hundreth partes of ☿ crude, myngle together and kepe in very lent fyre in Asshes the space of .8. dayes yt will be congealed or coagulated into a masse wch may be molten downe (wth Borace and Salpeter in a crusible) into fyne Sol.

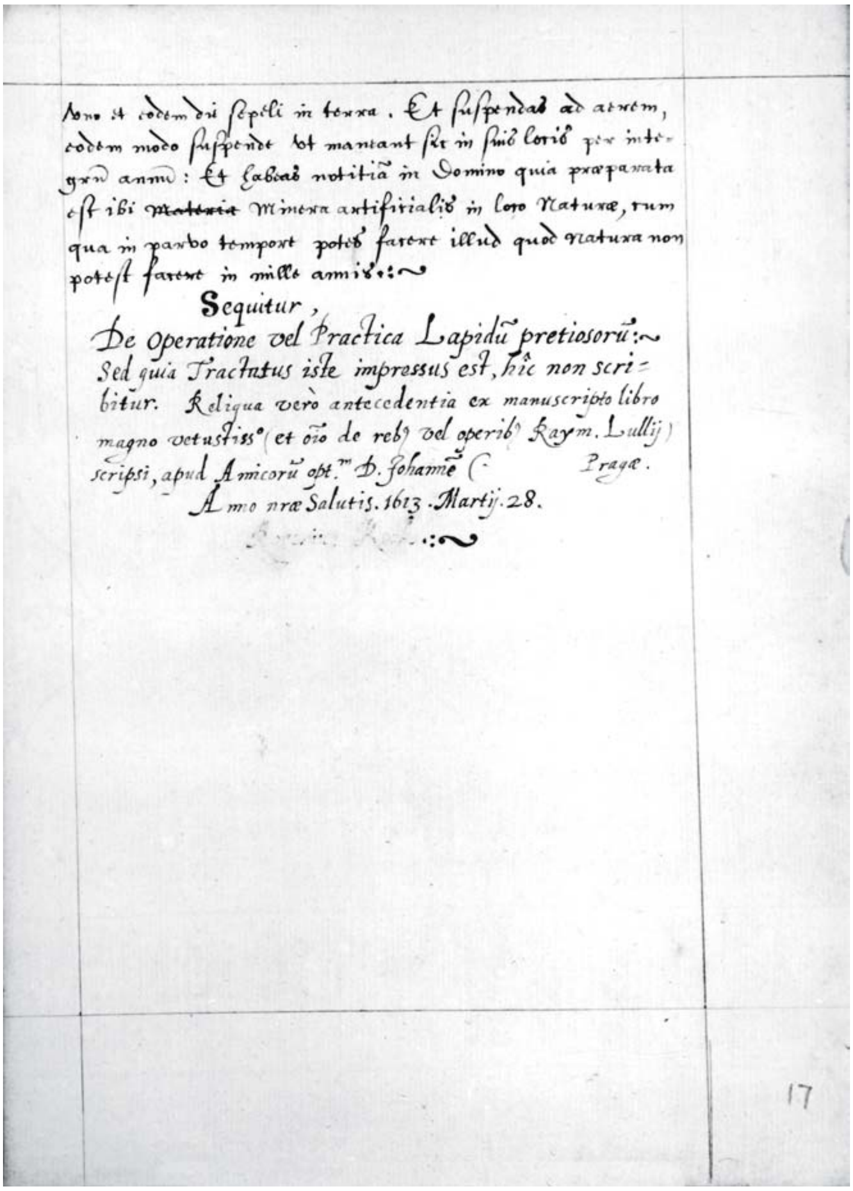
operibus Raym. Lullij) scripsi, apud Amicorum optimum D. Johannem C· Pragæ. Anno nostrae Salutatis 1613 Martis 28" (Plate 21), confirming that this scribe was active in Prague, and furthermore "apud amicorum Johannem C[arpionem]", i.e. John Carpe, with whom Kelley travelled several times to Prague. The last historically established trace of Carpe is the previously mentioned entry in Dee's diary, recording the departure of Kelley, Garland, and Carpe to Prague.[42] After the John Carpe signature there is an erased name which very well could be read as "Rogero Kock", a Germanized spelling of Dee's laboratory assistant Roger Cook (b. 1553).[43] Cook worked with Dee from 1567 to 1581, then left him after a violent quarrel, but eventually returned to Dee's service in Manchester in 1600, and in 1606 he was building a still-house for the Earl of Northumberland. Especially interesting in our connection is that he is probably to be identified as the Roger Cock who was assisting Cornelius Drebbel as an alchemist at the court of Rudolph II up to the time of the Emperor's death.[44] Not irrelevant in this connection is that it appears that the "John Carpe" signatures in the manuscript were added some years later by the same hand (which could explain why both are dated the 28 March, but of different years). This does not necessarily mean that the dating is inaccurate. In any case, this signature (John Carpe in Prague 1612 and/or 1613) as well as the, in my opinion, identical English hand do in fact strongly suggest that the production of English alchemical manuscripts stemming from a circle around Dee and Kelley in Prague did continue up to the year of the Emperor's death in 1612. As we have seen, John Carpe was with Francis Garland and Edward Kelley in Prague in the years 1588-89, and, though Dee's correspondence with Burleigh, Garland, Carpe and others with links to Prague seems to have ceased by 1595, the alchemical activities intimately connected to Kelley's activities there obviously continued a good many years after 1595.

We possess yet another manuscript in the same hand: Old Royal Coll. 245 fol., written partly in German, partly in Dutch, with shorter sections in English and Latin, consonant with the assumption that this manuscript springs from the multilingual milieu of Prague. The manuscript is dated "Ex Libro Loogenhagij 1601".[45] Aside from a number of obvious similarities, this assumption is supported by another fact: both manuscripts contain texts by the otherwise totally unknown alchemical writer John Tychborn (possibly related to the Tichborne family).[46] Here we have three texts, the greater part taken "ex libro Loogenhage": "De vitriolo", "A Discourse of Antymony, wrytten by Mr John Tychborn of London (Anno Domini 1560) After a duch Booke pertayning to Mr Albert of Brydewell", and "De Antimonio vel Stibio", which is a compilation of recipes gleaned from various authors. An interesting feature of this manuscript and Old Royal Coll. 1723 4° is that both have "flower signs" in the margins. From Julian Roberts and Andrew G. Watson we know that identical "flower signs" were employed by Dee.[47] Obviously, these signs were also in use by members of the alchemical circle around him.

The last of the Copenhagen manuscripts that I find relevant in this connection is also the most intriguing, although at the same time it is that which yields the least factual information. The manuscript in question is Old Royal Collection 247 fol., written by one English hand, with a title page: "Apotelesmata | The Phylosophycal



bono et eodem die sepeli in terra. Et suspendas ad aerem,

Plate 21: Note concerning a Lullian manuscript owned by ‘D. Johanne[m] C[arpionem]’, Prague 1613. Copenhagen, Royal Library MS 1723, fol. 17^{r} Reproduced by permission of the Royal Library, Copenhagen (Det Kongelige Bibliotek).

effects of Mercurye | in his Tryvmphe | concernynge | The trew & cheyfe medycyne of the most | avncyent Phylosophers. In whiche is | contayned the openynge & keye | of the whole worke, done by | Arioponus Cæphalus of Eutopia", with a dedication: "To the most myghty & Invyncible Emperour | Rvdolphus 2· Always Avgvstus. | M. C. M. D. the least of the | phylosophers. | ffrom forth the most Inward affectyon of a devoted mynd, and humble observance, doth dedycate, consecrate, and submytt This present worke".

Two Latin tracts have been published by this Arioponus Cæphalus of Eutopia, one with the title: *Mercurius Triumphans & Hebdomas Ecologarum Hermeticarum* (Magdeburg: Andreas Seydner, 1600).[48] The other work is *Apotelesmata Philosophica, Mercurii Triumphantis* (Magdeburg: Andreas Seydner, 1601).[49] I have previously vaguely suggested that the manuscript could have been composed or copied by Edward Kelley, but at the time I was not aware of the existence of the two printed editions – though both are included in Ferguson – and as I have not yet had the opportunity to collate these editions with our manuscript, I cannot say how the manuscript, numbering only 14 leaves, corresponds with the two editions respectively comprising 144 pages in octavo and 72 pages in quarto, but it is undeniable that elements from both printed titles appear on its own "titlepage". Pending a collation with the printed editions, we can at least note that this tract, as the previous ones, suggests a connection between the continent (possibly Prague, the hand being very similar to that in 245 fol., 246 fol., and the "apud amicorum optimum D. Johannem C." of Old Coll. 1723 4°), and a group of English writers, scribes and/or friends of alchemy. That this tract was in fact written, or later owned, by someone in the aforementioned circle, possibly around the time of Dee's and especially Kelley's travels from 1585 until at least 1597, follows from the signature on the upper part of the title page: "Liber Christopheri Taylour".

Taken individually, these manuscripts can hardly be said to prove anything, but considered as a whole, they suggest a pattern which could be a promising approach to research on the late career of Edward Kelley. If I may summarize: these eight manuscripts may be divided into two main groups, which could be labelled the "R.K." group and the "Christopher Taylour" group. Of the "R.K." group, two of the manuscripts, 245 and 246, are obviously written by the same English hand, in Prague, 1601 and 1599. Both contain tracts from the otherwise little known alchemist John Tychborn. The scribe, with the initials R.K., must have been rather close to Edward Kelley, as he or she by some means had access to Kelley's papers. In my opinion this scribe is to be identified with hand II of manuscript 1723 (fols. 9–20^v). If so, this R.K. refers to one of Kelley's alchemical travel companions in Bohemia, John Carpe, as "the best of friends", which implies that R.K. and John Carpe both were active in Prague up to the time of the Emperor's death. As hand II (i.e. R.K.) comprises only the half of quire C and hand III of the same manuscript continues directly after on leaf C_5 and ends on leaf D_8, hand III ought either to be the same person as hand II, or another person working together with hand II/R.K. on this manuscript book in Carpe's house. This R.K. further seems to have been familiar with John Dee's methods of annotating books, which follows from the "flower signs" in the margin throughout manuscript 245, as well as in manuscript 1723, a fact that strengthens the identification of hand II with the signature R.K.

Two manuscripts in the "Christopher Taylour" group seem to have been written in Prague, 242 (partly) and 247; the relevant part of manuscript 242 is dated 1589 and manuscript 247 is written about 1600. But the first part of manuscript 242 is obviously written in London 1579 from a copy from the bookseller Birckmann. As we can regard the number of Englishmen interested in alchemical books and in contact with Birckmann in Cologne in 1579 as limited, we can assume that it was written by someone in the John Dee circle.[50] Furthermore, given the alchemical verses, dated 1589 and signed "Sir Edward Kelle", possibly a holograph, and given the circumstances of the name and the year, which implies Prague, the provenance of this manuscript is as close to Edward Kelley as it can be without conclusive evidence. Still without conclusive evidence, this provenance is strengthened by the rest of the manuscripts which have the "Liber Christopheri Taylour" signatures, and which, apart from manuscript 247 (the Arioponus Cæphalus tract), all contain reference to persons in contact with Dee and Kelley: Mr. Powell (manuscripts 240 and 1727), Nicholas Hill and Digges (manuscript 1727), Garland (manuscripts 1727 and 1749), and further the "Monas hieroglyphica" sign on the spine of manuscript 240.[51]

The link between these two groups of manuscripts is that both are connected to alchemical activities in Prague during the years 1589-1612, and both are closely connected to Edward Kelley's alchemical friends and travelling companions from 1589 onwards. The crucial question, not only in relation to the Copenhagen manuscripts, but more importantly, to Kelley's and others' activities in Prague between 1589 and 1612, must then be the identity and biography of R.K. and Christopher Taylour.

APPENDIX

A DESCRIPTION OF THE ROYAL LIBRARY MANUSCRIPTS.

Old Royal Coll. 240 fol.

English, last third of the sixteenth century, dated 1567 and 1600, paper, in-fol. 29-31 × 19-20 cm, made up of nine books: [A]^{12} [B–E]^{8} [F]^{6} [G–H]^{8} [I]^{8} (I$_{1}$+2) [K]^{4} (80 leaves); [L]^{10} [M–Q]^{8} [R–X]^{6} (80 leaves); [Y]^{2} [Z]^{32} (-Z$_{32}$) (33 leaves); [Aa]^{30} (-Aa$_{29–30}$) (28 leaves); [Bb]^{6} [Cc]^{4} (10 leaves); [Dd]^{30} (30 leaves); [Ee–Gg]^{8} [Hh]^{4} (Hh$_{2}$+2, 2+Hh$_{3}$, -Hh$_{4}$) (31 leaves); [Ii]^{8} (8 leaves); [Kk–Ll]^{6} (12 leaves). In total: 312 leaves + Flyleaf and Endleaf. No folio numbers, but quires [Z] and [Aa] with their own foliation: 1-30 [31], and 1-28 respectively, and quires [Bb–Cc] with own pagination 1-4 [5] 6 [7] 8 … [19] 20. Due to extremely tight binding I have not been able to describe how quires [Ee–Gg] are made up, but from the watermarks I can conclude that they are not gathered as ordinary eights. Bound in contemporary vellum, between 1600 and 1616, but probably immediately after 1600. On the spine: “Liber Christopheri | Taylour | [Monas hieroglyphica]. Old signature on front cover: “14”, and, by another hand: “quo mihi fortuna, si non conceditur vti?”. On the back cover: “Mr Powell·/”, and another sentence: “Scientia non habet inimicum, nisi ignorantem·/”, and, by another hand: “aeyreus”. A provenance signature on the inside of the front cover reads: “sum Habrechtj q[ui] me emit Londinj 1616· 10 Martij p[ro] ·4· Coronichi ·2·s 6[d]”. On flyleaf: “Opus Isaaci Hollandi Mineral”.

Paper: 5 different papers (quire Ii without watermarks, quire Y unidentifiable). **A]** (quires A–K): chainlines 22 mm, watermark: pot with two handles with grapes on top 57 × 18 mm (Not unlike Briquet IV, 12.885, i.e.: C.M. Briquet, *Les Filigranes,* 4 vols (Leipzig: Karl W. Hiersemann, 1923), hereafter referred to as “Briquet” followed by a volume number. **B]** (quires M–T) chainlines 22 mm. Grapes 35 × 18 mm. (as in Briquet IV, 13.065 or 13.066, but far from identical). **C]** (quires A, L, V–X, Z–Aa–Cc, Ee, Hh, K–L) types of pots with one handle and a four-petalled flower on top, and some signs on the lower part of the pot (of which there exists a great variety, often of French or Flemish origin, cf. Briquet IV, 12.505–12.818); C_{67}: height 67 mm (quire X), not in Briquet. C_{64}: 64 × 24 mm (quires Z, Aa), with a “B” on the lower part of the pot, not in Briquet. C_{61}: with “D” and “reversed P” on the urn, height: 61 mm (quire V), identical with Briquet IV, 12.721 (Moscow 1594). C_{58a}: 58 × 26 mm circle, triangle above a “B” on the pot (quires A & L, $M_{1/8}$), not in Briquet. C_{58b}: circle, quadrate, and triangle, no letters (quires Bb–Cc), not in Briquet. C_{58c}: 58 × 25 mm (another variant) (quires Ee & Hh). C_{50} height 50 mm, no flower at top (Kk–Ll). **D]** standard, bottom to top: two feet, a rod, a schematised man in a globe, a rod, on which a schematised man is sitting with arms and legs streched out. 56 × 15 mm (quires Dd). I have found no similiar type of watermark in Briquet. **E]** a crudely drawn pot with two handles, on top a three-petalled flower. 60 × 31 mm (quires Ee–Gg). Not in Briquet.

Nine hands: Hand I (fols. 2-80^v.). Hand II (fols. 81-160). Hand III (fols. 161-162). Hand IV (fols. 163-221), signed: “Thomas Newton 1567”. Hand V (fols. 222-231). Hand VI (fols. 232-261). Hand VII (fols. 262-291^v). Hand VIII (fols. 293-300). Hand IX (fols. 301-312). Some of these hands could however be identical.

1. fols. 2–69 (fol. 1 *blank*) [Isaac Hollandus. Opus minerale] *Tit.:* The book of the conditions or qualities of the Physical stone *with preface-title:* The p[re]face of the booke of the condytions or qualytyes | of the Physycall ston. | Wherin is rehearsed the seu[er]all labors of sondry | men, as also the Aucthors intent. *Inc. Old Royal Coll. 1723 4°.

Latin, early seventeenth-century, paper, in-4°, ca. 21 × 15 cm.: [A–D]^{8} (32 leaves), written by three hands. Unbound, second leaf of front cover cropped after B$_{8}$, first leaf of back cover cropped before D$_{1}$. On front board old sign.: "N. 54." & "6". Paper: Quire A: vertical chainlines 24-25 mm, watermark: heraldic shield with four compartments, upper left four vertical lines, upper right lion (?) [Lower: double-headed eagle and tower (?)]. On top a crown ca. 100 × 62 mm. Quire B–D: Watermark: two symmetrical towers with one window each flanking a simple tri-angular building with one rounded door, width between towers: 43 mm. (Close to Briquet, 15.943: Prague 1573, but cf. Gerhard Piccard, *Die Turmwasserzeichen. Findbuch III* (Stuttgart: Kohlhammer, 1970), X, 183-84, 193-95, or 202-207, Ravensburg, 1583-98. This firm had two papermills in Bohemia: Prague and Trautenau). Cover: vertical chainlines 21 mm, watermark: pot with one handle, crown and a four-petalled flower above crown 64 × 24 mm (seems to be close to quire A of manuscript 247, and possibly also to quires Z and Aa of manuscript 240).

Hands: I: (with separate foliation), quire A; II: fols. B$_{1}$–C$_{4}$, not unlike Old Royal Coll. 244 & 245; III: C$_{5}$–D$_{8}$.

On front cover, list of contents: TRACTATVS | Varij, de Lapide | I. Processus Raym: Lullii, Abbati Angelo, itineris | comiti com[m]unicatus, in monasterio

Angliæ | repertus | II. Ejusdem tractatus de investigatione secreti occulti, | ad Celestinum discipulum suum, quem edidit | Anoniæ, in Coenobio fr. Prædicat· a[nn]o 1319· | III. Epistola totam artem complectens. | IV. Alphidii philosophi liber, dictus Domus thesau= | rorum. | V. Dicta Hermetis & Ortolphi, philosophorum. | VI. Hermetis Regis Græcorum, dicta.

NOTES

[1] Elias Ashmole, *Theatrum chemicum britannicum* (London, 1652), 481-484. Anthony à Wood, *Athenæ Oxoniensis, An exact history of all the writers and bishops who have had their education in the University of Oxford. To which are added the Fasti, or Annals of the said University*, ed. Philip Bliss, 4 vols (London, 1813-1820), I, 639-643, III, 286. Thompson Cooper, “Kelley, Edward”, in *DNB*, X, 1230-1232.

[2] Numerous records of Kelley’s travels are given in Halliwell’s edition of Dee’s diary, starting with 18 October 1586: “E. K. recessit a Trebona versus Pragam curru delatus; mansit hic per tres hebdomadas” (*Private Diary,* 21.) 30 December 1586 “E. K. versus Pragam. [...] Jan. 18th, rediit E. K. a Praga” (*Private Diary*, 22), “Jan. 21st, E. K. again to Prage and so to Poland ward. [...] Feb. 19th, E. K. cam from Poland abowt none to Trebone:” (*Private Diary*, 22.) “Sept. 30th, T[homas] K[elly] and J[ohn] C[arp] went toward Prage. / Oct. 12th, Mr. E. K. toward Prage on horsbak [...] Oct. 26th, Mr. Edward Kelly cam to Trebona from Prage” (*Private Diary*, 24). And in 1588 “Oct. 25th, Mr. Ed. Kelley and John Carpio rode toward Prage; [...] Nov. 6th, Mr. Kelly cam home from Prage and Mr. Francys Garland, and Edward Rolls with him from Englis” (*Private Diary*, 29). And finally, in 1589: “Feb. 16th

Mr. Edward Kelley rode toward Prage after none, John Carpio, Edmond Hilton, Henry Garlande, Thomas Simkinson, Lodovik." (*Private Diary*, 30)

[4] Ashmole, *Theatrum chemicum*, 482.

[5] The Alexander Robert mentioned by Ashmole seems to be the same Roberts, who at least once delivered a letter from Kelley to Dee (Dee did not always give the names of those from whom he got Kelley's letters), as a note from November 1594 suggests, "Receyued a letter from Sir Ed. Kelley by Roberts" (Oxford, Bodleian Library, Ashmole MS 487, containing diary notes and occasional short memoranda of John Dee from January 1577 to December 1600 in Iohannes Stadius, *Ephemerides novæ,* Cologne 1570. Hereafter referred to as "Ashmole MS 487" and the relevant date).

[14] Arthur Edward Waite, "Biographical Preface" in *The Alchemical Writings of Edward Kelley* (London: Robinson & Watkins, 1973), xxxix.

[15] Quoted from Waite, xxxix. My emphasis.

[16] Prague, Nat. Mus. MS VI.D.17, cit. R. J. W. Evans, *Rudolph II and his Time* (Oxford: Clarendon Press, 1973), 227. Evans does not give any mention of the death of Kelley. Louise Schleiner kindly informed me of a Czech historian, Ivan Sviták, who gives Kelley's date of death as 1598. As I have not been able to read Sviták's two biographies of Kelley, I do not know which sources Sviták uses for that statement, but they are obviously better than the usual ones. The books are: *Hledání kamene mudrcu. Rehabilitace pana Edwarda Kelleye – neoplatonického hermetického filozofa a rytíre Ceského království, který zil v letech 1584-1598 v Praze* (Prague: [n.pub.], 1991) and *Sir Edward Kelley: ceskå rytmr*, *1555-1598* (Prague: Samisdat ISIS, 1994). Nevertheless, in the "Bibliographical notes" – which are written in English – of the first monograph, Sviták writes: "A. The Published Works of Edward Kelley (1555-1597, often given with the wrong date 1595)" (*Hledání kamene mudrcu …*, 213).

[17] Cf. Oxford, Bodleian Library, Ashmole MS 488, containing diary notes and occasional short memoranda of John Dee from December 1586 to April 1601 in Iohannes Antonius Manginus, *Ephemerides coelestium motuum* (Venice 1582). Hereafter referred to as "Ashmole MS 488" and the relevant date. During the period from January to September 1590 there are at least eight notes relating to correspondence and "talks" about Kelley: for the period January 1593 to the aforementioned "death news" of 25 November 1595, there are at least thirteen such entries.

[18] *NP,* 228.

[19] In British Library, Sloane MS 68 containing different loose items, mostly letters, we read in item 85, "A true copy of a letter written from Frankfort concerning Sir Edward Kelly's troubles, May 15, 1591." But this document does not suggest that Kelley's troubles with the Bohemian authorities were of an alchemical, hermetical or mystical nature, but speaks of a political conflict between the substantial English community in Bohemia and the Bohemian authorities. It appears from this letter that Kelley was involved in the conflict as a prestigious member of the English community rather than as a persecuted alchemist. The political problem of being an Englishman in Prague at that time is reflected in some passages in this letter: "To Prag I durst not inquire much after it bicause it tutcht the Emperors brother neerly and was odious in it self. [...] At my first comming I was aduertisd that there were many English in the Towne vpon which I ment not to discover my self, till I had sounded out what they were, the state they bare, and what course they tooke. Worde was given me that one Mr Dyer was in Sir Edward Kellyes house, and an other Paje with one of the Lees in the Towne and two or 3 other Captains which departed, as I was informd [...]." Cf. also item 93 in the same manuscript "A letter from Mr Tho. Webbes, at Stade, to Lord Burghley; concerning Mr. Dier's and Sir Edw. Kelley's trouble, June 26, 1591."

[20] Ashmole MS 487, October 1593. In Ashmole MS 488, however, the note "The Newes of Sir Edward Kelly his libertie" is dated the 5 December 1593.

[21] Ashmole MS 487, 12 August 1594.

[22] Wayne Shumaker, *Renaissance Curiosa* (Binghamton: Mediaeval and Renaissance Texts and Studies, 1982), 25-26. Even though I have not checked the sources, it is my opinion that these rumours are obviously just fantastic stories. In the *Dictionary of National Biography* they are summarized in the following way: "Leaving Oxford "abruptly", Kelley appears at London as a fraudulent scrivener or attorney (Du Fresnoy, *Hist. De la Philosophie Hermétique*, i. 307). About 1580 he had his ears cropped in the pillory at Lancaster for forging some ancient title-deeds (Nash, ii, 446); or, according to another account, for coining base money. Weever, in his "Funerall Monuments" (p.46), charges him in addition with having dug up a corpse in Walton-le-Dale Park for the purpose of questioning the dead." (*DNB*, X, 231).

[23] For a full description of the manuscripts see Appendix.

[24] Wilkinson; *R&W*, 67 .

[25] Dee writes about a Mr. Powell – probably the father of Griffith, as he calls the Mr. Powell whom he met in 1582, "Mr. Powell the younger" – in Hearne's *Compendious Rehearsal*: "To my foresaid library and studies, may my three Laboratories, serving for *Pyrotechnia,* be justly accounted, as Appendix practical. The furniture of which and of all the storehouses, chambers, and garrets, belonging and replenished with Chymical stuff, was (for above 20 years) of my getting together, farr and near, with great pains, cost and damages; as partly Mr. Powel, her Majestie's servant at this present, can testifie for one journey, wherein he took pains with me, into the Dukedome of Lorrain (A. 1571.) and we brought from thence one great cart lading of purposely made vessels *&c.*", *R&W*, 197.

[26] From Adam McLean's website (http://www.levity.com/alchemy/almss5.html, accessed July 2005). I note the occurence of the name Christopher Taylour in the following manuscripts: Oxford, Bodleian Library, Ashmole MS 1406. Part II, 131-173: "A treatise of the Numbers one and two, and the Unity and Chaos". "Liber Christophori Taylour. 1600", Oxford, Bodleian Library, Ashmole MS 1482, fols. 136-138: "Processus operis" (An account of an alchemical process, written partly in a secret alphabet, partly in Latin, and partly in English, superscribed by the writer "Liber Christopheri Taylour"), and Oxford, Bodleian Library, Ashmole MS 1492. Sixteenth and seventeenth centuries, IX. 1, 130: "A vessell of circulation, with blind head of the owne. (In the handwriting of Christopher Taylour)."

[27] There are several manuscripts which were owned or written by Isaac Habrecht in the Royal Library in Copenhagen. I have not had the opportunity to undertake a close examination of them, but they are, apart from the one that will be discussed later, Old Royal Coll. 1727 4°, Old Royal Coll. 1661 4° (Fragmentum Codicis chart. anonymi Sec. XV. de morbis, eorumque cura), Old Royal Coll. 1667 4° (Hohenloesch Artzeneybuch, nominibus morborum manu, ut videtur Habrechti, in margine annotatis.), Old Royal Coll. 1688 4° (Farrago medica 1606 collecta a Isaaci Habrechti), Old Royal Coll. 1689 4° (Farrago chemica 1606 collecta a Isaaci Habrechti), Old Royal Coll. 1690 4° (Isaac Habrechti Collectanea Chymica), Old Royal Coll. 1691 4° (Isaac Habrechti Dispositio in breves et succinctas theses totius medicinæ theoretica.), Old Royal Coll. 1692 4° (Fasciculus variorum excerptiorum medicorum), Old Royal Coll. 258 fol. (Commercium Epistolicum Habrechtianum sive Epistolæ variorum Autographie ad Isacum Habrechtum maxime de rebus ad Alchymiam pertinentibus, ord. alphab.), and probably some more which I have not noted. This Isaac Habrecht is an interesting figure in connection with the "Filius Sendivogii", or "Hautnorthon" figure, known under the monogram "J.H.F.S.", who has been identified as an Johann Harprecht (Fortitudo) Starcke by Joachim Telle in an excellent study "Zum "Filius Sendivogii" Johann Harprecht" (in Christoph Meinel, ed., *Die Alchimie in der europäischen Kultur- und Wissenschaftsgeschichte*, Wolfenbütteler Forschungen, 32 (Wiesbaden: Harrassowitz, 1986), 119-36. This is not the place to discuss the complicated and confused relation between the above mentioned "Filius Sendivogii", the Tübingen professors Johann Harprecht (1560-1639), his son, Johann Harprecht (1610-166?), this Isaac Habrecht (1589-1633), his father, also called Isaac (1544-1620), and the equally confusing identities of the author names "Isaac Hollandus", and "his son" "Johann Isaac Hollandus", but I hope to have the opportunity to return to this subject in some other connection.

[28] These crossings and cancellations seem not to have been "approved" by all hands in the manuscript, thus we read – crossed out! – on fol. 30^{v}: "[…] I crossed these lettres […] takinge them to be but sophysticacious", on fol. 33, in the margin, with another, Italic, hand: "some Also o*ut*crossede this."

[29] Cf. Old Royal Coll. 1727 4°, pp. 165-167, 175-177. My decipherings are based on the following substitution cipher: I=I, M=M, N&U=L/L=N K=P/P=C or K, A=V/V=A, D=T/T=A, E=O/O=E, F=S/S=F, G=R/R=G.

[30] C. J. Robinson "Hill, Nicholas", in *DNB* X, 855–856. Cf. also Hugh Trevor-Roper, "Nicholas Hill, the English Atomist" in *Catholics, Anglicans and Puritans* (London: Martin Secker & Warburg, 1987), 1–39.

[31] Trevor-Roper, 8.

[32] As the *Dictionary of National Biography* states, but see Trevor-Roper, 19.

[33] This is the hypothesis put forward by Trevor-Roper, 19–39.

[34] None of which seems to have survived, but Trevor-Roper's account of one of them is interesting in an alchemical connection: "According to Henshaw, the manuscript which he possessed was a copy taken by John Everard, a Neoplatonist who had translated the Hermetic writers, from "an imperfect copy in the hands of Edmund Earl of Mulgrave" […]. The Earl's manuscript was anonymous, but presumably it was he who ascribed it to Hill since he was the source of Henshaw's information (or misinformation) about Hill's life. […] When Henshaw had acquired Everard's transcript of the manuscript, about 1637, he showed it to the greatest expert on such arcane matters, his own kinsman William Backhouse of Swallowfield. This William Backhouse was a patron and himself a student of alchemy and other mysteries: he was the alchemical "father" – i.e. initiator – of the alchemical virtuoso Elias Ashmole […]. On reading Henshaw's manuscript, Backhouse, who knew Hill's printed work, recognized it as being by the same writer and determined to discover more about him. […] It is unfortunate that Backhouse – the one person, who, through Hill's widow, could have discovered, and perhaps did discover, the true history of his life – left no record of it or indeed anything else. But Backhouse was a strange and secretive character who led a hidden life – *sache cacher* was his chosen motto – and committed nothing to paper." (Trevor-Roper, 15).

[35] Thompson Cooper, "Digges, Thomas", in: *DNB*, V, 976–978; *Biographia Britannica*, 2nd edn, 5 vols (London, 1778-93), V, 239, and Wood, I, 414–415, 636-639.

[36] See, for example, fols. 96^{v} and 110^{v}.

[37] Julian Roberts, personal communication.

[38] *R&W*, 11–13.

[39] Ashmole, *Theatrum chemicum*, 332-333.

[40] At least two other copies of this text exist in British libraries: British Library, Sloane MS 319, p.3 (around 1600) and Oxford, Bodleian Library, Ashmole MS 1394, item VI, 11.

[41] Since it could be the name "Rogero Kock" that is erased after two tracts in Old Royal Coll. 1723 4° (see below), and since Roger Cook was in Prague at least from about 1609 up until 1612, this is of course a possibility. Speaking against this identification of the scribe with Roger Cook is the fact that the initials would then reasonably be R.C. and not R.K. since the larger part of the manuscript is written in English, and since Cook was definitively in England the 30 September 1600 (returning to the service of Dee, cf. *R&W*, 43), less than a year after the dating of this manuscript. I know nothing of Cook's whereabouts following his departure from the service of Dee the 7 September 1581 to 1600, nor have I been able to find any other possible candidate for the R.K. signature.

[42] *Private Diary*, 30.

[43] I am grateful to Dr Stephen Clucas for calling my attention to this and suggesting this reading, and I agree on the plausibility of this reading even though I find it very hard to confirm it after seeing the original. If this reading is correct, then the erased signature on fol. 20^{v} could read: "[per*?*] Rogerius Cooke", that is, with an English spelling of the name. On Cook, cf. Edward Heron-Allen, "Cooke, Roger", in *DNB*, IV, 1018-1019. According to *DNB* all traces of Cook are lost after 1584.

[44] *R&W*, 43 and *NP*, 178.

[45] I have not been able to find any information on this "Constantius Loogenhagius" (fol. 1^{v}) but the many references to the Netherlands is interesting in the light of two seventeenth-century tracts in Sloane MS 83 referring to a "Dr of Physicke" in the Netherlands, William Johnson, who is said to be Edward Kelley's "alchemical son", if we are to believe the titles "A Treatise of the Philosophers Stone. A Letter from S. Edward Kelly to his Son &c." (fol. 1) and, on fols. 8-11 "A letter from Sir Edward Kelley to his sonne Mr. Will. Johnson, Dr. of Physicke in the Lowe Countryes."

[46] The only trace I have found of this John Tichborn, after Mr. Adam McLean had brought it to my attention, is the signature "finis. Jo. Tichborn" after the explicit "of the nature of thinges | The Seaven bookes of Aureolus Theophrastus Paracelsus", in British Library, Sloane MS 320, fol. 96. Extracts from this text are interestingly enough to be found in MS 1723, 145-148.

[47] *R&W*, 25. See, for example, 23, 29, and 102 in the facsimile reproduction of the Catalogue.

[48] *Mercurius Triumphans & Hebdomas Eclogarum Hermeticarum. Vnà cum commentariis Acroamaticis et Mysticis. In quibus de vnica, vera, summa, & antiquissima Philosophorum Medicina disseritur*

Libris XIIX. Omnia Studio & Opera: *Arioponi Cephali Eutopiensis* [etc] (Magdeburg, 1600) in-8:vo, [xx], 144 pp., with a vignette representing a dragon in a fire with the motto: “Durare Mori et non Perire”. The dedication to Rudolph II is signed “M. C. M. D.”, that is Martinus Copus, Medicinæ Doctor, the author (See John Ferguson: *Bibliotheca chemica. A catalogue of the alchemical, chemical and pharmaceutical books in the collection of the late James Young of Kelly and Durris,* 2 vols (Glasgow, 1906), I, 150).

[49] *Apotelesmata Philosophica, Mercurii Triumphantis, de vera, et summa Antiquissimorum Philosophorum Medicina. In quibus Elucidatio & Clauis totius Operis. Labore & studio Arioponi Cephali Eutopiensis. Cum Grat: & Priuileg. Cæs. Maiest. ad Decennium.* (Magdeburg, 1601) in-4°, [72] pp., with the same vignette, and the motto: “Aut taceant aut discant” (Cf. Ferguson).

[50] From the early 1570s untill 1581 Roger Cook was Dee’s alchemical assistant, and from this period “there is evidence of continuous and considerable alchemical activity on Dee’s part” (*NP*, 178). Edward Kelley did not enter the scene until 1582.

[51] Appendix on paper. First I want to issue a warning: I am not an expert in the examination of watermarks, and I am very uncertain about the conclusions which can be drawn from the often insufficient information I present in my catalogue of the MSS, and, finally, this preliminary examination is too brief to be considered scientifically accurate. Nevertheless I will venture some general remarks which in my opinion strengthen the impression of the homogeneity of this group of manuscripts. First I note that manuscript 245 from the “R.K.” group and manuscripts 240 and 247 from the “Christopher Taylour” group have a watermark of the same type of grapes (consisting of 34-42 grapes, “hanging” vertically between two chainlines and with a right-twisted branch), but in different dimensions. What speaks for their shared origin at the same manufacturer is the fact that both manuscript 240 and manuscript 247 are made up of another seemingly identical type of paper, i.e. the 64mm high one-handled pot with a four-petalled flower (other details could however be different). This very same type and dimensions also occurs in manuscript 1723, which again strengthens the hypothesis that hand II of this manuscript and the “R.K.” signature in manuscript 246 are identical. The equation is this: The grapes of manuscript 245 (written by the same hand as manuscript 246) seem to stem from the same manufacturer as the grapes of manuscripts 240 and 247; the 64mm pot type of manuscripts 240 and 247 seem to stem from the same manufacturer as the 64mm pot type of manuscript 1723. Under all circumstances, the 64mm pot type occurs in the “Christopher Taylour” group as well as in the “R.K.” group. The close connection of these manuscripts is also indicated by the similar watermarks of manuscript 246 and quires Kk–Ll of manuscript 240 (the 50mm one-handled pot without flower on top). I said that manuscript 247 was the most intriguing of the Copenhagen manuscripts, but at the same time the one that yielded the least amount of factual information. With regard to watermarks this manuscript nevertheless seems to be very close in origin to manuscript 240 (one watermark that is seemingly identical and one of an identical type), which in turn is very close in origin as well as provenance to manuscript 1727. Further, manuscript 247 seems very close in origin to manuscript 1723 (the John Carpe signature) because of the similiar 64mm urn type. It is thus worth noting that if manuscript 1723 is written by the same hand as manuscripts 245 and 246, this also suggests a link between manuscripts 245/246 and manuscript 247 (the Arioponus Cephalus tract to the Emperour). Another curious detail is that quire V (a part of the “Lyttle Key of Raymond Lully”) of the otherwise rather English-looking manuscript 240 is written on paper which, according to Briquet, was produced in Moscow 1594 (Briquet, IV, 12.721).

PART SIX: LIBRARY CATALOGUE AND BIBLIOGRAPHY

JULIAN ROBERTS

ADDITIONS AND CORRECTIONS TO "JOHN DEE'S LIBRARY CATALOGUE" [*]

Our publication of *John Dee's Library Catalogue* in 1990 has not, to our great relief, been followed by critical demolition. A number of reviewers and correspondents pointed out, quite correctly, that there were omissions and inaccuracies, while others found fault with aspects of our method. Our intention, some fifteen or twenty years in execution, had been to describe the purposeful growth, the extent and the final dispersal of John Dee's library, and to provide by illustration, where possible, a means of identifying more survivors, whether manuscript or printed. The areas where our conjectures fell some way short of final proof, were the naming of those who raided Dee's house after his departure in 1583 – and we still do not know why they did so – and the final passing of his books into the hands of John Pontois and Patrick Saunders. So far these conjectures have stood; no cache of Dee's books, overlooked by us, had then been found, though the painstaking searches of Dr. William H. Sherman, particularly in Cambridge, notably increased the tally of survivors. His discovery of no. 1101, the *Historie* of Fernando Colombo, in the British Library, brought to light one of the most heavily and interestingly annotated of his books. Another new survivor which falls into this category is no. 282, Simler's *Epitome*, now in the Bodleian. The intensity of Dee's interest in British and Welsh antiquities was one of the major revelations after the publication of the *Catalogue*.[1]

We suspected then that more evidence for this interest might emerge in Welsh libraries, and it still may do so, though the focus of attention is now upon Dublin. Lyndy Abraham has done something which we had toyed with and abandoned – examined Arthur Dee's *Fasciculus chemicus* for evidence of the availability to him of any of his father's books.[2] Given Arthur Dee's sojourn in Moscow, a further question suggests itself: do any of Arthur Dee's books remain in Moscow?

In December 1997 a survey by Mr. Ray Jordan of the Conservation Department of the Library of Trinity College Dublin brought to light a number of survivors among the books collected by Archbishop James Ussher of Armagh, and presented to the College in 1661. That Ussher had owned many of the manuscripts from Dee's library was well known, and we recorded this fact, and that in 1626 John Bainbridge wrote to Ussher asking for the names of mathematical books that had been Dee's.[3]

---

[*] An earlier version of the following list of additions and corrections to John Dee's Library Catalogue was privately printed and issued for the Colloquium on John Dee held at Birkbeck College in the University of London in April 1995, and was introduced there by a brief paper from Julian Roberts entitled, "Life after the Library Catalogue."

S. Clucas (ed.), John Dee: Interdisciplinary Studies in English Renaissance Thought, 333–343.
© 2006 *Springer. Printed in the Netherlands.*

None of the survivors among Ussher's books – so far – is mathematical. At least two, however, of these survivors have proved to be of the greatest interest. The three folio volumes of Giovanni Battista Ramusio's *Navigationi et viaggi* (no. 273) have probably gained the title of Dee's most heavily annotated work, and are now vital, along with Dr. Sherman's account of Colombo's *Historie,* to any future study of his navigational and geographical interests, and of his own involvement in the settlement of North America. The notes in his copy – if they are his, and original to him – of William Salesbury's *A dictionary in Englishe and Welshe, 1547,* (no. 1645) reveal a knowledge of, and interest in, the Welsh language much greater than that indicated in Julian Roberts's 1991 article.[4] All the newly discovered books in Dublin had been rebound in eighteenth-century calf, with the exception of no. 387. Grateful thanks are due to Mr. Jordan for making the results of his survey available, and to Mr. Charles Benson, the Keeper of Early Printed Books in Trinity College for his help.

One biographical question remains unanswered; the nature of Dee's relationship with the London Grocer Thomas Constable, whose widow Katherine he married. The scrap of information provided by E.G.R. Taylor in her *Tudor Geographers,* (1930) is the only clue to the name of Dee's first wife. Taylor's reference takes us to a record of a 1566 lawsuit between John and Katherine Dee and Richard Payne of Lynton in Cambridgeshire over a debt of £18 incurred by Payne to Thomas Constable in 1558, and witnessed then by John Dee.[5]

Two discoveries have brought some shame upon us, since they were made in the two libraries we were supposed to know best: Deborah Harkness has found Latin versions of the mysterious "Soyga" (DM 166) in the Bodleian Library and the British Library.[6]

In offering this brief list of Additions and Corrections, we would point out that it is all too possible to be in doubt over the attribution of a book or manuscript to Dee's library. With printed books, the problem is perhaps smaller, because the 1583 catalogue of them is a more definitive record (though examination of his Simler suggests that he *did* buy books after 1583), whereas the catalogue of manuscripts of that year is a hasty work. There are, simply, manuscripts about which we cannot be sure.

ADDITIONS AND CORRECTIONS

ANNALS OF JOHN DEE'S LIFE

1550 (24 July) acquired no. 230.
1555 (28 September) acquired no. 548; (29 September) acquired no. 387.
1556 (26 March) acquired no. 338.
1558 (August 14) witnessed loan from Thomas Constable to Richard Payne of Lynton Cambs.
1563 (June 6) acquired no. 1620 at Venice; (July) in Rome (note in no. 273).
1566 described, with wife Katherine, as of Mortlake, in action against Richard Payne.
1575 correct date of burial of Katherine Dee.

NOTES ON BOOKS AND MANUSCRIPTS

22 T Platonis opera à Marsilio Ficino conversa & co*m*me*n*tarijs illustrata fº Basil.

Dee's copy of this, an edition by Froben of 1532, is in the library of St John's College, Cambridge, class-mark Cc.2.16. "IOHN DEE" is written on the bottom edge in front of the tail-band, and the title "Opera platonis" on the fore-edge. The "P Ssaunder<s> is written at the head of the title-page. Dee has heavily annotated and underlined Ficino's *argumenta* to many dialogues, and the texts of some, notably, *Phaedo*, *Timaeus* and *Critias*. Bequeathed to the College by Bishop Peter Gunning in 1684.

23 T Etymologicu*m* Magnu*m* græcu*m* fº. ven. ald*us* 1549

Dee's copy is in Corpus Christi College, Oxford O.9.8., inscribed "Joannes Dee .1572." and, beside imprint, .o. (possibly .o̲̣.) and on right of title, .g̲. Also "Sum Christophori Gardyneri (?)" in seventeenth-century hand and a Greek motto. There are a few Greek side-notes, probably not Dee's. Bequeathed to the College by John Rosewell, 1684.

133 Fr. Pauli Germani de Middelburgo, de recta paschæ celebratione & de die passionis Christi, libri 19. fº Forosempronij 1513

Dee's copy is TCD Lib., DD.d.36 (formerly DD.4.36 and M.3.5). At the head of the titlepage is "Nicolaus de nale"; then "Joannes Dee ex dono humanissimi viri Nicolai de Nale 1557 .16. Aprilis Londini In die passionis D*omi*ni"; then "Servire Deo regnare est W: Crashawe: 160<?>". At foot of page is "forosempronij 1513" (in Crashawe's hand?). Heavily annotated throughout in a variety of Dee's hands though there are few notes after lib.14. Very heavy annotation on the calendar, and Dee always draws attention to English writers, Roger Bacon, John of Salisbury, "Lincolniensis" (i.e. Robert Grosseteste) and Eschenden. Nicolas de Nale was a

Toulouse merchant, presumably resident in London, since his name appears in the Returns of Aliens in 1541, 1547 and 1564. Later Archbishop Ussher’s.

230 J. Davis spoyle Georgij vallæ opera fº. ven. 1501 Correctly, *De expetendis et fugiendis rebus.*

Dee’s copy is TCD Lib., EE.aa.30. At head of titlepage is “Joannes Deëus 1550. 24: julij Parisijs. prætiu*m*. 10 franch. 4s:” At foot of title is “ru.” This was bought four days after Dee’s arrival, and two days after the purchase of three other books. Lightly annotated throughout, with notes usually correcting or criticising Valla. On sig. a5^{v} is a cropped note “< >verbum ex primo libro <Proc>li in Euclidem, traduxit. <O>bscurè valde, ut omnia vero hos libros correximus < >is ubique illustravimus & < >lijs, & in lingua*m* latinam <du?>cere incepimus, anno 1549. Vltimo Augusti Lo=<vani?>“. Later Archbishop Ussher’s.

267 Fr. Bernardini Longi Expositio in prologum Averrhois in posteriora Aristotelis la*tine* fº. Neapoli 1551.

There is a copy (not Dee’s) of this work in the Bodleian.

273 T Δ+ Navigationi & viaggi di diversi, raccolti da Ramusio, italicè fº. ven. 2 volum.

Dee’s copy in TCD Lib., DD.dd.40,41 (formerly DD.aa.18, DD.13.18 and Q.2.9) is of the Giunta edn of 1563-65, and was later Archbishop Ussher’s. It is unsigned. After the imprint of vol. 1 is “re.2.” The three volumes, bound in two, are massively annotated throughout, usually in English. There are frequent notes of travel times and distances. Dee refers several times to the voyage of Prince Madoc in 1170, to the early preaching of the Gospel in America and to the prior title of the British to the New World. In vol. 3 there are frequent, and approving, signs of interest in possible settlement and trade in Hochelaga, Canada, and “New France”. On fol. 148 of vol. 3 a note refers to Dee’s (previously unknown) presence in Rome in July 1563.

282 Joh Davis spoyle + Δ Josiæ Simleri Bibliothecæ Gesneri Epitom f° Tig. 1574

Dee’s copy was in the possession of Professor A.C. Hamilton, Queen’s University, Kingston, Ontario. It was subsequently acquired by the Bodleian Library, shelf-mark Arch.H.c.7. For an account of the book and its heavy annotations, see R.J. Roberts, *Bodleian Library Record*, 14 (1994): 529-33.

338 Fr Jacobi Carpe*n*tarij animadversiones in Rami libros tres dialecticaru*m* institutionu*m*, 4°. paris 1555

Dee’s copy is TCD Lib., EE.hh.33 (formerly GG.17.33). At the head of the titlepage is “Joannes Dee 1556 .26 Martij”. There are underlinings and notes throughout. Later Archbishop Ussher’s.

387 Fr Clementis Romani Episcopi de rebus D. Petri, Epitome, græcè, 4° paris 1555
A suppositious work. H inserts “gestis” after “rebus”.
Dee’s copy is TCD Lib., BB.i.23 (formerly E.4.18 and C44). At head of titlepage is “Joannes Dee 1555. 29. Sep.” There are no other annotations. In a contemporary calf binding, with blind-tooled shields in the centre of each cover. Later Archbishop Ussher’s.

398 T Joh. vernerus de Eleme*nt*is conicis &c 4° Norib 1522
Dr. B. Lawn informs us that this was in Thomas Rodd’s catalogue, 1820, item 737, priced at £1.8.0d.

416 J Davis spoyle Tabulæ astronomicæ Elizabethæ Reginæ 4° Ven. Petr*us* Liechtenstein. 1503
Dr. B. Lawn informs us that this was lot 220 in the B.H. Bright sale, 3 March 1845, sold to Rodd for 7s.

446 Fr Albumasaris introductoriu*m* in astronomia*m* 4° Ven. 1506
Dee’s copy is CUL R*.4.23^{1}(D), bound (not by Dee?) with no. 421. (Information from Dr. W.H. Sherman.) With a few underlinings, and notes by Dee.

499 Jo. Davis spoyle Co*n*sentij & Cassiodori disciplinaru*m* liberaliu*m* orbis. 4° Basileæ. 1528
The copy in TCD Lib., EE.e.26, later Archbishop Ussher’s, has a few notes and underlinings, which may be Dee’s.

548 Fr Joh. Balei de scriptorib*us* Brytan*n*iæ, ce*n*turiæ quinque 4° Wesaliæ. 1549
Dee’s copy is St. John’s College, Cambridge, A.2.29. (Information from Dr. W.H. Sherman). It is signed “Joannes Dee 1555.28.Sept. ex dono Tristrami Suadel”. There are some annotations, particularly in the early part of the book. “Suadel” is almost certainly Tristram Swadell, rector of Stepney and prebendary of St. Paul’s, deprived 1560. After the imprint is r .o. Gift of Thomas Baker, ejected Fellow, with many notes, apparently his.

578 Fr Fra*n*cesco Serdonati de’ fatti d’arme de’ Romani 4° Ven. 1572
The copy in TCD Lib., EE.f.32, later Archbishop Ussher’s, may be Dee’s, since the price written below the colophon, “pret: ijs.iiij.d.” may be in his hand.

701 T Jordani Ruffi opuscul*um* de Equis, lingua vulgari -/. italica 4°. Bresciæ 1493
Professor T.A. Birrell has pointed out that this is *L'Arte de cognoscere la natura de caualli.* The British Lib. copy at IA 31020 may well have been Dee's, though it only has a few underlinings.

715 Ovidii Metamorphosis 8°. Parisiis. Colinæus 1529
There is a copy (not Dee's) in the Bodleian.

812 T Ignatij Epistolæ græcè & la*tine* 8° Parisijs 1562
The copy in TCD Lib., BB.g.36 (formerly BB.16.36 and H.2.11), later Archbishop Ussher's, may be Dee's; it is heavily annotated in Greek in a hand which may be his.

856 T Achillis P. Gassari Epitome historiaru*m* & chronicoru*m* mu*n*di. 8°. Lugduni
Dee's copy is CUL L*.6.60, [1538]. On the titlepage is "P Saunders". (Information from Dr. W.H. Sherman.) There are extensive notes and underlinings, in particular to entries for the "British History", but also to later events.

1011 Fr Michaël. Neander de Methodo artiu*m* 8°. Oporin 1556
Dee's copy is TCD Lib., EE.kk.54 (formerly EE.19.54). Apart from "Joannes Dee 1556." at the head of the titlepage, there are no notes. Later Archbishop Ussher's.

1027 Claudi*us* Campensis in Aristot*elis* De memoria & recordatione 8° parisijs 1557
Dee's copy is at BL 1030.e.1.(2). It is unsigned, but there are frequent underlinings and annotations. Dee evidently had the book in 1556, as he noted on fol. 17^{v}. "Author 30 annorum hoc anno 1556."

1101 T Historia del mondo nuovo di Fernando Colombo. 8° ven. 1571.
Dee's copy is British Lib. 615.d.7. (Information from Dr. W.H. Sherman). One of the most heavily annotated of all Dee's books, mainly in English. Another hand is also occasionally present. The Sloane press-mark g.300 appears on the title-page; a mark of ownership (?) beside the printer's device has been heavily crossed out; the letter .g. follows the imprint. The annotations reveal Dee's intense interest in Colombo's account of his father's voyages, and in particular in the customs and appearance of the inhabitants of the New World. Dee makes several notes about the voyage of Madoc ap Owen Gwynedd, "white men" (fol. 114^{v}) and to the

"Brytishe custom of names" (fol. 125) which suggest that he was looking for evidence of Madoc.

1158 Secreti dell'arte profumatoria italicè 8° ven 1555
This is *Notandissimi de l'arte profumatoria: a fare ogli, acque, paste, balle, moscardini, etc.* Venezia, F. Rampazzetto, 1555. 12°. It was lot 417 in Captain H. Trotter's sale, Christie's, Feb. 10/11 1947, bought by Myers of Bond St. for £12. It had a signature and date 1558. (Information from Dr. B. Lawn.)

1186 Fr Illyrici paralipomena dialectices 8° Bas 1558.
Dr. B. Lawn informed us that Goldschmidt offered this in at least three other catalogues.

1459 Alchimic*us* libell*us* anonymi cuiusda*m*, lingua belgica. 8° Campis 1551.
This has been identified for us by Professor T.A. Birrell, as by S. Andree, *Kunst boecke nyeulick wten alchemistischen gront vergadert,* 1551. (Copy, not Dee's, in British Lib.)

1552 Fr Tractatus in dialogi forma de pythonicis.
By Ulrich Molitor (?) whose work is in the form of a dialogue. Perhaps an earlier edition than no.1035.

1559 T. R. David Kimchi liber radicu*m*, sive Thesaurus linguæ sanctæ, vel dictionariu*m* hebraicu*m* f° ven. Daniel Bomberg*us*
Dee's copy is Bodleian Lib. EE17. Art. Seld. It is signed "Joannes Dee 1565:" Later John Selden's with his motto. There are no notes, but corrections to the column numbers and some titling on the rear cover may be Dee's.

1560 T Concordantiæ hebraicæ in f°. minori. ven.
Dee's copy of an edition of 1564 is in the library of Sidney Sussex College, Cambridge, Y-3-15. It is inscribed "Concordantiæ Maiores. Joannes Dee :1565" and below the imprint "Venetijs:" with an illegible date or code (probably M.C.δ). There are apparently no other notes. Given to the College by Paul Mickle-thwait in 1639.

1568 Fr Pentateuch*us* Mosis, [*etc.*] 4°. ven.1551
Dee's copy is TCD Lib., CC.g.3 (formerly AA.7.3 and A.2.2). At the head of the titlepage is "Joannes Dee 1561: Londini" and at the foot "·g·" There are a few notes and underlinings. Later Archbishop Ussher's.

1571 Fr. Eliæ Levitæ Gram*m*atica hebraica 4o Isnæ
Later John Selden's.

1605 Jo. Dauis spoyle Jonas propheta hebraïcè cu*m* versione la*tina* et exercitatione Gram*ma*ticali Wiga*n*di Happellij 8° Basileæ: 1561
Dee's copy is TCD Lib., CC.g.9 (formerly AA.7.9). At head of titlepage is "Joannes Dee 1562," and after date ".f." There is a single underlining. Later Archbishop Ussher's.

1606 Fr Joh. Isaaci defe*n*sio veritatis hebraicæ sacraru*m* scripturaru*m* advers*us* Wilhelmi Lindani libros tres de optimo scripturas interpreta*n*di ratione 8° colon. 1559
Dee's copy may be TCD Lib., CC.h.61 (formerly A.8.61), later Archbishop Ussher's; the letter "*.ạ.*" is written after the imprint, but there are no other notes.

1620 T Thesei Ambrosij Gram*m*atica Chaldaica Syriaca & Armenica. *Item* Appendix multaru*m* diversaru*m*q*ue* linguaru*m*. 4° Papiæ. 1539
Dee's copy is in fact in the library of St. John's College, Cambridge, L.8.35. (Information from Elizabeth Quarmby-Lawrence.) It is signed "Joannes Dee 1563: Junij .6. Venetijs", and, bracketed off, "p*re*tium 10[?] F F[?]"; above the title is "pret.10s". There are underlinings and annotations by Dee throughout. At the end is "Perlegi festinus".

1645 T Willia*m* Salesbury his Dictionarie in Englishe & Welshe, or Brytishe. 4° Lo*n*do*n* 1547
Dee's copy is TCD Lib., EE.e.32 (formerly C.10.17). At the head of the titlepage is "John.Dee." The first half of the book (up to sig.K) has been extensively annotated and corrected. In some instances Salesbury has put words of English origin in the "Camraec" column and Dee has supplied a Welsh word. Where Salesbury has occasionally left a blank, Dee has supplied an English equivalent. He has also corrected equivalents in both languages. Later Archbishop Ussher's.[7]

1671 T Vocabulario de quatro lenguas, gall. lat. ital & hispanic. 4° Lovanij 1558
This has been identified for us by Professor T.A. Birrell as *Vocabulario de quatro lenguas,* 1558. The only copy recorded by J. Peeters-Fontainas, *Bibliographie des impressions espagnoles des Pays-Bas* (Bruges: Nieuwkoop, 1965), is in the Biblioteca Nacional, Madrid.

M51 Roberti Gloucestrensis, Chronica, rhythmo Anglico. papyro. f°
Dr. W.H. Sherman has suggested that this is British Library, MS Harley 201, s. xv in. Against this is the fact that the latter is on vellum and is hardly a folio. However, several names from the "British History", e.g. Eldol, Gorlois, Merlinus, Malgwyn, have

been added in the margin in a hand almost certainly Dee's. (See also Watson, *D'Ewes,* A889.) In H M51 follows M52.

D5a Cicero, Marcus Tullius. Tusculanæ quaestiones. Lugduni, apud Seb. Gryphium, 1541. 8°.
Dee's copy is British Lib., 8461.b.13, inscribed "Iste liber pertinet ad me Johannem Dee teste Barleo, Smitheo, Odell cum multis alijs" [all deleted], in an upright hand, not wholly italic (Information from Dr W. H. Sherman). On verso of titlepage "Liber Rogeri Cook ex dono Domini Dee./ 1569." and "Liber Francisci Jones ex dono Georgij Wood 1635". On the fly-leaves are many pen-trials including "For Mr. Merritt Deane". There are notes throughout in a rather unsure italic, probably Dee's, and in other hands in secretary. There are translations into English, e.g. on p. 33 against "pusio" "a litle boy" and on p. 87 against "ballistae" "An ingin or crossbow wherwith a stone or arrow is shot". This has all the appearance of an undergraduate's book; Barley was probably Henry, scholar or fellow of Trinity (as Barkeley), BA 1546-47; Odell according to Venn was probably Fulke Woodhull, matriculated at St. John's MT 1544.

D26 Wynman, Nicolaus. *Colymbetes, sive de arte natandi, dialogus & festivus & iucundus lectu.* Augustæ Vindelicorum, excudebat Henricus Steyner, 1538. 8°.
Dee's copy is TCD Lib., DD.i.65. It is inscribed "Joannes Dee" at the head of the titlepage, and after the date ".u." There are a few underlinings. Later Archbishop Ussher's.

DM166 Aldaraia sive Soyga.
Professor Deborah Harkness, by the simple expedient of consulting the index to Thorndike and Kibre's *Catalogue of Incipits*, revealed that there were copies of a Latin text of this name in the Bodleian (MS Bodley 908) and the British Library (MS Sloane 8). Neither answers to the description of an Arabic book, since both are in Latin (partly, indeed, in Latin hexameter verse), written on paper, and both are of late sixteenth-century date and of probable English origin. It is possible that these are translations made in the 1590s, when Dee was seeking opinions on his Arabic book. He would not, we suppose, have needed to consult Uriel about the excellency of a Latin text. The Sloane manuscript is probably that sold in the Lauderdale sale of 1692, since its title (in gothic script) is "Aldaraia siue Soyga vocor" followed by (in a later hand) "Tractatus Astrologico-Magicus". ".g." follows the first title, and below it is the price, "11s".

DM? Cambridge, Trinity College, MS. O.2.21, Geoffrey of Monmouth, *Historia regum Britanniae,* and other works.

Dr. W.H. Sherman says that the title on fol. 5 is in Dee's hand. There are three "Jupiter" marks on fol. 1, and two on fol. 2. Although it must be remembered that Dee was not alone in using the "Jupiter" mark, this is a "possible".

STEPHEN CLUCAS

RECENT WORKS ON JOHN DEE (1988-2005)

A Select Bibliography

This bibliography does not pretend to be an exhaustive record of all scholarly works on John Dee in this period. It is a select bibliography of work which has been published since Nicholas Clulee's *John Dee's Natural Philosophy: Between Science and Religion* (1988), and readers are directed to the bibliography of that work and those of William H. Sherman (1995) and Deborah E. Harkness (1999) for more comprehensive information on essays, articles and books published prior to 1988. The bibliography also includes recent PhD theses on Dee, and one or two non-academic titles dealing with Dee and his career (such as the "novelised" biographies of Postel and Wilding). An unlisted, but important resource for Dee scholars is the microfilm series of John Dee's books and manuscripts produced by Adam Matthew: *Renaissance man: the reconstructed libraries of European scholars, 1450-1700. Series 1: The books and manuscripts of John Dee, 1527-1608. Part 1: Manuscripts from the Bodleian Library, Oxford*, and *Part 2: John Dee's manuscripts from Corpus Christi College, Oxford* (Marlborough: Adam Matthew, 1992-3). I have not included review-articles in the bibliography.

Dedication

For my wife, Candy. You have supported me in so many ways, especially by helping me sort out and keep track of all the piles of obscure dead guy stuff. Without your help, so many things would have been impossible.

For Kerry, Sarah, Lisa, and Karl. You are the best kids a parent could ever hope for. Thanks for all the times you shared your precious computer time.

For my close friend, Paul Deneka, who introduced me to John Dee's writings and continues to share my enthusiasm for obscure dead guys.

For the Board of Trustees of the British Museum who granted me special permission to study manuscripts while I was under their age requirements, helped me during the many years that have passed since then, and gave me permission to publish this unique material from their collections.

For my friend, Roger Williamson, at Magus Books for his encouragement and support over the years.

For Jill Rogers at Red Wheel/Weiser, who has been great to work with. Thanks for helping to make this a better book.

Finally, for Betty Lundsted, who is sincerely missed.

PREFACE TO THE REVISED EDITION

Dr. John Dee (1527 to 1608 or 1609) has been the subject of much interest in several fields. Several good book-length studies of him have appeared,[1] as well as numerous articles.[2] My intent in presenting this text is not to recap Dee's life or present a new perspective, but to fill in an important gap that has been generally neglected. The manuscript presented adds considerable detail for the years 1581–1583, by most accounts the climax of his career. It sheds light on Dee's politics, science, and occultism.

For the first edition of this text, I had the simple goal of eliminating two major barriers to the study of John Dee and Edward Kelley. These barriers are availability and legibility of the material. With this new edition, I hope to address two other problems as well. First, the English of Dee's day was somewhat different from that spoken today, so I have added many footnotes to clarify obscurities in the language. I have also translated the frequent Latin passages. Second, the subject matter of the text, medieval and Renaissance magic, assumes a view of the universe not commonly held today. To further clarify the text in this context, I have expanded the introduction and index and explained otherwise obscure references in the footnotes. I have also added supplementary material from Dee's diary and other manuscripts.

J. Peterson, 1999

INTRODUCTION

These secret writings of John Dee, one of the leading scientists and occultists in Elizabethan England, record in minute detail his researches into the occult. They were discovered in a hidden compartment of an old chest along with various magical implements. Although the angels made him swear never to reveal these doctrines to anyone not sanctioned by them, he complained, “If no man, by no means, shall perceive anything hereof by me, I would think that I should not do well.” Nevertheless, these pages were carefully concealed, and nearly lost forever. Although this present work is concerned primarily with his occult experiments, through it, we catch many glimpses of Elizabethan life and politics.

Dr. Dee represents the true Renaissance man—a master of many areas of learning. He was born in 1527 and lived at the height of the English Renaissance. Dee’s knowledge included astronomy, mathematics, navigation, medicine, geography, history, music, painting, astrology, and the occult sciences.

In many ways, Dee lived at the center of conflicting forces and ideas—tradition vs. reformation, science vs. magic, Christianity vs. paganism (that is, Judaism, Hermeticism, and even studies of Arabic traditions). By studying Dee, we can gain insight into all these subjects and into the Renaissance as a whole. We can even throw light on our own struggle to reconcile our own conflicts.[3]

Dee had many famous and powerful friends and was heavily involved in politics. He became scientific advisor and astrologer to Queen Elizabeth, who occasionally visited him at his home at Mortlake. He was instrumental in planning the expansion of the British Empire, exploring the New World, and, with the help of angelic agents, ushering in the new age as well. One of the main objectives of his life’s work was to bring about religious and social reform. It has been suggested[4] that in this endeavor he was, to some extent, successful.

Dee began his “mystical experiments” with a solid foundation in medieval and Renaissance science, magic, Kabbalah, and the Hermetic arts. Further mysteries were revealed by the “angels” who manifested themselves, ultimately resulting in a new, unified occult system.[5] This occult system is perhaps closer to a face-lift than a new system. Most of it would have been familiar to occultists of the day, but with a veneer of new names and symbols.

Aside from the mechanical details of Dee’s system for communicating with angels, these records reveal that the angels were interested in and involved with the exploration and colonization of the New World, and in heralding in a new age or new world order. The one aspect of these writings that has fascinated most, however, is that the angels delivered a complete book in an otherwise unknown language. They claimed this book, named *Loagaeth,* to be of utmost importance. Its language is the true language of creation so sought after by Kabbalists and by Dee himself.[6] This “angelic book” was later used to extract a long series of messages (or “calls”) in yet another unknown language, called Enochian.

Interest in John Dee and his occult activities has increased tremendously in recent years. One reason for this is the growing debate over the importance of Dee’s role in history by such eminent scholars as Francis Yates,[7] Wayne Shumaker, and, more recently, William Sherman. Another reason for Dee’s popularity is undoubtedly the fact that his system was used and adapted by the Hermetic

Order of the Golden Dawn, and, subsequently, by Aleister Crowley. If one examines the Golden Dawn material, its appeal soon becomes clear: It draws together various occult methods into a highly coherent system. In adapting Dee's system, various additions, omissions, and mistakes were made. This departure was compounded by uncritical, although imaginative, treatments of the Golden Dawn and Crowley material by some authors. The net result is a maze of misinformation.[8] The material presented here provides us with the keys necessary for understanding Dee's original system as a whole. Since its previous editions were very limited in availability,[9] it has largely been ignored, in spite of its importance.

Dee studies have created two radically different pictures of Dee—one as Magus, and the other as scientist-politician. I hope this volume will help bridge the gap. This polarization is partly caused by the lack of availability of Dee's writings. Those interested only in the occult have largely ignored Dee's published output, and those who focus on his published output will find very little evidence of occult influences. Placing the focus on Dee's public writings, however, can give the modern reader the mistaken impression that occultism was not central to his thinking. This is simply because, in Dee's day, the occult was a dangerous pastime, placing you at risk, not just from hostile spirits, but from the frightened public. We would do well to keep in mind the fate of the less cautious magus Giordano Bruno, who was burned alive at the stake by the Inquisition only a few years after Dee recorded these accounts. Dee's childhood idols, Roger Bacon, Trithemius, Agrippa, Paracelsus, and others, all had suffered greatly because of their reputations as magi. Dee himself was imprisoned early in life, an experience he was careful to avoid thereafter. His thoughts and motivations, however, centered around his "mystical experiments." In addition, there is an "anti-manuscript" bias to overcome. Although many of Dee's books were widely circulated, they were not intended for publication, but rather were "directed inward, to an extremely restricted circle" for private political aims.[10]

Another goal in presenting this text is to help elucidate the tradition in which Dee's occult endeavors took place. Although it has repeatedly been observed that Henry Cornelius Agrippa was a major influence on Dee, most have concluded that Dee's system is highly nontraditional. This view is distorted by the fact that most attention has centered around an isolated set of records that describe a system that, on the surface at least, appears to be highly original.[11] I hope to show that Dee and his spirit medium, Edward Kelley, were following traditional methods, especially during their earlier efforts, and that his later methods are adaptations of traditional ones, used within a traditional framework.

Dee's writings also are of interest in that they are a record of the most educated English of Shakespeare's age. To some extent, Dee is even said to have influenced the English language.[12]

Dee’s Early Period

John Dee was born in London on July 13, 1527. His father, Rowland Dee, was an official at the court of Henry VIII. John was born shortly after Luther’s break with Rome, and immediately after England’s, during a period of radical reform. The resurgence of classical Greek studies combined with new interest in Hebrew studies to create Renaissance Neoplatonism. Renaissance philosophers sought to integrate Greek and Hebrew traditions in an attempt to unify the rapidly disintegrating religious factions and end the constant political strife. They were thus the forerunners or prophets of the Rosicrucian and Illuminati movements.

By the age of 23, Dee had already established a brilliant reputation, lecturing in Paris on Euclid. At age 31 (1558), he published his first major work, *Aphoristic Introduction* (Propædeumata Aphoristica), and at age 37 (1564), his *Monas Hieroglyphica*. The *Monas* is a highly esoteric work. In it, he claims to be in possession of the most secret mysteries. He wrote it in twelve days, while apparently in a peak (mystical) state: “[I am] the pen merely of [God] Whose Spirit, quickly writing these things through me, I wish and I hope to be.”[13] He claimed the work would revolutionize astronomy, alchemy, mathematics, linguistics, mechanics, music, optics, magic, and adeptship.[14]

Like the *Monas Hieroglyphica,* the angel magic in the *Mysteriorum Libri Quinque* seeks a higher wisdom than science, religion, or Jewish Kabbalah—one that will unite them all, convince atheists, convert Jews as well as pagans, and heal Christendom.

John Dee, the Politician

The Renaissance saw a giant leap in the evolution of the Information Age. Printed works, a recent innovation, were becoming more and more available, and manuscript collections were threatened with neglect. Dee was fascinated with books and spent vast amounts of energy and money collecting them. Eventually Dee's library became "Elizabethan England's greatest library,"[15] attracting scholars and dignitaries alike. It is possible that Dee's inspiration and model for his library came from Johannes Trithemius, one of the greatest scholars and occultists of the sixteenth century. While abbot of the monastery of Sponheim in Germany, Trithemius built a library of unparalleled importance, and turned one of the poorest monasteries in the Palatinate into an "obligatory" place of pilgrimage for scholars.[16] As William Sherman has noted, "Renaissance libraries were powerful sites of intellectual creativity, social status, and political influence." As such, their owners "were at once empowered and endangered by their collections and skills."[17] This must have been a source of great anxiety to Dee.

Dee's library was a bustle of activity, especially in 1583, with frequent planning sessions for nautical expeditions, visitors borrowing and lending books, dignitaries, including the queen, and others, such as Francis Bacon, who sought Dee's advice and help.[18]

Plans for the New World and the New Age

Perhaps Dee's greatest legacy is his seminal role in building Britain into a major maritime power.[19] He is usually credited with coining the phrase "British Empire." Dee played a prominent role in plans to colonize the New World (involving Lord Burghley, John Davis, Adrian Gilbert, and Sir Walter Raleigh), and consulted the angels quite often about the venture. His interest was not merely patriotic.[20] He had a farsighted plan for the new (or rather restored) British Empire to compete with (or replace) the Hispano-Papal empire. Part of his justification was the same as Rome's—to "carry the name of Jesus among the infidells to the great glory of God."[21] The magnitude of his vision is reflected in the vast extent of the empire that Britain went on to establish.

Dee associated the new empire and the New World with the new age. He was fascinated by the apocalyptic prophecies of his day, and tried his own hand at them based on his knowledge of astrology. He believed the new age would begin in a few years, perhaps in 1583 or 1584. He based this on astronomical models of world history published by Trithemius *(De Septem Secundeis)* and Cyprian Leowitz *(De coniunctionibus magnis)*.[22] The fact that Dee dated two of his works[23] using his calculation of the "world year" allows us to calculate where he thought the world was in the cycle.These works place the start of the cycles at 3763 B.C.[24] Nevertheless, Dee felt the end of the world was immanent, largely based on astronomical observations.[25] The coming great conjunction was foreshadowed by the appearance of a supernova in 1572, a comet in 1577, and a solar eclipse in 1582.

In his scrying experiments,[26] the angels tell Dee and Kelley that "the tyme of God's visitation" was "8." Dee's speculation that this might mean 1588 seemed to be confirmed in later scrying sessions.[27]

Dee found political authority for the British Empire in the accounts of King Arthur and Owen Madoc, a legendary Welsh prince said to have discovered America in 1170.[28] To compete with the spiritual authority of Rome, however, Dee sought divine authority from the angels and God himself. The angels told him what he wanted to hear—that "the World begynnes with thy doings."[29] Thus his scrying, publications, and political activities were all part of his grand scheme to unify the peoples, religions, and languages of the world through universal knowledge. An element of this plan was to convert the pagans of the New World, and the Jews.[30]

The angels revealed details of the New World and new age on several occasions. For example: "What I speak hath not byn reuealed, no not in these last tymes, of the second last world. But I begynne new worldes, new people, new kings, & new knowledge of a new Gouernment." "New worlds, shall spring of these. New manners: strange men:" "The old ways cease, the new begin."[31]

After the appearance of the Polish prince, Albrecht (or Albertus) Laski, Dee shifted his hope for a royal patron to Europe. In the end, Dee failed to convince any of his would-be royal patrons of the cosmic plan. He was also thwarted by the papal nuncio (ambassador) who managed to have him and Kelley expelled by Rudolf. Dee was wise enough to decline an "invitation" to Rome.[32]

Renaissance Magic

By the Renaissance, magic had developed a complex theoretical and philosophical foundation. There was also a considerable amount of practical literature in circulation. Dee's public and secret writings show the remarkable depth and breadth of his studies of magical literature. The classical philosophers, especially Plato and Aristotle, were the foundation on which the so-called Neoplatonic philosophers built. Plotinus, Porphyry, Proclus, Iamblicus, and the Christian Pseudo-Dionysius were all familiar to Dee, as were the Italian Neoplatonic revivalists Ficino, Pico, and others.

The practical literature largely relies on knowing the secret names of God (mostly from the Hebrew Old Testament)[33] and of the angels or spirits themselves. The more cautious methods involve praying to God directly to send his angels.[34] The less cautious methods involve appealing to the spirits directly. The use of consecrated tools in ceremonial magic reflects their use in religious ceremonies. Most of the literature also deals with the use of talismans or symbols of some kind, and often with squares of letters or numbers.[35]

The object of these practices, often called "experiments," is sometimes as sublime as the vision of God, but frequently as base as the recovery of stolen goods or the discovery of treasure. The mention of treasure during a scrying session with Barnabas Saul (22 December 1581) probably reflects the grimoire he is using more than a specific inquiry by Dee.

John Dee, The Magus

Dee’s reputation as a magus, or rather a conjurer, started fairly early in his life and has continued to this day.[36] While he was highly respected as a man of great learning within the scholarly community and court circles, the less educated came to fear him. He was even briefly imprisoned in 1555 on charges that he tried to enchant Queen Mary. He is said to have been the model for Prospero in Shakespeare’s play *The Tempest*.

In his explanatory note to the present work, Dee writes that his interest shifted more toward the occult after becoming convinced of the hopelessness of human endeavors as paths to wisdom. Sloane 3188 records his earliest occult experiments centered around scrying. These early methods were remarkably consistent with the occultism prevalent at the time, and Dee seems to be as widely read here as he was in science. He mentions the famous occultists Cornelius Agrippa and Johann Reuchlin. The widely known *Heptameron* of Peter de Abano and Arbatel’s Of *Magic* are also mentioned, even though he did not include them in his *externa bibliotheca.*

Dee’s interest in angelology is indicated by his heavy annotations of such works as Pseudo-Dionysius’ *Coelestis hierarchia,* Richard of St. Victor’s *De superdivina trinitate* (1510), Scalinger’s *Exotericarum exercitationum liber decimus* (1557), Pompilius Azalus’ *De omnium rebus naturalibus* (1554), and J. Rivius’ *Opera theologica* (1562).[37]

Although Dee was careful not to catalog his more dangerous volumes, other sources can be identified or deduced. One of these is *Liber Juratus,* or the *Sworne Book of Honorius.* Sloane 313 (late fourteenth or early fifteenth century) is known to have been in his collection and contains marginal notes in his handwriting.[38] *Liber Juratus* contains detailed instructions for communicating with spirits, as well as obtaining the sight of God through the use of an elaborate sigil, named the *Sigillum Dei Aemeth*. Dee is directed by the angels to use this sigil “which is allready perfected in a boke of thyne.” Dee is also promised the sight of God (“videbis Deum”).[39] Another source that Dee mentions is the magical text *Aldaraia sive Soyga* (discussed below), which has squares of magical letters and heavy astrological elements.

In addition to these, I believe that two other magical texts can be identified as having been used by Dee. The first is Sloane 3849 article 1, “Manner of proceding in order to discover in the crystall,”in which the three angels Anchor, Anachor, and Anilos are central. This, or a similar text, seems to be behind Dee’s first scrying session with Kelley, in which they try to call forth these three spirits.

Another magical text I believe may have been used is Sloane 3854. The first part includes article 4 (“Book of Consecrations”)[40] and article 5 (“Experimenta de Speculo”). In the blank space between these two articles (folio 75r) a second hand, which I believe can be identified as Edward Kelley’s, has written some notes. This manuscript is also bound with the most complete and correct manuscript of *Liber Juratus* that I have seen.

There are many examples of medieval and Renaissance magic texts with similar methods. I include some examples in the appendices.

Dee’s system started with some Hebrew-centered Kabbalah like that he found in the writings of Reuchlin. Kabbalistic concepts abound, including his use of Hebrew etymology, traditional Hebrew names of God and angels, and extracting names from tables of letters à la Abulafia. Dee had a large Hebrew collection in his library, and took many of the volumes with him to the continent in 1583, showing sustained interest.

Nevertheless, in the end his *Sigillum Dei Aemeth* replaced the traditional Hebrew names with new names, and his angelic book was not in Hebrew, but a new (or unknown old) language. This may reflect Dee's (or Kelley's) mistrust of Jews,[41] or perhaps it may have been a way to compensate for Kelley's lack of knowledge of Hebrew and traditional Kabbalah. In any event, it is interesting to note that what Dee found in these actions is exactly what he expected to discover. Instead of the confusing maze of corruptions and variants found in the grimoires, he found an uncorrupted way of communicating with angels based on their own language, and on mathematics.

The first angels to make their appearance at the scrying sessions all belong to the Judeo-Christian tradition. They are later supplemented with otherwise unknown names, derived mathematically from letter squares. Dee is careful to catalog their jurisdictions, apparel, and symbols for future use. The revealed method of invoking their help is described in detail in the action of 17 November 1582.

In addition to the seals of the spirits, the ritual apparatus included several other items: various scrying stones, sometimes set in a frame; a "holy table" on which was painted or engraved various symbols; wax seals called *Æmeth;* a ring and lamin to be worn by the practitioner; and the rod "el," divided into three parts, the ends painted black, the middle red.

The Mysterious *Book of Soyga*

As mentioned above, Dee refers in several places to a magical text named *Aldaraia sive Soyga.* Since Roberts' and Watson's 1990 book, *John Dee's Library Catalogue,*[42] two manuscripts of this work have been identified by Deborah E. Harkness. One is Sloane 8 in the British Library, and the other is Bodley 908 in the Bodleian library. It is possible that Sloane 8 was, in fact, the manuscript to which Dee refers in his records.[43]

In their very first scrying session with Kelley, Dee asks the angels, "Ys my book, of Soyga, of any excellency?" (10 March 1582). He laments at that time, "Oh, my great and long desyre hath byn to be hable to read those Tables of Soyga." *Liber Loagaeth* (Sloane 3189) has several tables from Aldaraia/Soyga appended (in Dee's handwriting—not Kelley's, as in the rest of the manuscript). In addition, Dee's statement, "Soyga: otherwise named ysoga, and Agyos, literis transpositis" is, in fact, a direct quote from the *Aldaraia.*[44] The angel Il responds, "Soyga signifieth not Agyos," in direct contradiction. This makes it probable that Kelley was not familiar with the text, and is possibly evidence that he was in fact carrying out a deception. I do not believe the *Book of Soyga* is the same as the "Arabick book" mentioned several times by Dee. The latter was apparently the same as that prized by Pontois and described as having "cost doctor dye £ 600 ready money as he the deponent did hear himself the said doctor afferme. . ."[45] There is nothing about either *Soyga* manuscript to justify such a vast sum.[46]

Scrying and Dee’s Earliest Attempts

The premise behind Dee’s mystical experiments is the veracity of scrying, or visions seen in a crystal ball or other shining surface. Today, the crystal ball has become an icon for superstition, but scrying has been widely used and respected for divination throughout history. It even has biblical authority.[47]

According to psychiatrist and researcher Raymond A. Moody, “That certain individuals do see visions—specifically, hypnagogic images—when gazing into a transparent or reflective surface is a well-established fact that can be regarded as an item of psychological knowledge.”[48] The real question is the value of these visions, or their interpretation.

Scrying instructions can be found widely in occult literature, in particular in manuscripts that it was dangerous to possess.[49] The published sources, such as Agrippa, make scant mention of scrying. Scrying also appears in popular legends, such as the legends of Roger Bacon’s scrying glass in which anyone could see anything they wished within fifty miles.

With few exceptions, Dee did not use scrying to see far-off happenings, or to divine the future. His aim was to see into the spiritual realms to receive wisdom from higher beings. The spiritual realms were thought to resemble, in many respects, the physical world.

It was common for scrying practices to be accompanied by religious and occult symbols and ceremonies. These served to ensure the spiritual purity of the practice, but also to focus concentration on the intent, much as techniques for lucid dreaming do. They also served to give form, context, and meaning to the images seen by the scryer. For example, surrounding the scrying table with the symbols of the seven planets provided a means of organizing and remembering the otherwise bewildering maze of images. This integration of magic with the art of memory was developed to a high degree in Renaissance occultism.[50]

Symbols and ceremonies also provided a means of controlling or manipulating the images (or, to use Couliano’s term, “phantasms”). For example, the scryer might place a talisman of Venus under the stone when he wanted to focus on affairs of the heart. This is essentially an attempt to facilitate communication between body and soul: “body and soul speak two languages, which are not only different, even inconsistent, but also inaudible to each other. The inner sense alone is able to hear and comprehend them both, also having the role of translating one into the other.”[51] The use of sacred symbols and ceremonies also helped the scryer summon courage to face the possible confrontation with demonic presences.

Dee’s interest in scrying clearly goes back far earlier than the records of his scrying experiments.[52] Although he may have begun to experiment much earlier, the earliest records of Dee’s scrying begin in 1581. On 8 March 1581, and several times during 1581, Dee records strange knocking and rapping in his chamber, and a voice like an owl’s shriek. These events were clearly regarded as supernatural and may have been related to early experiments.

His private diary records: “May 25th, I had sight in χρυσταλλω [Crystallo] offerd me, and I saw.” Generally, however, Dee relied on the scrying abilities of others, as prescribed by tradition. He mentions that he employed two seers around this time.[53]

Late in 1581, Dee began to employ Barnabas Saul as a scryer. Saul was a minister who was heavily involved with magic. Dee’s diary records additional details regarding his dealings with Saul:

> Oct. 9th, Barnabas Saul, lying in the .... hall was strangely trubled by a spiritual creature abowt mydnight. [1582] Jan. 27th, Barnabas Sawl his brother cam. Feb. 12th, abowt 9 of the clok, Barnabas Saul and his brother Edward went homward from Mortlak: Saul his inditement being by law fownd insufficient at Westminster Hall: Mr. Serjeant Walmesley, Mr. Owen and Mr. Hyde, his lawyers at the bar for the matter, and Mr. Ive, the clerk of the Crown Office, favoring the other. Feb. 20th I receyved a letter from Barnabas Saul. Feb. 21st, Mr. Skullthorp rod toward Barnabas. Feb. 25th, Mr. Skulthorp cam home. March 6th, Barnabas Saul cam this day agayn abowt one of the clok and went to London the same afternone. He confessed that he neyther hard or saw any spirituall creature any more. March 8th, Mr. Clerkson and his frende[54] cam to my howse. Barnabas went home agayne abowt 3 or 2 clok, he lay not at my howse now; he went, I say, on Thursday, with Mr. Clerkson. March 9th, Fryday at dynner tyme Mr. Clerkson and Mr. Talbot declared a great deale of Barnabas nowghty dealing toward me, as in telling Mr. Clerkson ill things of me that I should mak his frend, as that he was wery of me, that I wold so flatter his frende the lerned man that I wold borow him of him. But his frend told me, before my wife and Mr. Clerkson, that a spirituall creature told him that Barnabas had censured both Mr. Clerkson and me. The injuries which this Barnabas had done me diverse wayes were very great. July 19th, Barnabas Saul came to see me at Mortlak: I chyd hym for his manifold untrue reports.[55]

The experiments with Saul were not regarded as successful. His sessions were largely rejected as false. Dee records one of these sessions in the beginning of *Mysteriorum Libri Quinque.*

On 8 March 1582, Dee was visited by Edward Kelley, a.k.a. Edward Talbot. They were introduced by Dee’s friend Mr. Clerkson. Kelley began to scry regularly with Dee two days later. From Dee’s records, it is apparent that Kelley had a highly unstable personality. The relationship between the two men was often strained, and Kelley would storm off for months at a time. Aside from their conflicts, however, Dee regarded their sessions as highly successful.

Scrying Methods

Dee used various media for scrying—several crystal balls and the famous obsidian mirror are now preserved in the British Museum.[56] Dee drew a picture of one of them in the record of the first scrying session (see below). This shows an elaborate frame with a cross at the top. This is probably the stone that William Lilly described as the size of a large orange, "set in silver, with a cross on the top, and another on the handle; and round about engraved the names of these angels, Raphael, Gabriel, Uriel."[57] After intense prayer, the stone was placed in a frame and set on a specially prepared table. The angels were then called to appear in the stone to answer questions.

Nicholas Clulee has argued that Dee did not seem to consider these actions magical, but rather a variety of religious experience. He based this partly on the observation that they do not seem to invoke the angels directly, as directed by the magical books. Rather, they start off with prayers to God, and petitions that God send his angels.[58] This is consistent with the method found in the *Arbatel,* which Dee mentions by name in the text. In his first action with Kelley, Dee is very careful to distinguish between "spirituall practise" and what is "vulgarly accownted Magik." On the other hand, Dee and Kelley immediately proceed to "call for the good Angel Anchor, to appere in that stone *to my owne sight.*" Dee states that he "make[s] motion to god, and his good Creatures." Also, Dee's synopsis of his instructions for communicating with angels *(Heptarchia Mystica* and *Tabula bonorum angelorum invocationes*, bound in Sloane 3191) contains numerous invocations or "invitations" addressed directly to individual angels. These were based on the records Dee kept in Sloane 3188.

It does not appear that God or the angels obliged Dee's request that they appear to his own sight, but Kelley experiences vivid and detailed apparitions. As soon as the angels appear in the stone, they "give thanks to God, and Wellcome to the good Creature." Then they demand the angel's name. These steps are all consistent with the texts of ritual magic. In the second action, Dee is told that the method of invoking the archangel Michael is by "the Seven psalmes." This is also consistent with the grimoires.[59] The apparitions do not always seem confined to the crystal.[60]

Edward Kelley, the Magician

Edward Kelley was born on 1 August 1555. He was thus 28 years younger than Dee. He attended Oxford under the alias of Edward Talbot, but left after some trouble. He was later pilloried in Lancaster for forgery. He was 26 when he arrived at Dee’s door on 10 March 1582.[61] By this time, Kelley was well versed in the occult arts, including Agrippa’s works. He also possessed various texts on magic, at least some of which were regarded as “devilish.” Kelley was also an alchemist. His only book is on alchemy, and his final months were occupied with alchemical experiments for Rudolph II. Elias Ashmole says, “Mr. Lilly told me that John Evans informed him that he was acquainted with Kelly’s sister in Worchester, that she shewed him some of the gold her brother had transmuted, and that Kelly was first an apothecary in Worcester.”[62] Kelley later married Jane Cooper. He also had a brother, Thomas.

The *Sigillum Aemeth* and Its Variations

The use of the *Sigillum Aemeth* (or Emeth) is central to Dee's system, as well as to other forms of magic. The earliest examples of the *Sigillum Aemeth* are found in the *Liber Juratus* (see appendix 1). Most manuscripts describe the seal in great detail, but don't actually draw it out. The versions that do exist vary, probably because they were based on the written description. *Liber Juratus* calls this seal the "seal of God . . . which is the beginning,in this art."[63] Between the outer circles is to be written the 72–letter name of God, or *Schemhamphoras*. Both Agrippa and Reuchlin refer to a seal by this name, although I have been unable to find any descriptions or drawings of it in their writings. Dee was well aware of the fact that variations existed, since he asks the angels to provide a definitive version for his works. The version by Athanasius Kircher, which appears many years later in his monumental work *Oedipus Aegyptiacus*, is highly corrupt.[64]

Dee was originally told by the angels to use a version found in one of his books. He thereupon consulted several sources and asked the angels to resolve the discrepancies. This prompted them to deliver a radically new version of the sigil.

An examination of Dee's original wax sigil (see figure 1, page 42), now preserved in the British Museum, shows differences from that found in Sloane 3188.

The Holy Table and Its Variations

Dee's scrying was conducted on a specially constructed table, two versions of which were described to him by the angels. The first, whose design is now lost, was later declared by the angels to be false. The second design is apparently similar to the first. It consists of a large hexagram containing a square of letters. Surrounding the hexagram is a border containing additional letters. Although the original table does not appear to have survived, it was described in detail by Elias Ashmole, who saw it in John Cotton's library. It was "composed of 3 boards broad-waies besides the borderings; of a fine grained wood & very heavy, but the scent now lost." He described the Enochian letters as painted in red on a gold background, between two blue lines. The seven sigils, or "ensigns of Creation" were also painted with red letters and blue lines. The lines of the hexagon were gold, and the central square had gold letters and blue lines.[65] (The engraving found in Dee's *True and Faithful Relation . . .* does not correspond exactly with the description in Sloane 3188. See figure 3, page 43.)

As with the *Sigillum Aemeth* described above, this design is a variation of designs found in magic texts. It is likely that Dee employed one of the conventional designs in his early scrying before the angels revealed their version.

The instructions given in the grimoires concerning the holy table probably give a fairly accurate idea of how Dee proceeded in these experiments. In appendices 3, 4, and 5, I present excerpts from the *Theurgia Goetia, Art Pauline*, and *Ars Almadel*. The *Art Pauline* seems particularly close to Dee's method. The table contains a hexagram with the seven planetary seals arranged around it (see figure 5, page 44). The spirit's seal is placed on the appropriate planetary seal. Dee was instructed that the seven seals could be constructed separately and arranged around the table, or they could be painted onto the table.

The third example is from the *Ars Almadel*. This gives a method for calling forth the spirits that govern the four directions, north, south, east, and west. Here, we also find a hexagram on the holy table, and the use of wax sigils. This time, there is a border around the table with holy names drawn around it. In the center of the hexagram is a small triangular seal with more names (see figures 6 and 7, pages 45–46). *Aldaraia sive Soyga* also contains diagrams reminiscent of Dee's (see figure 4, page 44).

Other Ritual Implements

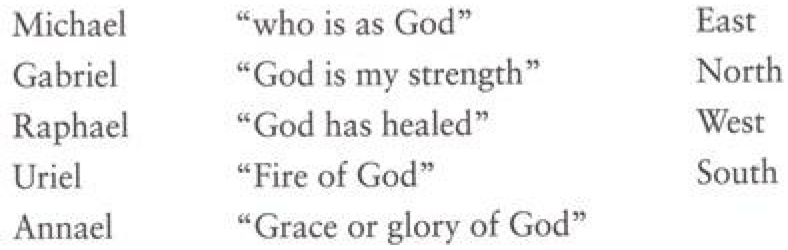
According to the *Key of Solomon,*[66] *Heptameron, Lemegeton,*[67] and other magical texts, the master should wear on his chest a lamin with a hexagram. Dee is likewise told to prepare a lamin to be used for this purpose, but his was triangular, thus symbolizing his name (Δ = Dee). He is later given a new version, the original version having been declared false. The final version has Enochian lettering.

Dee is also instructed to prepare another ritual implement, the ring of Solomon. Solomon's magical ring appears in early magical literature. For example, in the *Testament of Solomon* (first to third century A.D.), Solomon is given the magical ring by the archangel Michael.[68] He uses it to call and control the demons. The archangel Michael likewise reveals Solomon's ring to Dee, stating that it was by it that Solomon worked all his wonders. The *Testament of Solomon* was known in medieval manuscripts and could have been known to Dee.[69]

The Spirits

Five archangels are central to Dee’s actions: Michael, Gabriel, Raphael, Uriel, and Annael. This grouping is common in medieval and Renaissance occult works. In *Liber Juratus,* the first four are known as the “Angels of the 4 winds.” Agrippa calls them the “four angels ruling over the corners of the world.”[70] *The Magical Calendar* gives the same.[71] The names of the first four are also found written on the frame that holds the scrying crystal in Trithemius’ method of calling angels into a crystal.[72] Michael and Gabriel are the only two angels mentioned by name in the Old Testament. Raphael is mentioned in the Apocryphal *Book of Tobit*, and Uriel is well known in noncanonical lore. Annael is relatively unknown.

The meanings of the Hebrew names and their compass allocations are:



Michael	“who is as God”	East
Gabriel	“God is my strength”	North
Raphael	“God has healed”	West
Uriel	“Fire of God”	South
Annael	“Grace or glory of God”	

During their first scrying session, Dee and Kelley called three angels: Anchor, Anachor, and Anilos. These names also occur in mainstream occult sources. In the *Heptameron or Magical Elements* of Peter de Abano, they are mentioned in the oration to be said when the vesture is put on.[73] It is known that Dee made use of that book, but he must have been following another source here, since the names are not exactly the same. A likely source is Sloane 3849, article 1, “Manner of preceding in order to discover in the crystall,” where these three angels are central.

It would be interesting to try to trace the development of this oration. The *Heptameron* version is as follows:

> Ancor, Amacor, Amides, Theodonias, Anitor, by the merits of thy Angel, O Lord, I will put on the Garments of Salvation, that this which I desire I may bring to effect: through thee the most holy Adonay, whose kingdom endureth for ever and ever. Amen[74]

The *Clavicula Salomonis* gives the following:

> Amor, Amator, Amides, Ideodaniach, Pamor, Plaior, Anitor; through the merits of these holy Angels will I robe and indue myself with the vestments of Power, through which may I conduct unto the desired end those things which I ardently wish, through Thee, O most Holy ADONAI, whose Kingdom and Empire endureth forever. Amen.[75]

The *Lemegeton* gives:

> By the figurative mystery of these holy vestures I will clothe me with the armour of salvation in the strength of the Most High, ANCHOR; AMACOR; AMIDES; THEODONIAS; ANITOR; that my desired end may be effected through Thy Strength, Adonai; unto whom the praise and glory will for ever and ever belong. Amen.[76]

Liber Juratus contains the earliest version with which I am familiar. It is numbered oration 17:

> O Jesu the sonne of the incomprehensible god,
>
> hancor hanacor hamylos iehorna theodonos heliothos phagor corphandonos norizane corithico hanosae helsezope phagora.
>
> ELEMINATOR candones helos helee resphaga thephagayn theundyn thahonos micemyahe hortahonas nelos behebos belhores hacaphagan belehothol ortophagon corphandonos born in the shape of a man for us sinners and yow holy angells heliothos phagnoraherken and teche me and gouerne me [hic oic petitionem tuam sed p visione diuina dic ut sequitr] that I may come to obtayne the visyon of the deyte throwgh thee glorious and moste gentle and moste almightie creator oure lyuyng lorde holy infinite godely and euerlastinge to whome be prayse honor and glorye worlde withowt ende. Amen.[77]

The *Ars Notoria* has a very similar oration, numbered 24 and called “The Oration of the Physical Art.” Its purpose is for determining the condition of a sick person:

> Ihesus fili Dominus Incomprehensibilis:
>
> Ancor, Anacor, Anylos, Zohorna, Theodonas, helyotes Phagor, Norizane, Corichito, Anosae, Helse Tonope, Phagora
>
> [another part of the same orison:]
>
> Elleminator, Cardones helosi, Tophagain, Tecendum, Thaones, Behelos, Belhoros, Hocho Phagan, Corphandonos, Humanae natus & vos Eloytus Phugora: Be present ye holy Angels, advertise and reach me, whether such a one shall recover, or dye of this infirmity.[78]

The *Ars Notoria* reproduces most of the Orations found in the *Liber Juratus,* though in slightly altered forms.

In *Liber II*, two other conventional lists of angels are given. The first is: Zaphiel, Zadkiel, Cumael, Raphael, Haniel, Michael, and Gabriel. The second is: Zedekieil, Madimiel, Semeliel, Nogahel, Corabiel, and Leuenael. Most of these names are identical to those given by Agrippa in his “Scale of the number seven.” The first list corresponds to the “seven angels which stand in the presence of God.” This also corresponds to the list of seven archangels according to Geonic lore, as well as that of Pseudo-Dionysius.[79] The second list corresponds to the Hebrew names for the seven planets, with the name of God, “EL,” added to each. It is also found in Agrippa, book 3.

Description of the Manuscript

One of the most remarkable things about Dee, as exemplified by these records, is his meticulous attention to detail. In fact, Dee's are probably the most detailed records of the actual practice of ceremonial magic extant.

The title of the book is slightly ambiguous. "Mysteriorum," as in *Mysteriorum Libri*, can mean either mysteries or secret rites. Both meanings seem fitting in this context.

The manuscript consists of 104 folios, mostly in Dee's hand. It measures approximately 320mm by 205mm. It contains a short preface by Elias Ashmole, and is bound with notes by Ashmole, many of which are in his stenographic notation.[80]

Synopsis of Dee’s “Mystical Experiments” (1581–1583)

In his *Mysteriorum Libri Quinque,* Dee records prophetic visions (e.g., the Spanish Armada), visions of angels, magical instruction, and religious teachings. A few of the key messages of the angels include:

- Flesh is vile and corrupt (Gnostic or Neoplatonic attitude);
- Mercy for the repentant is necessary;
- Temptation of the faithful is necessary in order to show God’s mercy;
- The immanent coming of the antichrist;
- The immanent fall of existing political and religious establishments as punishment for mankind’s corruption, to be replaced by new, righteous ones.

Although a lot of material remains obscure, especially passages from the “holy book,” I believe Christopher Whitby is correct in dismissing the theory of cryptographic messages hidden in these records.[81]

There is suprisingly little discussion of alchemy in these records, especially in view of the fact that Dee pursued it actively during this period.[82] Perhaps Dee did not mention it here because he didn’t want to reveal his alchemical work to Kelley, who probably came to Dee for that purpose. Perhaps this helps explain Kelley’s bouts of anger at Dee. One might also wonder if Kelley brought the scroll, book, and red powder in order to entice Dee into letting him in on Dee’s own secret alchemical work. The evidence that there was more to the visions than simply conscious deception from Kelley will be discussed later.

The Book of Angelic Wisdom

Dee seems to have had an almost obsessive facination with the lost *Apocrypha, especially* the *Book of Enoch*, which is mentioned and even quoted in the Bible (Jude 14), and *Esdras*. He is told by the angels that the *Apocrypha* are not lost, but in the keeping of the Jews.[83] Most of his mystical exercises are focused on recovery of the lost wisdom that these books represented to him.

The core of this book describes the revelation of a book of angelic wisdom, *Liber Loagaeth* (so named by Dee in *A True and Faithful Relation . . .*). It is reported to be in the tongue of the angels. Only a few angelic words are translated in these manuscripts. The first parts of this book were dictated by Kelley and recorded meticulously by Dee in Sloane 3188. Later parts were written by Kelley directly and are now found in Sloane 3189. The latter manuscript is incomplete in that it does not repeat the earlier material. It is also bound with four tables from the *Book of Soyga,* written in Dee's handwriting. Since the angels state that the angelic book contains forty-nine leaves (one of which cannot be revealed), it is clear that the four tables from *Soyga* do not belong to it.

Dee was instructed to rewrite the book in the delivered script, but this does not seem to have been done. One copy was to be bound in blue. Another, "whose skin shall bear Silver," was to be "in length; 8 [inches], in breadth 7. "[84]

The importance of *Liber Loagaeth* cannot be overemphasized. From it would "be restored the holy bokes, which haue perished euen from the begynning, and from the first that liued." The truths it contains will end religious disputes and restore religious unity. "Which when it hath spread a while, THEN COMMETH THE ENDE."[85] In short, it will usher in the new age. Since the book is so central to these angelic communications, it is amazing that it has remained unpublished.

Synopsis of Dee’s *True & Faithful Relation*

The record of Dee’s experiments continues in later manuscripts. The bulk of the later material was published in 1659 by Meric Casaubon as *A True & Faithful Relation . . . Between Dr. John Dee . . . and some Spirits*. These records were published by Casaubon with the intent of discrediting Dee and Kelley. The Casaubon edition, it should be noted, is full of typographic errors. Reliance on it alone, without the manuscript sources, has sadly resulted in the perpetuation of many errors.

A *True & Faithful Relation* takes up where *Mysteriorum Libri Quinque* left off. It goes on to describe their six-year missionary journey to the continent. The revelations of the mystical heptarchy were followed by that of the 30 “Aethyrs,” the “48 Claves Angelicae,” and the four “Enochian Tables.” The later material included a second language popularly known as “Enochian.”

Dee’s mission to the court of Rudolph II in Prague cannot be considered a success. An occultist himself, Rudolph proved very unsupportive. In fact, Dee and Kelley narrowly escaped the papal nuncio and the possibility of facing the deadly Inquisition. Dee returned to England in 1589. Kelley remained behind and had limited success in alchemical experiments for Rudolph. He died trying to escape in 1595.

Dee's Later Life

The final period of Dee's life and career have been judged variously as one of disgrace and failure, or as one of continued success and renown. I think William Sherman has made a credible case for the latter view.[86] While it is clear that his mission to the continent cost him politically, Dee continued to maintain his contacts and influence, and even served in an official capacity to King James I when he succeeded Queen Elizabeth in 1603. He continued his scrying experiments, but never again achieved the dramatic results he had seen with Kelley. While the promised new age never materialized in the dramatic and apocalyptic way he had visualized, history has acknowledged Dee's vital role in shaping our modern world.

Adaptation of Dee’s System by Later Occultists

Dee’s activities and writings have made a deep impact on later occult movements. Among the fruits of his labor is a heavy influence on the German Rosicrucian movement, whose manifestos began to appear around 1610.[87]

As mentioned above, Dee’s experiments also had a great influence on the Golden Dawn. Unfortunately, the process of adapting and assimilating Dee’s system was undertaken with uncritical methods and incomplete materials. In particular, these efforts have been based almost entirely on Casaubon’s *True & Faithful Relation*, with all its typographic errors. In many particulars, the Casaubon edition is impossible to understand without the *Mysteriorum Libri Quinque*.

The Four Angelic Tablets

Four tables of letters were produced during the later conferences.[88] These tables served two different purposes: the production of ninety-one names that correspond to the ninety-one parts of the world (as catalogued by Agrippa in his *Occult Philosophy* I, chap. 31), and the production of invocations ("Tabula Bonorum") to be used with the names. The Golden Dawn adaptation of Dee's system places heavy emphasis of these tables.

Christian Wilby has written an excellent article on the four angelic tablets. There he states:

> Unfortunately for later day occultists, the so-called synthetic genius—I prefer to call it rampant eclecticism—of McGregor Mathers has obscured the field of vision on this problem for too long. For some reason best known to himself, Mathers was content to use the originally received tablets and ALL of the emmendations of the "corrected" version. This has produced, to the detriment of everybody, one of the biggest mish-mashes ever to grace the Tradition.[89]

Another inaccuracy in the Golden Dawn system is the compass allocations used for the four angelic tablets. The original allocations given to Dee were later corrected by the angels.[90] The correct allocations are also given by Dee in his synopsis of his magical system (see Sloane 3191). These errors have been perpetuated by more recent writers.

History of the Manuscript

In addition to the preface by Elias Ashmole, further history of the manuscript is found in the following notes written on the end sheets:

Ms A. 3188./XVI F

This volume is in Dr. Dee's own handwriting, as far as fol 108.

A fair copy of it by Elias Ashmole was purchased at Sir Joseph Jekyll's sale, Jan 1739/40 (lot 465) and is now Ms. Sloane 3677.

The original Mss. of the remaining Books are in the Cottonian Collection, Appendix XLVI but were formerly (erroneously) numbered as Add. Mss. No. 5007 A.B.C.

J.M. Jan 1856

Dr. John Dee's Conference with Angels from Dec 22 1581. to May 30 1583. being what preceeds the other Conferences printed by Dr. Meric Causabon [sic] Lond. 1659. in folio.

With a preface by Elias Ashmole An: 1672.

Notes on This Edition

This edition of John Dee's spiritual diaries was prepared from the original manuscript in Dee's own handwriting. The original manuscript is preserved in the British Library.[91] Dee prepared a synopsis of this material in a short manuscript, *De Heptarchia Mystica.*[92] This latter manuscript provides some material that has been lost from the original manuscript, along with additional explanatory notes. All material used by Dee in his synopsis are printed in bold font to indicate its special importance. Additional notes from *De Heptarchia Mystica* are marked -*D (HM)*.

The text has been normalized in some particulars. The personal pronoun *thee* is sometimes written *thé* or *the* in the manuscript. These have all been resolved into *thee*. The tittle—or macron (~), usually indicating a missing "m" or "n"—has been expanded in nearly all cases. Except for these particulars, everything else has been preserved, including spelling, capitalization, punctuation, and underscores. Marginal notes are incorporated into the text as footnotes. Square brackets and parentheses are Dee's. All editor's notes are denoted by -*Ed.*

Ashmole's notes are denoted by -*E.A.* Bound with the manuscript are partial transcriptions and notes on this manuscript and the printed diaries by Elias Ashmole. Most of this is in Ashmole's shorthand cipher. Some of these notes have also been included in this edition. Asmole's "fair copy" is full of careless errors.This is very surprising, since he apparently thought the book of utmost importance.

In preparing this edition, I took the opportunity to review Christopher Whitby's doctoral thesis. Garland Press printed a limited edition of this in 1988. It was poorly reproduced from his typewritten thesis, making it completely illegible in many spots. I found Whitby's introductory material very well researched and useful, although I was surprised at the number of errors in transcription and translation. Also unfortunate is the fact that Whitby doesn't compare Sloane 3188 with Dee's manuscript *Heptarchia Mystica,* where Dee collects excerpts from the *Mysteriorum Libri Qunique.*[93] These compensate greatly for much of the damage and illegibility of the latter, much more so than Ashmole's transcriptions. Although Whitby makes note of its importance, he doesn't make much use of it.

Conclusions: The Evidence

Colin Wilson has written: “Dee is one of the few great magical adepts of the past who can present us with some practical evidence of the existence of non-human entities.”[94] How solid is this evidence? The most convincing evidence is perhaps the “Enochian” language revealed by the angels. Enochian has been extensively studied by Donald Laycock, a prominent linguist. His comments indicate that he, for one, is not entirely convinced.[95]

The second body of evidence is the word and credibility of John Dee. It must be remembered that he was regarded as one of the most educated people of his age, acknowledged to have impressive scientific credentials. In at least two places, he reports firsthand experience of supernatural events. In his diary, he writes, “I had sight in Crystallo offerd me, and I saw.”[96] And in the *Mysteriorum Libri Quinque,* he reports, “I fele: and (by a great thundring noyce, thumming thuning myne eares) I perceyue the presence of some spirituall creature abowt me.”[97] He also witnessed the seemingly miraculous materialization of the stone (21 November 1582). On the other hand, it must be admitted that Dee was highly motivated to believe, and thus was more likely to misinterpret events.

The largest body of evidence comes in the form of the word and credibility of Edward Kelley. Views of him range from that of a highly gifted scryer to an outright charlatan. I am inclined to believe that the truth lies somewhere in the middle. Clulee concluded that Kelley

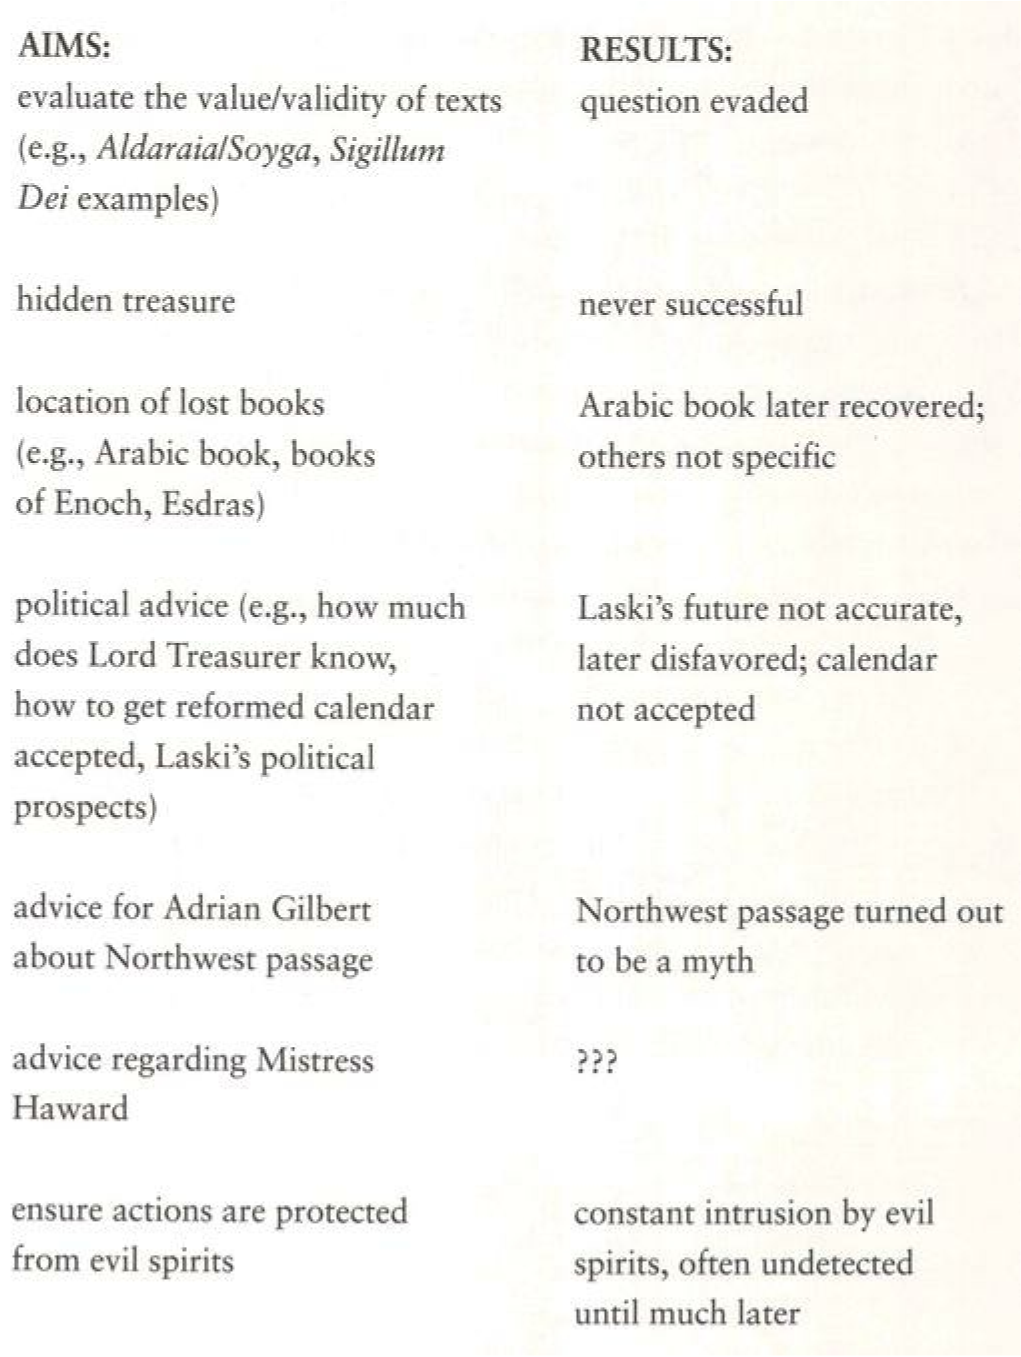
> . . . may well have consciously fabricated everything to deceive Dee, but his bouts of emotional anxiety and arguments with the spirits in the course of his visions, his reluctance to continue except for Dee’s desperate pleadings, and his admission of the visions to religious authorities in Prague when that might have had serious consequences all suggest that more than conscious deception was involved (TFR, 64, 102, 370).[98] Although Kelley often questioned the divine character of the angels, he seems to have believed in their reality as firmly as Dee, and while it is clear that the revelations of the angels through Kelley were often prejudiced in favor of Kelley’s interests in particular circumstances, they also reflect what Kelley knew of Dee’s interests. In a number of places in the minutes Dee has noted the similarity of the angelic revelations to material in Agrippa, Reuchlin, Trithemius, and Peter of Abano, and since Kelley lived with Dee and had access to his library, the revelations are very likely the joint product of Kelley’s imagination and stock of knowledge and what he knew of Dee’s thinking from their discussions and his reading among books of current interest to Dee.[99]

Dee and Kelley’s actions may be compared with so-called UFO abductees’ recovered memories, wherein a “hypnotist” puts the “witness” into a suggestible state, and, through leading questions, manages to arrive at all sorts of “memories.” The process may not be unlike the art of taking political polls. Of course, the better therapists and pollsters are trained to avoid biased results.

Another similarity with the UFO phenomena is the apparent trickster nature of the entities. They seem to combine convincing elements with apparent nonsense in a way that has led some researchers to theorize deep psychological manipulation.[100] Uri Geller’s suspicion that there was just some “goddam little clown that is playing with us” sounds hauntingly similar to many of Kelley’s complaints.

Other significant evidence lies in the various accurate predictions (e.g., Mary's beheading, the Spanish Armada, the homecoming of the Jews). These must, however, be weighed against those predictions that weren't accurate (e.g., prophecies of doom, Laski's future).[101] Another event that deserves mention is a secret conversation between Dee and the angels, held in Greek in order to prevent Kelley from understanding it. Aside from this incident, the angels' use of Latin seems to reflect Kelley's limited schooling in that language. When using Latin, they tend to deliver fixed speeches and avoid discourse. Also, as noticed by Calder, the angels "increase in fluency through the years."[102]

A quick survey of how practical the angel magic was to Dee is even less convincing. Although Dee's aims were not only practical, but mystical as well, the results do not seem to be very reliable:



AIMS:	RESULTS:
evaluate the value/validity of texts (e.g., *Aldaraia/Soyga*, *Sigillum Dei* examples)	question evaded
hidden treasure	never successful
location of lost books (e.g., Arabic book, books of Enoch, Esdras)	Arabic book later recovered; others not specific
political advice (e.g., how much does Lord Treasurer know, how to get reformed calendar accepted, Laski's political prospects)	Laski's future not accurate, later disfavored; calendar not accepted
advice for Adrian Gilbert about Northwest passage	Northwest passage turned out to be a myth
advice regarding Mistress Haward	???
ensure actions are protected from evil spirits	constant intrusion by evil spirits, often undetected until much later

Some of the instructions, such as those concerning etymology and geography, are straight out of textbooks. This is also true of the names of angels, their descriptions, offices, and so forth. The episode of the dictation of the table can easily be seen as evidence that Kelley was fabricating the "revelations." First Dee is told that the sigil *Aemeth* was correct in his books, but when confronted by conflicting versions, the "angels" produce yet another version. At one point, Kelley takes the sigil to his room to correct it. Later, he frequently interrupts sessions when the extraction methods fail. This may mean that Kelley needed time to figure out where his mistakes were. And what are we to make of the episode in which Kelley produces a drawing in his own handwriting that appears to be a prototype of one of the diagrams? He proclaimed it a counterfeit, and Dee congratulated himself in not succumbing to doubt, but trusting God.

Indeed, the angels often seem to be telling Dee and Kelley what they want to hear to gain their cooperation, but their reasons are not apparent.

PREFACE

BE IT REMEMBERED, that the 20th of August 1672, I received by the hands of my servant Samuell Story, a parcell of Dr: Dee's manuscripts, all written with his owne hand; vizt: his Conference with Angells, which first began the 22th of Dec: Anno: 1581, & continued to the end of May Anno: 1583, where the printed booke of the remaining conferences (published by Dr: Cawsabon) begins, & are bound up in this volume.

Beside these, the booke intituled, *The 48 Claves Angelicae,*[103] *also, Liber Scientia Terrestris Auxilij & Victoria*[104] (these two being those very individuall bookes which the angells commanded to be burnt,[105] & were after restored[106] by them as appeares by the printed Relation of Dr: Dee's Actions with Spirits pag: 418 & 419) The booke intituled De *Heptarchia Mystica Collectaneorum Lib: Primus,*[107] and a booke of invocations or Calls, begining with the squares filld with letters, about the black cross. These 4 bookes I have bound up in another volume.[108]

All which, were a few daies before delivered to my said servant, for my perusall (I being then at Mr: William Lillies[109] house at Hersham in Surrey) by my good freind Mr: Thomas Wale, one of his maiesties warders in the Tower of London.

The 5th of Sept: following Mr: Wale (having heard of my retourne to towne) came to my office in the Excise Office in Broadstreete, & told me he was content to exchang all the foresaid bookes, for one of myne, vizt: *The Institution, Lawes & Ceremonies of the most Noble Order of the Garter,* to this I agreed, and provided one, which I sent him fairely bound, & gilt on the back.[110]

On the 10th: of the said Sept: Mr: Wale came thither to me againe, & brought his wife with him, from her I received the following account of the preservation of these bookes, even till they came to my hands, vizt: That her former husband was one Mr: Jones[111] a confectioner, who formerly dwelt at the Plow in Lumbardstreet London, & who, shortly after they were married, tooke her with him into Adle streete among the joyners, to buy some houshold stuff, where (at the corner house) they saw a chest of cedarwood, about a yard & halfe long, whose lock & hinges, being of extraordinary neate worke, invited them to buy it. The master of the shop told them it had ben parcell of the goods of Mr: John Woodall Chirurgeon (father to Mr: Thomas Woodall late Serjant Chirurgeon to his now Maiestie King Charles the 2nd: (my intimate friend) and tis very probable he bought it after Dr: Dee's death, when his goods were exposed to sale.

Twenty yeares after this (& about 4 yeares before the fatall fire of London) she & her said husband occasionally removing this chest out of its usuall place, thought they heard some loose thing ratle in it, toward the right hand end, under the box or till[112] thereof, & by shaking it, were fully satisfied it was so: Hereupon her husband thrust a peece of iron into a small crevice at the bottome of the Chest, & thereupon appeared a private drawer, which being drawne out, therein were found divers bookes in manuscript, & papers, together with a litle box, & therein a chaplet of olive beades, & a cross of the same wood, hanging at the end of them.

They made no great matter of these bookes &c: because they understood them not, which occasioned their servant maide to wast about one halfe of them under pyes & other like uses, which when discovered, they kept the rest more safe.

About two yeares after the discovery of these bookes, Mr: Jones died, & when the fire of London hapned, though the chest perished in the flames, because not easily to be removed, yet the bookes were taken out & carried with the rest of Mrs: Jones her goods into Moorefields, & being brought safely back, she tooke care to preserve them; and after marrying with the foresaid Mr: Wale, he came to the knowledge of them, & thereupon, with her consent, sent them to me, as I haue before set downe.

E. Ashmole

Mysteriorum Liber Primus

Mortlaci

1

Præter alias meas extemporaneas preces, et eiaculationes ad Deum vehementiores: Hæc una, maximè usitata fuit

Oratio mea Matutina, Vespertinaque: pro Sapientia.[113]

In nomine Dei Patris, Dei Filij, Dei Spiritus Sancti.

Amen.

Omnipotens, Sempiterne, vere, et viue Deus, in adiutorium meum intende: Domine Dominantium, Rex Regum, Jeouah Zebaoth, ad adiuuandum me festina:

Gloria Deo, Patri, Filio, et spiritui Sancto: Sicut erat in principio, et nunc, et semper et in sæcula sæculorum: Amen.

Recte sapere, et intelligere doceto me, (Ô rerum omnium Creator,) Nam Sapientia tua, totum est, quod volo: Da verbum tuum in ore meo, (Ô rerum omnium Creator,) et sapientiam tuam in corde meo fige.

O Domine Jesu Christe (qui sapientia vera es, æterni et Omnipotentis tui Patris) humilimè tuam oro Diuinam Maiestatem, expeditum mihi ut mittere digneris, alicuius pij, Sapientis expertique Philosophi auxilium, ad illa plenissimè intelligenda perficiendaque, quæ maximi valoris erunt ad tuam laudem et gloriam amplificandam: Et si Mortalis nullus iam in terris viuat, qui ad hoc munus aptus sit: vel qui ex æterna tua prouidentia, ad istud mihi præstandum beneficium assignatus fuerit: Tunc equidem humilimè, ardentissimè et constantissimè a tua Diuina Maiestate requiro, ut ad me de cælis mittere digneris bonos tuos Spirituales Ministros; Angelosque, videlicet Michaëlem, Gabrielem, Raphaëlem ac Urielem: et (ex Diuino tuo fauore) quoscunque, alios, veros, fidelesque tuos Angelos, qui me plene et perfecte informent et instruant, in cognitione, intelligentiaque vera et exacta, Arcanorum et

Magnalium tuorum (Creaturas omnes tuas, illarumque naturas, proprietates, et optimos usus, concernentium) et nobis Mortalibus Scitu necessariorum; ad tui nominis laudem, honorem, et gloriam; et ad solidam meam, aliorumque (per me,) plurimorum tuorum fidelium consolationem: et ad Inimicorum tuorum confusionem, et subversionem. Amen. Fiat Jeouah Zebaoth: Fiat Adonay, fiat Elohim. O beata, et superbenedicta Omnipotens Trinitas, Concedas mihi (Joanni Dee) petitionem hanc, modo tali, qui tibi maximè placebit.[114]

Amen.

Ab anno 1579. hoc ferè modo: Latinè, vel Anglicè; (ast circa annum 1569 alio et peculiari, particulari modo: interdum pro Raphaële, interdum pro Michaële) ad Deum præces fundere: mihi gratissimum fuit: Mirabilem in me faciat Deus Misericordiam suam.[115]

Amen

Ad Deum Omnipotentem Protestatio fidelis:
ad perpetuam rei memoriam[123] *Anno 1582.*

O God Almighty, thow knowest, & art my director, and witnes herein, That I haue from my youth up, desyred & prayed unto thee for pure & sownd wisdome and understanding of some of thy truthes naturall and artificiall: such, as by which, thy wisdome, goodnes & powre bestowed in the frame of the word might be browght, in some bowntifull measure under the Talent[124] of my Capacitie, to thy honor & glory, & the benefit of thy Servants, my brethern & Sistern, in, & by thy Christ our Saviour. And for as much as, many yeres, in many places, far & nere, in many bokes, & sundry languagis, I haue sowght, & studyed; and with sundry men conferred, and with my owne reasonable discourse labored, whereby to fynde or get some ynckling, glyms, or beame of such the forsaid radicall truthes: But, (to be brief) after all my forsaid endevor I could fynde no other way, to such true wisdome atteyning, but by thy extraordinary gift: and by no vulgar Schole doctrine, or humane Invention. And, Seing, I haue red in thy bokes, & records, how Enoch enioyed thy favor and conversation, with Moyses thow wast familier: And allso that to Abraham, Isaac, and Jacob, Josua, Gedeon, Esdras, Daniel, Tobias, and sundry other, thy good Angels were sent, by thy disposition, to instruct them, informe them, help them, yea in worldly and domesticall affaires, yea and sometimes to satisfy theyr desyres, dowtes & questions of thy Secrets: And furdermore Considering, the Shew-stone, which the high preists did use, by thy owne ordering: wherein they had lights and Judgments in theyr great dowtes: and considering allso that thow (O God) didst not refuse to instruct thy prophets, (then, called Seers) to give true answers to common people of things æconomicall, as Samuel, for Saul,[125] seeking for his fathers asses being gon astray: and of other things vulgar true predictions, whereby to wyn credyt unto thy waightier affayres: And thinking with my self, the lack of thy wisdome; to me, to be of more importance, then the Value of an Asse or two, could be to Cis, (Saul his father): And remembring what good cownsayle thy Apostle James giveth, saying, *Si quis autem vestrûm indiget sapientia, postulet a Deo,* &c.[126] And that Salomon the wise, did so, euen immediately by thy self, atteyne to his wonderfull wisdome. Therfore, seeing I was sufficiently towght and confirmed, that this wisdome could not be come by at mans hand or by humane powre, but onely from thee (Ô God) mediately[127] or immediately) And having allwayes a great regarde & care to beware of the filthy abvse of such as willingly and wetingly, did invocate & consult (in diuerse sorts) Spirituall creatures of the damned sort: angels of darknes, forgers & patrons of lies & untruthes: I did fly unto thee by harty prayer, full oft, & in sundry manners: sometymes Crying unto thee, *Mittas lucem tuam et veritatem tuam, quę me ducant* &c,[128] sometymes *Recte sapere et intelligere doceto me, Nam sapientia tua totum est quod volo: &c,*[129] *sometymes, Da verbum tuum in ore meo, et sapientiam, tuam in corde meo fige &c.*[130] And having perceyued by some slight experiens with two diuerse persons, that thow hadst a speciall care to give me thy light, and truth, by thy holy and true ministers Angelic and Spirituall: and at length, hearing of one, (a master of Arte, a preacher of thy word admitted) accownted as a good Seer,[131] and skryer of Spirituall apparitions, in Christalline receptacle, or in open ayre, by his practise procured: and trusting to frame him, by my ernest & faithfull prayers unto thee (my God) to some my help in my forsayd Studies: tyll, thow (o hevenly father) woldest by thy unserchable proveydence, send me some apter man or means thereto. Thereuppon trying him and using him, I fownd great diuersity betwene his private usuall manner, and intente of practise, and my pure, sincere, devowte, & faithfull prayer unto thee onely. And therfore often & fervently I exhorted him to the good; and reproved both him, and his ministers, with my no small daunger, but that thow (in manner unhard of) didst pitch thy holy tente to my defence, and cumfert, in conflict most terrible: as thow best knowest O God, and I willed him thereuppon to preach thy mercyes, & the verity of the kingly prophet his testimony, *Castrametatur Angelus Domini, in Circuitu timentium eum.*[132] And out of Roger Bachon his boke written *De mirabili potestate Artis et Natura,*[133] (where he writeth against the wycked Diuel callers) I noted unto him this sentence, *Facilius (sine comparatione a Deo*[134] *impetrandum foret, vel a bonis spiritibus, quicquid homini utile reputare &c*[135] which my cownsayle he promised me to follow, as thow art witnes, ô our true & almighty God. And as thy good spirituall creatures neyther had delight in the man, neyther wold so playnely & preistly give me theyr answers or informations by him, that he might be hable to perceyve the pith therof: So was he at length very unwilling to here him self rebuked for his nawghtynes, and to be barred from the Mysteries of thy truthes understanding; which were the onely things that I desyred, throwgh thy grace, o our most mercifull God. Therfore, as well for a Memoriall answerable to the premisses, as for the better warrant of my Such exercises to be made accownt of, hereafter: (leaving all unto thy infinite mercies, and unsearchable providence,) I haue thowght it not impertinent, to note downe, even in this place one of the last Actions, which I had with the forsayd preacher: when I made ernest & faythfull petition unto thee (o the true and Almighty God) for sending, unto my cumfort & eridition, (yf it were thy blessed will,) thy holy, & mighty Angel Annael: of whome and of all the

Hierarchies hevenly all prayer honor & thanks, be rendred unto thy diuine maistie: now & euer: & worlde without ende. Amen. Amen. Amen.

Anno 1581 Decembris 22. Mane[136] *Mortlak*

Δ: After my fervent prayers made to God, for his mercifull cumfort and instruction, throwgh the ministery of his holy and myghty Angel, named Anael,[137] (yf it wer his diuine pleasure) I willed, the Skryer, (named Saul) to loke into my great Chrystaline Globe, yf God had sent his holy Angel Anael, or no: And Saul loking into my forsayd stone, (or Chrystall Globe) for to espie Anael, he saw there one,[138] which answered to that name. But being ernestly requested of me to tell the Truthe yf he were Anaël, An other did appere very bewtifull, with apparell yellow, glittering, like gold: and his hed had beames like ster beams, biasing, and spredding from it; his eyes fyrie. He wrote in the stone very much in hebrue letters, and the letters seamed all transparent gold: which, Saul was not able eyther presently to reade, that I might write after his voyce, neyther to imitate the letters in short tyme. A bright ster, did go up and down by him. There appeared allso a white dog, with a long hed.[139] And many other visions appeared, with this second: The first being voyded quite away. Thereuppon I sayd, as followeth,

Δ: In nomine Jesu Christi, Quis tu es?[140] He answered to Saul his hearing.

AN: Potestas omnis, in me sita est.[141]

Δ: Quake?[142]

AN: Bona, et mala.[143]

Δ: Then appeared in the stone, these two letters **M. G.** I then axing him some questions, de Thesauro abscondito:[144] He answered,

AN: Ne perturbes: Nam hæ sunt Nugse.[145]

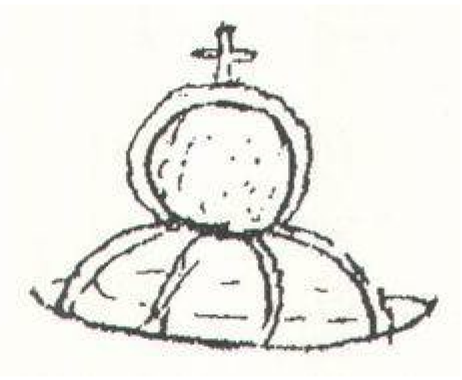
And withall appeared many dedd mens skulls, on his left hand. He sayd to me,

AN: Ubi est potestas tua?[146]

Δ: Cur quæris de potestate aliqua mea?[147]

AN: Cur? Signifi, non mihi placet.[148]

Δ: I, thereuppon, set by him, the stone in the frame:



and sayd,

Δ: An bonus aliquis Angelus, assignatus est huic speculo?[149]

AN: Etiam.[150]

Δ: Quis?[151]

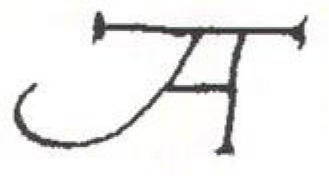
AN:  He answered, by the shew of these letters in the stone.

Δ: Bonus ne ille Angelus, de quo in scripturis fit mentio?[152]

AN: Maximè.[153]

Δ: Fieri ne potest, quod ego eundem videam, et cum illo agam?[154]

AN: Ita.[155] And therewith appeared this character—



Δ: Quid per hoc, significare velis?[156]

AN: Alterius Angeli character est.[157]

Δ: Cur hîc, et nunc ostendis?[158]

AN: Causam ob magnam.[159] Make an ende: It shalbe declared, but not by me.

Δ: By whome then?

AN: By him that is assigned to the stone: but not, tyll after the feast. And then thow must prepare thyself, to prayer and fasting.[160]

In the Name of God, be Secret: and in all thy doings praying, tyll thow hast thy desyre: which shall not be far of. After Newyeres tyde, Deale, But not on the Sabaoth day. Pray contynually. When it shall pleas god, to stir thee up, Then procede. In the brightest day, When the Sonne shyneth: In the morning, fasting, begynne to pray. In the Sonne Set the stone. Deale both Kneeling, and sitting. I haue done for this tyme.

My name is ANNAEL.

I will speak ones more to thee: and than farewell: for thow shalt not haue me any more.

Be not to hasty in wrath.

Δ: Is this, that, you ment to speak?

AN: I. Do good to all men. God hath sufficient for thee, and for all men.

Farewell.

Δ: Gloria patri et filio et spiritui sancto. Sicut erat in principio, et nunc et semper: et in sæcula sæculorum.[161]

Amen.

Δ: Remember, that diuerse other particulars, mowght haue byn Noted of this dayes Action: but these may suffice: And yet it is not to be forgotten, that as he sayd his name was Annael (with a dubble n) so he allso confessed himself to be the same Annaël which is *prepositus orbis veneris*:[162] and allso Chief governor Generall of this great period, as I haue Noted in my boke *of Famous and rich Discoueries*.[163]

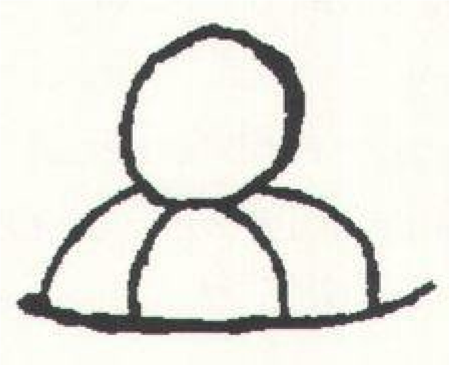
Consider and Remember: That this Note, of the Action, (had with holy ANNAEL), is, of prince Befafes, (otherwise called Obelison) accownted as the Prolog of my first boke of mystical exercises Anno 1582. Nouembris 20. Vide post.

At Mortlak

In nomine Jesv CHRISTI.[164] Amen.

Anno 1582. Martij die. 10. hora 11¼ Ante meridiem. Saterday

Δ: One[165] Mr. Edward Talbot cam to my howse,[166] and he being willing and desyrous to see or shew some thing in spirituall practise, wold haue had me to haue done some thing therein. And I truely excused myself therein as not in the, vulgarly accownted Magik, neyther studied, or exercised: But confessed my self, long tyme to haue byn desyrous to haue help in my philosophicall studies throwgh the Cumpany and information of the blessed Angels of God. And thereuppon, I browght furth to him, my stone in the frame,



(which was given me of a frende) and I sayd unto him, that I was credibly informed, that to it (after a sort) were answerable *Aliqui Angeli boni:*[167] And allso that I was ones willed by a Skryer, to call for the good Angel Anchor, to appere in that stone to my owne sight. And therfore I desyred him to call him: and (yf he wold) Anachor and Anilos likewise, accownted good Angels, for I was not prepared thereunto. &c. He than settled him self to the Action: and on his Knees att my desk (setting the stone before him) fell to prayer and entreaty &c. In the mean space, I, in my Oratory did pray, and make motion to god, and his good Creatures for the furdering of this Action. And within one quarter of an howre (or less) he had sight of one in the stone. but he still expected for two more: deeming this to be one of the three (namely Anchor Anachor Anilos). But I then cam to him, to the stone: And after some thanks to God, and Wellcome to the good Creature, used, I required to know his name. And he spake plainly, (to the hearing of E.T.) that his name is URIEL.

Δ: Are you one of them (sayd I, John Dee) that are answerable, (uppon due observations performed) to this stone?

URIEL: I am.

Δ: Are there any more besyde you?

UR: Michael and Raphaël. But, *Michael est princeps in operibus nostris.*[168]

Δ: Ys my boke, of Soyga,[169] of any excellency?

UR: Liber ille, erat Adæ in Paradiso reuelatus, per Angelos Dei bonos.[170]

Δ: Will you give me any instructions, how I may read those Tables of Soyga?

UR: I can - But *solus Michaël illius libri est interpretator.*[171]

Δ: I was told, that after I could read that boke, I shold liue but two yeres and a half.

UR: Thow shallt liue an Hundred and od yeres.[172]

Δ: What may I, or must I do, to haue the sight, and presence, of Michael, that blessed Angel?

UR: Præssentias nostras postulate et invocate, sinceritate et humilitate. Et Anchor, Anachor, et Anilos, non sunt in hunc Lapidem invocandi.[173]

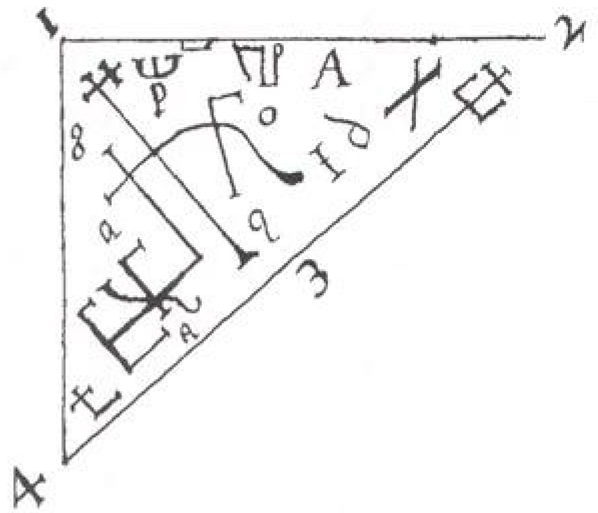
Δ: Oh, my great and long desyre hath byn to be hable to read those Tables of Soyga.

UR: Hæc maximè respiciunt Michaëlem. Michaël est Angelus, qui illuminat gressus tuos. Et hæc revelantur in virtute et veritate non vi.[174]

Δ: Is there any speciall tyme, or howre to be observed, to deale for the enioying of Michael?

UR: *Omnis hora, est hora nobis.*[175]

Δ: After this, there appered[176] in the stone a strange seale, or Characterismus of this fashion ensuing:



Δ: What is the intente, or use of this?

UR:[177] *Sigillum hoc in auro sculpendum, ad defensionem corporis, omni loco, tempore et occasione: et in pectus gestandum.*[178]

Δ: So we ceased, with thanks to god: and I mused much uppon this Action: and layd all up in mynde, and writing.

Δ: Soli Deo Honor omnis, et *gloria.*[179]

Amen.

The same Saterday after none. Hora. 5.

Δ: After that Mr. E.T. had called Uriel, and I was come to the stone and had used a short speche of thanks giving to God: I then required some instruction for the purpose of Soyga.

UR: Peace. You must use Michael.

Δ: I know no meanes or order to use in the invocating of Michaël.[180]

UR: He is to be invocated by certayn of the psalmes of Dauid, and prayers. The which psalmes, are nothing els, but a means unto the seat and Maiestie of God: whereby you gather with your selues due powre, to apply your natures to the holy Angels. I mean the psalmes, commonly called the Seven psalmes.[181] You must use pleasant sauours: with hand and hart: whereby you shall allure him and wynn him (thorowgh Gods fauour) to atteyn unto the thing, you haue long sowght for. There must be Coniunction of myndes in prayer, betwyxt you two, to God Contynually. Yt is the wyll of God, that you shold, ioinctly, haue the knowledge of his Angells to-gither. You had atteyned unto the sight of Michaël, but for the imperfection of Saul. Be of good Cumfort.

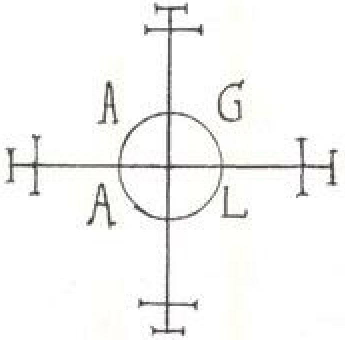
Δ: The chayre cam into the stone againe: and I axed what it ment.

UR: This is a seat of perfection: from the which, things shall be shewed unto thee, which thow hast long desyred.

Δ: Then was there a square Table browght into the stone: and I demaunded, what that Table betokened.

UR: A Mysterie, not yet to be known. These two, shall remayn in the stone, to the sight of all undefyled creatures.

You must use a fowre square Table, two cubits square: Where uppon must be set Sigillum Dei,[182] which is allready perfected[183] in a boke of thyne: Blessed be God, in all his Mysteries, and Holy in all his works. **This seal must not be loked on, without great reuerence and deuotion. This seale is to be made of perfect wax.** I mean, wax, which is clean purified: we haue no respect of cullours. **This seal must be 9 ynches in diameter: The rowndnes must be 27 ynches, and somwhat more. The Thicknes of it, must be of an ynche and half a quarter, and a figure of a crosse, must be on the back-side of it, made thus:**



The Table is to be made of swete wood: and to be of two Cubits high: with 4 feete: with 4 of the

former seales under the 4 feet.

Δ: The fashion of the 4 feet, standing uppon the foresayd rownd seales, was shewed: so as the uttermost circle conteyning the letters, did seme to be clean without[184] the cumpas of the fete, equally rownd abowt the same fete. And these seales were shewed much lesser than the principall seal.[185] Under the Table did seme to be layd red sylk, two yardes square. And ouer the seal, did seme likewise red sylk to lye fowr square: somwhat broader then the Table, hanging down with 4 knops or tassells at the 4 corners thereof.

Uppon this uppermost red silk, did seme to be set the stone with the frame: right ouer, and uppon the principall seal: sauing that the sayd sylk was betwene the one and the other.

The Table was shewed to haue on the fowre sides of it, Characters[186] and names, these, that are here in a schedule annexed, in 4 diuerse rowes.

UR: The characters and words on the sides of the square Table, are to be written with yellow, made of perfect oyle, used in the church.

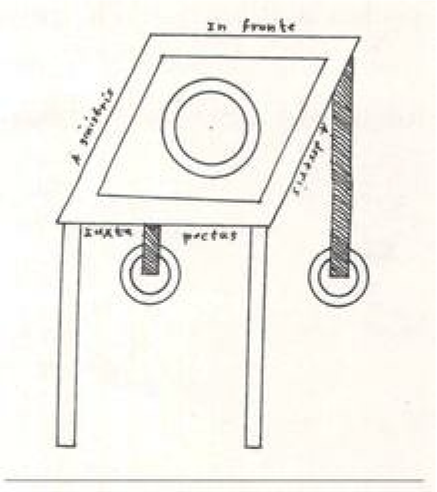
Δ: What oyle is that?

UR: That oyle shalbe opened unto you. The oyle, is perfect prayers: of other oyle I haue no respect. We sanctifie, bycause we are holy: and you sanctify bycause of your holines.

UR: There is a spirit, named Lundrumguffa using you who seketh your destruction, in the hatred of men, in the hurt of thy goods. Discharge him to morrow with Brymstone.[187] He haunteth thy howse, and seketh the destruction of thy dowghter. His pretence was to haue maymed thee in thy Sholder the last night, and long ago. Yf thow do not dischardg him to morrow, he will hurt, both thy wife and thy dowghter.[188]

He is here now.[189]

Giue him a generall discharge from your familie and howse. He will seke Sauls death, who is accursed.[190]



Δ: I know no means, or art to do this by. For I did burn in flame of Brymstone, Maherion his name and Character, whan I fownd Saul priuilie dealing with him (which manner of wicked dealing I had oft forbydden him) and yet he cam after, and wold haue carryed Saul away quick: as Robert Hilton, George,[191] and other of my howse can testify.

UR: The cursed will come to the cursed.

Δ: I beseche you to discharge him: and to bynde him somwhere far of, as Raphael did (for Thobias sake) with the wycked spirit Asmodeus.

UR: But Thobias did his part.[192] Art is vayne, in respect of God his powre. Brymstone is a mean.

Δ: Whan shall I do this?

UR: To morrow at the tyme of prayers.

Δ: *Gloria Patri et filio et Spiritui Sancto,*

sicut &c.[193] Amen.

1582 Martij 11

Sonday. a Meridie hora .3. a circiter.[194]

Δ: Uriel being called by E.T. there appeared one, clothed with a long robe, of purple: all spanged with gold, and on his hed, a garland, or wreath of gold: his eyes sparkling: of whome I axed Whether the characters noted for the Table, wer perfect: He answered,

They are perfect:[195] There is no question.

Δ: Are you Uriel?

Than presently[196] cam in One, and threw the brave[197] spirit down by the sholders: and bet him mightyly with a whip: and toke all his robes, and apparell of him: and then he remayned all heary and owggly: and styll the spirit was beaten of him, who cam-in after him. And that spirit, which so bet him, sayd to the hearing of my Skryer,

Lo, thus are the wycked skourged.

Δ: Are you Uriel, who speaketh that?

Uri: I am he. Write down and mark this: for it is worthy of the Noting.

This was thy persecutor Lundrumguffa. I browght him hither to let thee see, how God hath ponished thy enemy.[198]

Lo, thus, hath God delt for thee: Lo thus haue I delt for thee: Thank God.

Δ: Blessed be his holy name; and extolled, world with out ende.

E.T: He drew the wycked spirit away, by the leggs, and threw him into a great pitt, and washed his hands, as it were, with the sweat of his own hed: for he seamed to be all in a sweat.

Δ: Here-uppon, my skryer saw Uriel go away: and he remayned out of sight a little while. **Then he cam-in agayn: and an other with him: and iointly these two said to gither, Glorifie God for euer. And than Uriel did stand behinde: and the other did set down in the chayre, with a sworde in his right hand: all his hed glystring**[199] like the sonne. The heare of his hed was long. He had wings: and all his lower parts seamed to be with feathers. He had a roab ouer his body: and a great light in his left hand. He sayd,

Michaël: We are blessed from the begynning: and blessed be the name of God for euer.

Δ: **My skryer saw an innumerable Cumpany of Angels abowt him: And Uriel did lean on the square Table by. He that sat in the chayre** (whom we take to be Michaël) **sayd Than,**

Go forward: God hath blessed thee.

I will be thy Guyde.

Thow shallt atteyne unto thy serching.

The World begynnes with thy doings.

Prayse God.

The Angels under my powre, shall be at thy commaundement. Lo, I will do thus much for thee.

Lo, God will do thus much for thee.

Thow shalt see me: and I will be seen of thee.

And I will direct thy liuing and conversation.

Those that sowght thy life,[200] are vanished away.

Put up thy pen.

Δ: So he departed.
Δ: Gloria, laus, honor, virtus et Imperium Deo immortali, invisibili, et Omnipotenti, in sæcula sæculorum.[201]

Amen.

Martij 14. Wensday. mane circa horam 9ã.

Δ: Being desirous to procede in this matter, by consent, we bent our selues to the Action. And after that E.T. had called Uriel and saw him, I cam to the desk from my oratorie. There did contynually appeare, the chayre and the Table. I than being affrayde that any other shold come into the stone, instead of Uriel, did ernestly require the spirituall creature appearing, to shew who he was, and what was his name: At length he answered, and sayde to the hearing of E.T.,

Uriel is my name, with diuerse called Nariel.[202]

Stay.

Δ: Then he went away, for a while: and cam agayn, and sayd thus,

Ur: The strength of God, is allwayes with thee. Dost thow know, what thow writest?

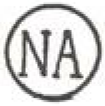
Δ: In two senses, I may understand it: eyther that the good Angel Gabriel[203] is allwayes with me, thowgh invisibly: or els, that the strength, and mighty hand of God, allwayes is my defense.

Ur: *Fortitudo Dei, tecum semper est.*[204]

Δ: He went away agayn, and cam agayn, following or wayting uppon an other: and before that other, was a man hauing his hed all couered with blak. Then he that cam so in the middle, did sit down in the chayre, and spake this worde following:

Mi: Note.

Δ: This was Michael, with his sword in his right hand. Then cam Uriel to the man (hauing his hed all hyd, as it were in a blak hode) and toke-of that blak hode: and then lifted-up the Table cloth. He looked under it, and put it down againe: and lifted it up again. The man stode still before Michael. Then Michael rose; and toke-of all the mans clothes, and left him, as it were, onely in his shirt. Then Uriel toke a little rownd Tablet, as it were, of the bignes of a sixpence, hauing two letters in it, thus:



and gaue it to Michaël. Uriel lifted up the Table cloth: and, from thence, seamed to take apparaile, and put on the man. It semed to be sylk: and very full of wrynkles, or plights. And the man kneeled, and held-up his hands. Uriel toke like a lawrell bush, and set uppon the mans hed. And than the man kneeled before Michaël. Michaël toke the rownd thing, with the letters: and gaue it the man to eat: and he did eat it.

Ur: Lo, things are covered.

Δ: Then he couered the Table and pluckt the cloth over it, down to the grownd, on euery side. The man rose up: And Michaël dubbed him on the hed with his sworde. Then the man stode-up. Then the man turned his face toward E.T. the skryer: and the man did resemble me (John Dee) in cowntenance. And then he turned to Michaël agayn. Michael wrote uppon the mans back, thus,

ANGELVS TVÆ PROFESSIONIS.[205]

Δ: Then E.T. asked me, yf there were such Angels of a mans Profession: and I answered yea; as in Agrippa[206] and other, is declared.

Mi: Leaue your folly: Hold thy peace. Haue you not red, that they that cleaue unto God, are made like unto him.

Δ: Yes, forsoth.

Mic: Thow camst hither to lern, and not to dispute. *Laudate Dominum in operibus suis*.[207]

Δ: The man kneled down, and so went out of sight.

Mi: He hath eaten strength against trubble: He hath eaten nothing: and in eating, he hath eaten all things. The name[208] NA, be praysed in trubbles.

Δ: Now Michael thrust out his right arme, with the sword: and bad the skryer to loke. Then his sword did seame to cleaue in two: and a great fyre, flamed out of it, vehemently. Then he toke a ring out of the flame of his sworde: and gaue it, to Uriel: and sayd, thus:

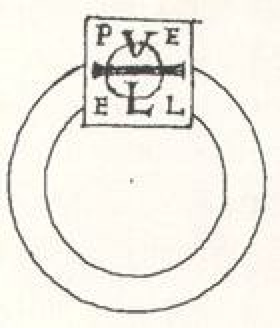
Mic: The strength of God, is unspeakable. Praysed be god for euer and euer.

Δ: Then Uriel did make cursy unto him.

Mi: After this sort, must thy ring be: Note it.

Δ: Then he rose, or disapeared, out of the chayre, and by and by, cam again, and sayde, as followeth.

Mi: I will reveale thee this ring: which was never revealed since the death of Salomon: with whom I was present. I was present with him in strength, and mercy. Lo, this it is. This is it, wherewith all Miracles, and diuine works and wonders were wrowght by Salomon: This is it, which I haue revealed unto thee. This is it, which Philosophie dreameth of. This is it, which the Angels skarse know. This is it, and blessed be his Name: yea, his Name be blessed for euer.



Δ: Then he layd the Ring down uppon the Table: and sayd,

Note.

Δ: It shewed to be a Ring of Gold: with a seale graued in it: and had a rownd thing in the myddle of the seale and a thing like a V, throwgh the top of the circle: and an L, in the bottome: and a barr ————cleane throwgh it: And had these fowre letters in it, PELE.[209]

After that, he threw the ring on the borde, or Table: and it semed to fall throwgh the Table: and then he sayde, thus,

Mi: So shall it do, at thy commaundement.

Without this, thow shalt do nothing.[210] Blessed be his name, that cumpasseth all things: Wonders are in him, and his Name is WONDERFVLL : His Name worketh wonders from generation, to generation.

Δ: Then he went away: and cam-in agayn by and by.

Mi: Note.

Δ: Then he browght-in the Seale, which he shewed the other day: and opened his sworde, and bad the skryer, reade, and he red, EMETH.[211]

Then the sword closed up agayn: and he sayde,

Mi: This I do open unto thee, bycause thow mervayledst at SIGILLVM DEI. This is the Name of the Seale: Which be blessed for euer. This is the seale self. This is Holy: This is pure: This is for euer. Amen.

Δ: Then the seale vanished away. And I sayd to my frende (the Skryer) In dede, this other day, I considered diuerse fashions of the seal: and I fownd them much differing, one from an other: and therfore I had nede to know, which of them I shall imitate: or how to make one perfect of them all.

Mi: Dowt not for the making of it: for God hath perfyted all things. Ask not the cause of my absence, nor of my apparell: for that Mysterie, is known to God. I haue no cloathing, as thow thy self shalt see. I am a Spirit of Truth, and Vertue.[212] Yea you shall see me in Powre, and I will viset you in HOPE. Bless you the Lorde, and follow his wayes, for euer.

Δ: Then he went away: and Uriel followed him. And then I sayde to my skryer: It were good, we had euer some watch-word, when we shold not loke for any more matter at theyr hands, euery tyme of theyr visitting of us. Whereuppon, (unlooked-for, of us,) he spake agayn.

Mi: We lead tyme, Tyme leadeth not us:

Put up thy pen.

The Name of God, be blessed for euer.

Δ: Then they lifted up theyr hands to heuenward (which heven, appeared allso in the stone) and turned toward us, and sayd,

Valete.[213]

Δ: So they departed: and at theyr going, the chayr, and the Table, in the stone, did seme to shake.

Δ: Soli Deo omnis honor Laus et Gloria.[214]

Amen.

Martij 15. Thursday. Hora 1¼ a meridie.

Δ: After E.T. his calling into the stone, appeared a tall man, with a sceptre (very great) of gold, glittring. His body all red: and out of his hed, did shote out beames of light, like the sonne beames.

Δ: Being desirous, to know who he was, and his name, I requested him ernestly thereto. But he answered, as followeth,

Invocate nomen Domini, et agnoscetis eum.[215]

Δ: Then I prayed the psalme, Deus misereatur nostri, et benedicat nobis &c.[216] After that, he sayd,

I am mighty.

Δ: Bycause he delayed to declare his name, E.T. the skryer did require him, in the name of God the father, Jesus Christ his sonne, and of the holy ghost, to express his name: and he answered in speche.

So I will by and by.

Δ: Then he seamed to take from his hed little bright sparcks, like little candells endes: and to stick them abowt the chayre: and he went rownd abowt the chayre: and than he spake, as followeth,

I am mighty, and working wonders: I am SALAMIAN.[217] I rule in the hevens, and beare sway uppon erth in his name, who be blessed for euer. Thow doost dowt at me. I am the servant of God, in his light: I serve him. I say, I serve him, with feare and reverence. My name is SALAMIAN: Mighty in the Sonne, worker of wordly actions, as well internall, as externall: known unto God: whose name I know, and bless for euer.

Δ: Then appeared a big flame of fyre by him in the ayre.

Sal: Thow knowest not, or thow wilt not know, that Mamon, with his servants, are present abowt thee: whose presence doth hinder the presence of the vertues Adonay our comming. Blessed be God, in the highest.

Amen.

Δ: He toke the forsaide flame of fyre, and flung it up unto the heven ward.

Sal: Mamon is a king whome God hateth: whose sect, contynually tempt, provoke and stir-up wickednes, against the Lord, and against his annoynted. But he dyeth: blessed be God for euer. Driue him away.

Δ: It is incomparably more easy for you to do. And as for my parte, I fele neyther in body, nor sowle, any token of his presence or working. Thereuppon he caused the whole chamber (which we were in) to appere very playnely in the stone: and so there shewed a great cumpany of wycked spirits to be in the chamber: and among them, One, most horrible and grisely thretting,[218] and approaching to our heds: and skorning and gnashing at us.

Sala: God determines his mysteries, by Arte and vertue.

Δ: Then he willed me very egerly, to drive them away. And I prayed fervently. And there seamed One to come into the stone, which had very long armes: and he draue them away courragiously: And so they were driuen away. After that presently, cam one into the stone, all white. Salamian reached this white one a Cup. The white man held-up the Cup: and sayd, as followeth,

Lo, this is my name.

God shall bless you. Fear not: your faithfullness provoketh me to tell my name, and this it is:

(putting furth the Cup again) for, I am called Medicina Dei.[219] I will shew thee, and I will shew you, the Angel of your Direction, which is called OCH.[220]

Δ: This name he spake: he shewed it allso on the Table (before him) written.

Raph: He is mighty in the sonne beames: He shall profit thee hereafter.

Δ: Then cam in an other, and sat down in the chayre: and he sayde, as followeth,

The strength of God liueth: and God raigneth for euer. I am Fortitudo Dei.

Δ: Why, then, you are Gabriel: and I toke you hitherto to be Michaël. How shall I then amend my boke, in respect of your name, allwayes before, written Michael?

For.Dei: What thow hast written, that hast thow written: and it is true. Write down this name. POLIPOS.[221] Dost thow understand it?

Δ: No, God knoweth.

For.Dei: When that day commeth, I will speak with thee: yf thow observe that which I haue commaunded thee.[222] **As truely, as I was with SALOMON, so truely will I be with thee.**

Δ: Then cam in an other, whom we toke to be Uriel: for he went allso, as he was wont, and leaned at the Table.

For.Dei: Search for wisdome and lerning, and the lord will deliuer it unto you.

Δ: I wold to god, I knew your name truely, or what peculier letter I might set for you, to Note your words and Actions by.

For.Dei: Name I haue none, but by my office. SALAMIAN cam not hither, but by me. He is a mighty Prince, governing the hevens, under my powre. This is sufficient for thy Instruction. **I was with Salomon, in all his works and wonders:** and so was this, whome God had appointed unto him. The Diuines know his name: and he is not hidden from the face of the erth: His name is written in the boke which lyeth in the Wyndow.

Δ: Do you mean Agrippa his boke? And is it there expressed by the name SALAMIAN?[223]

For.Dei: I haue sayde.

Δ: What order will you appoint unto us two, in respect of our two beings to-gither? My frende here, may haue other intents and purposes of his affayres, then will serve me, for his ayde hauing in these Actions.

For.Dei: Joyne in prayers. For God hath blessed you: Dowt not.

> Consider these mysteries.

Δ: Then they in the stone used talk to gither: but not well to be discerned of the eare of E.T.

At length F.D. talked very much, and spedily to E.T. and disclosed unto him (which he expressed not to me, at the stone but afterward) all the manner of the practise, and the Circumstance abowt the Action intended, with the Gold lamin, the ring, the seales &c. And after I had spoken somwhat, in requesting him, to shew me the manner, How I shold artificially prepare euery thing spoken of, he sayd,

F.D:

> [. . . Use me, in the Name of God, for all occasions.[224] . . .]

Blessed[225] be God, who revealeth all Mysteries, &c. I am strength in nede. And Lo, here is Medicine for the sore. We bless the Lord: We gouern the erth, by the societie of Gabriel: whose powre, is with us: but he not here. &c.

Use Patience.

Ur: I liued with Esdras: I liued in him, in the lord, who liueth for euer.[226]

Raph: I liued with Tobie: Tobie the yonger.[227]

Δ: This was the white creature, that spake this.

F.D: We liue in the Lorde: who be praysed for euer.

Δ: I stode silent a good while.

FD: What wilt thow?

Δ: I did attend, what you wold say.

F.D: I haue sayd.

Δ: I haue byn long at this tyme, in my dealing with you. I trust, I do not offend you therewith. But, for my parte, I could finde in my hart to contynue whole dayes and nights in this manner of doing: euen tyll my body shold be ready to synk down for wearines, before I wold giue ouer. But I feare, I haue caused wearines to my frende here.

F.D: In vertue is no wearines.

Δ: Now he stode up, out of his chayr: and he, and they all, ioinctly blessed us, stretching theyr hands toward us, Crossingly. And so they went away. The Table and the chayre remayned and the glyttring sparckles, or drops of streaming little lightes were of the chayre immediately.

Δ: Glorie, thanks, and honor be unto the Almighty Trinitie.

Amen.[228]

[Mysteriorum Liber Secundus]

. . . mysteryes,[229] . . .
. . . ow toward a thing, r . . .
. . . howse is hollow, it is empty and voyde . . .
. . . ants: The God of heuen and erth, will send into . . .

> NOTE. We bring tydings of light* . The Lord is owr . . . you and we prayse to gither. His name be praysed for ever. O . . . in his Mysteries: O holy and eternall God.

Δ: He bowed down to the Chayre and then to the table, and sayd, Benedictus qui venit in,[230] (and there stayed a little) and sayd agayn, Benedictus qui venit in, nomine Domini.[231]

Δ: Than cam in Michael, with a sword in his hand, as he was wont: and I sayd unto him, are you Michael?

Mich: Dowt not: I am he which reioyce in him that reioyceth in the Fortitude and strength of God.[232]

Δ: Is this Forme, for the Great Seale perfect?

Mi: The forme is true and perfect. Thow shalt sweare by the liuing God, the strength of his Mercy, and his Medicinall vertue, powred into mans sowle neuer to disclose these Mysteries.[233]

Δ: Yf No man, by no means, shall perceyue any thing herof, by me, I wold think that I shold not do well.

Mi: Nothing is cut from the Church of God. We in his Saincts are blessed for euer.

We separate thee, from fyled and wycked persons: We move thee to God.

Δ: I vow, as you require: God be my help, and Gwyde, now and euer, amen.

MIC: This is a Mystery, skarse worthy for us ourselues, to know, muche lesse to Reueale. Art thow, then, so Contented?

Δ: I am: God be my strength.

Mic: Blessed art thow among the Saincts: And blessed are you both.

I will pluck thee, from among the wycked [he spake to my skryer.][234] Thow Commyttest Idolatry. But take hede of Temptation: The Lord hath blessed thee. This is a Mystery.

Dee, what woldest thow haue?

Δ: Recte sapere et Intelligere &c.[235]

Mic: Thy Desyre is graunted thee. Use . . .

. . . with[236] . . .
. . . they are corrupted . . .

. . . they haue byn used to the wycked. Ther . . .

[Michael: -]:[237] I will shew thee in the mighty hand and strength of God, [what] his Mysteries are: The true Circle of his æternitie Comprehending all vertue: The whole and Sacred Trinitie. Oh, holy be he: Oh, holy be he: Oh, holy be he.

Uriel answered, Amen.

Mic: Now what wilt thow? Δ: I wold full fayne procede according to the matter in hand.

Mic: Diuide the owtward circle into 40 æquall partes: whose greatest numbers are fowre. See thow do it presently.

Δ: I did so. Diuiding it first into fowre: and then every of them into ten. He called Semiel, and one cam in and kneled down: and great fyre cam out of his mowth.[238]

Michael sayde, To him, are the Mysteries of these Tables known.

Michael sayde, Semiel (agayn) and by and by, he[239] said, O God thow hast sayd and thow liuest for euer. Do not think here I speake to him. Δ: He spake that to us, least we might dowte of his last speches, as being spoken to Semiel: which he directed to the æternall god and not to Semiel. **Semiel stode up, and flaming fire cam out of his mowth: and than he sayd, as followeth,**

Sem: Mighty Lord, what woldest thow with the Tables?

Mic: It is the will of God, Thow fatche them hither.

Sem: I am his Tables.

Behold these are his Tables. Lo where they are.

Δ: There cam-in 40 white Creatures, all in white Sylk long robes and they like chyldern: and all they fallyng on theyr knees sayd,

Thow onely art Holy among the highest. O God, Thy Name,[240] be blessed for euer.

Δ: Michael stode up out of his chayre, and by and by, all his leggs semed to be like two great pillers of brass:[241] and he as high as half way to the heven. And by and by, his sword was all on fyre and he stroke, or drew his sworde ouer all theyr 40 heds. The Erth quaked: and the 40 fell down: and Michael called Semiael, with a thundring voyce, and sayd,

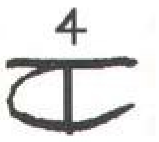
Declare the Mysteries of the Liuing God, our God, of one that liueth for euer.

Sem: I am redy. Δ: Michael stroke ouer them, with his sword agayne: and they all fell down, and Uriel allso on his knees. And commonly at the striking with his sword, flamyng fier like lightening did flash with all.

Mi: Note: here is a Mysterie.

Δ: Then stept furth, one of the 40, from the rest, and opened his brest which was couered with Sylk, and there appeared a great T all of Gold.[242]

Mi: Note the Number. Δ: Ouer the T, stode the figure of 4, after this manner:



The 40, all, cryed, Yt liueth and Multiplyeth for euer: blessed be his name.[243]

Δ: That creature did shut up his bosome, and vanished away, like unto a fyre.

Mi: Place that, in the first place. It is the name of the Lorde.[244]

Δ: Than there seamed a great clap of thunder to be. Then stepped (before the rest) one other of the 40, and kneled as the other did before. And a voyce was herd saying, Prayse God, for his **name** is reuerent.

Michael sayd to me, say after me thus,

Deus Deus Deus noster, benedictus es nunc et semper: Amen.
Deus Deus Deus noster, benedictus es nunc et semper: Amen.
Deus Deus Deus noster, benedictus es nunc et semper: [245] Amen.

Δ: Then this Creature opened his breast, and fyre cam oute of the stone as before and a great romayne G appeared.[246]

Mi: Write with reuerence, These Mysteries are wunderfull, the Number of his name, and knowledge: Lo, this it is, 9. Behold, it is but one, and it is Marveylous.

Δ: Then this Creature vanished away . . . . [247]

Mi: The Seale of Gods Mercy: blessed be thy name.

Δ: It semed to rayne, as thowgh it had rayned fyre from heuen. Then one other of the 40 was browght furth: The rest all fell down and sayd, Lo, thus is God known.

Then he opened his brest, and there appered an n, (not of so big proportion as the other), with the number of 7 over it.[248]

Mi: Multiplicatum est Nomen tuum in terra.[249]

Δ: Then that man vanished away as it were in a golden smoke.

Mi: Thow must not write these things, but with great devotion. He Liueth. Δ: Then cam an other furth. Then all falling down sayde, Vidimus Gloriam tuam Domine.[250] They were prostrate on theyr faces. Then this Creature opened his breast and he had there a Tablet all of Gold (as it were) and there appered a small t uppon it: and the figure of 9 under this letter t.[251]

Mi: Mark it, for this is a Mysterye. Δ: Then that Shewer (of the 40) seamed to fly up into the ayre, like as it were a white garment.

Mi: Illius Gloria sit nobiscum.[252] Δ: All sayd, amen: and fell down.

Δ: Then stode up an other, and opened his bosom, and shewed on his brest bare (being like syluer) a small h;[253] and he pointed to it, and ouer it was the number of 22.

Mi: Et est numerus virtutis benedictus. Videte Angelos Lucis.[254] Δ: This shewer went away like a white Cok flying up.

Δ: There cam an other in, and sayd,

Et sum Finis et non est mihi Numerus. Sum Numerus in numero Et omnis Numerus est mihi Numerus. Videte.[255]

Δ: There appeared a small n[256] on his skyn, being all spotted with Gold. Then he went away like three fyres, red flaming, and coming to gather agayn in the myddst of the firmament.

Δ: You must Note that in the stone the whole world in a manner did seme to appere, heuen, and erth, &c.

Mi: (Δ he cryed with a lowde voyce,) Et est vita in cælis.[257]

Δ: Then stepped furth one and sayd, Et ego viuo cum bene viuentibus, [258] and withall he kneeled down: and Michael stepped furth and toke of his veale on his brest and he made Cursy and stode up.

Mi: Viuamus Halleluyah. O Sanctum Nomen.[259]

Δ: All fell down on theyr faces, and Michael stroke ouer them with his sword and a great flash of fyre: And this man his brest seemed open, that his hart appeared bleading, and therein the letter m,[260] and 6, over it thus $\overset{6}{m}$

Mic: Benedictus est Numerus Agni.[261]

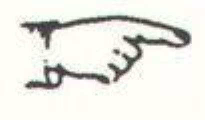
Δ: Hereuppon They all fell down.

Mi: Orate invicem.[262] Δ: Hereuppon we prayed a psalme; my skryer saying one verse, and I the other &c.

Mi: Omnia data sunt a Deo.[263] Δ: Then cam one in, hauing a rownd Tablet in his forhed and a little o[264] in his forhed: and 22 ouer it.

Mi: Et non est finis in illo.

Benedictus es tu Deus.[265] Δ: And then that shewer vanished away: He flew up, like a rownd raynbow knyt togither at the endes.



Mi: Angeli a nomine tuo procident Domine.

Tu es primus O Halleluyah.[266]

Δ: One stode up and the rest fell down, and out of his mowth that stode, cam a sworde: and the point, a Triangle, and in the myddest of it a small a[267] thus , of pure gold, grauen very depe: Et Numerus tuus viuit in cæteris,[268] sayd this shewer. The number was ~~22~~ 20[269] over the a. This shewer went away with great lightening covering all the world.

Mi: Nomen illius est nobiscum.[270] Δ: He stroke agayne with his sword ouer them. Then stode one up: who, uppon his garment had an n: and he turned abowt: and on his back were very many (ens) n.[271]

Mi: Creasti tu Domine Angelos tuos ad Gloriam tuam.[272] Δ: Ouer the ‘n’ was the number of 14, ouer that n (I meane) which was onely on his brest.

Mi: Et te primus Creauit Deus.[273] Δ: Then the shewer flew up like a star. And an other cam in, all his cloth being plucked up: and so seamed naked: He hath a little ‘a’.[274] This ‘a’ did go rownd abowt him, begynning at his feete: and so spirally upward: and he seemed to be all Clay. Ouer the ‘a’ was the number 6.

Mi: Et Creata sunt et pereunt in Nomine tuo.[275] Δ: And therwith this shewer fell down all into dust on the Earth: and his white garment flew up like a white smoke: and allso a white thing did fly out of his body.[276]

Surgit Innocentia ad faciem Dei.[277]

Δ: Michael did ouer them agayn with his sworde, and it seemed to lighten. He began to speak, and he stopped suddenly, and the fyre flew from his mowth.

Mi: Innocentium Nomina, et sanguinem vidisti Domine a Terra, et Iustus es in operibus tuis.[278] Δ: Then cam one in, with a garment all bluddy. He was like a chylde, he had a ball in his hand of perfume which smoked: and he hath uppon his forhed a little 'h'.[279] He bowed to Michaël: and Michael sayd, Numerus tuus est infinitus, et erit finis rerum.[280] Δ: This shewer seemed to powre him self awaye like a flud of blud: and his garment flew upward.

Mi: Non est illi numerus. Omnia pereunt a facie Dei, et a facie Terræ.[281]

Δ: Then stepped one furth, like a water running rownd abowt him, and he cryeth miserably, O benedictum Nomen tuum Domine. Numerus perijt cum illis.[282] Δ: A little 'o' with 18 ouer it, appered.[283]

Δ: This shewer seemed to vanish away, and to cause a great water remayn ouer all.

Mi: Lux manet in tenebris. Gloriosum est Nomen tuum.[284]

Δ: Then stept one furth from the rest, who fell down, as theyr manner was.

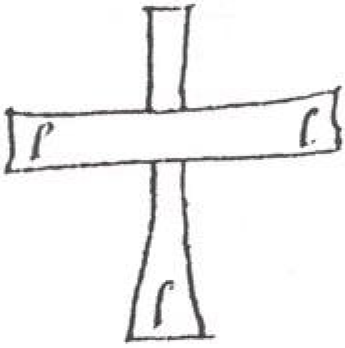
> Δ: Note: All the Cumpanies of these 40, stode five to gither, and five to gither, and so in eight Cumpanyes; each, of fiue.

Δ: This was a very white one: The upper partes of his throate, seemed open and there seemed to cum out of it fyre, in very many and diuerse cullours.

He sayd, Trinus sum.[285]

Mi: Benedictum sit nomen El.[286]

Δ: Than in the myddle of the fyres or smoke semed an '1'[287] thrise placed, on a bluddy cross, and ouer the '1' the number 26.



Δ: This shewer seemed to haue three mens heds and to vanish away in a myst with a thunder.

Mi: Labia mea laudant Dominum.[288]

Δ: Then cam a very fayre yong one in with long heare hanging on her (or his) sholders: and on her belly appered a great scotcheon;[289] to hir, or him, Michael gaue a flame of fyre: and she, or he, did eat it.

Mi: Et hic est El:[290] and so appeared a little '1' on the scotcheon, and it waxed bigger and bigger: and a fyre did seeme to go rownd abowt it.

Mi: Benedicta sit ætas tua:[291] Δ: And there appeared '30' under the 1.

Δ: There cam a great many of little fyers and did seeme to eleuate this yong woman (or child) out of sight.

Michael stroke his sword ouer them agayn, and sayd,

Natus est illa Lux.

Ille est Lux noster.[292]

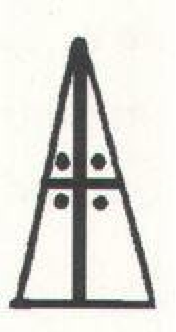
Δ: Then stept out an other and opened his white silk garment uppermost: and under it, he seemed to be sowed up in a white silk cloth. He had in his forhed an ‘n’[293] in his brest an ‘n’ and in his right hand an ‘n’.

Mi: Numerus tuus est benedictus.[294] Δ: They all fell down, saying, Numerus tuus est Nobiscum: Nec adhuc nouimus finem illius Venies cum numero tuo O unus in æternum.[295]

Δ: And they fell all down agayn. This shewer departed clyming up into the ayre, as if he had clymed on a ladder.

Mi: Linguis suis cognouerunt eum.[296]

Δ: All sayd, Benedictus est qui sic et sic est,[297] throwing up into the ayre thre cornerd trenchers[298] of this fashion all of Gold. The one side of the trenchers was thus marked, and the other side had nothing on.



Δ: Then stept one oute: and fyre cam out and in of his mowth. He kneeled, the rest fell down. This seemed a transparent body, and he had in his eyes a small 1:[299] and in his forhed the figure of 8.

Mi: Note this, under. I meane the figure 8. Thus, $\overset{1}{8}$

Δ: All sayd, Et es verus in operibus tuis:[300] and so he vanished away in a flame of fyre.

Mi: Gaudete omnes populi eius, gaudete omnes populi eius, ab hinc Gaudete.[301] Δ: All sayd, Amen.

Δ: One stept furth saying, Incipit virtus nostra,[302] he being covered under his robe, all with armor: and hath a great G[303] on his armor and the figure of ‘7’ ouer it. He went **behynde** Michael and so vanished away.[304]

Mi: Recte viuite omnes Sancti eius.[305]

Δ: One stept furth: and opening his brest, there appered a boke, and turning ouer the leaves there appeared nothing but a little ‘r’[306] and 13 over it. He went behinde the Chayre and so vanished awaye.

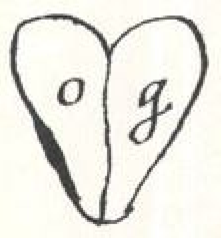
Mi: Hic est Angelus Eccliæ meæ, qui doceat Ille viam meam.[307]

Δ: There stept oute a playn man, and under his garment a gyrdel, and under his gyrdle a Rod: and in his hand he had a Sworde, and in his mowth a flame of fyre: he had a great H[308] uppon his sworde and under it 22. He went behynde the chayre &c. Michael standing up still uppon his leggs, like pillers of brass.

Δ: I axed him yf I shold not cease now, by reason of the folk tarying for us to come to supper.

Mic: Lay away the world. Contynue your work: Coniunxit spiritum mentibus illorum.[309]

Δ: Then stept out one, hauing under his garment a little Chest, and therein a mans hart raw: and the hart was thus with two letters, one on the one side ‘o’ and on the other a ‘g’.[310]



[Δ: As in scotcheons of armes, where the man and his wifes armes ar ioyned perpale, as the heraulds term it.] This shewer shut up the chest and went his way.

Mi: Numerus illius est sine numero.[311]

Δ: Then cam in an other, saying,

Tempus est. Deum vestrum agnoscite.[312]

Δ: This shewer his armes reached down to his feete: he shewed furth his right hand and in it a little ‘t’[313] and 11 under it.

Mi: Stay; place this, in the second place. This went away.

Mi: Ymago tua, (mors,) est amara.[314]

Δ: Then cam one in, with a big belly, and fat cheekes: an half sword perced his hart, and a little ‘y’[315] written on it. Iustus est malis deus noster. [316] Δ: The number of 15 under it.

Mi: Place it in the former place.

Mi: Opera fidelium, Delectatio mea.[317] [Δ: Then cam one in.] Hic est Deus noster.[318] He shewed the letter of o on his naked brest, and the figure of 8 under it. He went away.

Mi: Ecce, Iniquitas regnat in domo mea.[319]

Δ: Then stept one oute very lean, all his body full of little e,[320] and under euery one of them, 21. He went away behynde the chayre.

Mi: Bestia deuoravit populum meum, peribit autem in æternum.[321]

Δ: Then stept out one in bluddy apparell, all his body full of serpents heds and a b[322] on his forhed, and the number of 10 ouer it. He went away.

Mi: Iniquitas Abundat in templo meo, et sancti viuunt cum Iniquis.[323]

Δ: One very lean, hunger sterued cam out, an A on his brest, and, 11 over it, and so went away.

Δ: There cam in another.[324]

Mi: Iniqua est Terra malitijs suis.[325]

Δ: Then cam in one who drew out a bluddy sworde on his brest a great romayn I, and 15 over it. He went his way.

Mi: Angeli eius ministrauerunt sanctis.[326] Δ: Then stept one oute with a Target and a little a on it, and ouer it the number of 8.[327] He went away.

Mi: Regnabit Iniquitas pro tempore.[328] Δ: They all cryed, Halleluyah.

Δ: Then stept one furth with a golden crown, and a great arming sworde: his clothing all of gold, with a letter ‘r’ on his sword and 16 ouer it, and so he went away.

Mi: Nulla regnat virtus super terram.[329] Δ: Then stept one oute, hauing all his body under his white sylken habit (as they all, had) very braue after the fashion of those dayes, with great ruffs, cut hose, a great bellyed dubblet, a veluet hat on his hed, with a feather: and he advanced him self braggingly: He had burnt into his forhed a little n: and Michael sayd, Non est numerus illius in Cælis.[330] Δ: He went awaye.

Mi: Antiquus serpens extulit caput suum deuorans Innocentes.[331] Halleluyah.

Δ: Then cam one who put of his white habit: and he toke a sword, and smote up into the ayre, and it thundred: and he had a seal (suddenly there) very gorgeous of gold and precious stones: he sayd,

Regnum meum. Quis Contradicet?[332]

Δ: He hath proceding out of his mowth, many little (enns,) n, and on his forhed, a great A.

Mi: Non quòd est A, sed quod contradicit A.
Nec portio, nec numerus eius invenitur in cælo.
Habet autem Numerum terrestrem

Mysterium.[333]

Δ: He shewed three figures of ‘6’ set in triangle thus, 6 ^{6} 6

Mi: Vobis est Mysterium hoc, posterius reuelandum.[334]

Δ: And there cam a fyre and consumed him, and his chayre away, suddenly.

Mi: Perturbatur terra iniquitate sua.[335]

This shewer, his garments, white, under: his face as brass: his body grevous with leprosy: hauing uppon his brest an O, with the number of 10 under it: and so departed.[336]

Mi: Surgite O Ministri Dei: Surgite (inquam) Pugnate: Nomen Dei est æternum.[337]

Δ: Then cam two oute to gither: they had two edged swordes in theyr hands, and fyre cam oute of theyr mowthes. One had a G, and 5 ouer it, the other had...

[Δ: We fell to prayer, whereuppon Michael blessed us.]

The other had an h on his sword, and 14 under it: and so they went away.

Mi: Omnis terra tremet ad vocem tubæ illius.[338]

Δ: One stept out, and under his habit had a trumpet. He put it to his mowth, and blew it not. On his forhed a little ‘o’ and 17 under it. He went awaye.

Mi: Serua Deus populum tuum, Serua Deus populum tuum Israel, Serua (inquam) Deus populum tuum Israel.[339] Δ: He cryed this, alowde.

Δ: One appeared with a fyry sword, all bluddy, ~~his vesture all~~ ~~bluddy~~, his vesture all bluddy, and he had s.[340]

Est numerus in numero.[341]Δ: He went away.

Δ: I understand it to be a letter, and the number 5 also.

Mi: So it is.

Δ: There cam one in with diuerse owgly faces, and all his body skabbed.

Mi: Nunc sunt Dies tribulationis:[342] Δ: He had an a on his forhed and the Number 5 under it.

Mi: Hic est Numerus predictus.[343]

> Mi: Audite, consummatum est.[344]. This had a great pot of water in his hand and uppon the pot, grauen, a with 5 under it. He departed in fyre.[345]

Mi: Angele preparato Tubam tuam.[346]

A: Then cam one oute with a Trumpet. ----- Venite Tempus.[347]

Δ: He offered to blow, but blew it not. On the ende of his Trumpet was a little a and 24 under it. He went away.

Δ: They all now seemed to be gon: Michael and all. He cam in agayn and two with him. And he sayd, Hij duo Cælati sunt adhuc.[348] They two went away.

Mi: Vale. Natura habet terminum suum.[349]

Δ: He blessed us and florished his sword towards, and ouer us, and so went away: and Uriel after him: who all this while appeared not.

Δ: After supper Mr. Talbot went up to his chamber to prayers: and Uriel shewed himself unto him: and told him that somwhat was amyss, in the Table or seale which I had byn occupyed abowt this day. And thereuppon, Mr. Talbot cam to me into my study: and requyred the Seale (or Tables) of me: for he was wished to correct somthing therin, (sayd he). I deliuered him the seal, and he browght it agayn within a little tyme after, corrected: both in the numbers, for quantyty and some for place ouer or under: and also in one letter or place omitted. Which I denyed, of any place omitted by me, that was expressed unto me. And the rather I dowted, uppon Michael his words last spoken, uppon two places then remayning yet empty: saying, Hij duo cælati sunt adhuc.[350] But If I had omitted any, there shold more than two haue wanted.[351] Whereuppon we thowght good to ax Judgment and dissoluing of this dowte, by Michael. And comming to the stone He was redy. I prepownded this former Dowte. He answered,

Mi: Veritas est sola in DEO. Et hæc omnia vera sunt.[352] You omitted no letter or history that was told you. But the skryer omitted to declare unto you.[353] Δ: May I thus recorde it?

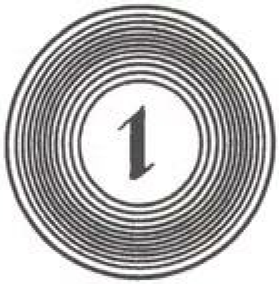
Yt is iustly reformed by Uriel: the one being omitted of the descrier and the other not yet to us declared, might make that phrase meete to be spoken, Hij duo cælati sunt adhuc.[354]

Mi: Thow hast sayd. Δ: I pray you to make-up that one place yet wanting. Then he stode up on his great brasen leggs agayn: He called agayn, Semiæl Semieil. Then he cam, and kneled down.

Consummatum est.[355] Δ: The shewer (a white man) pluckt oute a trumpet, and put it to his mowth, as thowgh he wold blow, but blew not: and there appeared at the ende of the Trumpet the greke ω. There arose a myst, and an horrible Thunder.

Mi: It is done. Δ: Then of the three 6 ^{6} 6 before Noted, with his finger he put oute the two lowermost: and sayd, Iste est numerus suus.[356][357] And Michael did put his finger into the Trumpets ende, and pulled furth a rownd plate of Gold, wheron was the figure of ‘i’ with many circles abowt it, and sayd, **Omnia unum es**

Δ: The forme of the world which appered before, vanished away: and Semyeil[358] went away, And Michael cam and sat in his chayr agayn: and his brasen leggs wer gone, and uppon our pawsing he sayd,



Mi: Go forward. Do you know what you haue allready written?

Laudate Dominum in Sanctus eius.[359]

Note: The Circumference (which is done) conteyneth 7 names:
7 names, conteyn 7 Angels:
Euery letter, conteyneth 7 Angels:
The numbers are applyed to the letters.
Whan thow dost know the 7 names, thow shalt understand the 7 Angells.

The Number of 4,[360] pertayning to the first T, is a Number significatiue: signifying, to what place thow shalt next apply the eye: and being placed aboue, it sheweth removing toward the right hand: Taking the figure for the number of the place applyable to the next letter to be taken. The under number, is significatiue: declaring, to what place thow shalt apply the next letter in the Circumference, toward the left hand. Which thow must reade, untyll it light uppon a letter, without number, not signifying. This is the Whole. So shalt thow fynde the 7 principall Names: known with us, and applyable to thy practise.

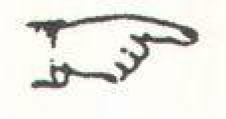
Make experience.[361]

Δ: Then telling from the T, 4 more places (toward the right hand) exclusiuely, I finde in that fowrth place, from T, (but being the fifth from the beginning, and with the begynning) this letter h: with 22, ouer it. Therfore, I procede to the right hand, 22 places: and there I finde A, and 11 over it. Going then toward the right hand 11 places furder: I finde a little a with 5 under it: by reason of which under place of 5, I go toward the left hand, 5 places, exclusiuely, where I finde o with 10, under it: wheruppon I procede to the left hand, farder by 10 places, and there I see the letter t, and 11, under it: and therfore going to the left hand 11 places, I see there the letter h alone without any number. Wherfore, that letter, endeth my word, and it is in all, ThAaoth. Ys this, as it shold be?

Mi: That is not the name. Thow shalt understand all in the next call.[362] The Rule is perfect. Call agayn within an howre and it shalbe shewed.

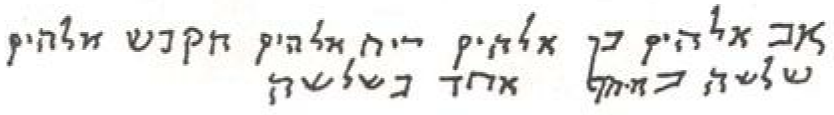
The howre being come we attended Michael his retorn to make the Practise euydent of his first Rule.

Mi: Saluete.[363]



Thow diddest erre: and herein hast thow erred: and yet notwithstanding no error in thee, bycause thow knowest not the error. Understand that the 7 Names must Comprehend, as many letters in the whole, as there are places in the Circle: Some letters are significatiue of them selues. In dede no letters, but dubble numbers, being the Name of God. Thow hast erred in the first name, in setting downe 'Aa'; that is, twise a togither, which differ the word. Which thow shalt Note to the ende of thy work: Wheresoever thow shalt finde two 'aa' togither the first is not to be placed within the Name, but rather left with his inward power. Thow shalt fynde 7 Names proceding from three generall partes of the Circumference: My meaning is, from three generall letters: and onely but one letter, that is, this letter A.[364] Accownt thow, and thow shalt finde the names iust. I speak not of any that come in the begynning of the word but such as light in the myddest: Proue, proue:[365] and thow shalt see. Whereas thow hast 'go', it is to be red 'og'. This is the whole.

Δ: I haue red in Cabala of the Name of God of 42 letters: but not yet of any, of 40 letters: That of 42 letters is this,



אב אלהים בן אלהים רוח אלהים הקדש אלהים
שלשה באחד אחד בשלשה

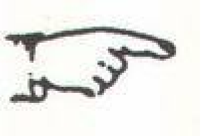
id est: Pater Deus, Filius Deus, spiritus sanctus Deus: Tres in uno, et unus in tribus. Vel Trinitas in unitate et unitas in Trinitate.[367] Or thus, which in Latin is, Pater Deus, Filius Deus, et Spiritus Sanctus, Deus, attamen non tres Dij sed unus Deus.[368] And as this is of God, Unitie in Trinitie, so of Christ onely (the second persone of the Diuine Trinitie) the Cabalists haue a name explained of 42 letters, on this manner,

אב אל בן אל ורוח הקדש אל אבל לא שלשה
אלהים כי אם אלוה אחד

כאשר הנפש המשכלת והבשר אדם אחד
כן האל והאדם משיח אחד

That is in Latine, Sicut anima rationalis, et caro, homo unus, ita Deus et homo Messias unus.[369] I am not good in the hebrue tung, but, you know my meaning.

Mi: The letters being so taken oute, being a name, and a number, doth certefye the old rule of 42 letters, whan you restore them in agayn.[370]



Mi: Note, Oute of this Circle[371] shall no Creature pass, that entreth, yf it be made uppon the earth. My meaning is, if he be defyled: This shalt thow proue to be a mysterie unknown to man. Beasts, birds, fowle and fish do all reuerence to it: In this they were all Created. In this, is all things conteyned. In tyme thow shalt finde it, in ADAMS Treatise from Paradise.[372] Looke to the Mysteries: for they are true. A and ω: Primus et Nouissimus; unus solus Deus viuit nunc et semper: Hic est, et hic erit: Et hîc, sunt Nomina sua Diuina.

Dixi:[373]

Thow art watcht all this night: who is euen now at the Dore: Clerkson. Blessed are those, whose portion is not with the wicked.

Benedicamus Dominum.[374] Halleluyah.

†

Tuesday the 20 of Marche: circa 10ã mane.

Δ: Are you Uriel?

Ur: I am. We thank thee for thy great good will.[375] We cannot viset thee now. At the twelfth howre thow shalt use us.

Δ: Fiat voluntas Dei.[376]

A meridie circa 2ã

Δ: At the twelfth howre, my partner was busyed in other affayres, and so contynued tyll abowt 2 of the Clok: when; we comming to the stone, fownd there Michael and Uriel: but Michael straight way[377] rose up and went out, and cam in agayn, and one after him, carrying on his right shulder, 7 little baskets,[378] of gold they seamed to be.

Mi: Shut up your doores. Δ: I had left the uttermore dore of my study, open: and did but shitt the portall dore of it.

Δ: He toke the 7 Baskets, and hanged them rownd abowt the border of a Canapie, of beaten gold, as it were.

Mi: Ecce, Mysterium est. Benedictus Dominus Deus Israel.[379]

Δ: Therewith he did spred oute, or stretch the Canapy: whereby it seamed to couer all the world [which seamed to be in the stone, allso, heven, an erth] so that the skryer could not now see the heven. And the baskets, by equall distances, did seeme to hang in the border of the horizon.

Mi: What wold you haue? Δ: Sapientiam.[380]

Mi: Rede the names thow hast written. Δ: I had written these according to the Rule before giuen, as I understode it:

Thaaoth
Gal~~a~~as
Gethog
Horlωn
Innon

A ^^{a}oth
Galetsog

Mi: Loke to the last name. Δ: I had written, (as appeareth) Galetsog, by misreckening the numbers, where I fownd it shold be Galethog with an h and not s.

Mi: Lo, els thow hadst erred. They are all right, but not in order. The second is the first (his name be honored for euer), The first here, must be our third, and the third here, must be our second: thus set downe.

1. Galas
2. Gethog
3. Thaoth
4. Horlωn
5. Innon
6. Aaoth
7. Galethog

Mi: Work from the right, toward the left, in the first angle next unto the circumference. .

Δ: He shewed than, thus, this letter

Mi: Make the number of 5 on the right hand, (that is, before it) at a reasonable distance, thus 
5.

Δ: After that he shewed the second letter, a great roman A, thus A+ 24.

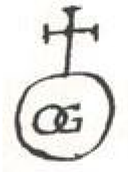
Then he shewed 30.

Then 21.

Then 9.

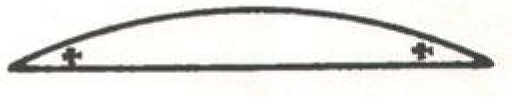
Then he shewed 14.

Then he shewed this compownd letter, with the circle and cross:



He willed me, at each corner of these Segments of circles, to make little Crosses, and so I did.

Δ: After euery of the 7 letters shewed he did put them up in his bosom as sone as he had shewed them fully. The plates wheron those letters were shewed, hath the forme of the segment of a circle, thus and seemed to be of pure gold. When the 7 letters were placed, he sayd,



Omnia unum est.[381]

Then he pulled all the 7 plates out of his bosom, and Uriel kneeled down before him. Then the plates did seeme to haue two wings (eche of them) and to fly up to heven[382] under the Canapye.

Δ: After this, one of the 7 baskets, (that which is in the east) cam to Michael, and he sayd,

Mi: Seal this:[383] For This was and is for euer.

Δ: Then he stode agayn on his leggs like brasen pillers, and sayd,

Mi: Oh how mighty is the name of God, which rayneth in the heavens, O God of the faithfull, for thow rayneth for euer.

Δ: He opened the basket, and there cam a great fyre out of it.

Mi: Diuide the 7 partes of the circle next unto that which thow hast done, euery one, into 7.

Note: (for the tyme wilbe Long) Seuen, rest in 7: and the 7, liue by 7: The 7, gouern the 7: And by 7, all Gouernment is. Blessed be he, yea blessed be the Lord: praysed be our god. His Name be magnified. All honor and Glory be unto him now and for euer. Amen.[384]

1. Δ: Then he toke oute of the fire in the basket, a white fowle like a pigeon. That fowle had a Z uppon the first of 7 feathers which were on his brest. That first feather was on the left side.

   Mi: Note. There is a mysterie in the seuen, which are the 7 governing the 7 which 7 gouern the earth. Halleluyah.

   Mi: Write the letters. Δ: Now, a small 1 in the second fether. Then he coured those first two letters, with the other feathers. The third an 1, like the other. Then he coured that allso. The fowrth an R. He covereth that. The fifth a great roman H. He couereth it. The sixth feather hath a little i. Then he hid that feather. The last feather had a small a.

   Mi: Prayse God.

   Δ: Then he put the fowle into the basket: and set it down by him. Then he hong it up in the ayre by him.

   Δ: Then he lift up his sworde over us, and bad us pray. Δ: We prayed.
2. Δ: Then he stretched out his hand and there cam an other basket to him, and he pluckt out a white byrd, much bigger than the other: as big as a swan: with '7' feathers on his brest.

   Mi: Dixit et factum est.[385]

   Mi: Note. Δ: The first feather hath a little a on it: and it went away. The next a Z great as the first. Then a C great. Then a little a. Then an other little a. Then a feather with a little c. Then one with a little b. Δ: Then he couered them all.

   Mi: Thow hast truth.

   Δ: Then he put up the fowle into the basket, and hung it up by the other in the ayre.

   Δ: Than the third Basket cam to him: and he toke out a byrd all green as grass, like to a peacok in form and bignes.

   Mi: Et viuis tu cum illo: et:

   regnum tuum cum illis est.[386]

   Δ: There started out of this birds brest, 7 fethers, like gold, and fyrie.

   Mi: Pray.
3. Mi: Note. Δ: On the first feather a small p.

   Then a small a.
   A little u.

   Then a small p.
   Then a small n.
   Then a small h.
   Then a small r. Then he put the fowle up into the Basket &c.

Δ: Then there cam an other basket to his hand.
Mi: Dedit illi potestatem in cælus.

Potestas illius magna est.
Orate.[387] Δ: We prayed.

4. Δ: Then he pluckt out a fowle, greater than any of the other, like a griphen (as commonly they are figured) all red fyry, with skales like brass. Then on seuen skales, appered letters.
Mi: Note. Δ: First a little h.

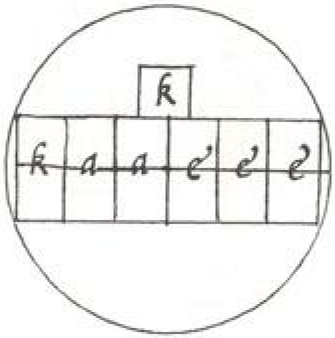
A little d.
A little m.
Then a little h.
Then a little i.
Then a little a.
Then a little i.

Δ: Then he put up the fowle, & hung the basket in the Ayre.
Δ: Then there cam an other Basket to him.
[Δ: Note: All this while the firmament was not to be seen.]
Mi: Magnum est DEVS in Angelis suis.

et magna est illorum potestas in Cælis.

Orate.[388] Δ: We prayed.

5. Δ: Then he pluckt out a bird like an Egle all his body like Gold, and he had a little circle of feathers on his brest: and in it, betwene fowre parallell lines, twelue equall squares: and on the top, on the myddle, one, like the other twelue, thus:



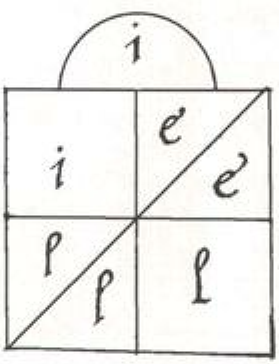
Δ: Then he put up the Egle &c.
Δ: Then cam an other Basket.
Mi: Nuncius tuus est magnus in cælis.

Orate.[389]

Δ: He, and the Basket that wer opened, shut, and set aside, seamed all to be gon: and the Baskets remayning, still hanging on the border of the Canapie. Then he cam agayn, and went awaye agayne. Then cam URIEL and held the Basket: and his leggs seemed to be such great tall pillers of Brass: as Michael did stand on before.

UR: This is a Mysterie. He is here, and not here which was here before.[390]

6. Δ: He opened the Basket and pluckt out like a phenix [or pelican $^{\Delta}$] of the bignes of a swan: all fyrie sparkling. His byll is bent into his brest and it bled. In his brest was a quadrangle made with his own feathers, thus. He put it up, and hung it by the other Baskets.



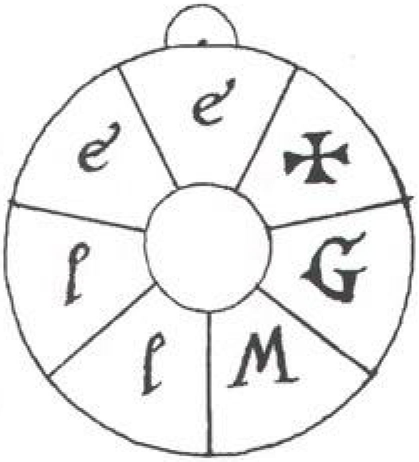
Then cam the last basket. Uriel stode still and sayde,

UR: Dedit angelis potestatem in lumine Cæli.[391]

Orate. Δ: We prayed.

7. Δ: Then cam Michael and toke the Basket of Uriel and becam standing on the great brasen legs, as before.

Δ: He toke out of the basket a strange fowle with many wings: This fowle had in his forhed a Tablet of this fashion:



Mi: Et Coniunxit illos DEVS in unum.[392]

Δ: All the Baskets flew up: and so the Canapie vanished away, and the Heaven appeared.

Δ: Now he cam and sat down in his chayre.

Δ: Michael sayd to Uriel, It is thy part, to expownd these Mysteries: Go to, in the name of our God.

Δ: Uriel cam and stode before him and sayde, What will you: Ô our fellows and seruants to GOD? What will you?

Δ: Perfect knowledg and understanding, such as is necessary for us.[393]

UR: Looke uppon, and see if thow canst not understand it: We will depart for a little space: and come to thee agayne.

Δ: So they went: and left all the stone in fyre, so that neyther the Chayr or Table could be seen in it.

Δ: After a quarter of an howre, Michael and Uriel cam both agayne.

Mi: Loke into the 7 angles: next unto the uppermost Circumference.

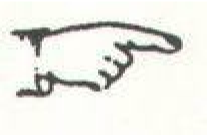
Δ: Uriel cam and stode before Michael.

UR: Those 7 letters[394] are the 7 Seats of the One and everlasting GOD. His 7 secret Angels proceding from euery letter and **Cross so formed**: referring in substance to the FATHER: in forme, to the SONNE: and Inwardly to the HOLI GHOSTE. Loke uppon it: it is one of the Names, which thou hast Before: euery **letter** conteyning an Angel of brightness: comprehending the 7 **in**ward **powres** of God: known to none, but him self: a Sufficient BOND to urge all Creatures to life or Death, or any thing els conteyned in this world.[395] Yt banisheth the wicked, expelleth euyll spirits: qualifieth the Waters, strengtheneth the Just, exalteth the righteous and destroyeth the Wicked. He is ONE in SEVEN. He is twise THREE.[396] He is seuen in the Whole. He is Almighty. His Name is euerlasting: His Truth can not fayle. His Glory is incomprehensible. Blessed be his name. Blessed be thow, (our God) for euer.

UR: Thow must refer thy numbers therin conteyned, to the upper circle. For, From Thence, all things in the inward partes, shalbe comprehended. Looke if thow understand it.

Δ: I finde it to be GALETHOG.

UR: It is so. Δ: I thank God and you, I understand now (allso) the numbers annexed.



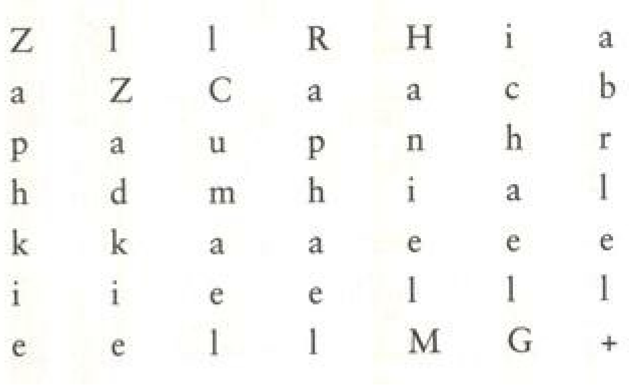
UR: As this darknes is lightened, by the spirit of God, herein; so will I lighten, yea so will the Lord lighten your Imperfections, and glorifie your myndes to the sight of innumerable most holy and unspeakable Mysteries.

UR: To the next part. Δ: Michael sat still, with his sword in his hand.

UR: The parte wherein thow hast labored, conteyneth 7 Angels. Dost thow understand it? Δ: Not yet. Ur: Oh how far is mans Judgment from Celestiall powres? Oh how far are these secrets hidden from the wycked? Glory be unto him, which seeth for euer. Δ: Amen, Amen, Amen.

UR: Note: We cannot tary long. Thow must set down these letters onely, by 7, in a spare paper, thus:[397]

UR: Rede----------------Begyn at the first, and rede downward.[398]



Z	l	l	R	H	i	a
a	Z	C	a	a	c	b
p	a	u	p	n	h	r
h	d	m	h	i	a	l
k	k	a	a	e	e	e
i	i	e	e	l	l	l
e	e	l	l	M	G	+

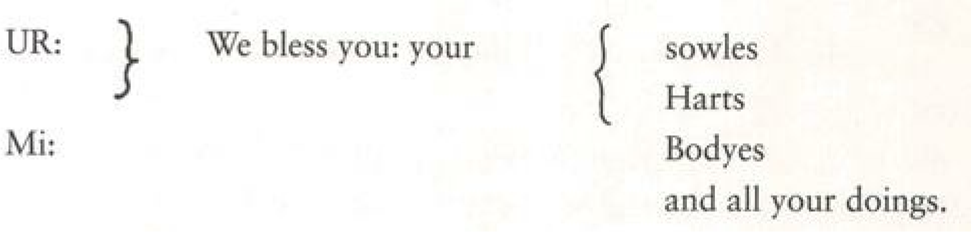
Δ: I rede thus, Zaphkiel, Zadkiel, Cumael, Raphael, Haniel, Michaël, Gabriel.[399]

Ur: Thow hast red right.

Δ: Praysed be God.

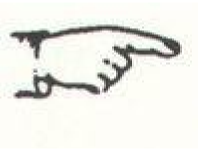
Ur: Thus dost thow see, how mercifully God dealeth with his seruants.

Euery letter here, conteyneth or comprehendeth the number of 72 Vertues:[400] Whose names thow shalt know: skarse yet revealed to the world. Uriel and Michael iointly togither pronownced this blessing on us.



UR: } We bless you: your { sowles
Mi: Harts
Bodyes
and all your doings.

Δ: Michael with his sword, and flame of fyre florished ouer our heds.



Yet I will thus much shew you, for your Cumfort beside. What seest thow? Δ: He spake to the skryer. And he saw an innumerable multitude of Angels in the Chamber or study abowt us, very bewtifull with wyngs of fyre. Then he sayd,[401]

Lo, thus you shalbe shaddowed[402] from the wicked. Kepe these Tables secret. He is secret that liueth for euer.

Man is frayle. Fare well.

¶ He must go for the bokes, els they will perish.[403] Δ: He ment that my partner Ed. Talbot, shold go to fatch the bokes from Lancaster (or therby) which were the L. Mowntegles[404] bokes, which Mr. Mort yet hath: wherof mention is made before.

Ended hor. 5. a meridie
Tuesday the 20 Martij
1582.

Wensday 21 Martij, circa 2ã a meridie.

Δ: After appearance was had, there cam in one before Michael (who sat in his seat) and Uriel leaned on the table (as he, usually did). This seemed to be a Trumpeter:[405] he was all in white, and his garments bespotted with blud. He had nothing on his hed. His heare very long hanging behynde him on his sholders. The Trumpet seamed to be gold. The sownd therof was very playne.

Δ: I axed of my skryer, in what manner Uriel now shewed, (and Michael likewise.) Then Michael sayd, I warned thee for axing of my apparell or manner.[406] Et hæc est Gloria illius, quæ non commouebitur ab impijs.

Mi: Quid vultis? Δ: Iuxta voluntate Dei, Sapientiam nobis necessariam &c.

Mi: Sapientia mundi, nihil est, peribit autem in æternum. Veniat æternitas DOMINI, ab uniuersis mundi partibus. Venite, venite, sic vult DEVS ADONAY fac officium Phanaël.[407]

Δ: This Phanael was the Trumpeter, (above mentioned) who thereupon blew his Trumpet, lustily,[408] turning him self rownd abowt, to all the world. Then, from 7 partes of the world, (being equally diuided abowt the Horizon,) cam 7 Cumpanyes of Pillers all of fyrye cullour glittring. And euery Cumpany of Pillers high and great and as thowgh they were Pillers of fyre. The Heauen, the Sonne, and, Mone and Sterrs seemed to tremble.

Mi: **Multiplex est Deus Noster**.[409]

Mi: Mark this Mystery. Seuen comprehendeth the Secrets of Heven and erth. seuen knitteth mans sowle and body togither (3, in sowle, and 4 in body).

In 7, thow shalt finde the unitie.

In 7, thow shalt finde the Trinitie.

In 7, thow shalt finde the Sonne, and the proportion of the Holy Ghoste.[410] O God, O God, O god, Thy Name (O God) be praysed euer, from thy 7 Thrones, from thy 7 Trumpets, and from thy 7 Angels. Δ: Amen, Amen, Amen.

Mi: In 7, God wrowght all things.

Mi: Note. In 7, and by 7 must you work all things. O Seuen tymes Seuen, Veritie, vertue and Maiestie. I Minister by thy licence. This expownd, by thy Vertue (Δ: Michael spake that, pointing to Uriel.)

Δ: Michael and Uriel both kneeled down, and the Pillers of fyrie and brasen cullour, cam nere, rownd abowt them uniformely.

Mi: Sic est DEVS noster.[411]

Δ: One of the pillers leaned toward the skryer, and had like a pommel or mace hed, on the top of it. And Michael with great reuerence toke out of the top of it a thing like an S.

Δ: Than leaned down 6 Pillers more: and Michael, cryed lowd,

Vnus est DEVS noster, Deus Deus noster.[412]

Δ: Then orderly he opened all the pillers heds: and then the 7 ioyned all togither, distinctly to be discerned.

Mi: Note. Δ: There appeared a great

S
A
A
I

Δ: Then the sides closed up, and hid those letters first shewed. After that appered two letters more

E
M

Δ: He made Cursy, and semed to go from ward, and vanished away.

E 8

Mus∈ριον est.[413]

Δ: The Pillers all ioyned togither at the tops, making (as it were) One Mace or Pommell, and so flew up to heven wards.

Δ: There seamed two pillers more to come down from heven (like **the other** in forme) and toke place there, where the other 7, stode, which went away.

Δ: Michael with his sword, Cut them asunder: and cryed out,

Away you workers of Iniquitie. [414]
Perijt Malus cum malis.[415]

Δ: The pillers fell down, and the grownd swallowed them up.

Tanta est tua audacia Sathan[416]
sed DEVS noster viuit.[417]

Δ: The pillers which before ascended, cam down ioyntly: and oute of them a Voyce saying, NON SVM.[418]

Δ: Then the 7 pillers next his right hand, bowed to Michael, And oute of them, a voyce sayd, SVM.[419]

Δ: Then one of the Pillers stode higher than his fellows, and Michael opened all the tops of them, and sayd,

Orate.[420] Δ: We prayed.

Mi: Write the Name down in the Tables.

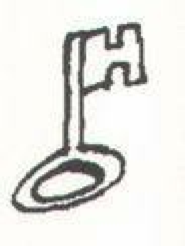
Δ: Then he toke of, 3 of the heds of the Pillers, and sett them downe and there appered, BTZ, great letters in hollow places like square cumfet [421] boxes.

Mi: Ista sunt secreta secretorum.[422]

Invocate Nomen eius, aut nihil agere possumus. [423] The key of Prayer openeth all things.

Δ: We prayed.

Note Key



> Δ: Then the other 4 pillers, bowingly shewed 4 letters thus, KASE, and the number 30 with a prik under. Then the Pillers ioyned theyr heds togither very close, and flew up into the firmament with Thunder.

Sic Domine, Sic, Sic.[424]

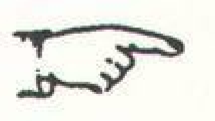
Mi: Place these in the Table. Δ: I wrote and he sayd, Thow hast done right. Laudate nomen Domini qui viuit in æternum.[425]

Δ: A voyce cam out of the next cumpany of the 7 pillers (ioyning them selues togither) saying, Ipse.[426]

Mi: Et Misericordia tua Domine magna est.[427]

Δ: Michael kneled whan he sayd this.

Δ: Michael shewed out of 4 of theyr heds, of the pillers, (and with all sayd,)



NO, NOT the Angels of heuen, (but I,) are priuie of these **things**. Δ: So there appeared, 4 letters, HEID.

Δ: Then the other 3 pillers were opened and had ENE on theyr tops.

Dominus collocatur in numero suo.[428]

Δ: The 7 pillers mownted up into the ayre, and it thundred at their going.

Δ: Then the fowrth Cumpany of pillers bowed to Michael: out of them cam a voyce: Viuo sicut LEO in medio illorum.[429]

Mi: Et tua potestas magna est ubique.[430]

Δ: Then Michael pluckt of, fiue of the tops. There appered Δ: then they ioyned all togither: then appered EIMO.

Mi: Hoc non est sine præce.[431]

Δ: The other two opened, and there appeared A.

Δ: Then they closed up, and went away, with a great thunder.

Δ: Then cam 7 other pillers to Michael, and a Voyce oute of them, saying, Serpens sum, et deuoraui serpentem.[432]

Mi: Et bonis et malis serpens es Domine.[433]

Δ: Then they closed all up; and Michael sayd, Orate. Δ: We prayed.

Δ: Then Michael toke of, the heds of 4: then appeared first an I, then MEG. Then he opened the other 3, and CBE appeared.

Mi: Numerus illius, est nulli cognitus.[434]

Δ: They ioyned theyr heds all togither, and ascended up to heuenward: and great lightening after them.

Δ: Then cam an other Septenarie of Pillers: and oute of them a voyce, saying,

Ignis sum penetrabilis.[435]

Mi: Et sit nobiscum, Ô Deus.[436] Pray. Δ: We prayed.

Δ: Then he opened 4 of theyr heds and appered in them ILAO.

Δ: They closed togither agayne.

Δ: Then one other was opened, and ***I*** appered.

Δ: Then . appered, and did shut up agayn.[437]

Δ: Then he smote fyre out of the last pyller, and it thundred and there seemed to come out of it innumerable Angels like little Children with wings, and there appered N, and suddenly did shut up.[438] **Sic sic sic Deus noster**.[439]

Δ: Then they ioyned all togither, and flew up.

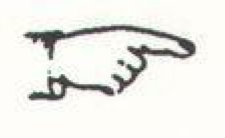
Mi: Note down in the table. Δ: I Noted them down.

Δ: Then cam the last 7 pillers, and out of them this Voyce,

Finis.

Gaudium et Lux nostra Deus.[440]

Δ: Then they closed all in One.
Mi: Orate. Δ: We prayed.
Δ: Then 6 of the heds opened and appered I H R L A A.



Δ: Then the seuenth opened: Then seamed trees to leap up, and hills, and the seas and waters to be trubbled, and thrown up.

Δ: A voyce cam out of the Pillers: Consummatum est.[441]
Δ: There appeared in that Piller $\overset{21}{8}$.
Δ: They ioyned togither and flew up to heven ward.
Mi: VNVS VNVS VNVS.

Omnis caro timet vocem eius.[442]
Pray. Δ: We prayed.

Δ: Note: my skryer was very faynt, and his hed in manner gyddy, and his eyes, dasyling, by reason of the sights seen so bright, and fyrie, &c. Michael bad him be of good cumfort, and sayd he shold do well.

Mi: Cease for a quarter of an howre.

Δ: After we had stayed for a quarter of an howre, we comming to the stone agayne, fownd him come all ready to the stone: and Uriel with him. Who, allso, had byn by, all the while, during the Mysterie of the ‘7’ pillers.

Mic: Set two stoles in the myddst of the flowre. On the one, set the stone: and at the other let him knele. I will shut the eares of them in the howse, that none shall heare us. I will shew great Mysteries.

Michael than, with a lowd voyce sayd,

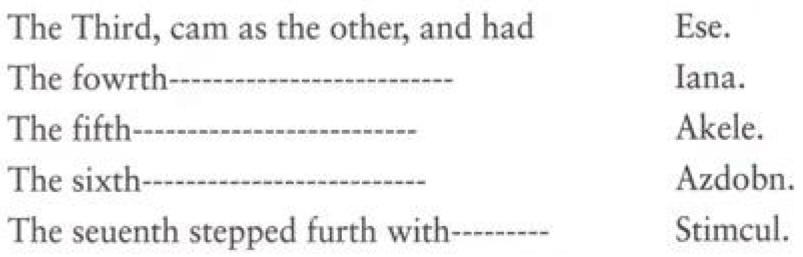
Adeste Filiæ Bonitatis:
Ecce DEVS vester adest:
Venite.[443]

Δ: There cam in 7 yong women apparelled all in Grene, having theyr heds rownd abowt attyred all with greene silk, with a wreath behinde hanging down to the grownd.[444] Michael stroke his sword ouer them, no fyre appearing: Then they kneeled: And after, rose agayn.

Mi: Scribe quæ vides.[445]

Δ: One of them stept out, with a little blue tablet on the forhed of her: and in it written, El.

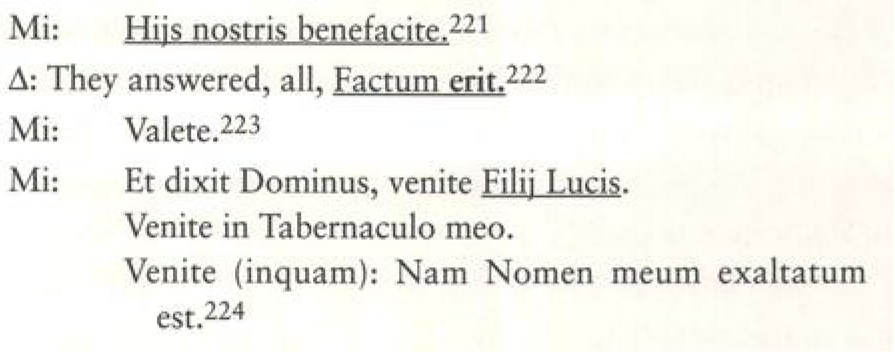
Δ: She stode a side, and an other cam in, after the same sort, with a great M, and a little e, thus, Me.



The Third, cam as the other, and had	Ese.
The fowrth--------------------------	Iana.
The fifth-------------------------	Akele.
The sixth--------------------------	Azdobn.
The seuenth stepped furth with---------	Stimcul.

Δ: They all togither, sayd, Nos possumus in Cælis multa.[446]
Δ: Then they went theyr way, suddenly disäpering.
Mi: Note this in your next place but one. Δ: I did so.
Mi: Go to the next place. Stay.
Mi: Adeste, Filiolæ Lucis.[447]
Δ: They all, cam in agayn, and answered, Adsumus Ô tu qui ante

faciem **DEI stas.**[448]



Mi: Hijs nostris benefacite.[221]
Δ: They answered, all, Factum erit.[222]
Mi: Valete.[223]
Mi: Et dixit Dominus, venite Filij Lucis.
Venite in Tabernaculo meo.
Venite (inquam): Nam Nomen meum exaltatum est.[224]

[449][450][451][452]

Δ: Then cam in 7 yong men, all with bright cowntenance, white apparaled, with white silk uppon theyr heds, pendant behinde as the women had.[453]

One of them had a rownd purifyed pece or ball of Gold in his hand.

One other had a ball of siluer in his hand.

The third a ball of Coper.

The fowrth a ball of Tynne in his hand.

The fifth had a ball of yern.[454]

The sixth had a rownd thing of Quicksyluer, tossing it betwene his two hands.

The last had a ball of Lead.[455]

They wer all apparayled of one sort.

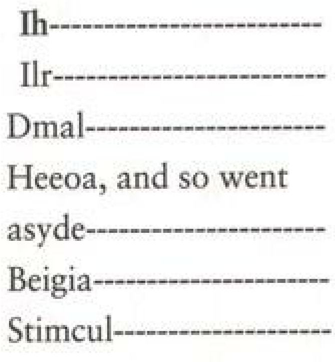
Mi: Quanmvis[456] **in uno generantur tempore, tamen unum sunt.**[457]

Δ: He that had the gold ball, had a rownd tablet of gold on his brest, and on it written a great

I---------------------------

Then he with the syluer ball, cam furth, with a golden tablet on his brest likewise, and on it written

He with the Copper ball, had in his tablet
He with the tyn ball, had in his tablet
He with the yern ball, had in his tablet



Ih-------------------------
Ilr-------------------------
Dmal----------------------
Heeoa, and so went
asyde----------------------
Beigia----------------------
Stimcul--------------------

He with the Mercury ball, had written
The yong man with the leaden ball, had
Mi: Facite pro illis, cum tempus erit.[458]
Δ: All answered, Volumus.[459]
Mi: Magna est Gloria Dei inter vos. Erit semper. Halleluyah.[460]

Valete.[461]

Δ: They made cursy, and went theyr way, mownting up to heven.
Mi: Dixit Deus, Memor esto nominis mei:

Vos autem immemores estis.[462]
I speak to you. Δ: Hereupon, we prayed.

Mi: Venite, Venite, Venite.

Filiæ Filiarum Lucis Venite.
Qui[463] habebitis filias venite nunc et semper.[464]

Dixit Deus, Creaui Angelos meos, qui destruent Filias Terræ.

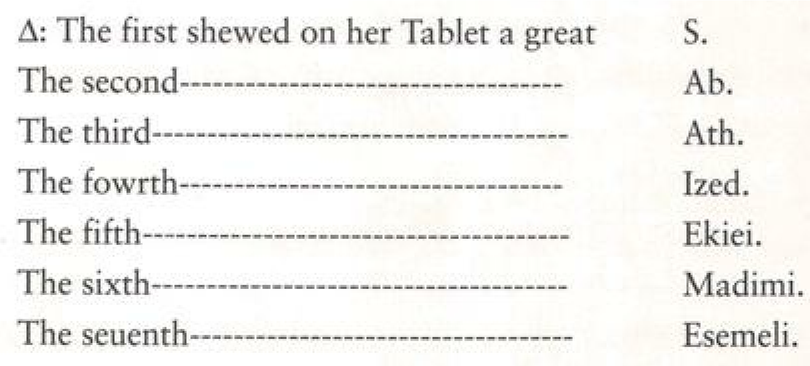
Adsumus,[465] Δ: Sayd 7 little wenches which cam in. They were couered with white silk robes, and with white abowt theyr hed, and pendant down behinde, very long.

Mi: Vbi fuistis vos?[466] Δ: They answered: In terris, cum sanctis et in cælis, cum glorificatis.[467]

Δ: These spake not so playn, as the former did; but as though they had an impediment in theyr tung.

Δ: They had, euery one, somwhat in theyr hands, but my skryer could not iudge what things they were. Mi: Non adhuc cognoscetur Mysterion hoc.[468]

Δ: Eache had fowre-square Tablets on theyr bosoms, as yf they were of white Ivory.



Δ: The first shewed on her Tablet a great	S.
The second------------------------------------	Ab.
The third---------------------------------------	Ath.
The fowrth------------------------------------	Ized.
The fifth--	Ekiei.
The sixth---------------------------------------	Madimi.
The seuenth-----------------------------------	Esemeli.

Mi: Quid istis facietis?

Erimus cum illis, in omnibus operibus illorum.[469] Δ: They answered.

Mi: Valete.[470] Δ: They answered, Valeas et tu Magnus O in Cælis.[471]
Δ: And so they went away.
Mi: Orate.[472] Δ: We prayed.
Mi: Et misit filios filiorum, edocentes Israel.
Mi: Dixit Dominus, Venite ad vocem meam.
Adsumus, [473] Δ: **Sayd 7 little Childern which cam in, like boyes couered all with purple, with hanging sleues like preists or scholers gown sleues: theyr heds attyred all (after the former manner) with purple sylk.**
Mi: Quid factum est inter filios hominum?

Male viuunt (sayd they) nec habemus locum cum illis tanta est illorum Iniustitia. Veh mundo, scandalis: vel scandalizantibus, Veh illis quibus Nos non sumus.[474]

Δ: These had tablets (on theyr brests) three cornerd, and seemed to be very grene and in

them, letters. The first had two letters in one: thus, of EL:

The first ----------  ----- Δ: He sayd, Nec nomine meo timet Mundus.[475]

The second ---------- An ----- Nullus videbit faciem meam.[476]

The third ---------- Aue ----- Non est virgo super terram cui dicam.[477]

[Δ: And pointed to his tablet, wherein that word, Aue, was written.]

The fowrth ---------- Liba ----- Tanta est infirmitas sanctitudinis Diei. Benefacientes decesserunt ab illo.[478]

The fifth ---------- Rocle - Opera manuum illorum sunt vana. Nemo autem videbit me.[479]

The sixth shewed his Tablet and said, Ecce -- Hagonel[480] - Qui adhuc Sancti sunt, cum illis viuo.[481]

The seuenth had on his tablet -- Ilemese -- Hij imitauerunt doctrinam meam. In me Omnis sita est Doctrina.[482]

Δ: I thowght my skryer had missherd, this word Imitauerunt, for Imitati sunt.[483] And Michael smyled and seemed to lawgh, and sayd, Non curat numerum Lupus.[484] And farder he sayd, Ne minimam detrahet à virtute, virtutem.

Mi: Estote cum illis: Estote (inquam cum istis) Estote (inquam) mecum. Valete.[485]

Δ: **So they went, making reuerence,[486] and went up to heuen.**

Mi: Dictum est hoc tempore.[487]

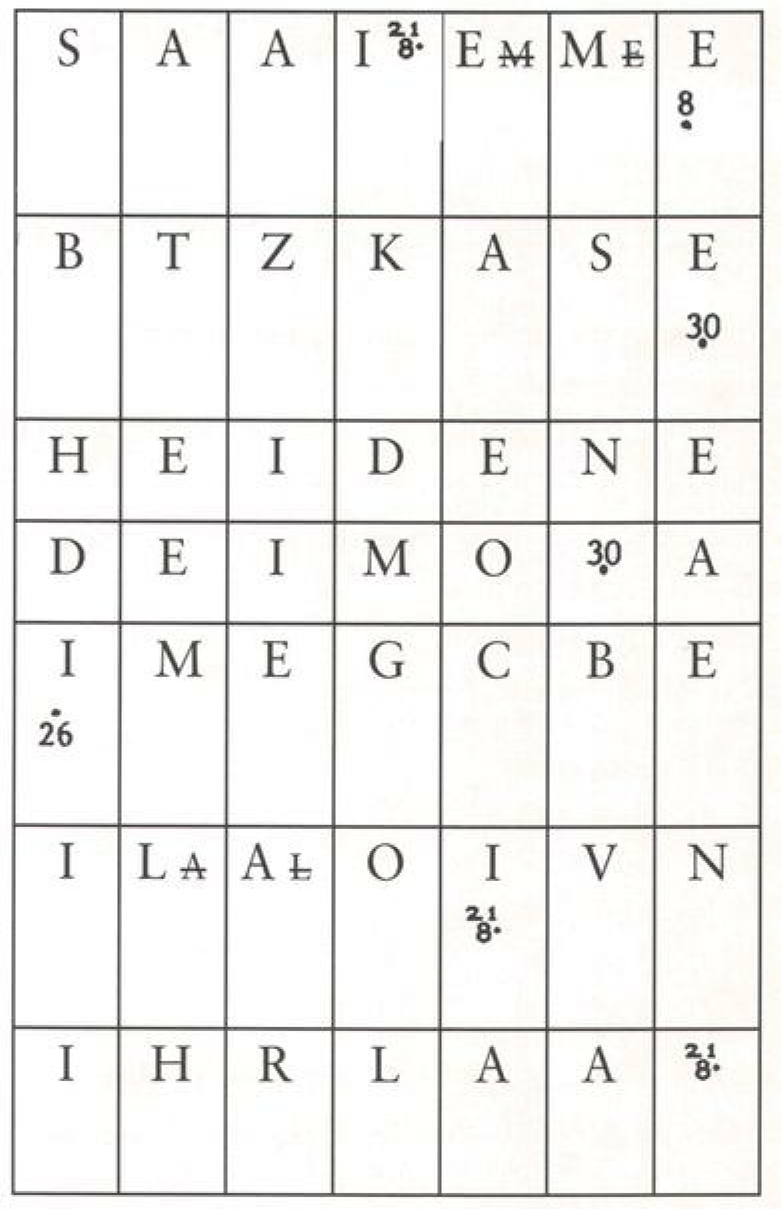
Mi: Note this in thy Tables. Dost thow understand it? Loke if thow canst.

Δ: He sayd to Uriel, It is thy part, to interpretate these things.[488]

Ur: Omnis Intelligentia est a Domino.

Mi: Et eius Nomen est Halleluyah.[489]

Compose a table, diuided into 7 parts, square.[490]



S	A	A	I 21/8	E ~~M~~	M ~~E~~	E 8
B	T	Z	K	A	S	E 30
H	E	I	D	E	N	E
D	E	I	M	O	30	A
I 26	M	E	G	C	B	E
I	L ~~A~~	A ~~L~~	O	I 21/8	V	N
I	H	R	L	A	A	21/8

Ur: Those 7 names, which procede from the left hand to the right, are the **Names of God**, not known to the Angels: neyther can be spoken or red of man. Proue if thou canst reade them.

Beatus est qui secrete.
Nomina sua conseruat.[491]

Ur: These Names, bring furth 7 Angels: The 7 Angels, and Governers in the heuens **next unto us,**[492] which stand allwayes before the face of God.[493]

Sanctus Sanctus Sanctus
est ille DEVS noster,[494]

Ur: Euery letter of the Angels names, bringeth furth 7 dowghters. Euery dowghter bringeth furth her dowghter, which is 7. Euery dowghter-her-dowghter bringeth furth a sonne. Euery sonne in him self, is 7. Euery sonne hath his sonne, and his sonne is 7.[495]

Let us prayse the God of Seuen, which was and is and shall liue for euer.

Vox Domini in Fortitudine.

Vox Domini in Decore.

Vox Domini reuelat Secreta.

In templo eius, Laudemus Nomen eius El. Halleluyah.[496]

See if thow canst now understand this table. The Dowghters procede from the angle on the right hand, cleaving the myddle: where **theyr generation** ceaseth. The Sonnes from the left hand to the right to the middle: so proceding where theyr number endeth in one Centre. The Residue thow mayst (by this Note) understande.[497]

Δ: Then Michael, he stroke ouer us ward, with his sword, and the flame of fire yssued oute.

Loke to the corner of the right hand, being the uppermost: where thow shalt finde $\underset{\bullet}{8}$. Refer thyne eye to the upper number, and the letter aboue it. But the Number must be fownd under neth, bycause his prick so noteth.[498] Than procede to the names of the dowghters in the Table: and thow shalt see that it is the first name of them: This shall teache thee.

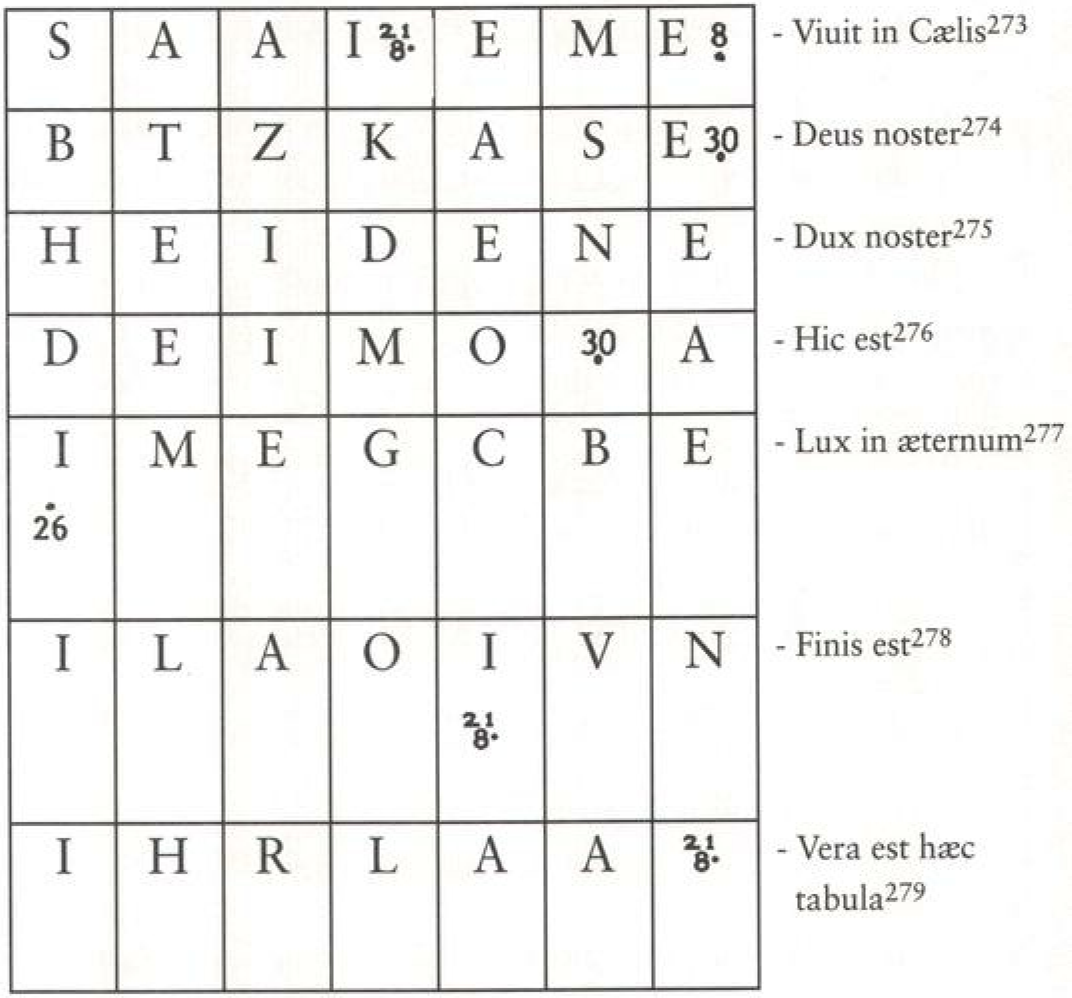
Δ: Loking now into my first and greatest Circle for $\underset{\bullet}{8}$ I finde it with 1 ouer it. I take this to be the first Dowghter.[499]

Ur: You must in this square Table set E by the $\underset{\bullet}{8}$ and now write them Composedly in one letter, thus  .

Nomen Domini viuit in æternum.[500]

Ur: Giue ouer, for half an howre, and thow shalt be fully instructed.

Δ: I did so, and after half an howre comming to the stone, I was willed to make a new square table of 7: and to write and note, as it followeth.



S	A	A	I 21 8	E	M	E 8	- Viuit in Cælis[273]
B	T	Z	K	A	S	E 30	- Deus noster[274]
H	E	I	D	E	N	E	- Dux noster[275]
D	E	I	M	O	30	A	- Hic est[276]
I 26	M	E	G	C	B	E	- Lux in æternum[277]
I	L	A	O	I 21 8	V	N	- Finis est[278]
I	H	R	L	A	A	21 8	- Vera est hæc tabula[279]

501, 502, 503, 504, 505, 506, 507

Vera est hæc Tabula, partim nobis cognita, et partim omnibus, incognita. Vide iam.[508]

The 30 by E, in the second place, in the upper right corner, serueth not in the consideration of the first Dowghters, but for an other purpose.[509]

The 26 by I, serueth **for an other** purpose: but not for this Dowghters Dowghter. The 21, is e, and 8 with the prick under it is 1: which togither maketh El, or thus compownded as if it were one letter, El .

The Names of the great Seale must follow the Orthographie of this Table. Virtus vobiscum est. Orate.[510] Δ: We prayed.

Δ: Then there appeared SAAI 21 8 M El . Here is an E comprehended in L.

Ur: Read now the Table.

Angeli lucis Dei nostri
Et posuit angelos illius in medio illorum.[511]

Ur: In the table are the names of 7 Angels. The first is Zabathiel, beginning from the left uppermost corner, taking the corner letter first, and then that on the right hand above, and than that under the first, and than the third from the first, in the upper row: and then cornerwise down toward the left hand, and then to the fowrth letter from the first in the upper row: where there is I with , which maketh el. So have you Zabathiel.

Ur: Go forward.

2. Δ: So, I finde next Zedekieil.

Ur: This I in the last Syllable augmenteth the true sownd of it.

3.	Δ: Then next I finde	Madimiel.-----	Ur: It is so.
4.	Δ: Then--------------	Semeliel.-----	Ur: It is true.
5.	Δ: Then--------------	Nogahel.-----	Ur: It is so.
6.	Δ: Then--------------	Corabiel.[284]-----	Ur: It is so.
7.	Δ: Then--------------	Leuanael.-----	Ur: It is so.

Ur: Write these names in the Great Seal, next under the 7 names which thow wrotest last: videlicet, under , An Aue &c. distinctly in great letters.

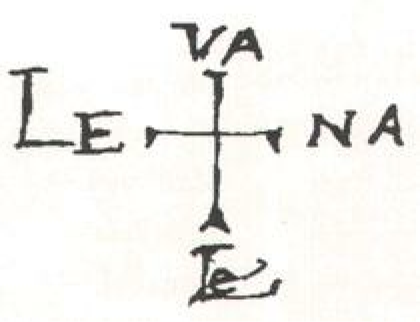
Ur: Make the E and L of Zabathiel, in one letter compownded, thus ZABATHI . In this, so fashion your E and L. And this name must be distributed in his letters into 7 sides of that innermost Heptagonum. For the other, I will teache you to dispose them. You must make for IEL (in this name onely) I with the annexed. So haue you iust 7 places.

Ur: The next fiue names thow shalt dispose in the fiue exterior angles of the Pentacle: euery angle conteyning one whole name.

Ur: Set the first letters of these 5 names, (in Capitall letters) within the fiue acute internall angles of the Pentacle: and the rest of eche name following Circularly from his Capitall letter, but in the 5 exterior obtuse angles of the Pentacle.

Ur: Set Z, of Zedekieil within the angle which standeth up toward the begynning of the greatest Circle. And so procede toward thy right hand.

Ur: In the middle now of thy Pentacle, make a cross † like a Crucifix and write the last of those 7 names Leuanael thus,



Uriel: Vidit DEVS, opus suum esse bonum

et cessauit a Labore suo.

Factum est.[513]

Δ: Michael stode up and sayd,
The æternall Blessing of God the FATHER,
The mercifull Goodnes of CHRIST, his SONNE
The unspeakable Dignitie of GOD the Holy GHOSTE bless you, preserue you, and multiply your

doings in his Honor and Glory.

Uriel: AMEN.
Ur: These Angels are the angells of the 7 Circles of Heven, gouerning the lightes of the 7 Circles.
Blessed be GOD in us, and by us,
Which stand contynually before
the presence of GOD, for euer.[514]

DIXI.[515]

Δ: Whan may we be so bold, as to require your help agayn.
Mic: Whan so euer you will, we are ready.

Farewell.

Δ: Sit Nomen Domini benedictum, ex hoc nunc, et usque in sæcula sæculorum.:
Amen.[516]

Mysteriorum, liber Tertius.

Anno 1582:

Aprilis 28: [518]

Anno 1582 Aprilis 28 a meridie hora 4.[519]

E.T: Onely Michael appeared; Δ: And to diuerse my Complayntes, and requests sayde,

Mi: The lord shall consider thee in this world, and in the world to come.

E.T: All the chayre seamed on fyre.

Mi: This is one Action, in one person: I speak of you two.[520]

Δ: You meane us two to be ioyned so, and in mynde united, as yf we wer one man?

Mi: Thou understandest.

Take heade of punishment for your last slaknes.

Δ: Yf you mean any slaknes on my behalf, Truely it was and is for lak of habilitie[521] to buy and prepare things, appointed of you. Procure I pray you habilitie, and so shall I make spede.

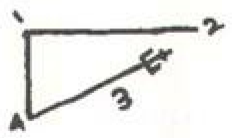
E.T: A great hill of gold with serpents lying on it appeared: he smyteth it with his sword, and it falleth into a mighty great water, hedlong.

Mi: Dost thow understand? Δ: No verylie.

E.T: He razed the hill away, as thowgh there had byn none; and sayd,

Mi: Lo, so it is of this worldly habilitie.

Δ: I pray you how must the Lamine be hanged?



Mi: As concerning the lamine, it must be hanged unseen, in some skarf.[522] The Ring when it is made, I will lessen it according to my pleasure.

I meane by two Cubites, your usuall yarde. Haste, for thow hast many things to do. Glory be to God, Peace unto his Creatures. Mercy to the wicked, Forgivenes to the Faithfull: He liueth, Ô he rayngneth, O thow art mighty, PELE: thy name be blessed. Δ: Amen.

Venito Ese,[523] Δ: He cryed so with a lowd voyce.

E.T: He is now couered, in a myghty couering of fyre, of a great beawty. There standeth a thing before him. I cannot tell what it is.

Laudate Dominum in cælis.

Orate.[524] Δ: We prayed.

E.T: His face remayneth couered with the fyre, but his body uncovered.

Mi: Adesdum Ese.

Adesdum Iana.[525]

Vobis dedit demonstrationem in Tabulis vestris.[526]

E.T: There appeare of the figure, (before, imperfect) two little women: One of them held up a Table which lightened[527] terribly: so that all the stone was couered: with a myst. A voyce cam out of the myst, and sayd,

Ex hijs creata sunt, [528] et hæc sunt nomina illorum.[529]

E.T: The myst cleareth, and one of the women held up a Table, being thus written uppon.

Numerus Primus.[530]

Δ: The Table semed square, and full of letters and numbers, and Crosses, in diuerse places, diuersly fashioned.

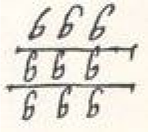
Numerus Primus[531]

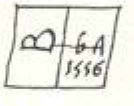
A finger cam out of the mist, and wyped oute, the first shew, with the Cross, letters, and numbers. The second was in like wise. The Third was a b with the tayle upward thus: g . The 52 with the three great BBB, semed to be couered with Gold. The two Crossed ones he did not wipe out with his finger.

The next he blotted oute.

He blotted not oute the three  with the 8 and 3.
The two barrs must go clere and not towch the bars.



The , the square, wherin it standeth, is all gold: and that he let stand.



Fire cam oute and burnt:
The  is all of a bright cullour, like the brightnes of the Sonne, and that was not put out. The places are very blak, but where the letters, and numbers do stand.
E.T. hard a voyce saying, Finis Tenebrarum:[532] Halleluyah.[533]
E.T: There commeth a hand and putteth the little woman into the clowde.
Mi: Prayse God: Be inwardly mery.

The Darknes is comprehended.
God bless you: God bless you: God blesse you.

You must leave of for an howre and a half: for you haue .6. other Tables to write to night.
Prayse God: be ioyfull.

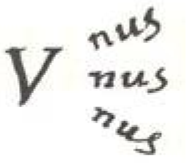
After supper we resorted to our scholemaster.
E.T: I here a voyce but see nothing: he sayeth,

Initium bonum in nomine eius
et est. Halleluyah.[534]

E.T: Three quarters of the stone (on the right side) are dark, the other quarter is clere.
Mi: Venite filiæ filiarum ESE.[535]

The nethermost......[536]

E.T: There come six yong maydens, all in white apparell, alike: Now they all be gonne into the dark parte of the stone, except one. There cam a flame of fyre out of the dark, and in the flame written Vnus[537] on this manner:



V
nus
nus
nus

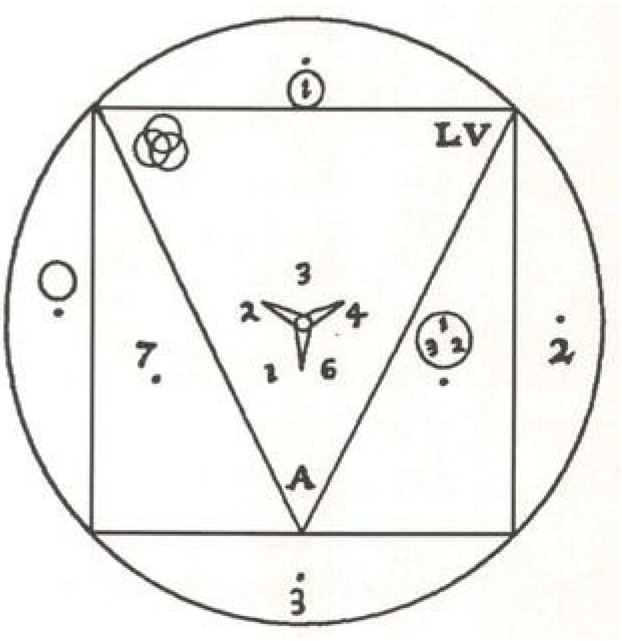
She that standeth without, putteth her hand into the dark: and pulleth out a ball of light: and threw it oute: and it waxed bigger and bigger; and it Thundred.

E.T: A voyce sayd --------- Dies primus.[538]

An other voyce --------- Ubi est Tabula?[539]

An answer --------- Est, Est, Est.[540]

She wyndeth and turneth her self abowt, begynning at her hed, and so was Transformed into a Table, rownde.



E.T: Three faces do shew and shote oute, and euer returne into one hed agayne: and with it cam a mervaylous swete sauour. The Table was of three cullours: white, redd, and a mixture of white[541] and red, changeably. A strong sownding cam withall, as of clattring of harness or fall of waters; or such like.

There cam a sterre shoting oute of the dark, and settled itself in the myddle of the Table: And the fyre which cam oute with the woman, did cumpas the Table abowt.

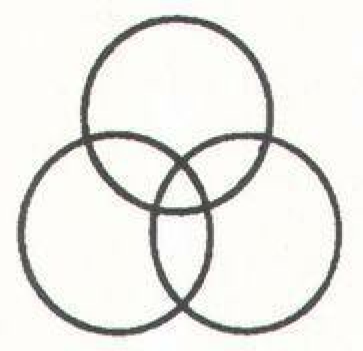
A voyce sayd, O honor, laus et gloria, Tibi qui es, et eris.[542]

The Table sheweth wunderfull fayre and glorious. Onely seuen priks appeare on the Table.

The three angles of the triangle open, and in the lower point appeared a great A.

And in the right upper corner LV. (E.T: The Table trembled.)

And in the other Corner appeared thre circles of æquall bignes, æqually, or alike intersecting eche others by theyr centers.



A voyce: Unus est, Trinus est; in omni Angulo est.

Omnia comprehendit: Fuit, est, et vobis erit.
Finis et Origo.[543] (E.T: Ô, Ô; with a dullfull sownd, he pronownced.)

E.T: The woman sayth, Fui: sum quod non sum.[544]

A voyce: Lux non erat et nunc est.[545]

E.T: The woman being turned, from the shape of the Table, into womans shape agayn, went into the dark. Then one part of the darknes diminished. In the dark was a mervaylous turmoyling, tossing, and stur, a long tyme during.

A voyce: For a tyme Nature can not abyde these sightes.

E.T: It is become Quiet, but dark still.

A voyce: Pray and that vehemently, For these things are not revealed without great prayer.

E.T: After a long tyme there cam a woman: and flung up a ball like a glass: and a voyce was hard saying, Fiat. The ball went into the darknes, and browght with it a great white Globe hollow transparent. Then she had a Table abowt her neck, square of 12 places.[546] The woman seamed to daunce and swyng the Table: Then cam a hand oute of the dark: and stroke her and she stode still, and becam fayrer: She sayd, Ecce signum Incomprehensibilitatis.[547]

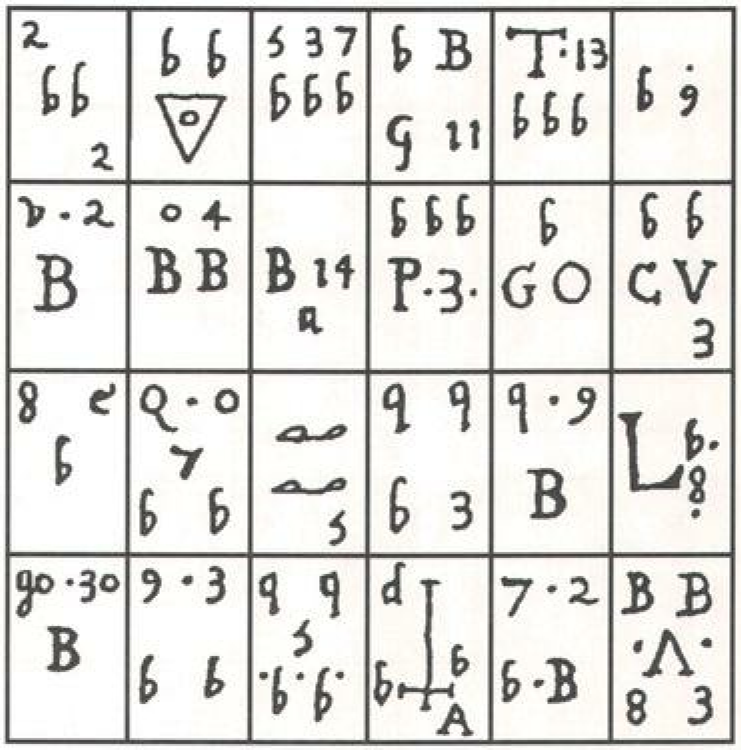
E.T: The woman is transformed into a water, and flyeth up into the Globe of Light.

E.T: A voyce: Est, Est, Est.[548]

E.T: One commeth, (a woman) out of the Dark very demurely, and soberly walking, carrying in her hand a little rownd ball: and threw it into the dark: and it becam a great thing of Earth. She taketh it in her hand agayne, and casteth it up into the rownd Globe and sayd,

Fiat.[549]

E.T: She turned her back toward E.T. and there appeared a Table diuided into 24 partes. Yt seemeth to be very Square.[550]



2 6 6 2	6 6 ▽	5 3 7 6 6 6	6 B G 11	T·13 6 6 6	6 9

A voyce: Scribe. Veritas est.[551]

E.T: A sword cam out of the Dark: and claue the woman a sunder, and the one half becam a man, and the other a woman,[552] and they went and sat uppon the Ball of cley or erth.

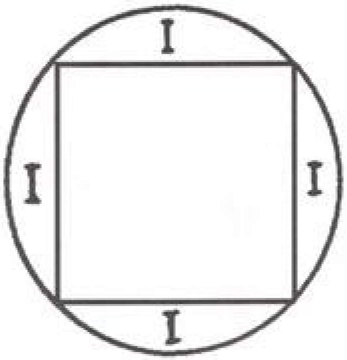
Now seemeth the Dark part to quake.

A voyce: Venito Vasedg.[553]

E.T: There cometh a woman oute of the Dark: she sayd,

Vita hijs ex mea manu.[554]

E.T: She sheweth a Table square full of holes, and many things creeping out of it. This square is within a rownd.



A voyce: O Lux Deus noster.[555]

Hamuthz Gethog.

E.T: Then stept out an other woman hauing a sword in her hand. She toke a thing oute of the dark (a bright thing) and cut it in twayn and the one parte she cut into two unæqual partes, and the other half she cutteth into a thowsand (or innumerable) partes. Then she toke all the partes up into her skyrt. She hath a Table, and it hangeth on her shulders. She stept before the other woman, whose hed standeth in the dark.[556] This woman her Table is fowresquare. She is very bewtifull.

Note this Cross with the two bees, the 4 and the 6, is one of the Notes annexed to the second Table of the 4 of Enoch’s Tables: And the T of Enoch’s Tables semeth to answer with the T first in the Seale of Æmeth, and the cross allso.

She sayd, Lumina sunt hæc Intelligentiæ tuæ.[557]

She sayd, Fere nulli Credendus est hic numerus.[558]

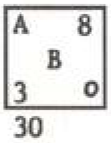
This woman taketh the little peces, and casteth them up, and they become little Sparks of light: and of the things she cast, There were two great rownd things. And they were allso cast up to the white Transparent Globe. And she went away into the Dark: which was, now, very much lessened.[559]

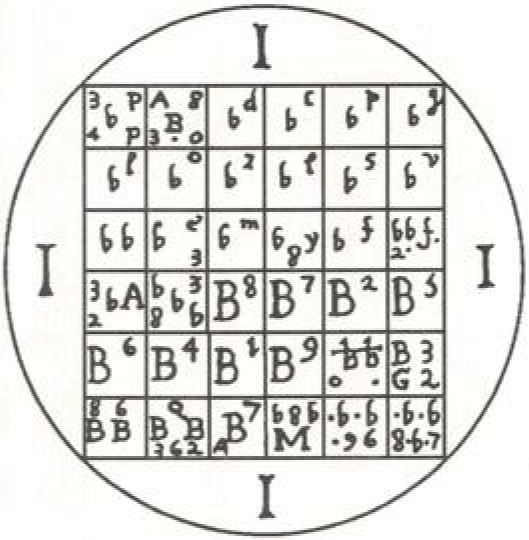
Then the other woman (who was forestept) thrust oute her hed who had the rownd conteyning the

Square, with 36 places. She crymbleth clay, and it turneth to byrds. She seameth to be like a witch. Into the bosse of her Table, she put her hand and that bosse, was in the Dark and oute of the bosse, she seemed to fatch that Clay. She sayd,

> Ad usum tuum Multiplicati sunt.[560]

E.T: She went into the Dark.





E.T: A voyce is hard saying,

> Omnia gaudent fine.[561]

E.T: There commeth oute a woman; out of the Dark. She plucketh at the dark, and casteth it on the grownd, and it turneth to herbes, and plants becomming like a garden, and they grow up very fast. She sayd,

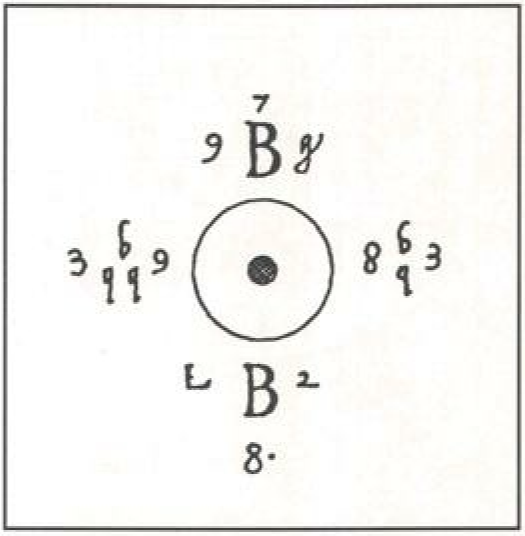
> Opus est.[562]

E.T: She hath a fowre square Table before her.

Then cam one, all in white, and taketh the Darknes, and wrappeth it up and casteth it into the myddle of the Erthen Globe, on which appeared Trees and Plants.

E.T: Then appered Michael, his Chayre, and Table agayne manifestly: which all this while, were not seen.

Mi: Obumbrabit vestigia vestram veritatis luce.[563]



The Actor, The Actor, The Actor:
One Disposer; he, which is one in all; and All in all:
bless you from the wickednes of Deceyte: Create you new
vessels: To whome I commyt you.

E.T: He holdeth his sword over us, in manner, out of the stone.

Mi: Fare Well. Serue God. Be patient. Hate vayne glorie. Liue iustly. Amen.

Δ: What spede shall I make for the yard square Table, the Wax, the seale, and the Character? Mi: As thow ar motioned, so do.

Δ: Gloria, Pri et F. et S.S. S.e.i.p.e.n.e.s.e.i.s.s. Amen.[564]

* * *

Δ: Note, All the Tables before were by E.T, letter for letter noted out of the stone standing before him all the while: and the 7 Tables following wer written by me as he repeted them orderly out of the stone.

* * *

Aprilis 29: Sonday: Nocte hora 8¼.

E.T: Two appeare, Michael and Uriel.

Mi: Et posuit illos in ministerium eius.

Quid desideratis?

Δ: Sapientiam et scientiam nobis necessariam, et in Dei servitio potentem ad eius gloriam.

Mi: Sapere, a Deo: Scire a Creatura et ex creaturis est.

Ur:[565] Venite filiæ.[566]

E.T: Seuen women appeare bewtifull and fayre.

Mi: This work is of wisdom (Δ: Sayd Michael, and stode up.) E.T, sayd to me (Δ), He putteth oute his sword and willeth me to sweare, to that, that he willeth me: and to follow his cownsayle.

Mi: Wilt thow. Δ: Then with much ado, E.T. sayd as followeth,

E.T: I promise,[567] in the name of God the Father, God the sonne and God the holy ghost, to performe that you shall will me, so far as it shall lye in my powre.

E.T: Now they two seeme to confer togither.

Mi: Now you towche world, and the doings uppon earth. Now we shew unto you the lower world: The Gouerners that work and rule under God:[568] **By whome you may haue powre to work such things, as shalbe to god his glorie, profit of your Cuntrie, and the knowledge of his Creatures.**

To E.T. he spake, What I do wish thee to do, thow shalt here know, before thow go. **We procede to One GOD, one knowledge, one Operation.**

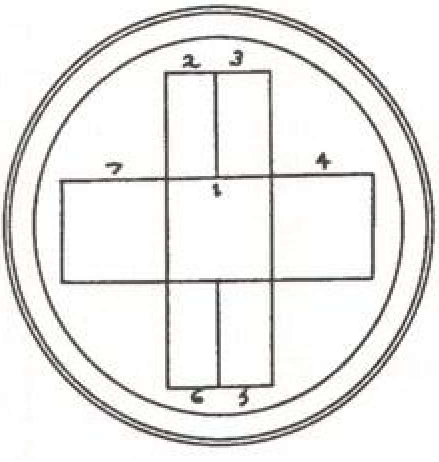
Venite filiæ.[569]

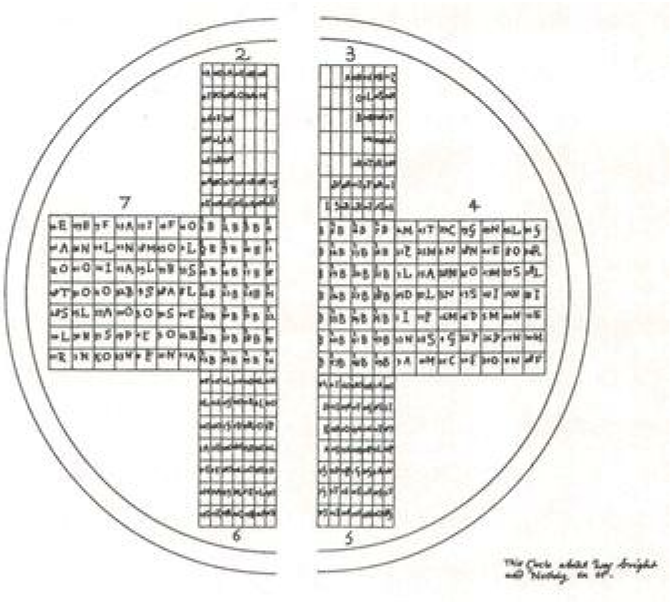
Behold these Tablets: Herein lye theyr names that work under God uppon earth: not of the wicked, but of the Angels of light. The Whole Gouernment, doth consist in the hands of 49: (in God his Powre, Strength, Mercy, and Iustice) whose names are here euident, excellent, and glorious. Mark these Tables: Mark them. Record them to your Cumfort.

This is the first knowledge. Here shall you haue Wisdome. Halleluyah.

Mighty and Omnipotent art thow, O God, God, God, amongst thy Creatures: Thow fillest all things with thy excellent foresight. Thy Glorie be amongst us for euer. Δ: Amen.

E.T: All the 7 (which here appeare) ioyne theyr Tables in One: Which, before they held apart. And they be of this Forme all to-gither. The myddelmost is a great Square and on eche side of it, One, as big as it, ioyning close to it. And ouer it ioyned two, which both togither wer æquall to it: and under it, wer such other two, as may appear in this little pattern. Being thus ioyned, a bright circle did cumpas and enclose them all, thus: but nothing was in the Circle.





[44 E: forte I, as in Baligon.]

E.T: One stept-furth, and sayde,

1: Wilt thow haue witt, and wisdome: Here, it is. (Δ: Pointing to the middle table.)

2: Another sayd, The Exaltation and Gouernment of Princes, is in my hand. (Δ: Pointing to that on the left hand of the two uppermost.)

3: In Cownsayle and Nobilitie I prevayle. (Δ: Pointing to the other of the two uppermost: which is on the right hand.)

4: The Gayne and Trade of Merchandise is in my hand: Lo, here it is.

Δ: He pointed to the great table on the right side of the myddle Table, that I meane which is opposite to our right hand while we behold those 7 Tables.

5: The Quality of the Earth, and waters, is my knowledge, and I know them: and here, it is. (Δ: Pointing to that on the right hand: of the two lowermost.)[570]

6: The motion of the Ayre, and those that moue in it, are all known to me. Lo here they are. (Δ: Pointing to the other Table below, on the left hand.)

7: I signifie wisdome: In fire is my Gouernment. I was in the begynning, and shalbe to the ende. (Δ:

Pointing to the great table on the left hand of the Middle Table.)

Mi: Mark these Mysteries: For, this knowne, the State of the whole earth is known, and all that is thereon. Mighty is God, yea mighty is he, who hath Composed for euer. Giue diligent eye. Be wise, mery, and pleasant in the Lorde; in Whose Name, NOTE,

Begynne the Middle Table &c. Δ: I wrote oute of the stone the whole 7 Tables (as you see them here with theyr numbers and letters) while E.T. did vew them in the stone, and orderly express them.

Δ: As concerning 39 V . 47 L &c in the second Table, where are 7 places: and there but 6 numbers and letters, and yet euery place semeth to haue a letter, in the iudgment of E.T. his sight. Which is the Number and letter wanting, and where must it be placed?

Mi: Non potestis hoc videre sine ratione.[571]

> Δ: The Next day, as I was loking on the Tables being finished, and ioyned all togither in One Compownd Figure, E.T. cam to me, and stode by me, and his ey was on the forsayd place which I was forced to leaue empty, in the 7th and last. And behold he saw houering and hopping in the ayre, two numbers and two letters cuppled to them, ouer the sayd place, and the next before it. And that, which I had placed the sixth, was to be put in the seuenth place, and that which was wanting, was to be set in the sixth place being 30 N.[572]

E.T: Euery of the 7 Tables, as they wer written out of the stone do seme afterward to burn all in fyre: and to stand in fyre.

E.T: After all the Tables wer written, eche toke hir Table aparte agayn and stode in theyr order.

E.T: Note moreouer. The First, had Bokes in hir hand.

Kings -------------- The second, a Crown in hir hand.

Nobilitie -------------- The Third, Robes.

Merchants - Δ: - Aqua[573] - The fowrth, animal quadrupes vicium omnim colorum.[574]

Terra[575] - The fifth, Herbes.

Aer[576] - The sixth, a fanne.

Ignis[577] - The seventh, a Flame of fyre in hir hand. Mi: Decedite in nomine eius, qui vos huc misit.[578]

E.T: Uriel opened a boke in his own hand, and sayde,

Ur: **The Fontayne of wisdome is opened. Nature shalbe knowne: Earth with her secrets disclosed. The Elements with theyr powres iudged.** Loke, if thow canst (in the name of God) understand these Tables. Δ: No: Not yet.

Ur: **Beholde; I teache. There are 49 Angels glorious and excellent, appointed for the government of all earthly actions: Which 49 do work and dispose the will of the Creator: limited from the begynning in strength, powre, and glorie.**

These shalbe Subiect unto you, In the Name, and by Invocating uppon the Name of GOD, which doth lighten, dispose and Cumfort you.

By them shall you work, in the quieting of the estates, in learning of wisdome: pacifying of the Nobilitie, iudgement in the rest, as well in the depth of waters, Secrets of the Ayre, as in the bowells and entralls of the Earth.

Ur: Theyr Names are comprehended within these Tables. Lo, he teacheth, he teacheth, Lo, he instructeth, which is holy, and most highest. Take hede, thow abuse not this Excellency, nor overshaddow it with Vanitie, But stick firmely, absolutely, and perfectly, in the love of God (for his honor) to-gither.[579]

Be mery in him: Prayse his name. Honor him in his Saincts. Behold him in wisdome: And shew him in understanding. Glorie be to him; To thee ô Lord, whose name perseth[580] throwgh the earth. Glorie be to thee, for euer. Δ: Amen, Amen, Amen.

Ur: Lo, I will breifly teache thee; you shall know the Mysteries in him: and by him, which is a Mysterie in all things. The letters are standing uppon 7 equall numbers. The Number before them is signifying, teaching and instructing (from the first Table to the last,) which are the letters that shalbe ioyned to gither:[581] begynning all, with B, according to the disposition of the number untyll the 29[582] generall names be known. The first 29 are more excellent than the rest. Euery Name doth consist uppon the quantitie of the place: Euerie place with addition bringeth furth his name, which are 49.------- I haue sayde.----------Δ: I pray you to tell me the first Name. Ur: The first Name is BALIGON.

Mi: I haue to say to thee,[583] and so haue I done:

Δ: Now he spake to E.T., of the matter he sware him to, at the begynning of this last Instruction: and he told me afterward what Michael had willed and moved him unto. Wherat he seamed very sore disquietted: and sayd this to me,

E.T: He sayd that I must betake my self to the world, and forsake the world. That is that I shold marry. Which thing to do, I haue no naturall Inclination: neyther with a safe Conscience may I do it, contrary to my vow and profession. Wherfore I think and hope, there is some other meaning in these theyr wordes.

Mi: Thow must of force kepe it. Thow knowest our mynde.

Δ: Deo opt. Max°. omnis honor laus et gloria in sæcula sæculorum. Amen.[584]

Liber 4.

Fryday Maij 4: hor 2½ a meridie

Δ: E.T. wold not willingly now deale with the former Creatures, utterly misliking and discrediting them, bycause they willed him to marry. Neyther wold he put of his hat in any prayer to god, for the Action with them: whereuppon I went into my Oratorie, and called unto God, for his diuine help for the understanding of his laws and vertues which he hath established in and amongst his Creatures, for the benefyt of mankinde, in his seruice, and for his glorie &c. And commyng to the Stone, E.T. saw there those two, whom hitherto, we wer instructed to be Michael and Uriel.

E.T: Michael and Uriel, both kneled holding up theyr hands: and Michael seamed to sweat water abundantly, somwhat reddish or bluddish. There cam 7 Bundells down, (like faggots) from heven-ward. And Michael taketh them kneeling. And Uriel taketh a thing like a superaltare and layeth it uppon the Table: and with a thing like a Senser doth make perfume at the fowre corners of the Table: the smoke ascending up: and the senser, at the last, being set on the Table it seemed to fall throwgh the Table.

URIEL semeth to be all in a white long robe tucked up: his garment full of plightes[588] and seemed now to haue wyngs: (which, hitherto, from the begynning of these kinde of Actions he did not) and on his hed a bewtifull crown, with a white Cross ouer the Crown.[589] Uriel taketh the 7 Bundells from Michael: and with reuerence layeth them on the forsayd Superaltare.

E.T: There commeth a man, as thowgh he were all of perfect pure glistring gold: somtyme seeming to haue One eye, and somtyme Three. From under the Table commeth a great smoke, and the place semeth to shake.

Uriel lieth now prostrate on his face: and Michael contynually prayed sweating.

The Glorious man seemed to open the Covering of the 7 bundells (being of diuerse cullored sylk,) and there appered, that these Bundells seemed to haue in them, of all Creatures some, in most glorious shew. The glorious man seemed to stand uppon a little hill of flaming fyre. He taketh-of, of one of the Bundells a thing like a little byrd; and it hoouereth affore him as thowgh it had life: and than it rested uppon the thing like a superaltare.

This glorious man[590] seemeth to be open before, and his brest somwhat spotted with blud. He hath a berd forked of brownish cullour, his heare of his hed, long, hanging down to his sholders: but his face, for beutifull glittring, can not be discerned. His heares do shake, as thowgh the wynde carryed them. This man blesseth the bird, making a Cross ouer it: and, so he did three tymes. He looketh up to heven. Now the byrd, which, before, seamed to be but as byg as a sparrow, seameth to be as great as a swanne: very beutifull: but of **many cullours.**[591]

Now looketh Michael up, and held up his hands to heven, and sayeth,

> Sic, Sic, Sic, Deus noster.[592]

Uriel, (sayd)- Multiplicabit omnia, benedictione sua.[593]

The former Bewtifull man taketh this fowle, setteth it on the bundell, and on the place, from whence it was taken:[594] And, now, the place where this byrd stode before, seameth allso, to be (proportionally) waxen as big as the byrd, (thus enlarged). This man taketh an other byrd, and putteth the wyng of it, **behind** the wyng of the first (as-thowgh he yoked them.)[595]

This second byrd, at this his first taking, was as byg, as the first was become, (encreased, as it shewed), and it was allso a very bewtifull ....

E.T: All is suddenly dark, and nothing to be seen, neyther Chayre, nor any thing els.

E.T: A voyce was hard, like Michael his voyce, saying,

It was a byrd, and is a byrd, absent there is nothing but Quantitie.

A voyce:[596] Beleue. The world is of Necessitie: His Necessitie is gouerned by supernaturall Wisdome. Necessarily you fall: and of Necessitie shall rise agayne. Follow me, loue me: embrace me: behold, I, AM.

E.T: Now all the Darknes vanished, the man is gon. Uriel standeth at the Table, and Michael sitteth now in his Chayre: and sayd,

Mi: This doth GOD work for your understanding. It is in vayne to stryve: All Government is in his hands. What will you els, what will you els?

Δ: Progressum et profectum in virtute et veritate ad Dei honorem et gloriam.[597]

Mi: This hath answered all our[598] cauillations.

Δ: What hath answered all our Cavillations?

Mi: Thow hast written.

One thing you shall see more, as a persuasion to the Infirmitie.

E.T: The two byrds, which were there, before, and gon out of sight, now are shewed agayn: but none of the bundells appere. They seme to grow to a huge bignes, as byg as mowntaynes: incredibly byg: and they seeme to hover up in the ayre, and to fly up toward heuen, and with theyr wyngs to towch the sky: And one of them with his bill seemeth to take sterrs into it: and the other bird to take them from the same byrd, and to place them agayn in the Skye. And this they did very often: and in diuerse places of the heuen with great celeritie.

After this they semed to fly ouer Cities, and townes, and to break the clowdes in peces, as they passed: and to cause all dust to flye from all walls, and towres, as they passed, and so to make them clene. And in the streetes, as these two Byrds flew, seemed diuerse brave fellows, like bisshops, and Princis and Kings, to pass: and by the wyngs of these byrds, they were striken down. But simple seely[599] ones, like beggers, lame and halt, childern, and old aged men, and wemen, seemed to pass quiettly, untowched and unouerthrown of these two Byrds.

And than they seemed to come to a place, where they lifted up, with the endes of theyr wyngs, fowre Carkasses of dead men (owte of the grownde) with crownes on theyr heds: wherof one seemed to be a Childe. First these 4, seemed leane, and deade: Then they seemed quick[600] and in good liking:[601] And they being raysed up: parted eche from the other, and went into 4 sundry wayes, Est, West, North and Sowth.

Now these two fowles hauing theyr wyngs ioyned togither, light uppon a great hill: and there the First fowle gryped the erth mightyly and there appeared diuerse Metalls, and the ^ Fowle spurned them away, still.

Then appeared an old mans hed, heare and all, on; very much wythered. They tossed it betwene them, with theyr feete: And they brake it: And in the hed appeared (in steede of the braynes) a stone, rownd, of the bignes of a Tennez ball of 4, cullours, White, black, red, and greene.

One of them (he that brake the skull), putteth that rownd stone to the others mowth or byll. The other eateth or nybbleth on it, and so doth the other allso.

¶ Now these two byrds, are turned into men: And eche of them haue two Crownes like paper

Crownes, white and bright, but seeme not to be syluer. Theyr teeth are gold, and so likewise theyr hands, feete, tung, eyes, and eares likewise All gold.

On eche of these two men, ar 26 Crownes of Gold, on theyr right sholders, euery of them, greater then other. They haue, by theyr sides, Sachels, like palmers[602] bags, full of gold, and they take it oute, and seemed to sow it, as corne; going or stepping forward, like Seedmen.

E.T: Then sayd Michael, This, is the ende.

E.T: The two men be vanished away.

Mi: Learne the Mysterie hereof.

Δ: Teache us (ô ye spirituall Creatures.) Than sayd Michael,

Mi: Joye and helth giue unto the riche:

Open strong locks:
Be Mercifull to the wicked:
Pluck up the poore:
Read unto the Ignorant:
I haue satisfyed thee: Understand:
Read them ouer: God shall giue thee some light in them. I haue satisfyed thee:

Both, How you shalbe ioyned,

By whome,
To what Intent, and purpose:
What you are,
What you were,
What you shalbe, (videlicet) in Deo.[603]

Lok up this Mysterie:

Forget not our Cownsayle:

O GOD, thow openest all things: Secret are thy Mysteries and holy is thy name, for euer. The vertue of his presence, here left, be amongst you.

Δ: Amen.

Δ: What am I to do, with the wax, the Table, the ring or the Lamine? &c.

Mi: When the things be ready, then thow shalt know, how to use them.

Δ: How shall I do for the grauing of the ring; May not another man do it, thowgh, E.T. graue it not?

Mi: Cause them to be made up, (according to Instruction) by any honest man.

Δ: What say you as concerning the Chamber, for our practise? May my fardermost little chamber, serue, yf the bed be taken downe?

Mi: At my next Call, for the Chamber, you shall know what to do.

Δ: Benedictus Deus in donis suis:

et sanctus in omnibus operibus eius.[604] Amen. ended hor. 4½[605]

✝

Quartus Liber Mysteriorum

A°. 1582
Nouembris 15.

Post reconciliationem Kellianam.

Miserere nostri Deus

Dimitte nobis, sicut et nos dimittimus[606]

Thursday. Nouembris 15.[607]

...

At the first, Uriel pluckt a thing from under the Covenant Table: **and it grew Rownd, Bigger &; bigger, (of fyrie Cullour) bigger then all the world: and he sayd to me Δ:**

Uriel: Ultima est hæc ætas vestram, quæ tibi revelata erit.[608]

Then cam swarming into the stone, Thowsand yea Inumerable people, Uriel sayd,

Est in mundo, et incipiet cum illo alter Mundus.[609] and he bad,

Note the forme of the thing seen. Note the cullour. The forme of the thing seen was a Globe Transparent fyre within which the people seemed to stand, Towers and Castells. &c. did appere therein, likewise. This Globe did king CARMARA seeme to go uppon, & to measure it: and there appeared a very riche chayre to be set: allmost at the top of the Convexitie of the sayd Globe. wherein he sat down.

...

Michael: The Mysteries of God haue a tyme: and Behold, Thow art provyded for that tyme.

...

All those before spoken of are Subiect to thy Call....

Of friendship, at any tyme, thow mayst see them: and know what thow wilt.

Every one (to be short) shall at all times and seasons shew thee direction in any thing....

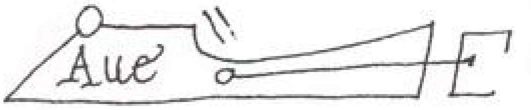
One thing I answer thee, for all offycis. Thow hast in subiection all officis. Use them whan it pleas thee, as thy Instruction hath byn.

...

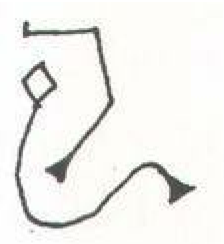
King CARMARA[610] - This king, (being called first by Uriel,) appeared, as a Man, very well proportioned: clad in a long purple Robe: and with a Triple Crowne of Gold on his hed. At his first coming he had 7 (like men) wayting on him: which afterwarde declared them selues to be the 7 Princis Heptarchicall. Uriel deliuered unto this king (at his first appearing) a rod or straight little rownd Staff of Gold: diuided into three equall distinctions, whereof, two were dark or blak: and the third bright red. This red he kept still in his hand.

...

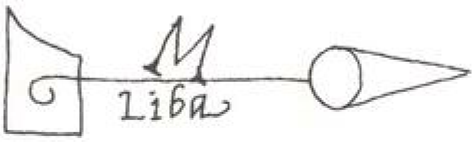
King BOBOGEL appeared in a blak veluet coat, and his hose close, rownd hose with veluet upperstocks: ouerlayde with gold lace: On his hed a veluet hatcap, with a blak feather in it: with a Cape hanging on one of his sholders, his purse hanging abowt his neck and so put under his gyrdell at which hong a gylt rapier, his berd was long: he had pantofells and pynsons. And he sayd, I weare these Robes, not in respect of my self, but of my government, etc.



Prince BORNOGO appeared in a red Robe, with a Gold Cerclet on his hed: he shewed his Seale, and sayde, This it is.

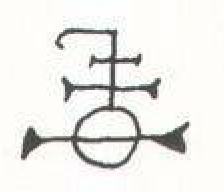


King BABALEL...

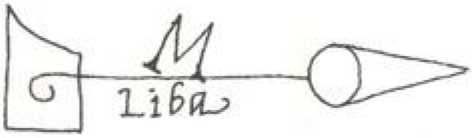


Prince BEFAFES appeared in a long red robe, with a cerclet of Gold on his hed. He had a golden girdle: and on it written BEFAFES. He opened his bosom, & appeared leane: and

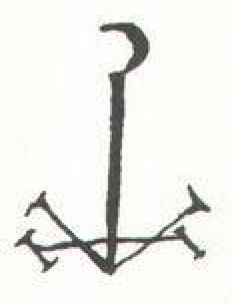
seamed to haue feathers under his Robes. His Seale, or Character, is this:



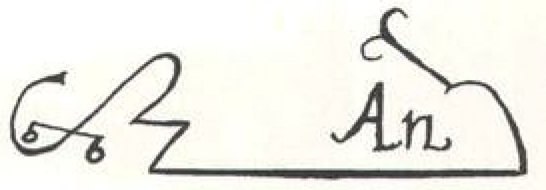
King BYNEPOR...



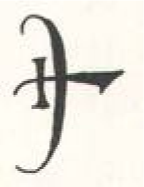
Prince BUTMONO appeared in a red Robe, with a golden Cerclet on his hed:
His Seal is this:



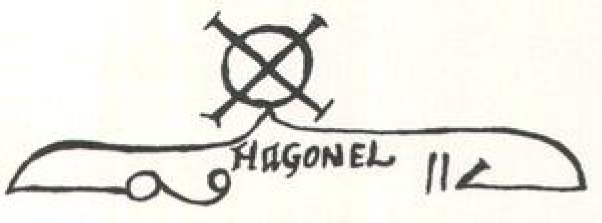
King BNASPOL...



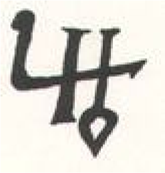
Prince BLISDON appeared in a Robe of many Cullours: and on his hed a Cerclet of Gold. His Character, or seale:



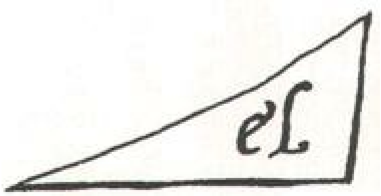
King BNAPSEN...



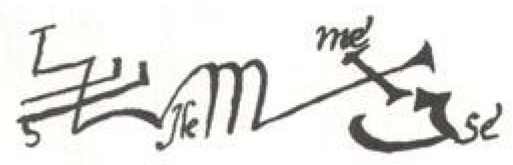
Prince BRORGES appeared in his red apparayle: & he opened his Cloathes and there did issue, mighty & most terrible or grisely flames of fyre out of his sides: whych no mortall eyr could abyde to loke uppon any long while. His Seale, or Character is this:



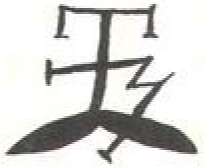
King BALIGON...



King BLVMAZA...



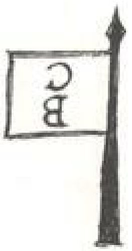
Prince BRALGES appeared in a red Robe with a Cerclet on his hed. This is the Seale of his gouernment:

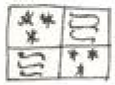


One[611] (of the 7 which was by him) he who stode before him, with his face from ward him, now turned his face to him ward.[612]

Regnat potestas tua in filijs. **Ecce signum Operis.**[613]

Δ: There appeared these two letters, euersed and aversed, in a white flag and a woman standing by, whose armes did not appere.



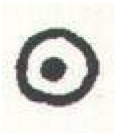


Note. My name is Carmara.[614]

Δ: On the other side of the flag appeared the armes of England. The flag semed old.

Adhuc duo, et tempus non est.[615] (Δ: Sayd the man[616] which stode before Carmara,) and lifted up his hand and avaunced his body: and the other 6 gaue him place. He spred his armes abroad: and so turned rownd toward all the multitude (appering within the Globe:) as if he wold require audience. He sayd than thus,

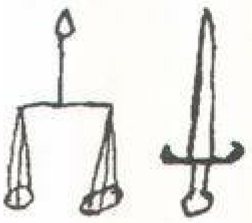
The Sonnes of men,[617] and theyr sonnes, ar subiected unto my commaundent. [618] This is a mystery. I haue spoken of it. Note it throwghly. They ar my seruants. By them thow shalt work mervayles. I gouern for a tyme:[619] **My tyme[620] is yet to come. The Operation of the Earth is subiect to my powre:[621] And I am the first of the twelve. My seale is called Barees: and here it is.**

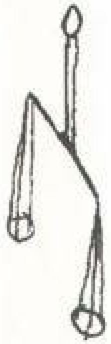


(Δ: This he held in the palm of his hand: as thowgh it had byn a ring, hanging allso over his myddle fingers[622]). With a great voyce he sayd, Come ô ye **people** of the erth:[623]

1. (Δ: Then there cam a great Number of onely **Kings**, from amongst the rest of the multitude within the Globe: They kneele down; and some kyssed his seale and some did stand frowning

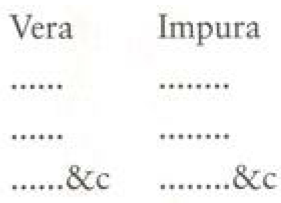
at it. Those kings that kissed it, had, eche of them, a sword in one hand, and a payre of Ballance in the other: the balances being euen, and counterpeysed.[624] But the other had allso ballances, which hong uneven, the one scale lower then the other. The euen balanced kings were of glad cheare:[625] but the other wer of a sowre and hevy cowntynance.





It is, and shalbe so: And the workmanship of this, is to this ende.

2. Then cam noble men: (Δ: and he held up his hand,) and they parted them selues into two Cumpanyes: and ouer the heds of them, appered these two wordes. Vera,[626] over one Cumpany: and Impura[627] over the other.



Vera	Impura
......	....
......	....
......&c	........&c

Verus cum veris, et Impurus cum Impuris.[628]

3. Come ô ye Princes of Nature. Δ: Then cam in Anncient and graue Cowtenanced men in blak gownes: of all manner of sortes.[629] Diuerse of them had bokes: and some had stiks like measures:[630] and they parted into two Cumpanies. Eyther cumpany had his principall. One of these Cumpanies fell at debate among them selues. The other Cumpany stode still. There appeared before eche of these Cumpanyes a great boke. Uppon the bokes was written; on the one, Lucem; and on the other, Mundi tenebras.[631] The Forman spred his hands ouer them, and they all fell down: and the boke with Lucem[632] on it waxed bright: and they which attended on

that boke (Lucem) departed.

Gather, by these few spriggs the Cumpas of the whole field. Δ: I demaunded of him, what his name was: and he answered,[633]

I am Primus et Quartus[634] Hagonel.

Δ: This Pri. Quar, shewed his[635] seal ⊙ to the Multitudes and they beheld it, and of them some florish, som stand, and some fall.

1. [Δ: Then he sayd,] The first were the Kings of the earth; which tell the priks of the last , take place, are, and shall be. In this thow mayst lern science. Note a mysterie. Take a place, is as much, as, Ende with place.

   Δ: Then he threw down a great many of them before him. Here is his name, (pointing to [Δ = Carmara[636]] on the upper part of the Globe.) Not withstanding I am his Minister - [D in generall particularly Blumaza.]

   There are kings fals and uniust, whose powre as I haue subuerted and destroyed, so shalt thow. Thow seest the weapons.[637] The Secret is not great.

   Δ: I know not what the weapons are. Pri. Quar. sayd, Write, and I will tell thee. Δ: The three, of eche side did syt down while Pri Quar did thus speake.

   I am the first of the fowrth Hagonel.

   Δ: I had thowght that ye sayd before, you had byn the first and the Fowrth of Hagonel.

   Pri Quar. I am HAGONEL, and govern HAGONEL. There is Hagonel the first, Hagonel the second, and Hagonel the third, I am the first that gouern the three. Therfore I am the first and last of the fowre.[638]

   Δ: In the meane space of the former multitude some were falln deade, of some theyr mowthes drawn awry: of some theyr legs broken &c. And then, pointing to (Δ: = Carmara) he sayd,

   In his name, with my name, by my character and the rest of my Ministers, are these things browght to pass.[639] These that lye here, are lyers, witches, enchanters, Deceyvers, Blasphemers: and finally all they that use NATVRE, with abuse: and dishonor him which rayneth for euer.
2. **The second assembly were the Gouerners of the Earth, whose glory yf they be good, the weapons which we haue towght thee, will augment: and Consequently, if they be euill, pervert.**
3. **The third assembly are those which taste of Gods mysteries, and drink of the iuyce of Nature, whose myndes are diuided, some with eyes looking toward heaven, the rest to the center of the Earth. Ubi non Gloria, nec bonitas nec bonum est.[640] It is wrowght, I say, it is wrowght (for thy understanding) by the seuen of the seuen which wer the sonnes of sempiternitie,[641] whose names thow hast written[642] and recorded to Gods Glory.[643]**

   Δ: Then he held up his hands, and seemed to speak but was not herd (of EK[644]) as he told me: and theruppon Pri Quar sayd, Neyther shalt thow heare, for it is Vox hominibus non digna. Illi autem cum filijs suis laudauerunt Deum. Benedictus est qui fiius est unicus,

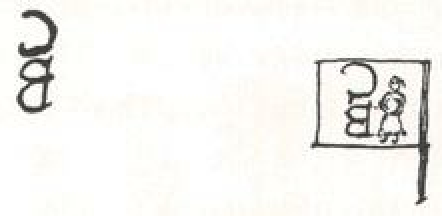
et Gloria mundi.[645]

EK saw like a black cloth[646] come-in and cover all the forepart of the stone, so that nothing appeared in the stone. Then was hard a voyce saying, Loke for us no more at this tyme: This[647] shalbe a token, (from this tyme forth) to leaue.[648]

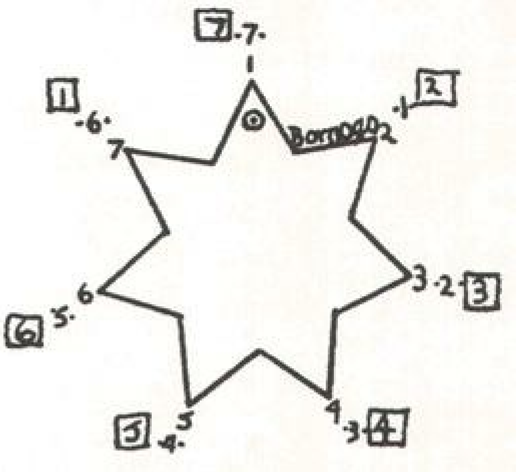
Δ: Laus et Honor sit Deo Immortali et Omnipotenti nunc et semp. Amen.[649]

1582 Die ♀ A meridie: hora 5. Nouemb. 16.

Δ: He with the triple Crown on his hed, in the long purple robe , had now onely that part of the rod in his hand, which was clere red: the other two parts being vanished awaye. He shoke his rod, and the Globe under him did quake. Then he sayde, Ille enim est Deus, Venite.[650] Δ: All the 7 did bow at his speache. He holdeth up the flag, with the picture of a woman paynted on it, with the (as before was noted) on the right side of her.



And on the other side of the flag, were the Armes of England. He florished with the flag very muche, and went as thowgh he did marche, in warlike manner uppon the upper and utterparte of the Globe. He pointed up to the Flag and sayde, There is two to come, there is no more.[651] All the people in the Globe seamed to be glad and reioyce. Now he setteth down the Flag, and sayd, Come, Come, Come; And the 7 cam all before him. They hold up all togither, Heptagonum stellare, seeming to be Copper.[652]



1: The first Holder,[653] sayd, Me nosti:[654] and so pulled his hand of from the Heptagonum.
2: The second of the .7. taketh his hand of and doth reverence and sayd, I am he which haue powre to alter the Incorruption of NATVRE. With my seale, I seale her and she is become perfect. I prevayle in Metalls: in the knowledge of them: I haue byn in Powre with many, but Actually with few. I am of the first of the[655] twelue the Second of the

Seuen. Wilt thow know my name?

Δ: Full gladly.

I am BORNOGO: this is my Seale: This is my true Character. What thow desyrest in me shalbe fullfilled. Glory to God. Δ: He kneled down, and held up his hands toward the Heptagonum.

3: The next (or third) sayd, I am the Prince of the Seas: My powre is uppon the waters. I drowned Pharao: and haue destroyed the wicked. I gaue **life unto the** seas: and by me the Waters move. My name was known to Moyses. I liued in Israel: Beholde the tyme of Gods visitation. I haue measured, and it is ‘8’.[656] This is a mysterie. God be mercifull to his people. **Behold, Behold Lo, behold, my mighty powr consisteth in this. Lern wisdome by my words. This is wrowght for thy erudition, what I enstruct thee from God: Loke unto thy charge truely. Thow art yet deade: Thow shalt be reuiued. But oh, bless God truely: The blessing that God giueth me, I will bestow uppon thee by permission.**

Ô, how mighty is our god which walked on the waters; which sealed me with his name, whose Glory is without ende. Thow hast written me, but yet dost not Know me. Use me in the name of God. I shall at the tyme appointed be ready. I will manifest the works of the seas and the miracles of the depe shalbe knowne. I was Glorifyed in God. I Skurged the world. Oh oh oh, how they do repent. Misery is theyr ende, and Calamitie theyr meat. Behold my name is print..... for euer: behold it. Δ: He opened his bosom and seamed leane: and seemed to haue feathers[657] under his robes. He had a golden gyrdel: and on it, written BEFAFES. Than he sayd, Blessed be thow Ô God, God, God, for euer. I haue said.

Δ: He toke his hand of from the Heptagonum.

Δ: The blak Cloth was drawn: which is now appointed to be our token from them, that we must leave of for that instant.

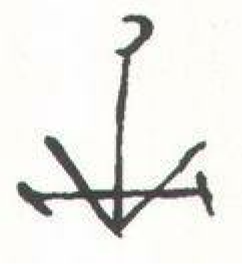
Δ: Deo soli, omnis honor, et Gloria.[658] Amen.

Friday. After drinking at night, circiter horam 8 ã.

Δ: On the left side of H (sitting in the Chayre) appeared yet three, holding up the Heptagonum, on one on the other side below. He sat with his face from EK toward me. I stode and my face sowthward. EK he sat at the same table, with his face Northward.

4: The Fowrth[659] (holding below) Cryed: Earth, Earth, Earth.

EK: He speaketh Hollow, so that I understand nothing. Δ: Than he answered, They are the wordes of my Creation, which you are not worthy to understand. My Powre is in Erth:[660] and I kepe the bodies of the Dead.[661] Theyr numbers are in my bokes. I haue the key of Dissolution. Behold, Behold, All things, yea All things, haue theyr workmanship with me. For I am the ende of working. EK: He falleth down prostrate, and speaketh, I know not what, Δ: Than he sayd, I haue the light of his anger,[662] and I will **destroy** it. Ô, Ô, Behold, It is a light left within the bottomles pit. It is the ende and the Last. O blessed shall thy name be, Blessed shall thy name be for euer. Behold this is my seale:



Behold, the bowels of the earth are at my opening. Δ: Than I requested him to help me with some portion of Threasor hid,[663] to pay my detts withall and to buy things necessarie &c. He answered, O wordling thow shalt be satisfyed with welth of this world. Behold Behold Lo, lo Behold, vehemently I say Behold. I haue, horded Threasor, for the sonne of perdition,[664] the first Instrument of his destruction. But, lo these Cauerns. Δ: He shewed to EK the Cavernes of the earth, and secret places therof and afterward sayd: **Mark this, All spirits, inhabiting within the earth, where, their habitation is, of force, not of will, (except the myddest of my self. which I know not), are subiect to the powre hereof. Δ: Pointing to his Seale.[665] With this you shall govern, with this you shall unlok. With this (in his name who rayneth) you shall discouer her entrayles.** How say you now? Can you do it? Ar not your Magiciens acquaynted with me? Yt greueth me to regester the bones of the Wycked. Prayse him Butmono, Prayse him Butmono, prayse him. Δ: Is that your name, I pray you tell me. He answered, yea it is my name. It is the ende[666] of all things. EK: Now he sitteth down.

5. Δ: Now the Fifth turned his face toward EK (Who [EK] sat before me, and opposite unto me) and stepped furth and sayd: I am life and breath in Liuing Creatures.[667] All things liue by me, the Image of One excepted.[668] Behold the face of the Earth. EK: There appeareth all Kindes of

brute beastes, fowles, Dragons, and other. Δ: He Clapt his hands to gither and they all, vanished away at ones: they cam agayn: and went then away and retorned no more. But the people within the Globe remayned still as from the begynning: he sayd while the beastes were yet in sight, Lo, all these, do I endue with life: my seale is theyr Glory. Of God I am Sanctifyed: I reioyse: (1) the **Liuing**, (2) The ende, and (3) begynning of these things,[669] are known unto me: and by sufferance I do dispose them untyll my Violl be run. EK: He taketh owt of his bosom a little vyol glass: and there seameth to be fiue or six sponefulls of oyle in it. Δ: He answered and sayde, That it is: and it is a mysterie. Δ: I spake somwhat of this oyle, and he answered me, and sayd, Thow sayst true. In token of God his Powre and Glory, write down BLISDON. EK: He taketh his hand of from the Heptagonum.

6. The sixth pulleth open his Clothes and red apparell, and there yssueth mighty fyre oute of his sides. [Δ: Note, the cote of the first of these seuen is shorter[670] then any of his fellows coats are.] The sight of the fyre is very owgly, grisely, terrible, and skarsly of mans eye can be beholden. At length he pluckt his coates to gither, and sayd to EK, Ô I wold shew thee, but flesh and blud cannot see. Write shortly, (it is enowgh) Noui Januam Mortis.[671] Δ: Than sayd he to me in an ernest muse, Ô, Muse not, My words ar dark; but with those that see, light enowgh. Et per cussit Gloria Dei, Impiorum parietes. Dixi.

   Δ: In mervaylous raging fyre, this worde BRORGES[673] **did appeare, tossed to and fro in the furious flames** thereof, so abundantly streaming out, as yf all the world had byn on fyre, so that EK, could not endure (without great annoyance to his ey sight) to behold the same. And finally he sayd, Mysteria in animis vestris imprimite.[674] And so the fyre vanished away.

7. **EK:** The stone semeth all Blew: and **onely One now beholdeth the Heptagonum: all the rest being set down: who semed now to extend theyr hands one toward an other, as thowgh they played, now being rid of theyr work.** Now the last putteth his hand to the Heptagonon and turned his face to EK hauing his face (all the while before) turned toward D. He sayd, The Creatures liuing in my Dominion,[675] ar subiect to my powre. Behold I am **BRALGES**.[676] **The powres under my subiection are Invisible**. Lo what... are. **EK: All the world semed to be in brightnes** or w... fire: and **therin appered Diuerse little things like little smokes without any forme.**[677] He sayd, **This is the seale**[678] **of my Gouernment.** Behold I am come, I will teache the names without Numbers. The Creatures subiect unto me shalbe known unto you.

¶ **Beware of wauering. Blot out suspition**[679] **of us for we are Gods Creatures, that haue rayned, do rayne & shall raigne for euer. All our Mysteries shalbe known unto you.**[680]

EK: All the 7 vanished away, onely H remayning who sayd (being stand up, and leaning uppon his Chayre, and turned to **EK**), **Behold, these things, and theyr mysteries shalbe known unto you, reseruing the Secrets**[681] **of him which raigneth for euer: [EK: The voyce of a multitude, answered singing,] Whose name is Great for euer. H Open your eyes, and you shall see from the Highest to the lowest.**[682] **The Peace of God be uppon you.**

Δ: Amen. **EK**: The blak Cloth was drawn before all the things conteyned in the stone: which was the Token of Ceasing for that tyme:

Sanctus sanctus sanctus Dominus Deus noster.[683]

Anno 1582: Saterday. Die 17. Nouemb: A meridie hora circiter 1 ã.[684]

Δ: The Cloth remayned drawn, a prety while after we had done our prayers to God, and so was all the things in the stone kept from sight.

Δ: The Man with the Crowne,[685] (he onely) appeared first, and the transparent Globe with the people of the world in it, as before. The Diaphanitie, or (as it wer) the Shell of the forsaid Globe, was very glystring bright. The man[686] shaked his hand toward me and the bak of the Chayre was toward EK. On the globe appered a trace like a seame, of two things ioyned to gither, or rather a very narrow path: which began below on the Convex superfices of this globe and went upward to the verticall point or (as it wer) the zenith prik of it: but from the lower part of the same to the place where the chayre stode, it seamed broder, and more worn, than from the chayre up to the vertex or top prik: for that part (which semed to be about the eighth part of the whole) did appere very smalle, and unworne, or unoccupyed.

Δ: He turning his face toward EK, spake thus, I haue declared things past and present. And now I speak of things to come. The Whole shalbe manifest. Nam ipse unus et Indiuisibilis est. Gloria Gloria Gloria Creatori nostro.[687] Two partes[688] are yet to come, the rest are finished allready. Δ: He shewed the rownd Table[689] with letters and numbers which master Kelly sent me: and than he toke it away agayn. Then he sayd,

> Venite gradatim repetamus,[690] opera Dei.[691]

Δ: The first of the .7. which had yesterday appeared, did now appere with the short robe,[692] as he did before. Than H sayd smylingly (being turned to EK),

> Hæc sunt documenta tua,[693] quæ nondum intelligis.[694]

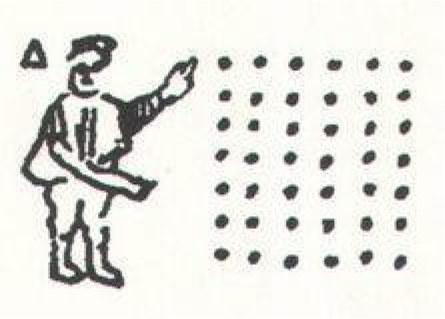
Δ: Than the man with the short robe, the Forman of the 7 (yesterday appearing) sayd,

> Unus est Deus, et Unum est opus nostrum.[696]

Δ: Then cam very many uppon the Globe his convex superficies and they sayd,

> Parati sumus seruire Deo nostro.[697]

Δ: Eche of these had somwhat in theyr hands. Som had crownes, some garments &c.[698]
The number of them was: 42: and stode in this order:



and sayd embracing (as it wer) the whole number of this Cumpany,

Et nomen meum, numerus est totus
Nec est crimen in numero nostro
Moyses nos nominauit.
Potestas istorum, quàm istarum, quamvis non una,
tamen in uno sunt.[700]

Δ: I sayd that I thowght there wanted at the begynning of this sentence, this word Tam.[701] He answered, it might be understode by his pointing to them there standing, and sayd farder in respect of this my dowt, Quatenus est hæc vanitas vestrorum? Tu nosti numeros hos esse in Deo, in Mundo, et in minori mundo. In Deo, id est Nobiscum. In Mundo, quantum apud vos: In minori Mundo, quantum in vobis.

(Combinatur animus tuus cogitatione.) Disseritur apud Phõs., idque maximè) de NATVRA, quæ non vobiscum, sed nobiscum (ah, ah, ah) et in nostra potestate est. Videbis Deum. Vidisti opera nostra, Opera (inquam) manuum suarum: Digito Dei mouebimur. A Deo venit. Homo, et cum hominibus fuit: est enim cum illis. Illius namque potestas, vim, virtutem, et esse dat,[702] non nobis solum modo, sed operibus nostris.

Inhumata tibi anima tua, quid quærit?[703]

Δ: I understand you now: He answered Ab humo, homine: Ab homine dictum est.[704] I axed thee, what thow desyrest.

Δ: Wisdom, and Veritie, I answered: // then, he answered, H: Thow shalt. Δ: There cam in a smyling fellow: and they pluckt him, and towsed him. He cryed he wold tell Newes: and they answered, that there was none for him to tell: and he skaped[705] from them, or they let him slyp, with all his clothes torn of: and he semed to crepe or get away under the globe, and (as it wer) to get behinde the Diaphanous Globe.

Δ: These 42 had all of them somwhat in theyr hands: as eyther whole Crownes, or 3/4 of Crownes, or robes &c. Six of them semed more glorious than the rest, and theyr Coates longer: and had cerclets (abowt theyr hed) of Gold: and these had perfect Crowns in theyr hands. The second six had thre quarters of Crownes, the Third six, haue clothes[706] in theyr hands.[707] All the rest semed to haue balls of gold: which they toss from one to an other: but at the catching they semed empty wynde balls: for they gripe them, closing theyr hand, as yf they wer not solid, but empty, like a bladder.[708]

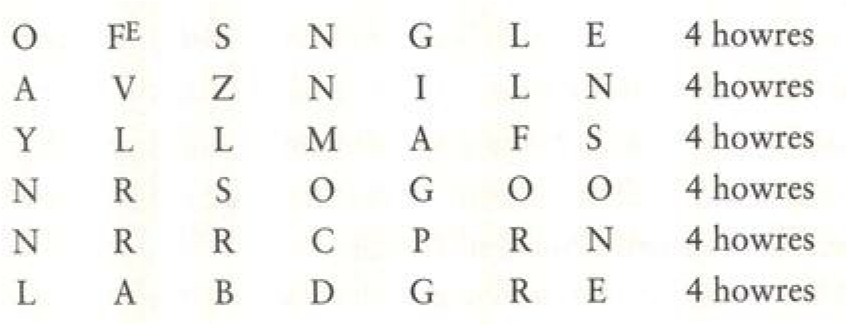
Δ: The first six sayd, Our names cannot be expressed: neyther can the names of these that follow.

Δ: The first six made cursy to the man with the short robe: the second six made cursy to the first, and the Third to the second, and they all, and the short robed man, made cursy to H.

Our workmanship is all one. Δ: Sayd the short robed man.[709]

H: The whole day is diuided into 6 partes:[710] Euery part occupyeth a part of them here. (Δ: Pointing to the 42 standing there.) Therfore yf thow wilt work with Kings (thow knowest my meaning), finally what so euer thow wilt do in theyr estate, Cast thyne eye unto the first place. In all good causes thow shalt work by six in generall. The rest are for Depriuation: I meane the next six. The residue all do serue to the entents and purposes apperteyning unto Kings. But bycause thow shalt not be ignorant, what they are, in name, they shall shew forth theyr Tables.

Δ: Than they, spedyly (eche of them uppon the place of theyr standing) made a square table: and euery table had but one Letter. The first of the first six did go away, and in his table appeared an O, &c, and so of the second six, orderly theyr letters appeared in theyr tables: But the Third six, they cowred down uppon theyr letters, and were loath to shew them: but at length, did &c: and at the last of euery row, they all cam togither &c.



O	FE	S	N	G	L	E	4 howres
A	V	Z	N	I	L	N	4 howres
Y	L	L	M	A	F	S	4 howres
N	R	S	O	G	O	O	4 howres
N	R	R	C	P	R	N	4 howres
L	A	B	D	G	R	E	4 howres

H: Remember how they stode, when they wer secondly disposed unto thee: They stode first in six rows; and next they wer turned into 7.[711] I speak of the greater number and not of the less. In speaking of the greater, I haue comprehended the lesser.[712]

Δ: They went euer away toward the[713] hand.

The third row went of lamenting: being commaunded by the Short robed man. All parted in fire, falling into the Globe. The fifth row did synk into the Globe, euery one in a sundry fyre by him self. The sixth fell with smoke down into the Globe.

EK: Now remayneth onely the man with the Crown H : he made shew with his hands, beckning toward E.K., and sayd, I haue told thee, that theyr workmanship, is to gither. Theyr names are uppon these tables. The first letter, is the Second letter, of the first[714] name of the Table.[715]

Thow hast 49 names in those Tables. Those names thow hast in former Tables by thee written: in that of 7 tymes 7. Confer it with the rownd Table.[716]

The first letter[717] from the point of his[718] sword, is B. That B signifieth the number of the Bees, begynning the 49 names, environing that Circle. In the former Tables thow shalt fynde B.1. B.2. B.3. B.4. &c and so to B.49. Those Bees begynne the names of all the powres that haue governed, do gouern, and shall gouern.

The next letter hath his circle and numbers going rownd abowt it: which thow shalt fynde in the former Tables. The letter standeth in the myddest of euery square, of euery Circle: thowgh some be turned upside down: Which onely signifyeth that they are Spirits of Destruction, wrath and Indignation in Gods Judgment. There are two numbers: that, on the right hand, over the letter, is the number pertayning to that letter.

O in the Circumference is the ninthe letter.[719]

Gather the former Tables to gither, which thow hast made before, conteyning 49, depending onely on B. Where thow shalt finde BOBOGEL, a name consisting on 7 letters, and so the rest. Reade my instructions as concerning those Tables, and thow shalt fynde the truth of them.-----------Ihaue sayd.[720]

Mighty is thy name, O God of Hostes:

Blessed is thy name, Ô Lord, for euer.
Δ:Amen.

After 7 of the clok at night. die ♄.[721]

H: Lo, here I byd them do, and they do. I haue appointed them, and they are contented. My Charge is not of my self, neyther do I speak darkly, obscurely or without a truth, in affirming that I towght thee those Tables: For they are from him, which made and created all things: I am from them[722] in powre and message, under whome I here rule[723] and shall do, tyll the ende[724] of all things be:[725] Ô, Great and bowntifull in his liberall mercy: The mercy of him, whome we prayse and laude and sing unto, with Joy for euer. Behold thow desyrest, and art syk with desire.[726] I am the disposer thowgh not the Composer of Gods medicines . Thow desirest to be cumforted and strengthened in thy labors. I mynister unto thee The strength of God.

What I say, is not of my self, neyther that which is sayd to me, is of them selues, but it is sayd of him which Liueth for euer.

These Mysteries hath God lastly, and of his great mercyes, graunted **unto thee.**[727] I haue answered thy dowting mynde.

Thow shalt be glutted, yea filled, yea thow shalt swell and be puffed up with the perfect knowledge of Gods Mysteries, in his mercyes. Abuse them not. Be faithfull. Use mercy. God shall enriche thee.

Banish wrath: yt was the first,[728] and is the greatest[729] Commaundement.

I rayng in him, and liue by him which rayngneth and liueth for euer.

Δ: I pray you make some of these last instructions, more playne, and euident.

H: I haue shewed thee perfectly. Behold I teache thee agayn. O how mercifull is God that revealeth so great secrets to flesh and blud? Thow hast 42 letters. Thy Tables, last, conteyn so many. Euery letter is the name particular by him self of the generall actions, being, and doing of these 42, which appeared with theyr workmanship. The first, was theyr Prince: and he gouerneth **onely**[730] theestate, condition and being, limited by God unto Kings of the earth. The 7 next him,[731] are those that are Messagers of God his good gifts to those that beleue him, and faithfully serue him: wherof few re ... and rayng now frutefull in his sight.[732]

Regnat, Regnat, Regnat ô regnat Iniquitas super faciem totius terræ Cor hominis impletum est malitia, et nequicijs. Incipit, incipit enim noua illorum potestas, illis non sine re dedita,[733] nec dis . . .[734]

Vide quæso.[735] Δ: He pointed down to the people, in the Globe, all being sore and diseased of some sore, ulcer, botch, &c.

H: All the residue of the Angels, (for so they are in dede) ar ministers of God his wrath and indignation uppon the Faythless:[736] whose myserie is most lamentable. 7 onely, haue 7 letters comprehending the dignitie of theyr vocation:[737] The rest are particular, not onely in powr, but allso in theyr vocation. Like leaves they spring and grow from one branche.

These words which thow seest in the last Table, **some** of them unhable to be pronownced, are notwithstanding the names of those 7[738] which held the fayr and bewtifull Crownes. Which names (as I sayd before) do comprehend not onely the **powre,** but allso the **Being of the rest.**[739] The whole Composition is the truth of the words. I will ones more teach. There were 42 that appeared, besides him, which was theyr prince. The first 7,[740] are called by those names, that thow seest, as OFS &c.

Δ: And so of AVZNILN &c. H : Thow hast sayde.

There are but 6 names,[741] that are in Subjection. I teache breifly. Doost thow not remember the **Circle** and the prick in the myddest: which was on the right hand[742] of him, that was theyr **Prince**? **That onely** representeth 7 in number which being added unto the rest maketh 49. Read the letters. Δ: I red OF &c, and he willed me to strike them out.

H: That is the name of **those** of the first of the 7.[743] which held the Crownes in theyr hands.

Note: The second line,[744] is the name of the second, and so to the ende of the table. 42 letters: 42 names: 42 persons.

The first, where his fote stode, is both his Name and Character.[745] And so of the second, Third &c.

Notwithstanding, Generally these are the names, the first 7, the One presupposed, the rest being six in order.

This is the truth, and the some of the Tables. Yt is easy to be understode and perfect.

Whan thow wilt work for anything apperteyning unto the estate of a good King: Thow must first call uppon[746] him which is theyr prince. Secondly the ministers of his powre ar Six:[747] whose names conteyne 7 letters apece: as thy Tables do manifest: by whome in generally, or by any one of them, in particularitie, thow shalt work for any Intent or purpose.

As concerning the letters particularly, they do concern the Names of 42 which 42, in generally, or one of them do and can work **the destruction**, [748] hindrance or annoyance of the estate, Condition or degree, as well for body as government, of any Wicked or yll Liuing **Prince**. In owtward sense, my words are true. I speak now of the use of one of the first, that I spake of, or manifested yesterday. Sayd I not, and shewed I not, which had the gouernment of Princes?[749] For, as it is a Mystery to a farder matter, so is it a purpose to a present use. Yf it rule worldly princis, how much more shall it work with the Princis of Creation?

Thow desyrest use, I teache use, and yet the Art is to the furder understanding **of all Sciences**, that are past, present or yet to come.[750]

Frute hath a furder vertue than onely in the eating: Gold his furder condition, property, and quality, then in melting, or common use. Kings there are in Nature, with Nature, and above Nature.[751]

Thow art Dignified.[752]

Δ: Yf I wold haue the King of Spayne his hart to be enclined to the purpose I haue in hand, what shall I do?

H: First Cast thyne ey unto the Generall prince,[753] Gouernor or Angel that is principall in this world.[754] [Δ as yet, is BALIGON or Carmara.]

Secondly consider the circumstances of thy Instruction.[755]

Thirdly place my name,[756] whome thow hast all ready.

Fowrthly, the name of him, which was shewed thee yesterday, whose garments were **short**, and of purple.[757]

Fifthly, his power,[758] with the rest of his six perfect Ministers.[759] With those thow shalt work to a good ende. All the rest thow mayst use to Gods Glorie. For euery of them shall minister to thy necessities. Moreouer, when thow workest, Thy feete must be placed uppon those tables[760] which thow seest written last comprehending 42 letters, and names. But with Consideration, that the first **Character**, which is the first of the 7, in thy former boke,[761] be placed uppon the top of the Table,[762] which thow wast, and art, and shalbe commaunded to haue, and use.

Last of all, the Ring, which was appointed thee: with the Lamine comprehending the forme of thy own name: which is to be made in perfect gold, as is affore sayd.[763]

Euen as God is iust, his iudgments true, his mercies unspeakable, so are we the true messagers of God: and our words are true in his mercy[764] for euer.

Glory, ô Glory be to thee, ô most high God.

EK: Now commeth Michael and heaveth in his hand out of the stone and sayeth, **GOD Bless you.**

H: As concerning the use of these Tables, this is but the first step. Neyther shalt thow practise them in vayne.[765]

And whereas thow dost use a demaunde, as concerning thy doings to a good intent and purpose: and for the prayse and advancement of Gods Glorie, with Philip the Spanish King: I answer that whatsoeuer thow **shalt speak, do or work,** shalbe profitable and accepted,And the ende of it shalbe good.[766]

Moreouer wheras thow urgest the absence of thy frende, as an excuse for the ring, No excuse can preuayle: Neyther canst thow shew the frutes of a iust mynde, but of a faynting stomack with this excuse. God hath retorned him, and wilbe mercifull unto you both. Thy Chargis in worldly affayres, are not so great, that God cannot Minister help to theyr necessities. Thow shalt be comforted. But Respect the world to come[767] (1); (whereunto thow art provided) and for what ende (2): and that, in (3) what tyme.

Serue God truely: Serue him iustly. Great Care is to be had with those that meddle with Princis affayres. Much more Consideration, **with whome** thow shalt medle or use any practise. But God hath shaddowed [768] thee from destruction. He preserueth his faithfull, and shaddoweth the iust with a shield of honor.

None shall enter **into the knowledge** of these mysteries[769] with thee but this Worker. Thy estate with the Prince (now rayngning,[770]) shall shortly be amended. Her fauor encreased, with the good wills of diuerse, that are now, deceyuers.

Thy hand, shall shortly be theyr help:[771] and thow shalt do wunderfull and many benifits (to the augmenting of Gods Glorie) for thy Cuntry.Finally, God doth enriche thee with Knowledge: and of thy self, hath giuen thee understanding of these worldly vanities.[772] He is Mercifull: and we his **good Creatures,**[773] neyther haue, do, nor will forget thee. God doth blesse you both: whose Mercy, Goodness, and Grace, I pronownce and utter uppon you. I haue sayd:

Δ: Laus, honor, Gloria, virtus et Imperium,

Deo opto. Max°.[774]
Amen.

H: Yf you will stay[775] one half howre, I will say farder unto you.

Δ: We will: by gods leave.

Δ: After that half howre passed, (being 10½ noctis ♄:) he sayde,

H: Venito BOBOGEL Rex et princeps Nobilitatis[776]

Venito cum ministris: Venito (inquam) Venito cum satellitibus tuis munitus.[777]

Δ: I fele: and (by a great thundring noyce, thumming thuming in myne eares) I perceyue the presence of some spirituall creature abowt me.

EK: And I here the thumming.

H: Behold, Before this work be finished,[778] (I meane the Manifestation of these Mysteries) thow shalt be trubbled, with **the Contrarie** Powres and beyond any accustomed manner. But take heade,[779] they prouoke thee not to work agaynst our Commaundements. Both thy ey and hand shall be manifest witness of it: well, this is true.

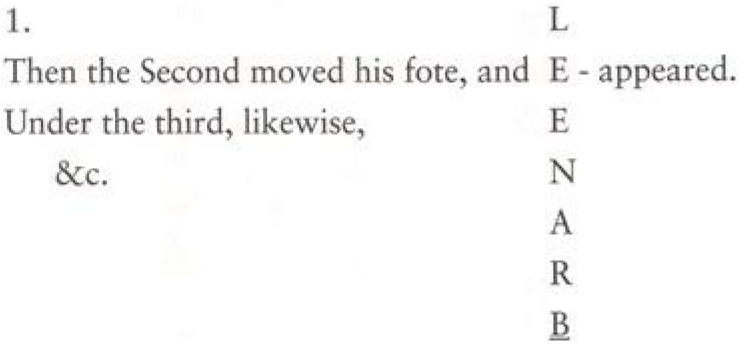
EK: They that now come in are ioly[780] fellows, all trymmed after the manner of Nobilitie now a dayes: with gylt rapers, curled heare: and they bragged up and down. BOBOGEL standeth in a blak veluet coat, and his hose close, rownd hose of veluet upperstoks: ouer layd with gold lace: he hath a veluet hat-cap, with a blak feather in it: with a cape on one of his sholders his purse hanging at his neck and so put under his gyrdell, his berd long: he had pantofells and pynsons.[781] Of these, in Company, are 42. 7 of them, are apparayled **like** BOBOGEL: sagely and gravely: All the rest are ruffyn like. Some, are like to be men and women: for, in the foreparte they semed women, and in the bakpart, men, by theyr apparayle, and these were the last 7. They daunsed, lept and kissed.

EK: The stone is brighter, where the sage and graue 7 do stand, and where the other do stand the stone is more dark.

EK: Now **they come to a circle**, the sage and the rest, but the sage stand all to gither.

Δ: The first of the sage, lyft up his hand a loft, and sayde:

Faciamus secundum voluntatem Dei: Ille Deus noster est verè nobilis & æternus.[782] He pluckt up his right fote, and under it appeared an L.



1. L
Then the Second moved his fote, and E - appeared.

Δ: Then he sayd, Well, I will shew thee more of these things at the next time.
God be with you: God bless you both.

Δ: Amen.

Δ: When shall that next tyme be? A voyce spake, On monday. Δ: Deo soli omnis Honor et Gloria.[788] Amen.

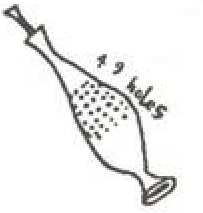
Monday. Nouembris 19: Circiter 1 ã horã a meridie[789]

Δ: Long after our comming to the stone (abowt half a quarter of an howre) the Cloth of sylence remayned drawn: and nothing appeared: but EK heard a far off very pleasant Musik the while.

H: He seamed to take the cloth away with his hands. After that (abowt 6 minutes), Nothing altered or shewed, other than the standing furniture, usually of late appearing there.

EK: Now come in 7 men with Musicall Instruments: and before them cam one with a veluet Coate,[790] and a hat-Cap, with a sword by his syde, and a Cloke or Cape hanging on one sholder: and a blak feather in his hat. &c. Afterward cam 42 more, seeming to be very far behynde the first 7. Their Melody sownded very swetely and pleasantly all the while from the begynning.

The forme of theyr Musicall Instrument:



These Musiciens did play, one with an other, iestingly: they bobbed one an other, and than played agayn. The 42, which semed a far of, cam nerer and nerer, and seamed to bring a rownd thing, like a table[791] in theyr hands. The 7 pipers went away: and the Man with the Cape hanging on one of his sholders (somwhat like a Nobleman) remayned. Then wer they come at hand, the 42 with the rownd table. These seamed to be of two sortes: Of which, the last 7: on the forepart to behold seamed rather wemen,[792] with fardingales[793] very much sprowting out, but theyr face had no peculier attyre of wemen. The 42 held the circle[794] (or rownd Table) up,over theyr hed, flat wise. Then they layd the Circle down, and stode rownd abowt it.

H sayd, Tam mali, quam boni, laudant te,

Deus, Deus, Deus noster.[795]

Δ: The letters appeared to EK, and he told me them, and I began to write:

LEENARB

H: Thow writest in vayne.Thow hast written them allready.

Δ: It is true: I see them now last before noted down.

H: Loke the eight name in the Tables. [Δ: of 49, collected.]. Δ: That eighth is Bobogel. Loke to his Character in the great Circle. Loke the second name in the Table with 7 angles.

Δ: That I finde to be Bornogo.

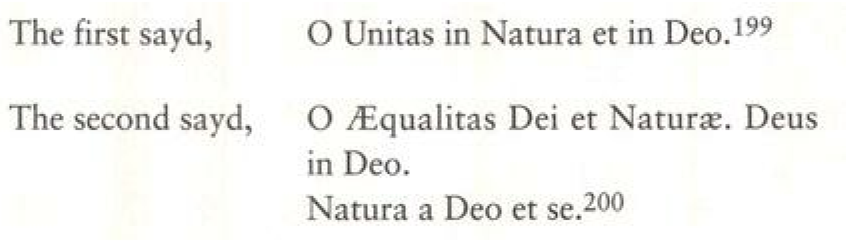
EK: He with the cape on his one sholder, sayeth, Nomen meum est Bobogel:[796] And he that is my subiect, is Governor of the second Angle of the 7.[797]

Bob: I weare these robes, not in respect of my self, but of my Government. I am the Prince, Chief; [EK: He falleth down on his knees and speaketh wordes which I understand not.] yea the **onely distributer** , giver, and bestower **of Wisdome and Science.**[798] I weare this apparayle, for that in dede, being a Prince I am a Cownsaylor[799] to estate and dignitie. All Dignitie and gouernment that is not cownsayled by me, and my subiects, is frustrate, voyde, and cleane[800] without firm grownd.

Those which thow sawest, (being pipers) signifie **praters.**[801] with unaccustomed, and not usuall Instruments: which allwayes seame to sownd that, which None but I my self, with my subiects, (yea **not all** of them, but the fewest) can performe. But I am true Philosophie. I am true understanding. Oh my descending from him which rayngneth, is euen uncomprehensible of the Angells. Neyther do I know, my self: But what I think,I utter, and What I measure, I am.

He sayd, Ordinationem Infinitæ potestatis eleuate.[802]

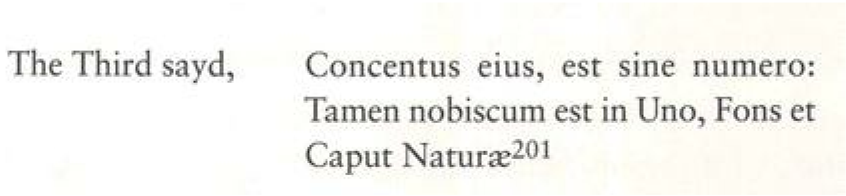
EK: Now come Three[803] out of the 42, and layd theyr fingers uppon the three first letters: and,



The first sayd, O Unitas in Natura et in Deo.[199]

The second sayd, O Æqualitas Dei et Naturæ. Deus in Deo.
Natura a Deo et se.[200]

[804], [805]

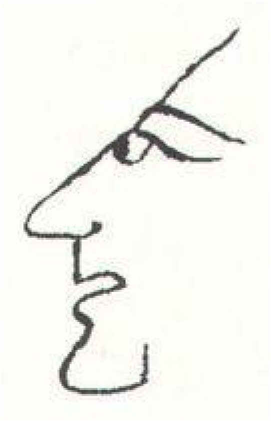


The Third sayd, Concentus eius, est sine numero: Tamen nobiscum est in Uno, Fons et Caput Naturæ[201]

[806]

EK: They ioyne them selues to gither and become, all One Man; most beawtifull to behold: Whose hed and to the brest, seamed to be neare to heven. His brest and myddle part, in the ayre: His feete seamed to stand on the earth. There cam like a Fire, oute of the Crown of his hed, and to enter into the heven, hard, by it: This great high and fayre man sayde,

Veritas quæsita,nostra est.[807] [808]EK: His apparayle is diuided into two halfes: from the crown of his hed to his fete. The one half seemed to be most fresh florishing herbes: The other half seemed to be of diuerse metalls:[809] and his right fote seamed to be Leade.[810] He sayd (with an Aposiopesis) thus,



Beatus est qui Lumen capitis mei &c.[811]

EK: The rest, all, quake. He sayd farder,

Unus in Capite, unus in pectore, unus in pedibus.[812]

EK: Then stept oute 9, at ones.

EK: Then the great man returned, or was restored to his former estate of three particular men agayn: and they three leaned to the Ientleman[813] with the Cape on his sholder - BOBOGEL - who sayde,

Dee, Dee, Dee, at length, but not to late.[814]

EK: In the place of the former first thre, appeared L E E.

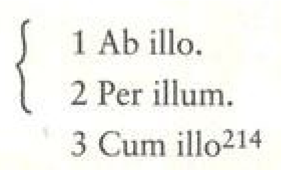
EK: Of the 9, which stept out, they of the first Ternarie[815] sayde, eche thus orderly,

1. Volumus.
2. Possumus.
3. Quid non.[816]

This Ternarie sayd, Faciamus, quæ fecerunt, nam nos Tres sumus Adam; societate.[817]

EK: They become One man, as the other before, but a slender and a weak one, neyther so high as the first, euer laboring or striving with it self to stand up right, but still it bended, bowed, and inclined downward, as thowgh it wold fall for feblenes. The Body of this Compownd man, seamed to be of Gold glittring. When they retorned to theyr distinct shape: they semed naked and to be sorry, and lament: And Bobogel did put them from him, with his sworde, skabbard and all, as it hanged by his side. Theyr letters were ----- N A R.

EK: Then cam the Ternarie—B L N,[818] and orderly they sayd thus,



1 Ab illo.
2 Per illum.
3 Cum illo[214]

{1 Ab illo.
2 Per illum.
3 Cum illo[819]

Bob: Qui caret hijs tribus,[820] [EK: He whispereth to the first Three leaning to him: and with all, seeing me muse at the Aposiopesis, he sayd,] No No, Thow shalt not dowt [pointing to me.]

In ecclesia Dei, laborabit in Vanum.[821]

EK: This Ternarie of men becam to haue one onely hed, and three bodyes and that one hed was in good proportion.

EK: The side of the Diaphonous Globe opened, and this Transformed Ternarie did point into it, toward the multitude: and the people had theyr brests naked, and semed to wepe:[822] and to wipe theyr brests, and where they wiped the place becam fayre.

EK: This Ternary did seme to stand uppon a triangular stone , and to turn (as a horsmyll doth, abowt one axeltree) orderly agaynst, and by, the hole of the Globe so opened. And euery of the three bodyes, in theyr turning, as they cam agaynst the open place of the Globe, they extended, and stretch out theyr hands toward the people: The first seamed to hold a rownd ball in his hand being little, but very fayre white. The second body, his hand had in it, a little sword flamming with fyre. The third had a thing like a hatt band of lawn,[823] of many cullours, which ever as his turne cam to be agaynst the opened hole, he seamed to cast toward the people, and the people did seme to be drawn to him ward, by the Casting of it toward them.

These three bodyes, thowgh they turned contynually, yet did the face or Cowntenance of that One Compownd hed, stedyly and immoveably regard or loke into the Globe at the forsayd hole therof.

H: A wonder to behold the heuen, much more this.

EK: Now this Ternarie separated it self, and the hole or clyft in the Globe did shut to. These three did sit down by Bobogel.

H: Sunt semper, et Cibus illorum est unus.[824]

Δ: Note: The first Ternarie, they semed to stand leaning to Bobogel. The Third Ternarie was set orderly and vicissim,[825] close by Bobogel his feete, one of these betwene two of the first; euer so that orderly one of the first, and one of the Third ternarie, one of the first and one of the third; one of the first and one of the third.

EK: Then cam the Ternarie A N A.[826]

They sayd, orderly thus,

1. Ab illo sed.
2. Cum illo sed,[827] looking on his own belly.

Δ: Then I demaunded of theyr Apparayle: and EK sayd that these were brauer than the former Ternary. Bobogel sayd, Aliqui a dignitate, Cæteri talia quia non sunt Digni.[828] This he sayd, pointing to theyr apparayle. Then the third sayd,

3. Per illum, Per illum, Per illum,[829] with a frowning cowntenance thrusting furth his hand.

EK: They ioyne to gither into one hed and three bodyes.The Hole of the Globe opened very wyde now. This one Compownd Hed had many eyes, many noses, many mowthes, as thowgh it were a Cahos[830] of Faces, in one hed, but three bodyes. One of this bodyes had in his hand a little Ball, like the other before, very white, but with twynkling brightnes in it. The other two bodyes, theyr hands were emptie.

EK: They turn in order agaynst the Hole of the Globe: But the People regarded them not: but at the comming of the hand with the Ball, against the hole, the people loked a little up at it.

Bob. sayd, Et quia carebant in ardentibus ignis.[831]

EK: These, being dissolued into theyr former state, go and sit (with hevy chere) by them that sat affar of from BOBOGEL. Theyr apparaill semed to be simple: theyr good apparayle was gone.

Δ: Here I fownd a certayn error in my writing of the first Notes: which I haue amended in the writing of this: But while that error did trubble me, the spirituall Creature sayd these wordes.
Bob: The Fawt is in EK his remembrance, and not in his will. Note this,

LEE ar the Three that stand with me.

NAR are the Three that I reiect.

BLN are the Thre which are enterlincked with me.

ANA are the Three that are reiected.[832]

Bob. sayd, Omnes naturam ad, Sed, Nôn in illo.[833]

EK: The 30 remayning,[834] cam all away, and satt betwene Bobogel and the reiected Cumpany: and from that Cumpany[835] cam onely 7 to the Circle agayn. Euery of these 7, sett theyr feete, eche uppon a letter of the Circle, which letters are these,[836]

AOIDIAB.

EK: **They** say, In use,[837] we are perfect; Misused, we are Monsters. Sumus septem Januæ Naturæ, et sui ipsius qui novit Deum.[838]

EK: These 7, seme to vanish into wynde, or white smoke, and to fall into the Globe. And the six reiected, turn into a black smoke: and the rest of the 30[839] semed also converted into black smoke, and to fall into the Globe.

Bob. sayd, In sexto et septimo sunt omnia.[840]

EK: The six that were next him, semed to clyng hard and close to Bobogel. (Bob: Behold.) EK: They be ioyned all into One body, and becam like the sonne, into the forme of a bowle or Globe: and so moved up or rowled up the small narrow race, or line unworne, which remayned higher then the chayre, toward the top of the Diaphanous Globe, as before is declared, so that this Princely Noble man, and his six adherents [LEE:BLN], in this manner went out of sight.[841]

H: Formator horum, Secundus[842]est in Heptagono.[843]

They are diuided into the day, as the other wer, before: But wheras the other are chiefly uppon that day which you call Monday, so ar these to be used onely on the Sabaoth day.

Theyr use, is onely thus (obseruing the former order) with the Circle uppon the grownd.[844] The first six,[845] with theyr King and the seale of theyr Prince, taketh place in the whole body of the day: The other being 6 tymes six,[846] are diuided into the partes of the day as before. The Letters onely where they stode, are theyr names and Characters. **What doth the heven behold or the earth conteyne, that is not (or may be) subdued, formed and made by these. What lerning, grownded uppon wisdome, with the excellencies in[847] Nature, cannot they manifest? One in heuen they know.**

One and all in Man, they Know.

One and all in erth, they know.

Measure heuen by a parte, (my meaning is, by these few). Let God be Glorifyed: His name praysed. His Creation[848] well taken, and his Creatures, well used.[849]

Δ: I craued for some playner Instruction, as concerning the use of the ... and he answered,

H: Behold: Are thy eyes so blynde? Dost thow see and wilt not see? Thy mynde telleth thee. Thy understanding furdereth, and thy Judgment doth establish it. That as thow sawest a Body in three places, and of Three Compositions: Thowgh but two in forme, **So shall this work haue relation to 1: tyme present and present use, to 2: Mysteries far exceding it, And 3: Finally to a purpose and intent, wherby the Maiestie, and Name of God shall and may, and of force must appeare, with the Apparition of his wonders, and mervayles, yet unhard of.** [850]

Dixi.[851]

Δ: Than immediately after he began agayne, as followeth,

H: **Venito, veni (inquam) adesto Veni Rex. O Rex, Rex, Rex Aquarum,**[852] **Venito, venito inquam. Magna est tua; maior autem mea potestas.** Deus noster, restat, regnat, et est, Quod, et sicut fuit.[853]

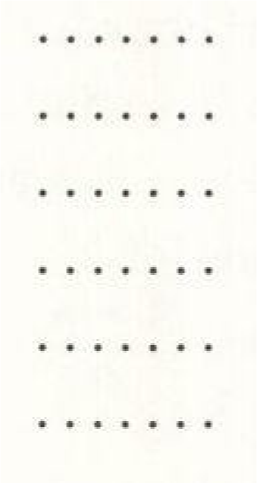
EK: Then cam one and sayd,

------------ Parati sumus nomen eius Creatoris nostri, nomen, nomen laudare Nomen (inquam) Unius nunc et viuentis.

Obscura sunt hæc animis obscuris. Vera et manifesta Veris et perfectis.

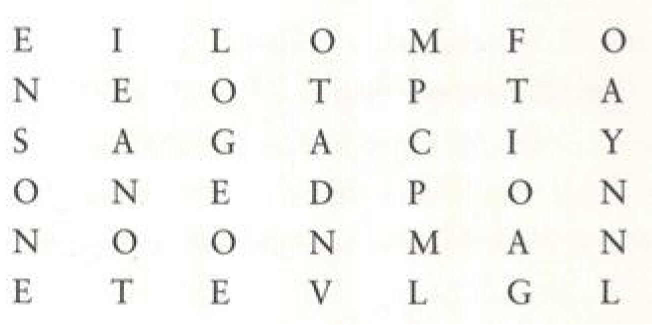
Ecce adsunt.[854] EK: He that sayd this, is as thowgh he were a king, with a Crown on his hed: His apparayle was a long robe whitish: But his left arme was very white, and his right arme, black.[855]

EK: There cam after this King a Cumpany of 42: and euery one of them had a letter in his forhed,and they were 7 in a row, and six, downward.



The King had written in his forhed, BABALEL.[856]

The first 7, (begynning from EK his left hand toward his right) had these letters, and the second, Thirdth &c had these letters as here appeare.



E	I	L	O	M	F	O
N	E	O	T	P	T	A
S	A	G	A	C	I	Y
O	N	E	D	P	O	N
N	O	O	N	M	A	N
E	T	E	V	L	G	L

H: At the next tyme, more.

Δ: Omne quod viuit laudet Deum unum et trinum, in omne æuum.[857] Amen.

EK: The cloth draws.

Nouemb. 20 Tuesday, a meridie circa 2ã.

Δ: After a great half howre attending, and diuerse tymes our prayers to god, The black Cloth was pulled upward: and so vanished away. H appered sitting in his chayre, and his face toward me: and so looking abowt he paused a while: half a quarter of an howr. In the meane space cam one skypping lightly, a little boy, in a grene coate, and sayd, He is here, at an ynche.[858] Than he sayd, Hark. To me he sayd, Ha-sir-ha. Δ: What wilt thow say to me? [Grene Coate:] I am Multin his minister, wilt thow any thing with me? I cannot tarry. Δ: Then this skipiak[859] espyed a spirituall creature comming, and sayd, Ha, ar you there? Δ: And so went out of sight.

Δ: This was King BABALEL, with a crown of Gold on his hed, his garment whitish, and his right sleue on his arme, blak: and the left sleve very white. He seamed to stand uppon water.

The other 42 cam likewise and stode.

Bab: **Veni princeps**[860] 7 **principum qui sunt Aquarum Principes. Ego sum Rex potens et mirabilis in aquis: cuius potestas est aquarum visceribus.** Princeps iste[861] (Δ: pointing to a Prince, new come to sight which **had a red long robe, and a cerclet of gold on his hed**[862]) est Tertius principum in Heptagonon.[863] Δ: I sayd Heptagono: he replyed, Heptagonωn,[864] and sayd: Verè planè, et perspicuè dixi.

Bab: Mensurasti aquas?[865] Befafes answered, Factum est.[866]

Δ: I seemed to dowt of some matter here, and Befafes sayd, Thow shalt be answered in any dowt. I am thy frende. I haue fauored thee **in many things.**[867] Ph'ers[868] haue imagined vaynely of my name. For thy loue towards me, Thow shalt know my name. I was with Salomon; I was also (unknown) with Scotus.[869] I was, in respect of my powr: unknown, in respect of my name. He called me Mares. Since, I was not with any. And I preserued thee from the powre of the wicked, when I told thee things of truth to come. When I rid thy howse of wycked ones and was with thee in extremities. I was with thee. Behold I was with thee throwghly.

Δ: Then he bad EK Ax me, yf I knew Obelison. Δ: I had to do with Obelison, but by reason of my Skryers nawghtynes, I was in dowt what I might credit. Bef: Thow shalt know this for a most manifest truth hereafter. I am Obelison, the fifth of the Seuenth,[870] which haue the skowrging of Obelison the wicked: but not wicked for euer, neyther accursed to the ende. We Angels haue tymes, and our faultes are amended.[871]

Δ: Shall I Note your name, by Befafes? He answered, My name is so, in dede: The Ægyptians called me Obelison in respect of my nature. Δ: I pray you what is the Etymologie of Obelison? Bef: A pleasant deliuerer.[872]

EK: The former 7, haue Crownes.[873] Theyr letters stand betwene theyr feete.[874]

E I L O M F O &c.

Bef: Thow hast receyued these letters allready.

EK: The water seameth, contynually to pass ouer these letters.

Bab: I Gouern uppon Tuesday.

1. **EK: The first seuen take the water and throw it up, and it becometh clowdes.**
2. **The second throweth it up, and it becommeth hayle and snow.** One of the first 7 sayde, Behold, Behold, Behold: All the motion of the waters, and the saltnes thereof is æqually assured by us. We giue good success in battayles, reduce ships & all manner of vessells that flote uppon the seas: Our make is great. Muse not [Δ], For whan the seas are trubbled, with the wickednes or uprore of man, our Authoritie giueth victory from him that is most Victorious. Fishes and Monsters of the sea, yea all that liueth therein, are well known with us. Behold we are (generally) the Distributers of Gods Judgments uppon the waters that **couer the earth.**

   EK: Than stept furth all the rest.
3. The Third seuen sayd, Some of us conduct the waters throwgh the earthe. Other of us, do beawtify Nature in her Composition. The rest of us ar distributers and Deliuerers of the Threasures and the unknown substances of the seas.[875]

Bab: Praysed be God which hath created us, from the begynning with Glory. His Glory be augmented.

EK: **Now the 42 diue into the Water and so vanish away: and Befafes, and Babalel also wer suddaynly gon.**

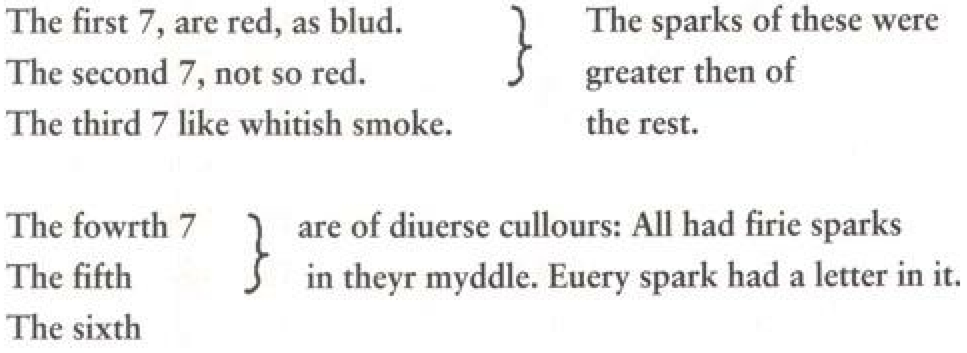
H standing up sayd, **LO, Thus thow seest the glory of Gods creatures: Whome thow mayst use,[876] with the consideration of the day, theyr king, theyr Prince, and his Character. The King and prince gouern for the whole daye.[877] The rest according to the six partes of the day.**

Use them, to the glory, prayse, and honor of him, which created them to the Laude and prayse of his Maiestie. Δ day is 24 howres. Δ: But whan doth that Day begyn?

H: Thow shalt be towght the rest.

H proceded, and sayd, **Vitam dedit Deus omnibus Creaturis. Venite Veni Ignis, veni Vita mortalium (inquam) Venito. Adesdum. Regnat Deus. Ô Venite. Nam unus ille Regnat, et est Vita Viuentium.**[878]

EK: **Now there commeth a King.[879] and hath a Prince[880] next him and after them 42, like ghostes, or smokes, with out forme: hauing euery of them a little glittring spark of fire in the myddest of them.**



The first 7, are red, as blud. } The sparks of these were
The second 7, not so red. } greater then of
The third 7 like whitish smoke. the rest.

The fowrth 7 } are of diuerse cullours: All had firie sparks
The fifth } in theyr myddle. Euery spark had a letter in it.
The sixth

Verè beatus[881] (sayd this King that now cam.)
Δ: I pray you to tell me your name.
King: I am the fowrth King in the Table and the two* and twentyth in number.
Δ: I understand in the Table of the names collected from the 7 Tables of 49.

B	B	A	R	N	F	L
B	B	A	I	G	A	O
B	B	A	L	P	A	E
B	B	A	N	I	F	G
B	B	O	S	N	I	A
B	B	A	S	N	O	D

And in those tables taking of the first septenarie, Baligon for the first King; and in the second septenarie, Bobogel for the second King, and in the third septenarie, taking Babalel, so accownted the third, and in the fowrth septenarie, the first of septenarie is Bynepor, and so accownted the fowrth: but accownting euery one from Baligon he is the 22th: and so the fowrth and the two and twentith.

EK: A Voyce I here, saying, You shall begynne to work agayn, at 6 of the clok next.

Δ: Omnium bonorum largitori, laus perennis et immensa.[882] Amen.

Δ: Abowt half a quarter of an howre after 6: we retorned to the work and the cloth was drawn away: H sitting in the chayre.

EK: There appeared a little ronning water very clere chrystalline: and on this side the 42 last specifyed.

Bynepor sayd: Lo, [and than he kneled down, and semed to pray, a prety while]. The generall state and condition of all things resteth onely and dependeth uppon the distribution, and participation of my exalted most especiall and glorified powr. My sanctification, glory, and renowne, allthowgh it had begynning, cannot, shall not nor will haue ending. He that Measureth, sayd,[883] and I was the ende of his workmanship. I am like him, and of him, yet not as partaking nor adherent, but distant in One degree. The Fire that holdeth, or is, the first Principle of all things in generally,[884] hath his universall and unmeasurable powre in the workmanship of my Creation. Visible and Invisible, were not, withoute my record. When he [Ipse[885]] cam, I was magnified by his comming, and I am sanctifyed, world Without ende.

Vita suprema,
Vita superior,

et Infima, sunt meis mensurata manibus.[886] Notwithstanding, I am not of my self, Neyther is my powre myne owne, Magnified by his name: Behold I dubble **life from One,** unto a thowsand of Thowsands: and One thowsand of thowsands, to a number, exceding cownt: I speak in respect of mans Capacitie. I am in all and all hath some being by me: yet my powre is nothing in respect of his powre, which hath sent me. **Write this reuerently. Note it with Submission: What I speak hath not byn reuealed, no not in these last tymes, of the second last world.**[887] But I begynne new worldes. new people, new kings, & new knowledge of a new Gouernment.[888] To be short,

> Vitam tradidit; deditque mihi potestatem
> esse, Viuere, et in perpetuum glorifica...
> Omnibus et ubique.[889]

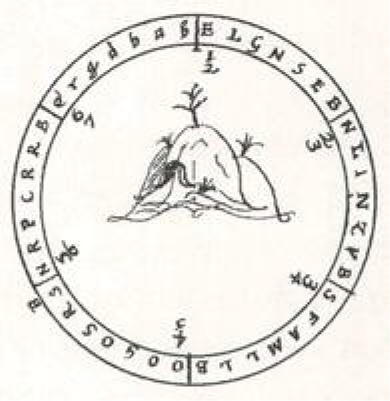
As these cannot be comprehended, what they are, with mor...

So cannot any thing be browght to pas in me, without a living sight, and a perfect mynde.[890] I Gouern uppon Thursday. For Instruction, the rest as before. **Thow shalt work mervaylous mervaylously. by my workmanship** in the highest. To whome[891] (with overshaddowing thy light with life, and blessing you both, in his name of whome I am the Image,) I prayse God.

EK: Now he descendeth into the Globe, and it becam very bright there among the people: which, allso, at his comming, seamed to be more cherefull.

H stode up and moved his hand, aboue his hed, cumpassing with it a loft.[892] After that cam a Cumpany, with a King,[893] and after him a prince.[894] The king had a red robe on, and a crown on his hed. The Prince had a robe of many cullours, and on his hed a Cerclet. **The Cumpany [42] seemed to stand rownd abowt a little hill of Claye. Behynde this Cumpany seamed to stand an innumerable multitude of ugly people, a far of:**[895] **Those which seeme to stand rownd abowt the little hill seme to haue in the palmes of theyr hands, letters, in order as here appereth.**

Δ: The king spake, Beholde, All the Earth with her bowells and secrets what soeuer, are deliuered unto me. And what I am there thow mayst know. I am great, But he, in whome I am, is greater then **I. Unto my Prince, (my Subiect) are deliuered the keyes of the Mysteries of the earth. All these are Angells that gouern under him:** whose Gouernment is diuided, as before. **Use them, they are and shalbe at thy commaundement.**[896]



Those that stand afarr off are the Spirits of perdition, which kepe earth with her Threasor, for him &c: and so furth.[897] I haue sayd.

H, standing up, sayd, His name is the fifth and the 29th: and his Prince his name, the fifth, and the 23th.[898] Δ: The first name, I understand in Tabula collecta, The second name I understand, for the fifth to be in Heptagono and the 23th to be so fownd the same, in Tabula collecta.

H: Venite, ubi nulla quies, sed stridor dentium.[899]

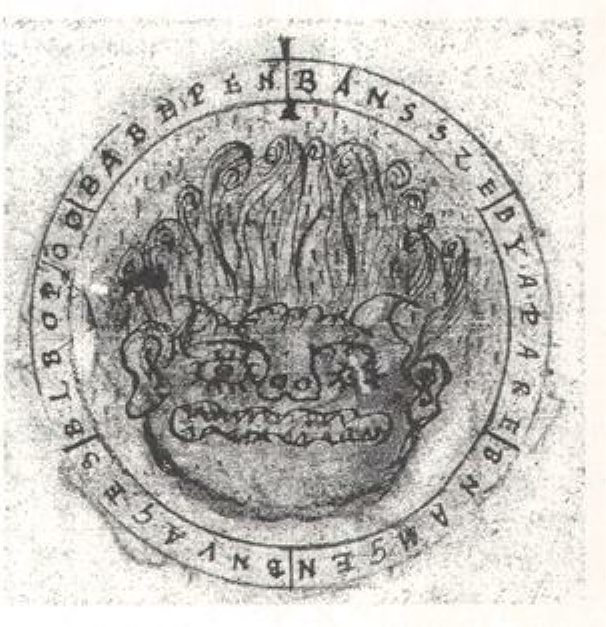
EK: Then cam the man agayn, with ugly fyrie flames out of his sides, which was here before, the last day.[900] H beckened with his hand unto him, and his coates went to gither, and so couered that horrible sight.

EK: **There appeareth a rownd Table, which 42 hold and toss, all in fyrie flames.**

H: Write quickly, thow [EK] canst not behold it.

EK: The first seameth to be a King[901] with a crown on his hed, and the &c.

Lo I gouern (as I[902] haue sayd before) All enchanters, Coniurers, witches, & Wicked spirites that are hated of God, and included for euer, in owteward darknes (except a few which remayn in a second payne, which gape and grone for the mercies of God, and haue tyme of Joye, whose measures I haue, and kepe accownt of) are all at my government. [903] By me, thow shalt cast oute **the powre of all wicked spirits. By me thow shalt know the doings and practises of euill men, and more then may be spoken or uttred to man.**



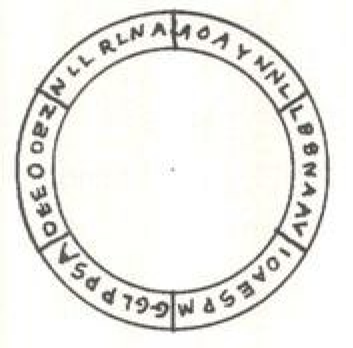
Blessed be his name, whose Glory is euerlasting fode to the Just, and Sempiternall[904]8 to the Wicked.

H: The 36the name, is the King his name,[905] And his Prince his name.[906] is the last [saue one] written in the Heptagonon.[907]

H: Venite vos qui sub mea estis potestate.[908]

EK: Then cam bright People 42: And besides these, all the Ayre swarmeth with creatures. Theyr letters are in theyr forheds: these stand in a circle: they take the letters from theyr forheds, and set them in a Circle.[909]

H: Of these, I am Gouernor my self.[910] Behold I am of tyme present . I am of the last Ternarie.[911] Loke what may be wrowght, in all aëriall Actions, I can distribute and bestow at my pleasure: my tyme and day, is Friday. The day of the last before, is Saterday. The day of the Fifth is Wensday.



H: Behold,

I haue towght thee. His name be blessed who raigneth and liueth for euer.

Δ: Amen, Amen, Amen.

H: I will answer thee of all Dowtes herein (being demaunded of me) to morrow. For, so I call it, for thy sake: Not, for that, it is so to me.

Δ: So he went away.

Δ: Then cam URIEL and MICHAEL, and an other (I think RAPHAEL) and the chayre and table appered, as in the first boke hath byn shewed: And also H had his peculier chayre, at his tymes of teaching me.

MICHAEL (sayd,[912]) **Mercifull is our God, and glorious is his name Which chuseth his creatures, according to his own Secret Judgment and good pleasure**.

This Arte is the first part of a Threefold Art,[913] ioyning Man (with the Knowledge of 1. the WORLDE, 2. the GOVERNMENT of his Creatures, and 3. the SIGHT of his Maiestie.):

Unto him (Ô., I say) unto him; which is
Strength, Medicine, and Mercie[914]
to those that feare him:
Amen.

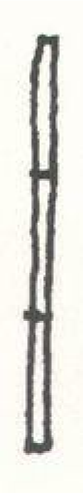
Δ: Gloria, laus, honor, et perennis Jubilatio, sit Deo nostro Omnipotenti, Optimo, Maximoque.[915] Amen.

Δ: Note, Remember, and enquire what it meaneth, that no Mention is made of Bralges the Prince, Nor of Blumaza his king in this Treatise, being a certayn Repetition of the Heptagonum stellare, going next before.[916]

Wensday: Nouemb 21. hora 7 a meridie

Δ: There appered the first table, covered with a cloth of silk changeable cullour red and grene:[917] **with a white cloth under it: all hanging very low.** The first Chayre allso: wherein Michael used to sit. And H did appere likewise, and his peculier chayre:[918] and he standing by it. But the Diaphanous Globe, and the people or world in it, did not now appere, and, bycause no voyce or word cam from those spirituall creatures, yet: I declared that I did attend theyr pleasure first, as a scholer comming in the presence of his Master, and whan they had sayd those things which were for us first, (at this instant) to lerne, that than, I wold move some dowtes of the premisses, as I was yesterday advised to do. H, he held up his rod (which had two portions or partes of it black and one, red): and sayde,

Ô quanta est hõis infirmitas et Corruptio, qui Angelis, idque suis bonis, fidem autem Deo, vix habet? Omnia mundana, fæces: Mundi Corruptiones in se habent: Deus noster, Deus noster, Deus (inquam) ille noster verus, cum Veris suis angelis, eique[919] inseruientibus Semper verus est. Pete quæ vis? Dixi: et quod dixi, obumbratum est veritate, iusticia et perfectione.[920]



Ecce, (Δ: holding up the rod[921]).

Hîc (Δ: pointing to the ende of the rod).

Per hoc (Δ: pointing to the middle of it). Et a Mensurae fine, nos nostramque mensurabis potestatem. Age (inquam) Quid vis?[922]

Δ: I, than, of the premisses used a little discourse: how they might parabolically,[923] betoken other more profownd matter, and litterally other: yet what sense so euer the premisses had, that theyr first rudiments and Text was to be made somwhat playner to me, then yet they were: bycause I dowted as well of the understanding of some of that, I had written, as allso of mys writing: eyther throwgh EK his mys reporting to me matter shewed to him, or by my mys-hering or negligent writing &c. To some part therof he sayd these words ensuing.

H: In umbra mortis non est æqualitas. **Obscurum enim nihil est quod per illum [EK] recepisti. Age**.[924]

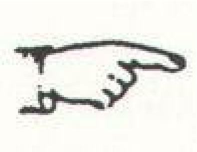
H: **Thow hast a work of three proportions in esse;**[925] **of 7 in forme: which is of it self diuided by a number septenarie, of the course, estate and determination of things aboue, things next, and things below: which, of it self is pure perfect and without blemish.**[926] Notwithstanding I will answer thee thus.

The 7 Kings are orderly conteyned in the first of the Seuens diuided in generall numbers: whose names are expressed; published and perfectly formed within the first grownd and fowndacion of this Threefold work.[927] The kings I meane with theyr Characters,[928] and the names of theyr 7 liuing and semper adherent Ministers:[929] Whose names thow mayst see not onely there written, but openly, and most playnely, truely, and sincerely spoken of before:[930] as, by due examination of thy bokes thow shalt manifestly perceyue. Notwithstanding, as euery king, in his Maiestie, doth comprehend the dignitie of his whole seat and estate, so I of my self being the First, haue the gouernment of my self perfectly, as a mysterie known unto my self: which is a thing unlawfull to be published unto man and lawfull[931] in respect of the charge committed unto us: and the slender Dignification of mans frayle estate; Which thow mayst see in the Heptagonon: where, there wanteth a name: the rest of the Cr... the utter Circumference of the Globe, are the Six Kings Or . . . following: according as they are written in the Mysteries of the . . . which do begynne the[932] Powres, with theyr Prince,[933] and theyr Characters orderly taken, by and uppon the Heptagonon . . .

Ô God, how easy is this first understanding. Thow hast byn told perfectly, playnely and absolutely, not onely the Condition dignitie. and estate of all things that God hath framed: But allso withall, thow wart deliuered the most perfect forme and use of them.[934]

But this will I tell thee (to the intent thow shalt know: and forby cause I wold not, thow sholdest be ignorant in true Wisdome) that those Six Names in and uppon the Heptagonum are Collected, do growe and are gathered from the names in generally aforesayd.[935]

Take the Names, I will teache thee to know them, which els, [without] by direction[936] thow canst not fynde.



> Loke thy First Table. I am called BALIGON with men. Thow hast Noted my name (which is secret) among the Angels,[937] begynning with this letter M, consisting of 7 letters, the last being an A.

I am called MARMARA: but otherwise CARMARA : but that letter M, shall not be expressed, &c.

Thowseest, next, BOBOGEL, He it is that is the Second King. Thow seest the name BORNOGO, to be the first[938] uppon the Heptagonum: it is his Prince. And therfore I did Note him with a Coronet, and not with a Crown: nay rather, but with a Cerclet abowt his hed. &c[939]

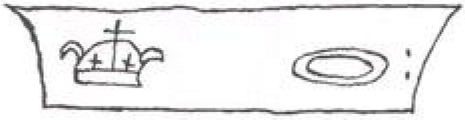
Δ: I concluded (of his instruction) the Kings and theyr Princes, theyr names to be thus lerned out of the Table Collected of 49, names, it is to weete,

1 --Δ-- 44
8 ----- 2
* 15 ----- 9
22 ----- 16
29 ----- 23
36 ----- 30
43 --Δ-- 37

modo
retrogrado
quasi[336]

** As far as I remember, he sayd,My Prince is in my self: which is a mysterie

~~My Coniecture (hereuppon, and uppon this retrograde respect to finde the princis among the 49 names in Tabula Collecta) is, that Baginol~~ *** ~~is the Prince under BALIGON: bycause the letters are all one: but the order of theyr places diuerse: and so is his prince conteyned in him self.~~



~~Δ He then allowed of my Coniecture for these .6. but of his Prince~~

~~Δ I than sayd nothing: tyll at the fayr writing hereof, this, here added, cam into my mynde. How well, I know not yet: Novemb .23.~~

941

* Addendo 7 - fit hic processus. Ergo addendo 7, numero 43, proueniet 50: numerus: major 40 quam 49 per .1. qui respicere pt illum: primum Regem Baligon.[942]

** addendo 7, fit processus hic g°. Si 7 addantur numero 37: inde emerget 44. pro proximo principe.[943]

~~*** It is not Baginol, but Bagenol, with e not i, and therfore consider.~~

and farder he sayd, **The Characters of Kings, are in the Globe:**[944] **and of the Princis in the Heptagonon**.

Δ: Note: from the ☞ on the last side, untyll these words finished, he was out of sight: and whan he had ended these words, he cam in sight agayn: and browght a thing in his hand like a sterre:  or Heptagonum.

H: **Beholde. Euery one of these Princis hath**[945] **his peculier Table.** Thow hast Noted the First Table which begynneth, as I will tell thee.

1. 2: In BOBOGEL, that O, (the second letter) is the first of the Table OESNGLE and the second of Befafes, is the second, and the thirdth of the third: and the fowrth of the fowrth and the fifth of the fifth, and the sixth of the sixth, and E, (in the seuenth. Bnagole is the seuenth and last of this first seuen of this first Table: accownted the first. ¶ AVZHILN.

   The second seuen by like order is gathered of Babalel, and the rest of his septenarie. And so furth, to the ende downward as thow didst before &c.
2. 3: In the second Table; L (the first letter therof) is out of Bobogel his last letter, the second letter, is the sixth of Befafes; the third, is the fifth of Basmelo &c and so you haue LEENARB.[947] For the rest kepe that order downward to the ende of the last Name Bamnode. Tranversim, quasi retrograde.[948]
3. 4: In the Third, begyn at the lower[949] letter [of the latter[950] worde] of the last of the second seven: and so upward, toward the right[951] hand: Δ: The last word is of second seven is Bnagole: the last letter therof is e: which is the first of this Third Table: and the i, in Brisfli, is the second, and the 1 in Branglo the thirdth, and than so furth, upward, overthwart, toward the left hand: till ye come to Bobogel, his second letter, being O. Then to N in Bonefor: e in Bermale: o in Bragiop. &c.
4. 5: For the Fowrth, loke, Bobogel. Then loke to this fowrth Table the first B of the Table is the first B of Bobogel. The second B of this Table, is the B of Befafes. The third letter is a, the second letter of Basmelo. The fowrth letter, R, is the thirdth of Bernole. The fifth is the fowrth of Branglo. The sixth, is the fifth of Brisfli. The seuenth is the sixth of Bnagole. And so in to the next sevens downward orderly for the rest of the table.
5. 6: The Fifth begynneth from Bnagole upward: begynning at the last letter being e: and then upward croswise exactly tyll the B of Bobogel. And so of the next seuen, for the next: begynning at the n of Bonefon, and so furth.
6. 7: In the sixth, (the Infernall Table) The first is B of Bobogel, The second is A of the 15th: The third is N of the 22th: the fowrth, is the fowrth of the 29: The fifth of the 36: the sixth of the 43: and the seuenth of the 49: being E in Bamnode, two letters being taken in that last septenarie. The second septenarie begynneth at the first of the 15th, the second at the second of the 22th, (being Y), the third at the thirdth of the 29th, then the 4th of the 30th,: the 5th of the 43th.
7. 1: The Seuenth: the first A, is the A, of Baligon, and so downward all the second letters of the

7 kings: Then all the third letters, then all the fowrth letters, then all the fifth letters, then all the sixth letters only and finally the seventh and last letters of the first names of the Septenaries.

Δ: Note, this Table is made all of Kingly substance &c.

Δ: Now I trust I understand (meterly well,[952]) the making of the 7 Tables. I wold gladly here som instruction of the great Circular table (which you call the Globe) which hath the Kn... with theyr Characters; and so within, 7 tymes 7, seuen tymes . . . 7 tymes 6, seuen tymes furnished with letters and numbers . . . sorts.

H: That doth apperteyn to an other tyme.[953]

EK: The Cloth was lett down, and the stone did yield voyce but nothing visible but the forsayd blak cloth.

H: One thing is yet wanting: a mete receptacle &c. There is yet wanting a stone &c. One there is, most excellent, hid in the secret of the depth &c. In the uttermost part of the Roman Possession.

H: Write. All lawd, Glorie and honor be unto him, which rayneth for euer. Amen. Be of good Cumfort.

Lo, the mighty hand of God is uppon thee.

Thow shalt haue it. Thow shalt haue it, Thow shalt haue it. Dost thow see, loke and styr not from thy place: EK pointed toward it.

Δ: I see it not.

H: It is sanctified, blessed, and . . . .[954] in the use of his Creatures.

Thow shalt preuayle with it, with Kings, and with all Creatures of the world: Whose beauty (in vertue) shall be more worth then the Kingdomes of the earth.

Loke, if thow see it: But styr not, for the Angel of his powre is present.

EK loked toward my west wyndow, and saw there first uppon the matts by my bokes a thing, (to his thinking) as bigg as an egg: most bright, clere, and glorious: and an angel of the heyth of a little chylde holding up the same thing in his hand toward me: and that Angel had a fyrey sword in his hand &c.[955]

H: **Go toward it; and take it up**.

Δ: I went toward the place, which EK pointed to: and tyll I cam within two fote of it, I saw nothing: and then I saw like a shaddow on the grownd or matts hard by my bokes under the west wyndow. The shaddow was rowndysh, and less then the palm of my hand. I put my hand down uppon it, and I felt a thing cold and hard: which, (taking up, I) perceyued to be the stone before mentioned.[956]

H: Kepe it sincerely.

Veritas in veritate: Deus in Deo, Unus in uno est.[957]

Let no mortall hand towche it but thyne owner[958]

Prayse God.

Δ: Illi qui venturus est Indicare Speculum per ignem sit omnis honor, laus, et gloria, in sempiterna sæcula.[959] Amen.

Liber Mysteriorum Quintus

1583 Martij 23.

Liber 6us.
Liber 7us[960]

Jesus †.

Anno 1583 Martij 23. Saterday a meridie.

Δ: EK being come, with Mr John Husey of Blokley. (on the 22 day of marche) and EK being desirous to understand somwhat of our spirituall frendes as concerning such matter as had falln out very strange to him and Mr Husey: abowt a certayne moniment of a boke and a skroll fownd in Northwik hill[961] by the direction and leading of such a spirituall Creature, as when they had gotten the same, and they endeuored by art to haue some exposition of the skroll, written in strange characters, they wer willed to repayre to me, and there they shold be answered: &c. which thing now they did.[962]

Being therfor now ready to receyue instructions of our frendes, there appered in the stone One,[963] in a foles cote, going abowt a clowde, which appered first in the stone. I charged him if he were the enemy of God to depart. He tore his clothes all, and appeared all hery under: and sayd, Penetrasti vim iniusticæ meæ.[964]

Δ: Glorifie God and depart. He sayd, Feci, Nam decedo.[965] He went away as it had byn a bunsh of fethers pulld in peces. The Clowd wexed bigger, and went all to the right hand. At length the Table appeared, But the Chayre seamed not to be of the same sort it was, but more Glorious. There appeared three, of which, two went away, and one tarryed behynde.

He sayd-----------Auete.

Verum est, et incredibile.[966] He kneeled to the Chayre and spake, but his words could not be discerned.

Via, veritas, et virtus, unum sunt: et multiplex et admirabilis est eius magnitudo: Et venit ab ore tuo flatus, (et vitam habet) quo viuunt omnia, nutu, et illuminatione tua.

Aue Verbum, Aue rerum formatrix[967] et mensura eorum quæ fuerunt, sunt, et erunt: Illuminasti oculos creaturarum monimentis et admonitionibus planis: Vita bonis, mors autem impijs, et a consideratione tua abiectis. Quanta et innumerabiliæ sunt (Iustitia) dona tua? O remiges varpax. Kyrie eleyson.[968]

Δ: All this he sayd Kneeling to the chayre; and then he rose; and I sayde, O beata Trinitas, mitte lucem et veritatem tuam, ut ipam me ducant ad montem sanctum. et ad tabernacula tua.

Me: Ubi, non increduli.

Δ: Nos non sumus increduli: sed spes nostra viuit æterna et Omnipotens est Veritas, fons vitæ.

Me: Adduxi vobis aquam[969] ex eodem riuulo. Medicina verò est imperfectionibus et necessitatibus vestris. Intelligite nunc et quis sum, et quibus ornatus. Bibite, et accipite Ossibus vestris pinguedinen. Multæ namque sunt mortalium imperfectiones. habeo, et habebitis: Adduxi, et videbiter. Verbum est Lumen illud quo omnis imperfectio aboletur. Credentes introibu... in Sanctum eius. vbi potio, et Medicina sempiterna.[970]

Cogitasti verè. Sum etiam, et Credas. Nam veritate et iustitia, vera et perfecta sunt verba et disciplina eius.[971] What willt thow?

Δ: Recte sapere.[972] Me: Thow hast it.

Δ: I perceyue it not otherwise, then that I beleue, it may be the decree of the highest.

Δ: He shewed a Tree, and a great deale of water at the roote or botom of it: and he sayd, Me: Hath this Tree, now, any frute?

Δ: I see it not. But the skryer may say.

EK: The water commeth up the tree, and it swelleth, and it hath frute, great, fayre, and red.

Me: Lo I eate of it my self, and it lighteth the harts of those that are chosen. [He semeth to eate.] **So is it** in thee.

Δ: Ecce seruus Domini, fiat Decretum eius in me (iuxta misericordiam eius) de me pronunciatum.[973]

Me: **Go and thow shallt receyue. Tary, and you shall receyue slepe, and you shall see, But watch, and your eyes shall be fully opened. One thing, which is the grownd and element of thy desyre, is allredy perfyted.**[974]

Yt seemeth that you beleue not.[975] But I haue sayde, as he hath sayd and his worde shall endure for euer. For he shall, and will performe it, for he liueth for euer. **Oute of Seuen thow hast byn instructed most perfectly of the lesser part,**[976] the rest I haue browght you, in this my vessell; A medicine sufficient to extinguish and quenche oute the enemy, to our felicitie: Muse not, thowgh I say ours: for we all liue in tasting of this liquor. His Hed is a marble stone.[977] His hart is the blud of a dragon. His leggs are the tops of the Northen Mowntaynes. His eyes are bright, and his face of many Cullours, eche substance amongst the turmoyle and trubble of nothing. For as then, they were Nothing: Had a forme applyable and necessary according to theyr quantitie and secret qualitie. The heuens are lightened by his two eyes: wherof the one sight is brighter then the other. Aboue and in him self which is by him self, and in no other, is this great and vertuous fowntayne. In nature Intellectuall he hath watred the plantes of her beauty, and stroked up the garments of her felicitie. In her darkest members entreth in the taste and sauour of this percing Medicine; reviving and recalling all things past present and to come, unto theyr lively and dignified perfection. My words ar sentences. My sentences, wisdome; My wisdome the ende in my message of all things. Mighty and glorious is the Vertue of it, whose springs do endure, and are clere for euer: Whose name be blessed.

Δ: Amen. I respect the tyme. God be with you.

Martij 24. Sonday: morning abowt 8.

Δ: The Table appeared, and the Chayre: and he who appeared yesterday: kneeling or rather lying prostrate on his face, as if he were a slepe: He lay a long while.

A thing like a lambs hed did seeme to lik him, and then he rose and wiped his face, as thowgh he had wept.

Me, he sayd, Signa sunt hæc vobis, humilitatis et pænitentiæ; quæ facio omnia, vestra, non mea sunt.[978] Laudetur verbum eius in Cælo, laudetur etiam et in terris: Investigate potentiam in humilitate loquelæ eius, et videbitis gloriam frontis eius. Misericors namque et omnipotens est gloria virtutis eius. Vana sunt, corruptionibus suis; Necessaria verò Necessitatibus vestris. Nam fecit omnia ad laudem eius: et opera manuum suarum (Ecce) collaudant lumen vultus eius. Adinvicem diligite Humilitate viuite. Medicina verò mea (quæ eius est) omnia resanabit.[979]

The feldes wither without the drops of his Mercie. Mans Memorie is dull, unleast it taste of the sprinkling of this vessell. [EK: He hath a great thing under his gown.]

Nature and reason[980] haue disputed profowndly and truely by the sauour hereof: it perceth therfore depely. But understanding and reason haue eleuated and lifted up the dignitie and worthynes of Mans Memorie, by taste hereof. The Immeasurable and unspeakable begynnings (yea with the begynner and Principle therof), are exactly (after a sort) and perfectly known of them. Yt hath towght from the earth unto the heauens: from the heven, unto his seat: from his seate, into his Diuinitie. From his Diuinitie, a Capable measuring of his unmeasurable mercies. It is true, most true, and true shalbe for euer. That from the lowest grass to the highest tree, [from] the smallest valley, to the greatest mowntayn; yea, euen in the distinction, betwixt light and darknes: the measure whereof is the deapest: yea (I say) it hath towght a Iudgment. When he axed wisdome, and forsoke the world, he receyued it: and it measured the things of the world. Great are the inward eyes, and greater are the meanes, which deliuer things subiect or obiect unto them.

Finally it procedeth from him, that procedeth: Whereunto the first was formed, **after**, and not **like**. Whose fote slipping hath dasshed his hed in peces, and it becam dark: untill agayn, the Medecine which I haue browght, revived his slombring. Hereby, he, not onely knew **all** things,[981] but the measure and true use therof. Yf the body haue no inward fyre, it presently falleth. Euery Organ is voyde of qualitie, unleast a meane be adiected. So, is all that thow hast before, more wonderfull, then, as yet, profitable, unleast thow be directed and led-in unto the true use and order of the same.[982] Great are my words, and great is thy thowght: Greater shalbe the ende of these Gods Mercies.

New worlds, shall spring of these.

New manners: strange men: The true light, and thorny path, openly seen. All things in one, and yet, this is but a vision. Wonderfull and great are the purposes of him, whose Medicine I carry. I haue sayde.

Δ: He lay down agayn, a good while, and at length he rose: after my long prayer and confession made to god, and my discourse to him, &c.

EK: He plucketh out a boke: all the leaves are, as thowgh they were gold, and it semeth written with blud, not dry.

Δ: He sayd, Cownt. Δ: He turned ouer the leaves, but EK could not well cownt them: whereuppon he sayd: I will raze out[983] thy dulnes, and at length, make thee clere.

EK: There are 48 leaves. Me: Et finis est.[984] One is one; neyther is, was or shalbe known: And yet there are iust so many. These haue so many **names,** of the so many Mysteries, that **went** before. This is the second and the Third: The Third and the last.[985] This is the measure of the whole.

Ô what is man, that is worthy to know these Secrets? Heavy are his Wickednesses, Mighty is his synne. These shallt thow know: These shall you use.[986] The One is a Master, the other is a Minister. The One, is a hand, the other is a finger: Grutch not. Neyther let wickednes tempt you: loue togither. Be contented with your calling: For, all beasts see not a like: yet are they all Creatures: Vessels, not of one bignes, yet are they all full. Both, most sufficient, but according to fayth, and understanding of Conscience. Yet must there be a third; whom, God doth not yet chuse. The tyme shalbe short: the matter great, the ende greater. Ask now what thow wilt and he shall answer thee.

EK: There appered one like my self laying his two armes, one, on EK his sholder: and the other on a man his sholder, unknown to us, but somwhat like to Mr Adrian Gilbert,[987] &c.

Δ: Ys it your will to procede in this matter, you now haue begonne withall: or will you of these characters and places of Threasor hid (here portrayled by picture), say any thing?

Me: As thow wilt. Δ: As the will of God is, so will I. The will of God you know, better than I.

Me: The æternallliquor be uppon you. Ones more, what wilt thow?

Δ: I do prefer the heuenly liquor, before all things, and do desire to be bedewed, with the supercælestiall dew thereof.

Me: Consider the former tree.

Δ: The tre with the water at the fote?

Me: Thow hast sayd. His growing powre, bringeth furth Act.[988] Remember the Prince and Subiects, which haue powre (as is told thee) of Erthly Bowels (The thing there, [~~whose~~] which you desire of me, is no parte of my charge), Call him: It is his office: for by his ministers it hath byn shewed.[989] God doth impart his mercy, to those he loueth, in all necessitie: whether of the one, or of the other, where it is dew: I leave it: his Office is to speak it. Notwithstanding liue in truth and humilitie: Use God his Creatures to his glorie, and thy Necessitie, the proffit of thy own lymms, and cutting out of all Canker and rotten flesh. Thow understandest: For thy eyes shalbe opened. Amen.

EK: He spreddeth his hands abroade, and goeth away, and putteth his boke in his bosom as he goeth.

Δ: Gloria patri.[990] &c. Amen.

Martij 26. hor. 10 ante Meridiem.

First, appered a clowd: and that vanished away: Three cam in, they made Cursy to the chayre: and two went away. Then the third which remayned, lay down on the grownd, as before. There cam like a lambs hed,[991] and licked him. He sayd then, as followeth: being stand up,

Magna sunt, Alla quæ dixisti,[992] making cursy to the chayre. There was a sownd hard before. After a while he sayd,

Me: Thy Kingdom is established in eternitie. Thy hands are invisible, and no man can distinguish thy mercies. I attend your desire.

Δ: As concerning the Characters, and shew of the ten places, we are desirous to know whyther we may require now Bnaspol, or other under him, to say unto us, that, which may content us, for the Case as it standeth with us.

Me: The buylder of the Temple was riche, before it was adorned. With Wisdome, cam the Instruments necessarie for mans worldly use. He hideth no light from those he loveth: neyther shutteth up his tents from such as seke him. Yf one be great, Ô how small is the other? How small therfore is the mynde, and how much weakened that desireth those **trifles?** But as the smallest thing is feefest to the smallest use, so is the existimation of things of light accownt, necessary for the lightnes and vanitie of this world. A part (Notwithstanding) may beawtify the whole, and a small thing, may cure a great infirmitie. I told thee before, that my fete are not placed uppon such brittle and crakling sand, neyther are my lipps occupyed with the vanitie of nothing. I will not[993]manifest in any point, the thing which thow desyrest, neyther is it any part of my charge.

I haue byn thy scholemaster and director to the Sterne, to rule the reason therof, with those, which can reache the Iudgment therof. All those before spoken of, are subiect to thy call.[994] This vessell at all tymes they greatly accept. Yet haue they times and seasons:[995] When order breaketh in her self, the labor is in vayne. Euery thing is for and to an ende. Of frendeship, at any time,[996] thow mayst see them, and Know what thow willt.

But One thing differeth, the Ende, and the Begynning. That onely, is the El, rod, or measure which all ready is deliuered. The stroke of which, bringeth all things, in theyr degree, to an ende: as far as the seven (magnificencie of euery Seuen) stretcheth out it self.

Euery one, (to be short) shall at all times and seasons,[997] shew thee direction in any thing. But, SO, thow canst not use them, in the determina tion, and **full ende** of euery practise. It is one thing to affectionate; and an other to effect. What thow seest, is true, and to a former[998] commoditie: For, with Furderance, euery thing in Nature is ayded.

Δ: ---

Reade ouer that, which now, lastly, I declared: Then see, if you be not answered.

Δ: ---

Therfore mayst thow know, what that is, allthowgh thow do not, yet, or presently, put it in practise, by him, whose Charge it is, to deliuer it.[999]

Δ: Of your so greatly commended liquor I am desirous to haue farder understanding.

Me: What liquor is more liuely then the dew of Truth, proceding from a fowntayn most swete and delectable? Euen that veritie which thy mowth hath preached of.[1000] What water recreateth more, or cooleth ignorance deeper than the knowledg of our Celestiall speche?[1001] your voyces are but fayned: shaddows of the wordes and voyces that substantially do comprehend euery substance in his kinde. The things which you do loke on, bycause you see them not in dede, you allso do name them amysse: you are confownded, for your offenses: and dispersed for your punishments: But we are all one, and are fully understanding. We open the eare, and the passage thereof, from the sonne in the morning to the sonne at night. Distance is nothing with us, unleast it be the distance, which separateth the wicked from his mercy. Secrets there are none, but that buried are in the shaddow of mans Sowle.

We see all things: and Nothing is hid from us: respecting our Creation. The waters shall stand, if they here theyr own speche. The heuens shall move, and shew them selues, when they know theyr thunder. Hell shall tremble, whan they know what is spoken to them.[1002] The first[1003] excepted, No man euer was, is, or shall be (excepted where I except) that euer shall understand, hath or doth know the least part (ô it is incomprehensible) of this Vessel. He named all things (which knew it) and they are so in dede, and shalbe so for euer.

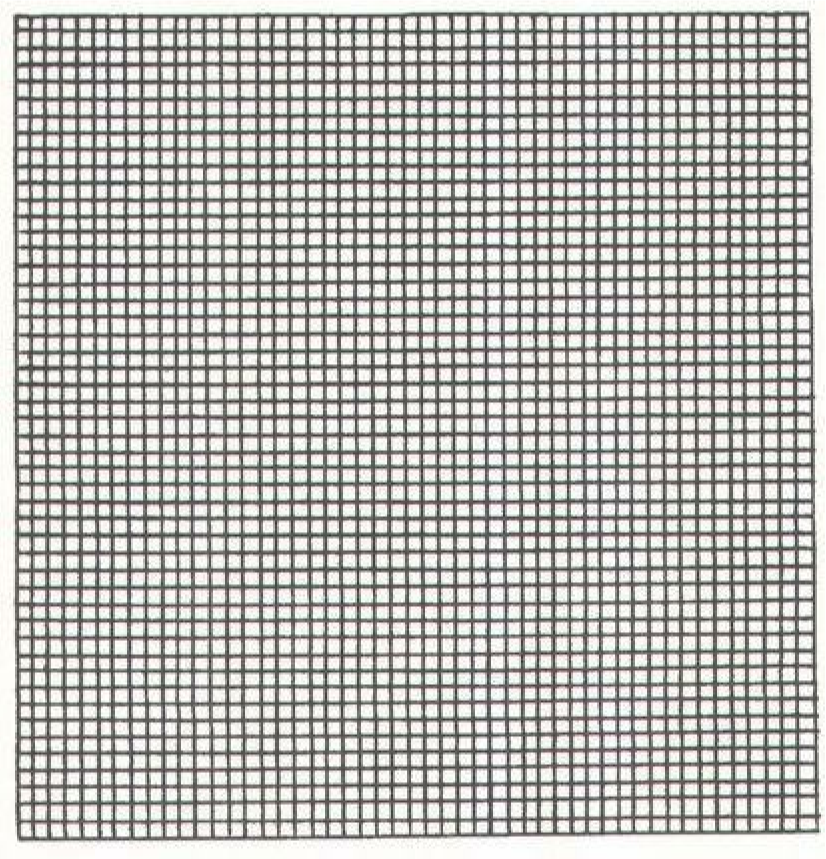
Thow shallt speak with us;[1004] And we will be spoken with, of thee. Three they are excepted, which taken from amongst you, as they were, do yet speak with us, which are provided in the three laws to destroy **that Monstre**.[46] They are fed with cælestiall fode, and they, talking, speak all understanding. This it is, I take God, (onely him that created me) to recorde. **It is determined**: else wold I not: **And may be undetermined. yf you break his** commaundements.[47]

A Stone it is that perceth[48] down all things before it; and kepeth them under him, as the heuens do a clowde. What art thow, (O god,) and how mighty ar the drops of thy mercy, that preparedst man before to examin thy Mysteries? The plagues of those that plagued them selues, shall fall uppon you, **yf you transgress**[49]one iote of your eyesight :

For, What you desire, is graunted: and if you loue him, you shall endure for euer. I am not as a clowde, sheuered[50] with the wynde: nor as a garment, that waxeth olde, and torn in peces: But I am for euer (bycause my message is such) and my truth, shall endure for euer.

Beholde, Beholde, yea let heven and earth behold: For with this, they were created: and it **is the voyce and speche of him**, which proceded from the first, and is the first; whose glorious name be exalted in his own horn of honor.[51] Lo, this it is. [EK: He sheweth a boke, as he did before all gold.] And it is truth; Whose truth shall endure for euer.

EK: The leaues of the boke, are all lyned: full of square places, and those square places haue characters in them, some more then other:, and they all written with cullour, like blud, not yet dry.[1005] 49 square spaces, euery way, were on euery leaf, which made in all .2401. square places. He wiped his finger on the top of the Table, and there cam out aboue the Table certayn Characters[1006] enclosed in no lines: but standing by them selues, and points betwene them. He pointed orderly to them with his finger, and loked toward the skryer at euery pointing.



Me: Note what they are.

Δ: They are Noted.

EK: He toke from under the Table, a thing like a great globe, and set that in the chayre: and uppon that Globe, layd the boke. He pointeth to the characters: and cownteth them with his finger, being 21, and begynning from the right hand, toward the left. He putteth-off the Crown of gold, from his hed: and layeth it, on the Table. His here appereth yellow. He maketh cursy: and from under the Table taketh a rod of gold in his hand, being diuided into three distinctions.[1007] He putteth the ende of the rod on the first of the Characters, and sayeth, Pa: and there appered in english, or latin letters, Pa: He sayd, veh: and there appered veh in writing: Then Ged: and after that he sayd, Unus Unus Unus, Magnus, Magnus, Magnus, es, [1008] Then he pointed to an other, and sayd Gal, and there appeared Gal: Then or [the voyce seemed Orh.] Then un [the sownd semed und.] Then Graph: [The sownd as Grakpha, in the throte.] Then Tal, [in sownd stall or xtall.] Then gon. Then na [but in sownd Nach as it were in the nose.] Then ur, [in sownd our or ourh.] Than mals, [in sownd machls.] Then Ger, [in sownd, gierh.] Then drux, [in sownd drovx.] Then Pal: the p being sownded remissly. Then med. He sayd, Magna est gloria eius.[1009] Ceph, sownded like Keph, But before that, was Don: Then van, Fam, Then Gisg.

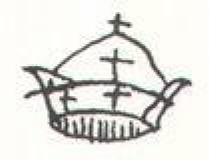
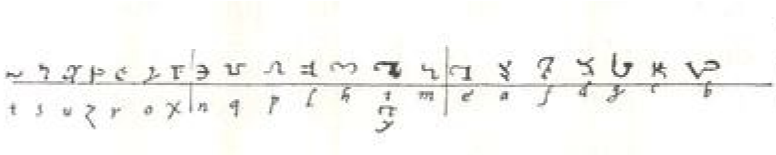
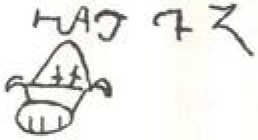
Then he lay down before it: and there cam two lines and parted the 21 letters into 3 partes, eche being of 7. He sayd, Numerus ô perfectissimus, Unus et Trinus. Gloria tibi, [1010] Amen.



Then he put on his Crown, and pluckt a black veale before all in the Chayre. He sayd, Remember to lerne those names without boke, and to know them.



Δ Thus I deciphred them after a day or two or three.



Martij 26. a meridie + Tuesday hor. 5½

First there was a great noyce of harmony, hard. There appeared two great Armies fighting, and much bludshed on both sides.[1011] One Captaine is in red harness, the Contrary Captayn, is white and grene. There appered Flags with a croked tree, or like a ragged staff, or cudgell, in them: and they were on the red Capitayns side. He and his soldiers had the worse and were putto flight, and they ran away. The Captayn with the white and grene was Master of the felde: and assembled and gathered his men to gather after the Victorie. Now this Capteyn goeth to a town and semeth with his hand to heave up the towne, being a big towne. There was a voyce hard, saying thus,—So shall it be, with 21 more.

Δ: Wyth what one and twenty?

A voyce:—As yet, you can not know. This shall happen, before the Sonne hath twise gon his course.[1012]

EK: Now the Capteyn appeared alone, on fote, in his harness. He holdeth up his hands to heven: He is now vanished away. I meane the Capteyn in white and grene. Now appeareth the red cloth before the chayre. There come in three: they all make cursy: and two of them went away.

Δ: Our desyre is to know what we are to think of the Man which cam out of my Oratory and layd the fyry Ball at Mr Adrian Gilbert his fete yesterday, as he sat in my study with Mr Kelly and me: whether it were any Illusion, or the act of any seducer?

Me: No wicked powre **shall enter** into this place.[1013] Neyther shall Iniquitie range where the fyre of his percing Judgment and election[1014] doth light, which shall quicken his deadness, and revive his courrage to the auancement of the name of him, which liueth now. He chose with fire and lightened theyr harts, and they immediately understode and felt the Illumination of his glory.[1015]

What wilt thow?

Δ:

To the performance of the glorie and encreasing of his name, which shortly maketh an ende with for euer.

Δ: This phrase, for euer, is somwhat dark.

Me: **With this world,** for euer. Δ: This giveth some light.

EK: The stone is become very dark.

Me: As the Buylding is grownded and ended uppon Three, So must the mysteries hereof be practised With **Three**. The fowrth is the Boke, which, Lo, is here present.

Δ: Must Adrian Gilbert, be made priuie of these Mysteries?

Me: Thow hast sayde.[1016]

Δ: May I note to your name any peculier Character or Syllable to distinguish your speches from ours or others?

Me: Medicina sum.[1017]

Δ: I may then use this syllable Me, to Note Medicina or Medicus Dei.[1018]

Me: Behold, these things, shall God bring to pass by his hands whose mynde he hath now newly set on fyre.[1019] The corners and streights of the earth shall be measured to the depth: And strange shalbe the wonders that are Creeping into new worldes. Tyme shalbe altred. with the difference of day and night.[1020] All things haue grown allmost to theyr fullness. But beware of Pride. We teache duty, Humbleness, and submission. Shortly shall these things come to passe.

Δ: Than, this Adrian Gilbert shall cary the name of Jesus among the Infidells to the great glory of god, and the recouery of those miserable people from the mowth of hell into which, for many hunderd yeres past, and yet contynually they do fall, &c.

Me: Who made thy mowth to prophesy? or, who* [Of God] opened the eyes of thy understanding? Who annoynted thy Jaws, or fed thee with unknown meate. Euen he* it is, that pricked these things forward, and **shall use you** as **his** Instruments to a mightie honor.

Δ: May we require description[1021] of the Cuntryes, for his better instruction, &c.

Me: Let darknes go behinde thee, and tempt him not, that iudgeth.[1022] These things belong not to my charge. Thow knowest them, which are sufficient,[1023] whan short time shall serue, for the whole instruction.[1024] Greater nede were to enquire How or by what meanes thow mayst be made worthy;[1025] and, so, consequently, haue knowledge for the knowing , hauing and using of this cælestiall medicine.

Forget not.

I instructed thee before-hand, and told thee, that both of you must iointly[1026]lerne those holy letters (For, so, I may boldely call them) in memory: with theyr names: to the intent, that the finger may point to the hed, and the hed to the understanding of his charge:

Δ: You perceyue that I haue diuerse affayres which at this present do withdraw me from peculier diligence using to these Characters and theyr names lerning by hart: And therfore I trust, I shall not offend, if I bestow all the convenient leysor[1027] that I shall get, abowt the lerning hereof.

Me: Peace, Thow talkest, as thowgh, thow understodest not. We know thee, we see thee in thy hart: Nor one thing shall not let an other. For short is the time, that shall bring these things to profe: Wherein he that liueth, shall approve him **self aliue.**[1028] Beautifull are the footesteps of his comming, and great is the reuenge of the wicked.

O Liber, Liber, Liber, bonis vita, malis vero mors ipsa. Magna sunt mirabilia in te inclusa: et magnum est nomen Sigilli tui

Lumen Medicinæ meæ, vobis.[1029]

EK: He holdeth his hands abroad. He draweth the Curten.

Δ: Gloria Laus et honor Deo patri et F. et SS.[1030] Amen.

Martij 28. Thursday morning. Mawndy Thursday.

A voyce: Pereant omnes qui insidiantur[1031] virtuti nominis mei: et qui Lumen absconderunt lustitia mea.[1032]

EK: Now the vale is pluckt away.

Three appeare, as before time.

All three sayd,—Multa nos, quia multa patitur ipem.[1033]

EK: The two go away, and the Third remayneth who is like in all points to him, who yesterday to me alone, in your absence had declared himself to be an Illuder. Δ: NOTE, for the better understanding of this dayes Act it may be remembred that E. Kelly, while I, (John Dee) was at London, yesterday (being wensday) had used meanes to haue conference, with the good Creatures, with whome we haue dealing iointly: and that there appeared one very **like** unto our good frende, who toke apon him to be **the same**, and now semed to be constrayned[1034] by EK to tell the truth: and therfore his outward beautifull apparell semed to go of, and his body appered hery and he confessed that he was an Illuder[1035] &c. Whereuppon EK was in a great perplexitie of mynde, and was ready to haue gone his way. And at my comming home told me a long processe of this Tragicall Act. But I comforted him, and wold not yeld to his opinion, But did declare my confidence in the goodnes of God: for that we craved at his hands, things good and necessarie: and that therefore he wold not giue his childern a stone for bred, or a scorpion for nedefull food required &c.[1036] And this morning the matter was propownded by me, and thereuppon the former sayings wer used, and all the consequences of matter, which hereafter is recorded.

Δ: The veritie I require of yesterdays doings with EK on my absence.

Camikas zure, he sayd, holding his hands to heuen.

EK: He walketh up and down and semeth angry: and did beat his hands togither. There commeth a little streame of fire whitish from aboue: and cam to his hed. He kneleth down before the Chayre, and loketh up, and sayde,

Me: Oh how brittle are the works of thy hands [he looked up] whose Imperfections are now more innumerable then the sands of the sea: or clowds that were lifted up since the begynning of the world. Darknes dare presume to place him self in Lightnes: yea dishonor, (o God) to dwell in place of glory: His lying lipps presume against Truth: whilest thow suffredst his old and withered face to be garnished with thy beawty. Heavines[1037] is his seat; yet are his lipps myrthfull: and little there that separateth him from the dignitie of honor: But his ponishment is sufficient, his dishonor unspeakable, and his damnation for euer: which how bitter it is, great and unspeakable, Thow, ô thow (I say) that liuest (which hast estranged him so far from thy glory) makest onely manifest. But yet how long shall the sonnes of men puff up them selues with bragging and.boasting of that they see not? But (alas) All things are confownded, and are contrary to thy commaundements: some onely which differ, remayn with concordant myndes praysing thee, and lifting up thy name, as much as strength performeth. But herein is thy glory and long sufferance manifest, in that thow dost not onely with greif behold theyr synnes, but like a iust iudge, fauorably doth ponder the greatnes of theyr enemies which infect theyr myndes, and blynde the light, which thow hast given unto theyr understanding, with inflammations bodyly, instigations worldly, and tentations innumerable. Great therfore and most great, and none greater can be, which deridest the Aduersarie, and healest the weak: whose smallnes of habilitie thow canst augment, wherein the mysteries of thy great glorie and might, is manifest. Thy seal yeld prayses, with incessant and dutifull obedience. Thy name be magnified, thy mercy published to thy glory: Holy Holy, yea great and most holy, is thy euerlasting kindenes for euer.

EK: Now he standeth up, and sayd,

Me: As I haue all ready told,[1038] from whome I cam, so haue I not hydden, what I am, or what message I bring; why it is sent, it is allso written. How long shall I perswade to stedfastnes? But the greater your measures are the greater shalbe the quantitie. These afflictions are necessary. For herin is a measure to distinguish[1039] from falshode, light from darknes, and honor from dishonor. The more they are like us, or shew them selues so, (for, nothing can be more dislike) the more they are Judges of theyr own damnation. Yea, if his strength had byn great, he wold haue devoured thy sowle. [Loking to EK.] But whome God hath chosen, shall none overturne. Brag not: eyther Credyt my words by thyne owne reason. But Consider that diuerse may be dishonored, yea thowgh they be in honor: yet shallt not thow neyther be ouerturned with the one wynde nor the other: thowgh the afflictions that shall **follow thee, be great and hard**.[1040] In my words are no error: neyther haue you fownd my lipps untrue. Whan I kneeled, I spake for you. But I haue promised that No unclean thing shall prevayle within this place. Neyther am I a revenging spirit nor of any such office. I quicken the dead, revive them that are falln and cure or sow up the wowndes, which they are permitted to work uppon man, as tokens of God his Iustice.

I call the same god, (whome I haue called before) to recorde, that these words are true, my sayings iust, and his mercies more perfect. Whilest heven endureth and earth lasteth, never shall be razed out the Memorie of these Actions.[1041] Use Humilitie: Reioyce whan the enemy is discomforted in his traynes,[1042] and inventions: A ponishment so great, Et cætera. Whan I yoked your feathers[1043] to gither, I ioyned them not for a while. Your flying is to be considered in quantitie, qualitie and Relation.

Thank God: Be mercifull: forget your synnes: and prepare your selues, For great and wonderfull is the immediate powre of him that illuminateth from aboue. It shall light apon you: For those that are present with him, liued with him, eat and drank with him, [and] were instructed by him, Were but hearers onely: At length God was glorified, in one instant all things browght unto theyr remembrance: yea some of them taken to behold the heavens, and the earthly glory. I haue sayd.

Δ:

Me: Behold. Veniat vindictum dei, et percutiat linguam mentientem.[1044]

EK: He goeth his waye and taketh all with him, Table, Chayre, and Curten and all. There cam in a great many with flaming swords, and bring in the wicked spirit, who yesterday delt so diuilishly with EK. One of them holding him by the arme, sayde, Speak now for your self, you could speak yesterday. They all drew theyr swords: they sknorked fire. And there seamed a water to com in, but it went away again.

A voyce:—Dicat, nam nrm non est.[1045]

EK: Now is the Skroll with the Characters browght in, which was fownd by spirituall direction this month, the 12 day, abowt 10½ after none by Mr Kelly and Master Husy.[1046] He semeth now as like our good frende, as may be. Our frende cam with a sponge and annoynted the wicked spirit his lipps.

A voyce:—Els could I not speak.

Δ: Seing now thow canst speak, answer me.

The wicked, sayd:—Ask quickly.

Δ: What is thy Name?—The wicked answered, Gargat.

Δ: What is the sentence of that skroll?—Gar: I know not.

Δ: In the name of Jesus, I charge thee to tell me the truth as concerning That roll here shewed.—Gar: I haue cownterfeted this roll, and browght it: for it is not the true roll.[1047]

Δ: After many words betwene him and me, and the more, bycause he denyed that he knew of any Glorie belonging to God, I urged him so, at length with short and euident argument, that he answered, he must confess the powre and glorie of god: and sayd, that he was damned for euer: and did wish damnation to me. And I requested God to use his Justice on him, for the glory of his name. Then he entreated me somwhile, and somwhile derided me, saying, Art thow so lusty? &c.

Δ: All the Cumpany fell on him, and hewed him in peces: and digged a hole in the earth, with theyr swords, and he fell in, and after that was a myghty roaring hard.

A voyce:—Sic soleo iniustis.[1048]

Δ: The Cumpany went away. There cam a fire and seamed to burn all the howse.

A voyce:—Purifica Domine sanctum tuum, et dele iniquitatem inimicorum nostrorum.[1049]

Δ: Then returned our frende, , and all seemed light and bright agayn: likewise all the furniture, of Table, Chayre, Globe in the chayre covered with a red covering &c.

Me: Visio vera, verè denotatur. Denotetur etiam ad gloriam Dei.[1050]

☞ Δ: Master Kelly, is your dowt of the spirit, now taken away?

EK: Ye truely, I beseche God to forgive me.

Me: Dixisti, et factum.[1051]

Δ: As concerning Adrian Gilbert, there might be some dowte in common externall Judgment, of his aptnes to the performance of the voyage with the appertenances, But the Secret of God his prouidence, I will not meddle withall: for he can make infants speak, and the dum to shew furth his glory &c.

Me: Yf God be mighty, acknowledge his powre. Who made the Sonne of nothing? or man, so brittle a substance? Nature thrusteth up her sholders amongst trees and herbs, like a ientle fyre: In beasts and all the creatures of the feelde, waters, and earth, in a palpable imagination: Amongst the sonns of men, she auanceth her self, wholy in the light of understanding. In all these she walketh by her own qualitie, mixing the quantities, with her before iudged proportion. Amongst all these is some distinction, yet all in theyr kindes are perfectly and substantially norrished. Yf Nature haue such powre, What powre hath our God, and how great is his might in those in whome He kindleth a sowle, understanding. The strength of 1. body, and 2. inward man, with 3. the strength of him that allso leadeth him[1052] are augmented and diminished at his pleasure. Yf earth, in myxture become fyre, hom much more shall he encrease, whome God hath strengthened: yf he wold haue conquered with thowsands, he wold not haue sent back **the dogged** harted people. Yf riches or renown were his felicitie, he wold haue kindled the twelue Lamps[1053] of his æternall light, on a higher mowntayne: But he chose them in the Valleys, and from the watering places. I think this be sufficient to confirme your understanding.

Δ: I trust, God be not offended with this matter propownded &c.

Me: He is pleased: And it is enowgh. Eternitie is mighty and glorious to the righteous.

Δ: Whan shall I make him[1054] priuie of these things?

Me: Whan thow wilt. For euery thing is acceptable with those that are accepted. See thow cownsayle him, and be his Father.

Δ: As concerning John Dauis,[1055] we are to ax somwhat &c.

Me: John Dauis, is not of my Kalender. Lern of them, of whome it is necessary. Be not negligent, in lerning the things before prescribed.[1056]

God be emongst you.

EK: He hath drawn the curten of red.

Δ: Soli Deo sit omnis honor et gloria.[1057] Amen.

Mawndy Thursday, after None. hor 3½

Δ: The Veale being drawn away after a quarter of an howre (almost) after the first motion made by me. Three cam in, and made obedience to the chayre. Two went away, and the third remayned there, as before.

Δ: As concerning the Kalender to be reformed, I am grieved that her Maiestie will not reforme it in the best termes of veritie.[1058] And as for the priuiledge for Mr Adrian Gilbert his voyage, I think not well of it, that Royalties shold not be graunted. Therfore both these points, respecting her Maiestie, I wold gladly haue cownsayle, such as in the Judgment of the highest might be most for my behofe, to follow.

Me: In one gouernment there are sundry principall partes: Euery part in subdiuision conteyneth many and sundry offices. Many Offices require many disposers: yet hath euery disposition continually some partition in his qualitie. All things, one thing: And one thing, something: some thing, many things, and many things, most innumerable. The heuens in proportion are gouerned universally of a few; particularly of many: eche place possesseth his diuision: and euery thing diuided, his propertie. Princis ar governors which move and stir them up to work, as it is provided, and to behold in speculation How euery particular Action, shall haue due, perfect, and appropriated Locall being, motion and Condition. Subiects, (yea, the Highest) are stirred up, by theyr propre Angels:[1059] The inferior sort do follow the disposition of theyr leaders. Vertue and Vice dwell euery where. Light and darknes, are allwayes intermedled.

Consider, How I speak it.

The myndes of all that move, euen unto the least qualitie in Nature, haue of them selues propre vertues: and therfore propre Instigators.[1060] I call to memory thy words, the manner of thy speche, and the secret purpose or meaning, whereunto it is uttred. I see thy Infirmities, and know what thow desyrest. But mark me, whom God commonly choseth,[1061] shalbe whom the Princis of the Erth do disdayn. Consider, how the prophet that slew that Monstrous Gyant, had his election.[1062]

God respecteth not princis, particularly, so much as the state of his whole people. For in Princis mowthes, is there poyson, as well as proverbs. And in one hart, more Synne, then a whole world can conteyn. Yt is not myne office to meddle with theyr vanities, neyther is it a part of my pageant to towch any thing that tasteth not of Medicine. But, what? doth thy mynde reply? Dost thow think, that my cownsayle herin, to a grieved mynde, is, (thowgh it can be) Medicinall? Peraduenture[1063] thow thinkest I am not, [in] thy marrow: yes I haue byn long in the highest part of thy body,[1064] and therfore ame somthing perswaded of thy meaning.

Δ: In dede, I thowght that your good Cownsaile, was or might be a remedie and a medicine to my afflicted mynde, for this unseamely doing, in the two former points expressed.

Me: Behold, where unto thy earthly man wold seduce thee. Dost thow think, that if it pleas god, it shall not please the Prince? **if it** be necessarie , **all ready** prepared?

Secretum dico.[1065]

For all things are Limited, with a full measuration, and unserchable forsight: yea, I say, all ready, unto the ende. Be not discomforted. Quayle not at the blast of a small tempest: For those that speak thee fayre,[1066] haue dissembling harts, and priuilie do they shote at thee, with arrows of reproche. Whan they[1067] shall haue nede of thee: I meane, of the help of God, throwgh thee, (some shut up, some entangled, some gadding[1068] like masterles Doggs,) Than shall they gladly seke thee and desire to finde thee. They shall smell oute thy fote steps, and thow shallt not see them. The key of theyr Cares shalt thow be Master of: And they them selues shall not unlok theyr own grievousness. Yea they shall say, Oh let the earth devowr us. But I am to long. I answer thee, all thowgh it be not my office,[1069] to declare that thow desirest: yet for that thow desyrest my Medicine. I say, Thow shalt preuayle agaynst them,[1070] yea euen agaynst the Mightiest. As thow wilt, so shall it be in God his blessings.

Beware of Vayne glory. Use few wordes.

Thy weapons, are small, But thy Conquest shalbe great. Lo. Doth this satisfy thee? Haue a firme faith. It is the greatest lesson. Be it unto thee as thow hast deliuered. One thing, I answer thee, for all Officis. Thow hast in Subiection all Offices. Use them when it pleas thee, And as thy Instruction hath byn.

I haue sayde.

Δ: As things be planted here, for preparation of Table, Sigillum Dei &c, which things are not portable with eas: So, bycause I think, that some seruices to be done in gods purposes by me, will require other places than this howse, so shall diuerse my practises haue (as I think) a more compendious manner, and redy, to be executed in any place &c.

Me: Truely thow hast sayd, and so shall it fall unto thee. As I am here in this place, and yet in dede not, So, here: So shall it fall oute, and follow in the Mysteries of your Associated Operation.

The other[1071] shall be, but, as a necessary help to the **first Practises, to plant the Tree:** which being confirmed and strongly rooted shall bring furth frute,most abundantly.[1072] The Erth and the tree, can not be **separated.** This is the ende, and true it is. Let him be record, whom I beare record of here,

And so, with thee, Amen.

I must help thee. Lerne ioyntly the Elements or grownds of this heuenly doctrine;[1073] the ende and Consummation of all thy desired thirst: in the which God shall performe thee, thy Philosophicall Harmonie in prayer.[1074] Thow knowest what I mean.

The Æternall physitien minister his heuenly grace and continuall blessings uppon you, to the Glorie of his name, execution of your procedings, and holy and insatiable desires.

Δ: Amen: Omnipotenti Deo, nostro,
Creatori Redemptori et
Santificatori, omnis honor
laus et gratiarum actio.[1075]
Amen.

Jesus.

On good friday; After None

Δ: There was a savor of fire felt by EK. There semed one with a sword, suddenly to thrust out of the stone at EK his hed. Whereat he started; and sayd he felt a thing (immediately) creeping within his hed, and in that pang becam all in a sweat. And he remayned much misliking the moving and creeping of the thing in his hed. At a quarter of an howre ende it cam to one place: and so ceased somwhat: & then the Curten was drawn away: and there appeared the Table, and the chayre covered. Then cam three, two went away and the one remayned: as before was used.

EK held the paper of the letters in his hand: and Me bad him put it out of his hand.

Me: The taste of this mercifull potion, yea the savour onely of the vessell worketh most extremely agaynst the maymed drowsines of ignorance. Yf the hand be heavy, how weighty and ponderous shall the whole world be? What will ye?

Δ: This he sayd uppon our silence after his former words. I answered, we desyred to lerne the Mysteries of the boke. The Boke now appeared (the cover of the chayre being taken away) the boke lying uppon a rownd thing: which EK, was not yet able to discern what it is.

The first side of the first leaffe of the boke appeared full of the former letters, euery side hauing 49 tymes 49 square places, with letters: some more then other.

Me: Euery side conteyneth 2400 and one od letter.[1076]

EK: All the letters semed to be of bluddy cullor, and wet. The lines betwene the squares, semed to be like a shaddow. In the first square were 7 letters.

Me: Say after me: But pray first, ere you begynne. Δ: We prayed.

EK: All became blak as pych in the boke.

Then it becam light agayne.

Now he pointeth up, with his rod of gold diuided into 3 equal parts, which rod he toke from under the Table.

Me:

1. Keph van [He lifted his face to heven.] { Don graph fam veh na

EK: Now he kneleth down; and holdeth up his hands:
The letters of the first square, ar 7.

7	6	5	4	3	2	1

Now he pointeth to the second.

2. Med gal [EK: He turneth him self abowt.]
3. un gal un Mals na.
    Me: Twise seven, Thre and All one: and his mercy endureth for euer.
4. Tal un vrh.
5. Fam graph Fam.
6. Ged graph drux med.
7. un van.
8. Tal un don ur un drux. Sownded as δρυξ
9. Med.
10. Tal van fam mals un.
11. un ged gon med gal.
12. Mals un drux.
13. Ged un.
14. Fam graph fam.
15. ged un tal mals graph gal un keph
16. veh un mals veh drux graph na [capcneh]
17. ged med.
18. med gal.
19. Fam graph tal graph ur un pa van ged graph drux

20. Gal med tal drux un.
21. mals na gon un tal
22. ged un
23. van un drux veh don un drux.[1077]
24. Van don graph mals don graph fam

EK: Now he seemeth to wepe, and knock his brest. He pointeth with the rod, up, agayn, and sayd,

25. un gal graph mals gal
26. un keph graph
27. Gal don van keph
28. Gisg un don gal graph tal un na.
29. van un
30. veh graph fam gisg fam
31. ged don un mals un gal. He stayed here a good while.
32. fam graph gal
33. van drux pa un don
34. gal med tal gon med urh
35. un gal graph mals med un gal
39. 38.37.36. veh na graph van un veh na / Tal un na / Med fam fam na graph / gal un mals na /
40. med drux gon keph gal un don. This is a word.
41. mals un drux ged graph mals na gon.

EK: Now he walked up and down before the chayre: and cam agayn and pointed. The letters now following seme to be written with Clay.

42. Med gal un tal na
43. ged graph tal graph gal fam un ur: eight letters[1078]
44. un
45. gal gon drux med keph un
46. na med pal mals med don. Now he walketh agayn, and loketh upward.

Then he pointed agayn.

47. Un gal mals van drux
48. Gal un don
49. ged un don tal graph fam: He walked betwene the shewing of tal and graph. There are six letters in that word.

Me: Say after me (Shall I speak the Mysteries of thy glory, which thow hast secreted from the Inhabitants uppon the erth? Yea lord, it is thy will, whose hed is high, and fete euery where, redy to revenge the blud of Innocents, and to call home the lost shepe.)

Say after me,

1. zuresk[1079] od adaph mal zez[1080] geno au marlan oh muzpa agiod pan ga zez[1081] gamphedax[1082] Kapene[1083] go[le] od Semelábugen donkna[1084] fian[1085] ga vankran vreprez[1086] ádeph[1087] arxe[1088]

drux[1089] Tardemah va tzests[1090] grapad. zed unba[1091] domiól adepóad chieuak mah oshe daph Onixdar[1092] pangepi adamh gemedsol a dinoxa hoxpor adpun dar garmes.[1093]

Me: I teache. Let this lesson instruct thee to read all that shalbe gathered out of this boke hereafter. It is not to be spoken,[1094] but in the time of his own time. It shalbe sufficient to instruct thee: Fare well.

EK: Now he couereth the boke with the veale.

Δ: Prayses and Thankes be rendred to god, of us his sely[1095] ones, now and euer. Amen.

Δ: Note. All the former letters and words in the squares, were onely in the first or upper row, begynning at the right hand, and so going orderly to the left. And secondly Note that this lesson he red, pointing with his rod orderly uppon the same forsaid first row.

Martij 31. Easter day after none abowt 4.

EK hard first a sownd of Musicall harmonie.

Δ: The Veale was pluckt away.

Three cam in, two went away, as was before accustomed.

EK: Now he lyeth down. He riseth and pulleth the veale from the chayre. That veale was of cullor as a raynbow. The boke appeared playne and evidently on the globe in the chayre. EK felt the thing ronne in his hed as the other day it did. Me taketh out the rod from under the Table: He sayd,

Æternitas in Cælo.

Δ: Uppon my staying from speche, he sayd, What wilt thow?

Δ: The proceding instruction necessary for understanding of the boke.

Me: Mensuratur.[1096] Δ: He putteth up his rod to the boke.

Me: Sint oculi illorum clari, ut intelligant.[1097] [He held up his hands and semed to pray.] He pointed now to the second row of the 49 rows of the first page of the boke, and sayd,

Secundus a primo.

1. Gon na graph na van fam veh na [Now he walketh up and down.]
2. Ged don med drux na un gal med Keph [He walketh agayn.]
3. Un don gal graph drux [He walked agayn.]
4. med
5. drux un [He walked.]

45. mals un gisg don med mals na graph fam.
46. van drux gal graph fam.
47. un gal med drux.
48. ged un drux graph pa drux[1101] fam.
49. gon na graph na van gal keph

Me: Shall I rede it? Δ: We pray you.

2. Ihehusch Gronadox[1102] arden, o na gémpalo micasman[1103] vandres orda beuegiah[1104] noz[1105] plígnase zampónon aneph[1106] Ophad[1107] a medox[1108] marúne gena pras[1109] no dasmat. Vorts manget a-deüne[1110] damph. naxt os vandeminaxat.[1111] Oróphas vor mínodal amúdas ger pa o daxzum banzes[1112] ordan ma pres umblosda vorx nadon patróphes undes adon ganebus Ihehudz

Δ: Gehudz consisteth of 6 letters: But, Gon na graph na van gal keph, consisteth of 7. I wold gladly be resolued of that dowt if it pleas you.

EK: He boweth down, and put the rod away, and than Kneled down.

Δ: He rose and axed me, What wilt thow?

Δ: The former question to be soluted. Me: Thow hast written fals: for, it must be Ihehudz, and so it is of 7 letters.

Δ: Yf euery side conteyne 49 rows, and euery row will require so much tyme to be receyued as this hath done it may seme that very long time will be requisite to this doctrine receyuing: But if it be gods good liking, we wold fayne haue some abridgment or compendious manner, wherby we might the soner be in the work of Gods servyce.

EK: The Chayre and the Table are snatched away,[1113] and seme to fly toward heven. And nothing appeared in the stone at all: But was all transparent clere.

Δ: What this snatching away of Chayre and Table doth meane we know not: But if the Lord be offended with his yonglings, and Novices in thes Mysteries, for propownding or requiring a compendious Method &c, Then we are very sorry, and ax forgivenes for the rashnes of our lipps: and desyre his maiestie not to deale so rigorously with us: as thowgh we had sufficient wisdom or warning, to beware of such motions or requests making to his ministers. Let it not be so sayd of the holy one of Israel: but let his mercies abownd with us to his glorie. Amen.

EK: Now commeth all down agayn, as before.

Me: What are the Sonnes of men, that they put time in her own bosom? or measure a Judgment that is unsearchable?

Δ:

Me: I help thy imperfections: What, man thinketh wisdome, is error in our sight. But bicause my Nature is to cure, and set up those that fall, Thus much understand.

As I haue sayde: The 49 partes of this boke[1114] -49 voyces, Whereunto the so many powres, with theyr inferiors and subiects,[1115] haue byn, are, and shalbe obedient.

Euery Element in this mysterie is a world of understanding. Euery one knoweth here what is his due obedience: and this shall differ thee **in speche** from a mortall creature.[1116]

Consider with thy self, How thow striuest against thyne own light, and shaddowest the windows of thyne own understanding.

I haue sayde: Be it unto thee, as God will. I am not a powre or whirlewynde that giueth occasion of offence.

Longe sumus a peruersitate destructionis.[1117] Thus much I haue sayd, for thy reformation and understanding.

Δ:[1118]

Me: Lo, untill the Secrets of this boke be written, I come no more: neyther of me shall You haue any apparition. Yet, in powre, **my office** shall be here.[1119]

Say, what you here, for every word shall be named unto you: it is somwhat a shorter way, and more according to your desyre.

Euery Element[1120] hath 49 manner of understandings. Therin is comprehended so many languages.[1121] They are all spoken at ones, and seuerally, by them selues, by distinction may be spoken. Untill thow come to the Citie, thow canst not behold the beawty thereof.

Nihil hic est, quod non est perfectum.[1122]

I go. I haue sayde, (and it is true,) No unclean thing shall enter: Much less, then, here: For, it is the sight of whose Maiestie we tremble and quake at. He shall teache, of himself; for, we are not worthy.[1123] What then, of your selues? But such is his great and singular fauor, that, he is of him self, and with those, whom he choseth.[1124] For, the ende of all things is at hand,[1125] and Powre must distinguish, or els nothing can prevayle. What you here, yea what thow feelest, by thy finger, Recorde; and seale sure. This is all, and in this is conteyned all, that comprehendeth all, The allmighty powre and profunditie of his glory.

What els?

As thow seest, and till he see, whose sight,[1126] is the light of this his own powre, His might is great. The dew of his stedfastnes and glorious perfection hold up and rectify the weaknes of your fragilitie: Make you strong to the ende of his workmanship to whome I commit you.

EK: He plucketh the veale ouer all.

A voyce afterward:—Ne Ne Ne na Jabes.

Δ: Sanctus Sanctus Sanctus Dominus Deus Zebaoth: Pleni sunt cæli et terra gloria Maiestatis eius. Cui soli omnis honor, laus et gloria.[1127]

Amen.

1583 Aprilis 2. Tuesday. Jesus + before none

Δ: A noyce like a Thunder was first hard. The Chayre and Table appered. There appered fyre in the chayre, and burnt away the veale or covering therof. The cullor of the flame of the fire was as of Aqua vitæ burnt.

A voyce:—Sum.[1128]

EK: There goeth a clowd or smoke from the chayre, and covereth the Table. That smoke filled all the place.

A voyce:—Impleta sunt omnia gloria et honore tuo.[1129]

EK: All is become clere, saue the Table which remayned couered with the clowde still.

A great th-under began agayn, and the chayre remayned all in fire. Now the boke appeareth euidently lying uppon the Globe in the chayre and the letters appered wet styll, as yf they were blud. There appered fire to be thrown oute of the stone, uppon EK.[1130]

The sownd of many voyces semed to pronownce this: Let all things prayse him and extoll his name for euer.

EK: The fire is still in the chayre, but so transparent, that the boke and letters therof may well be seen.

EK felt his hed as if it were on fire.

A voyce:—Sic soleo errores hominum purificare.[1131]

A voyce:—Say what you see.

EK: I see letters, as I saw before.

A voyce:—Moue not from your places;[1132] for, this place is holy.

A voyce:—Read.—EK: I cannot.

Δ: You shold haue lerned the characters perfectly and theyr names, that you mowght now haue redyly named them to me as you shold see them. Then there flashed fire uppon EK agayne.[1133]

A voyce:—Say what thow **thinkest**. Δ: He sayd so to EK.

EK: My hed is all on fire.

A voyce:—What thow thinkest, euery word, that speak.

EK: I can read all, now, most perfectly: and in the Third row[1134] thus I see to be red,

> 3. Palce[1135] duxma ge na dem oh elóg da ved ge ma fedes o ned a tha lepah nes din. Ihehudétha dan vangem onphe dabin oh nax palse ge dah maz gem fatesged oh mal dan gemph naha Lax ru lutúdah ages nagel osch. macom adeph a dosch ma handa.

EK: Now it thundreth agayn.

A voyce:—Ego sum qui in te. Mihi ergo qui Sum.

Δ: Non nobis domine non nobis, sed nomini tuo damus gloriam.[1136]

Δ: Then EK red the fowrth row, as followeth,

4. Pah o mata nax lasco vana ar von zimah la de de pah o gram nes ca pan amphan van zebog ahah dauez öl ga. van gedo oha ne daph aged onédon pan le ges ma gas axa nah alpod ne alida phar or ad gamésad argla nado oges.

Δ: Blessed be the name of the Highest, who giueth light and understanding.

EK: It thundreth agayn. All is covered.

A voyce:—Orate.[1137]

Δ: We prayed: and returning to the work agayn, the fire covered all still and EK hard voyces, singing (as a far of) very melodiously. Then all became euident agayn unto EK his perfect Judgment.

Δ: EK then red thus,

5. Mabeth ar mices[1139] achaph pax mara geduth alídes orcánor manch[1140] arseth. olontax ar geban vox portex ah pamo. agématon buríse ganport. vdríos pasch. Machel len arvin zembuges. vox mara. gons Ihehusch dah pársodan maäh alsplan donglses adípr[1141] agínot. archad[1142] dons a dax van famlet a dex arge pa gens.

6. Van danzan oripat es vami gest ageff ormaténodah zálpala doniton pasdaes[1143] gánpogan Undanpel adin achaph máradon oxámax anólphe dan ieh voxad mar vox iheduthar h aggs pal med lefe. IAN lefa dox parnix O droes[1144] marsíbleh aho dan adeph uloh iads ascleh da verox ans dalph che damph lam achos.[1145]

EK: There is a great Thundring agayn.

Δ: It is the hand of the highest, who will get him honor by his own works.

EK: The Voyce and sownd of pleasantnes and reioycing was hard: and all was dark.

A small voyce:—Locus est hic sanctus.[1146]

An other voyce:—Sacer est a te Domine.[1147]

EK: All is now opened agayne.

Δ: Then EK, red thus,

7. Amídan gah[1149] lesco van gedon amchih ax or madol cramsa ne dah vadgs lesgamph[1150] ar: mara panosch aschedh or samhámpors asco*. pacadabaah asto[1151] a vdrios archads ors arni. pamphíca lan gebed druxarh fres adma. nah pamphes eä vanglor brisfog mahad. no poho a palgeh donla def archas NA Degel.

8. Vnaem[1152] palugh agan drosad ger max fa lefe pandas mars langed undes mar. pachad odidos martíbah v'dramah noges gar. lenges argrasphe drulthe las aséraphos. gamled cam led caph Snicol lumrad v ma. pa granse paphres a drinox a demphe NA. genile o danpha. NA ges a ne gaph a.

EK: The sownd of Melodie, begynneth agayne.

Δ: The fire cam from EK his eyes, and went into the stone againe. And then, he could not perceyue, or read one worde.[1153] The Fyre flashed very thick and all was couered with a veale.

Δ: Prayse we the lord, and extoll his name. For, his hand hath wrought wundrous works, for his owne glorie.

Amen.

Aprilis.3. Wensday, Forenone †

Δ: First the Curten was drawn away: and then all appeared on fire: The whole place all ouer. EK hard voyces, but could not discern any thing but the hummering of them.

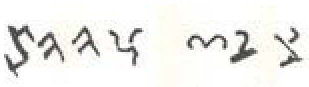
Δ: There cam fire agayn (out of the stone) uppon EK, all his body ouer.

EK: The fire so diminisheth it self that the boke may be perceyved.

A voyce:—Magnus Magnus Magnus.[1154]

An other voyce:—**Locus** sacer et acceptabilis Deo.[1155]

EK fellt the fire to gather up into his hed. Shortly after he could read the boke, as he could do yesterday.



9. Vlla[1156] doh aco par semná gan var se gar on dun. sebo dax se pal genso vax necra par sesqui nat. axo nat sesqui ax[1157] olna dam var gen vox nap vax. Vro[1158] varca cas nol undat vom Sangef famsed oh. sih ádra gad gesco vansax ora gal parsa.

--10. Varo. nab vbrah NA pa uotol ged ade pa cem[1159] na dax. van sebrá dah oghe aschin o nap gem phe axo or. nec a ve da pengon a moroh ah óha aspáh. niz ab vrdráh[1160] gohed[1161] a carnat dan faxmal gamph. gamph nacro vax asclad caf prac crúscanse.[1162]

11. gam. ohe gemph ubráh-ax.[1163] orpna[1164] nex-or napo, gemlo. a cheph[1165] can sedló pamgeman ange hanzu ALLA.[1166] Cáppo-se damo gam-vas oro-dax-vá ges-pálo palme pola.[1167]

EK: All these, (now red,) fall out and all the rows, before, likewise.

A voyce:—Prayse God.

Δ: We prayed. And after, was this shewed,[1168]

Gals-ange no-témpa-ro sama dan genzé axe. falod amruh ácurtoh saxx par mano gan vax no.[1169] gramfa gem sadglá[1170] loh vrox sappóh iad ah oha unra.

Δ: Now appeared an other row.

12. Se[1171] gors axol ma pa a oh la sabúlan. Caph ardox anpho nad v‘rnah ud ago lan vans.[1172] v’xa grad órno dax palmes árisso dan vnra. vánsample galse not zablis óphide ALLA loh. gaslah osson luze adaö max vanget or dámo ans. leóz dasch léöha dan se gla’spa neh.

All becam dark, and it thundred.

A voyce:—Prayse God.

Δ: We prayed.

Δ: Now appered three or fowr rows to gither. The boke seemed to fly, as if it wold fly a peces (the fyre remayning) and to make a great sturring in the place where it lay.

13. Amprí apx ard ardo argá[1173] argés argáh ax. osch nedo les icás. han andam von ga lax man. nosch. dóngo a yntar cey[1174] lude asch úrise alpé gem var dancet.[1175] nap alped v‘rsbe temps a vod nos gema o ulon máncepax oxné pricos a got. zalpa ne doxam órne.[1176]
14. Admag apa ascò[1177] tar. gans oärz am seph selqui quisben alman. gons sa ieh mársibleh gron áscabb gamat. neý aden vdan phand sempés nan narran al. cáno géme dansé álde nótes parcélah arb ner ga lum pancu[1178] príscas ábra músce[1179] an nox. napód[1180] a on dan sem ges asche[1181]

EK: A sownd of many voyces, sayd,—Orate.[1182]

15. Mica suráscha para te gámmes ádrios NA danos. vra lad pacad ur gesme crus[1183] a prásep ed. a palse nax varno zum. zancú asdom baged V’rmigar orch phaphes ustrá nox affod masco gax cámles vnsanba a oh la gras par quas. cónsaqual lat gemdax tantat ba vod. talpah ian.
16. Vórge afcál[1191] vslaffda mórsab gaf[1192] ham de Peleh asca.

Δ: This went away, when it was read. It waxed dark.

A voyce:—Orate.[1193] Δ: We prayed.

EK: It beginneth to clere.

A voyce to EK:—Say.

17. Ar’tosa geme oh gálsagen[1194] axa loph gebed adóp: zarcas vr vánta pas ámphe nóde alpan. nócas se ga ormácased lax naph talpt. pámphicas[1195] sandam Voscméh iodh asclad ar. phan gas málse a quaz nam vngem vansel gembúgel a gémbusez á-ro[1196] tehl alts murt valtab bániffa faxed ar chlyfod
18. A tam nat. glun asdeh ahlud gadre fam Shing la dan. guinsé[1197] life[1198] arilsar zabulan cheuách[1199] se. amph lesche andam var ges ar phex are.[1200] NA[1201] tax páchel lapídox ar da vax malcos. vna gra tassox varmára ud ga les vns ap se. ne da ox lat ges ar.

Now it waxeth dark. Δ: We must pray: (sayd I) and so we did. But EK prayed perfectly in this Angels language &c.

19. Asmo dahán pan casme co caph al oh. san ged a bansaa[1202] un adon a seb Ian. agláho dánfa zúna cap orcha[1203] dah os. fámsah ON naäb[1204] ab nagah geha fastod. hansey om hauan lagra gem gas mal. parcóg[1205] dax nedo va geda leb ar'ua ne cap sem[1206] carvan.
20. Onsem gelhóldim geb abníh ian. oxpha bas cappó cars órdriph grip gars. of víndres nah ges páhado vllónooh can vaz a. fam gisril ag nóhol sep gérba dot vánca NA.

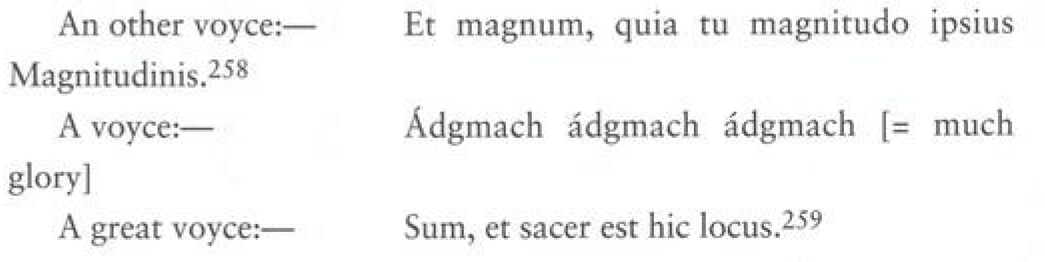
sem ah-pa[1207] nex ar-pah lad vamó iar séque.
Vad ro garb. ah sem dan van ged ah paleu[1208]

Now, the fire shot oute of EK his eyes, into the stone, agayne. And by and by he understode nothing of all, neyther could reade any thing: nor remember what he had sayde. All became dark. Then was the curten drawne, and so we ended.

Δ: Gloria patri et filio et spiritui sancto
nunc et semper.[1209]
Amen.

Aprilis .3. Wensday + After none hor 5¼

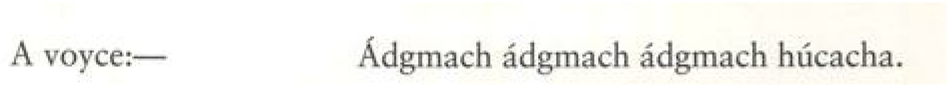
Δ: A prety while, the veale remayned ouer all: then it was taken away. First fire was thrown uppon EK out of the stone. Many voyces concordantly sayd,—Bonum est ô Deus, quia Bonitas ipa es.[1210]



An other voyce:— Et magnum, quia tu magnitudo ipsius Magnitudinis.[258]

A voyce:— Ádgmach ádgmach ádgmach [= much glory]

A great voyce:— Sum, et sacer est hic locus.[259]



A voyce:— Ádgmach ádgmach ádgmach húcacha.

[1211],[1212]

Δ: Then EK read the row on this manner,

21. Padohómagebs[1213] galpz arps[1214] apá nal Si. gámvagad al pódma gan NA. vr cas nátmaz ándiglon ar'mbu.[1215] zántclumbar ar noxócharmah. Sapoh lan gamnox vxála vors. Sábse cap vax mar vinco.[1216] Labandáho nas gampbox arce.[1217] dah gorhahálpstd gascámpho[1218] Ian ge. Béfes argédco[1219] nax arzulgh[1220] orh.[1221] sémhaham[1222] vn'cal laf garp oxox. Loangah.[1223]

Δ: Now appered Raphael [] or one like him, and sayde,

Salus vobis in illo qui vobiscum.[1224]

I am a medicine that must prevayle against your infirmities: and am come to teache, and byd take hede. Yf you use dubble repetition, in the things that follow, you shall both write and work and all at ones: which mans nature can not performe. The trubbles were so great that might ensue thereof, that your strength were nothing to preuayle against them. When it is written, reade it no more with voyce, till it **be in** practise. All wants shalbe opened unto you. Where I fownd you, (with him, and there,) I leave you. Cumfortable Instruction is a necessarie Medicine.

Farewell.

EK: The boke and the Chayre, and the rest were all out of sight while Raphael spake, and he lay down prostrate. EK saw a great multitude in the farder side of the stone. They all cam into the stone, and axed,

What now?
How now?

Vors mábberan = how now: what hast thow to do with us?

Δ: As I began thus to say (The God of powre, of wisdom,) they all interrupted my entended prayer to god for help &c and sayd, We go We go.

Δ: And so they went away.

Then the boke and the rest cam in agayne.

A voyce:—One Note more, I haue to tell thee. Ax him not, What he sayeth, but write as thow hearest: for it is true.

Δ: Then, o lord, make my hearing sharp and strong, to perceyue sufficiently as the case requireth.

Rap:—Be it unto thee.

Δ: Then EK red as followeth,

22. ors lah gemphe nahoh ama-natoph des garhul vanseph iuma lat gedos lubah aha last gesto

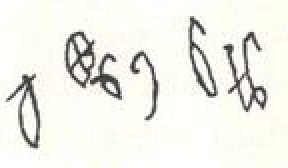
Δ: I think it will be dark by and by, and our Cumpany will expect our comming down to supper. Therfore, if, without offence we might now leave of, it might seme good so to do.

A voyce:—gemeganza = your will be done.

Δ: As I was discoursing with EK after we had done, and he seamed yet skylfull and hable to say much of the understanding of the premisses, and began to declare somwhat, How they did all apperteyne to Good Angels, suddenly there cam the fyre from his eyes into the stone agayne. And than he could say no more: nor remember any thing of that he had hard seen or understode less than half a quarter of an howre before.

Δ: Deo nostro Viuo Vero et Omnipotenti
sit omnis laus et graz actio
nunc et semper.[1237] Amen.



Aprilis 4 Thursday + mane hor. 5½

Δ: I made a prayer.

Δ: A voyce:—Quia ipem Deus Deus Deus noster cuius misericordia infinita.[1238]

Δ: The fire, immediately did shote out of the stone into EK, as before. His tung thereuppon did quake in his mowth.

EK: The Veale hangeth yet before.

Δ: Then, all being uncouered, thus he red.

Δ: Thereuppon the Vele was drawn, and the fire cam from EK his eyes again into the stone.

Δ: Deo opt. Max. omnis honor
laus et gloria.[1269] Amen.

Aprilis .5. Friday + a meridie hora 5¼

Δ: The Vele was taken away, without any speche used by me or EK. The boke and all the former furniture appeared very bright.

Δ: I made a prayer to god, begynning, Expectãs expectaui Dominum [1270] &c.

EK: I here the sownd of men playing very melodiously on Instruments and singing.

A Voyce:—Serue God and take hede of Nettels.[1271] Δ: This was spoken to EK in respect of a great anger he was-in yesternight, by reason that one had done him inurie in speche at my table. [Charles Sled.]

EK: There appere a great many, a far of; as thowgh they appered beyond the top of a howse: and so semed far of behinde the stone: and they seme to haue no heds.

A Voyce:—A peculier people, and shalbe restored.[1272]

Δ: After this voyce, the sayd hedles-people disäpered. Then all appered fyre, and a clowd covered all: and in the top of the fyre in the chayre, appered three faces, and seemed to shute and close in one. The faces seemed, eche to turn rownd, and so to ioyne in one afterward.

A Voyce:—Prayse him in his glorie and worship him, in his truth.

Δ: The fire entred into EK.

A voyce:—Orate.[1273] Δ: We prayed.

Δ: Then thus appeared,

36. gedóthar argo fa adóphanah gamsech olneh várasah iusmach [= begotten.]

[The 49th row followeth after 2 leaves: Arney vah nol, &c.]

Δ: Now the boke was couered with a blew silk sindall[1303] and uppon that blew covering appered letters of gold, conteyning these words,

Amzes naghézes Hardeh[1304]

EK: It signifieth, the universall name of him that created universally be praysed and extolled for euer.

Δ: Amen

A Clowde covered the boke.

A Voyce:—Mighty is thy Name (ô lorde) for euer.

EK: It lightneth.

A Voyce:—The place is Holy: stur not [sayd the three heds].

Δ: Now appered to EK, some imperfection passed in the eleuenth row. And that we wer towght how to amend it: and so we did.

Δ: Then the firy light went from EK into the stone agayn: and his inspired perceyuerance and understanding was gone: as often before it used to be.

Δ: Gloriam laudemque nostri Creatoris, omnes Creaturæ. indesinenter resonent:[1305] Amen.

Halleluiah Halleluiah Halleluiah
Amen.

Aprilis 6. Saterday after none.

Δ: The Table, Chayre, boke and fyre appeared. And while I went into my oratorie[1306] to pray, fire cam thrise out of the stone uppon EK, as he was at prayer, at my table in my study.

EK hard a voyce out of the fyre, saying,

Why do the Children of men prolong the time of theyr perfect felicitie: or why are they dedicated to vanitie? Many things ar yet to come: Notwithstanding, the Time must be shortned,

I AM THAT I AM.

A voyce: Veniet[1307] Vox eius, ut dicat filijs hominum quæ ventura sunt.[355]

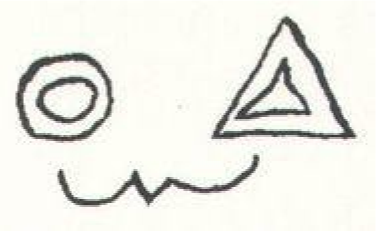
EK: here is a man, in white, come in, like Uriel, who cam first into the stone.

Δ: Benedictus qui venit in nomine Domini.[356]—Ur: Amen.

Ur:—I teache: EK sayd that he turned toward me.

Ur: What willt thow I shall answer thee, as concerning this work?

EK: He hath a ball of fire in his left hand and in his right hand a Triangle of fyre.



Δ: What is the most nedefull for us to lerne herin, that is my chief desire.

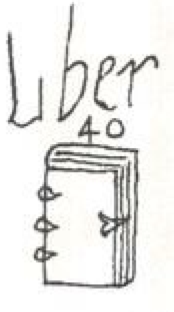
Uriel:—Fowre monthes, are yet to come: The fifth is the begynning of great miserie, to the heauens, to the earth and to all liuing Creatures.[357] Therfore must thow nedes attend uppon the will of God: Things must then be put in practise. A thing that knitteth up all must of force conteyn many celestiall Vertues. Therfore, in these doings, must things be finished spedyly,[1308] and with reuerence.

This, is the light, wherewith **thow shalt be Kindled.**[1309]

This is it, that shall renew thee: yea agayn and agayn, and, seventy seuen tymes, agayn.

Then shall thy eyes be clered from the dymnes. Thow shalt perceyue these[1310] things which haue not byn seen, No, not amongst the Sonnes of men.

This[1311] other haue I browght, whereof I will, now, bestow the seventith part of the first part of seuenty seuen. The residue shall be fullfilled, in, and with thee; In, (I says,) and **to gither,** with thee. Behold (sayth the lord) I will breath uppon men, and they shall haue the spirit of Understanding.



In 40 dayes[1312] must the boke of the Secrets, and key of this world be Written: euen as it is manifest to the one of you in sight, and to the other in **faith**. Therfore haue I browght it to the wyndow of thy senses, and dores of thy Imagination: to the ende he may see and performe the tyme of God his Abridgment.[1313] That shalt, thow,[1314] write down in his propre and sanctified distinctions.

This other, (pointing to EK) shall haue it allwayes before him, and shall **daylie** performe the office to him committed. Which if he do not, the Lord shall raze his name from the number of the blessed, and those that are annoynted with his blud.[1315]

For, behold, what man, can speak, or talk with the spirit of God? No flesh is hable to stand, whan the voyce of **his Thunder**[1316] shall present the parte of the next leaf unto sight.

You haue wauering myndes, and are drawn away with the World: But brittle is the state therof: Small therfore are the Vanities of his Illusion.

Be of sownd faith. Beleue. Great is the reward of those that are faithfull. God Will not be dishonored, neyther will suffer them to receyue dishonor, that honor him in holiness.

Behold, Behold, Mark ô and Behold: Eache line hath stretched him self, euen to his ende:[1317] and the Middst is glorious to the good, and dishonor to the wicked. Heuen and erth must decay: so, shall not the words of this Testimonie.

Δ: Ecce seruus et misellus homuncio Dei nostri, fiat mihi iuxta beneplacitum voluntatis suæ:[1318] &c.

Δ: Uriel toke a little of the fire in his left hand and flung it at EK: and it went in at his mowth.[1319]

Ur: My message is done.

Δ: May I Note Ur, (meaning Uriel,) for your name who now deale with us?—Ur:—I am so.

Δ: I pray you to give us advise what we are to doo in our affayres.

Ur: It is sayde.

Δ: He sayd to EK, Tell him, I haue told him, and seemed to smile.

Δ: Of Mistres Haward (Jentlewoman[1320] of her Maiesties priuie chamber) I wold fayn know, wherfore we were not warned of her comming? She hath caused us, now, for an howre or two, to intermit our exercise? Is it the Will of god, that for her great charitie used toward many, (as in procuring the Quenes Maiesties Almes to many nedy persons) the lord entendeth to be mercifull to her? I meane at the pynche of these great miseries ensuing, now (by you) told of. And that by her, I may do good seruice concerning the Quenes Maiesties Cumfort?

Ur:—Who is he, that opened thy mowth, or hath told thee of things to come? What thow hast sayd, is sayde. Mark the ende.[1321]

It is a sufficient answer.

Ur:—Loke up.—Δ: He sayd so to EK: who loking up, saw the boke, the chayre and the Globe a part, abroad, out of the stone, and then, none remayning in the stone to be seene: and it cam nearer & nearer to him, and it burned, as before.

Ur: So, set down, what thow seest. [Δ: The boke and writing was made very playne to him.]

What thow seest, deliuer unto him.
As it is his will, so be it unto thee:
Do thy duty, whereunto thow art moved,
and it shalbe sufficient.

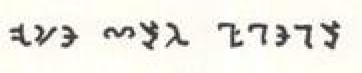
Farewell, for a time.

EK: Now is all couered with a white clowde, such an one as I saw not yet.

Δ: We put up the stone: and the former boke and other furniture, appeared uppon the table hard by EK: and he was to write out as he saw: which he began to do, both in character and words: but it was to cumbersome to him: and therfore he wrote onely the words in latin lettres.

Δ: After he had written 28 lines there in that paper boke, the first word being Arney, and the last, being nah suddenly all was taken away out of his sight: and so likewise his understanding of that he had written was quite gone. For, contynually as he wrote, he understode the language and sense thereof, as if it had byn english.

Δ: After he had finished that second page[1322] of the first leafe, I then did copy it out as followeth.



49.[1323] Arney[1324] vah nol gadeth[1325] adney ox vals nath gemseh ah orza val gemáh, oh gedvá on zembáh nohhad vomfah olden ampha nols admácha nonsah vamfas ornad, alphol andax o'rzadah vos ansoh hanzah voh adma iohá notma goth vamsed adges onseple ondemax orzan, vnfa onmah vndabra gonsah gols nahad NA.

Δ: And this is the late ende of the second page of the first leafe of this excellent boke. The other leaves are written, apart, in an other boke[1351] as may appere. But with these 9 rowes and the former 41, doth arise the some of 50: which is one more then 49: Therfore I am not onely of this but of diuerse other imperfections yet remayning in this page, to ax the solution and reformation.

Δ: Whan I had told this my dowte to EK, he answered me that the first row of these last .50. before set downe, was the last of the first page of this first leafe: and true it is that in the first page were first sett down 48 rows, of which eight and fortith row begynneth with this word Amgédpha &c And therfore the next row following, (begynning with Arney vah nol gadeth &c) is the nyne and fortyth row of the first page and so the last row of that page: And therby allso the second page of the first leaf hath these 49 rowes here noted: And so is one dowte taken away: The other is of the numbers of words in some of the 49 rows of this second page.

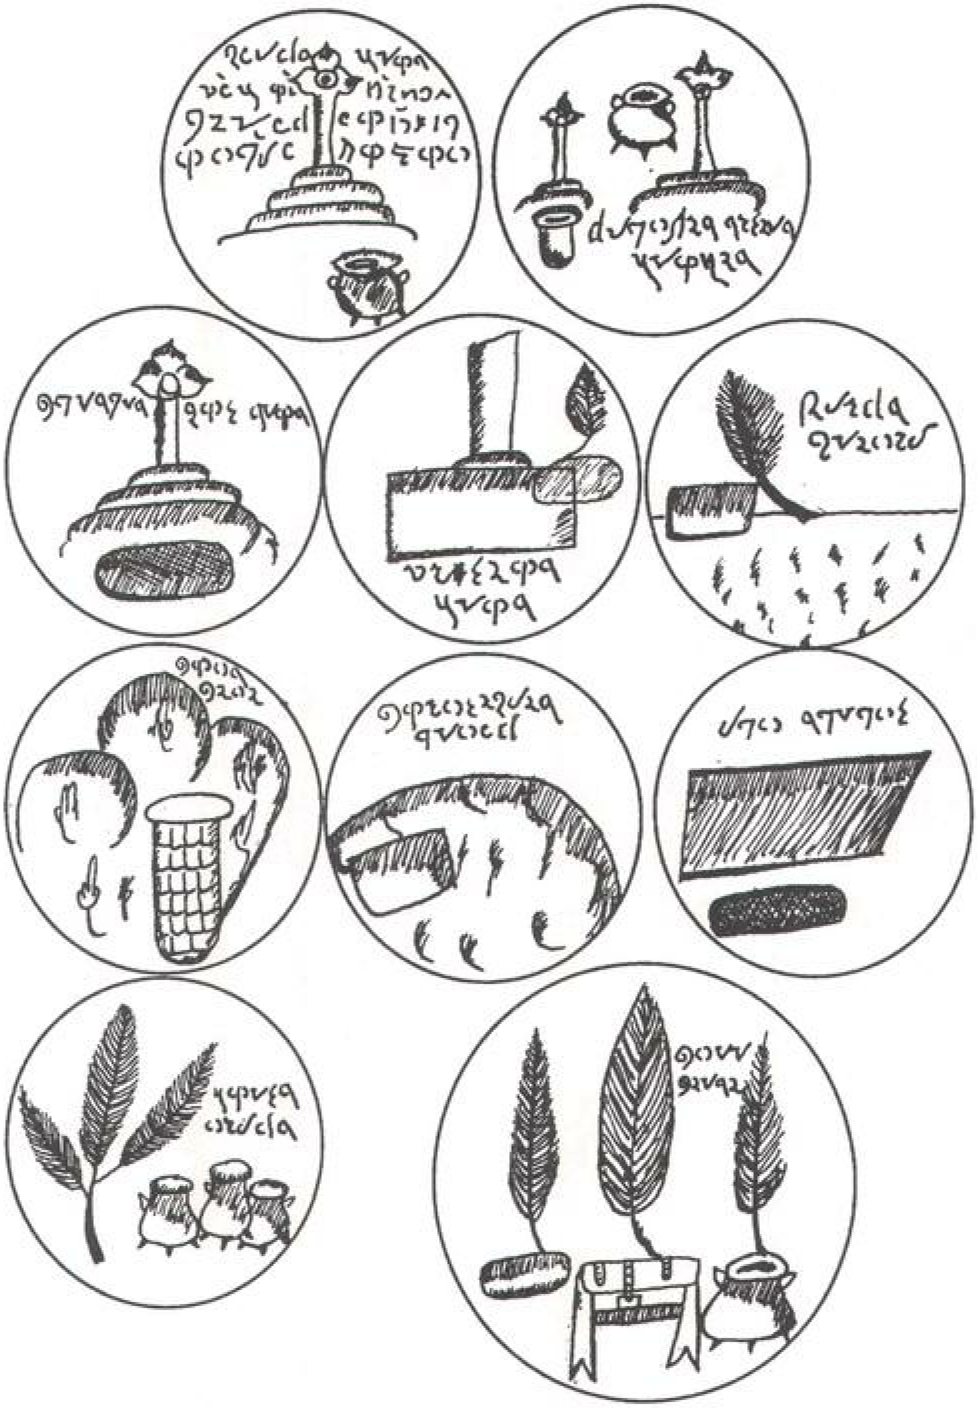
Aprilis 10. hor. 9.

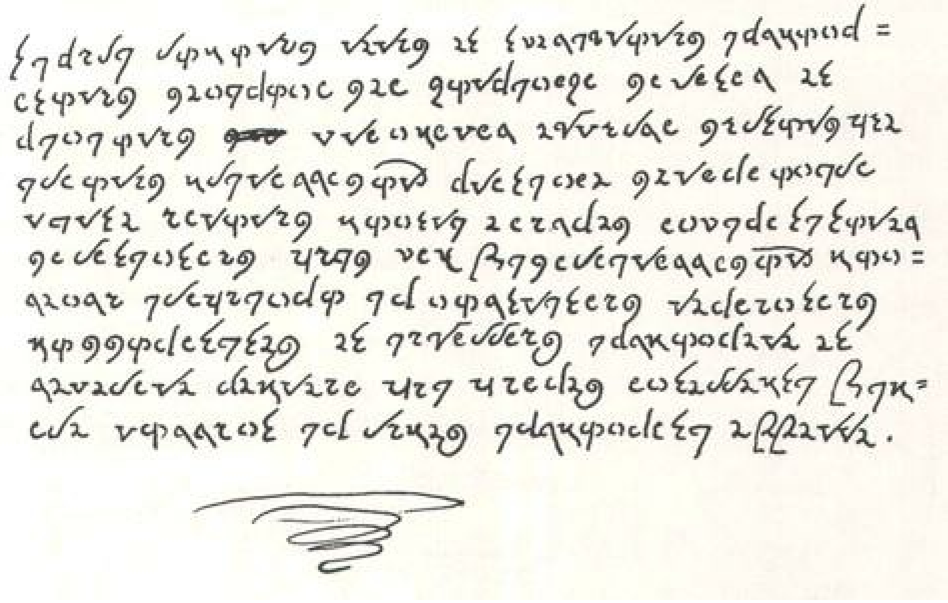
Δ: As we wer talking of the Macedonian (the grecian), who yesterday cam with Mr. Sanford his letters, there appeared in the corner of my study a blak shadow: and I did charge that shaddow to declare who he was: There cam a voyce and sayd that it was the Macedonian: and abowt his hat was written in great letters this word, , which EK wrote out and it signifieth maculosus,[1352] or condemnatus[1353] &c. and the Voyce sayd, that word was sufficient

adding Est,[1354]
Δ: God be thanked and praysed.

To me deliuered by Mr.
Edward Kelly
1583. Martij 22
Friday

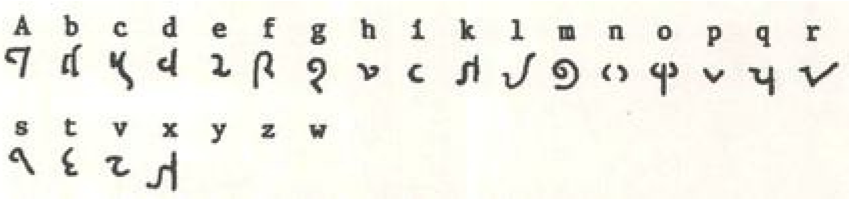
Mr. Husy cam with
him from blokley[1355]





Aprilis .11. Thursday

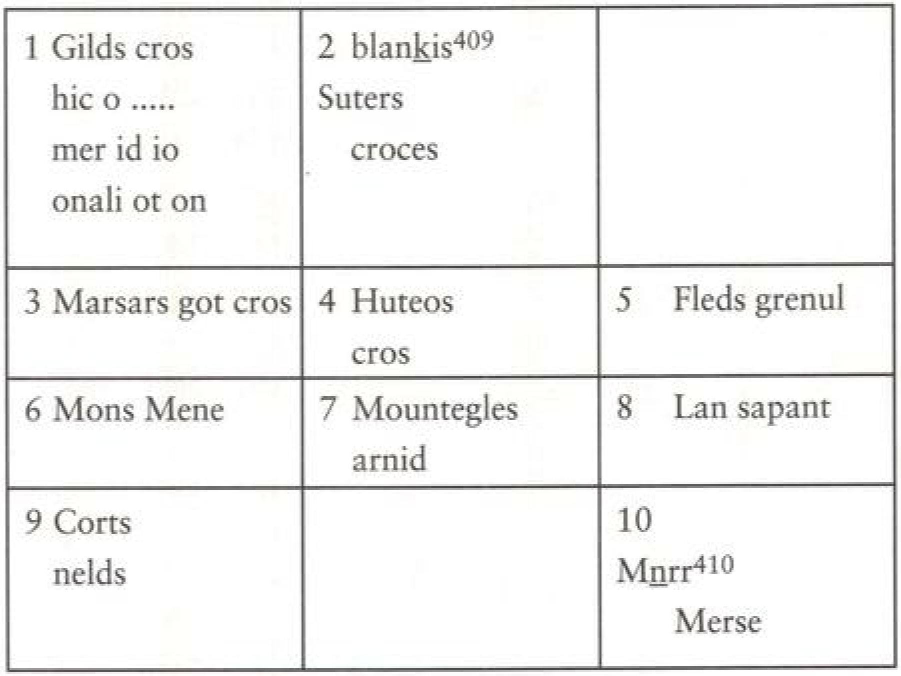
Δ: After my comming home from the court abowt 4 of the clok after none, and after my being in my study a while, it cam into my hed to assay[1356] to deciphre the cifre which before is spoken of, and was browght me by EK,[1357] as he was willed to do. And at the first I was half out of all hope: but yet making many assayes, and gessing at it (at the length) to be latine, I fownd this to be the true Alfabet. God giving me the perseyverance.



And, the first longer writing, was thus:

Tabula locorum rerum et Thesaurorum absconditorum Menaboni, mei Gordanili, militis, et Danaorum Principis, expulsi, multorumque aliorum clarissimorum (Britanie meridionali parte) virorum, contra eiusdem inhabitatores militantium: quam, hîc, familiarissimorum consensu, aliquando ad nostratium rediuntium commoditatem et auxilium abscondere et sepelire decreui: qua quidem intellecta, facile possunt ad lucem abscondita efferre.[1358]

And the Notes of the ten places, here by, affixed: are thus to be red orderly:

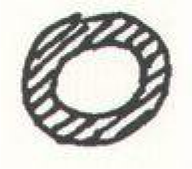


1 Gilds cros hic o ..... mer id io onali ot on	2 blankis[409] Suters croces	
3 Marsars got cros	4 Huteos cros	5 Fleds grenul
6 Mons Mene	7 Mountegles arnid	8 Lan sapant
9 Corts nelds		10 Mnrr[410] Merse

1359, 1360

Aprilis 15. Monday

Δ: As EK was writing the eightenth leaf which was of the spirites of the earth, (in the after none abowt 4½ of the clok) he red a parcell therof, playnely & alowde to him self, and thereuppon suddenly at his syde appeared three or fowre spirituall creatures like laboring men, having spades in theyr hands & theyr heares hangyng abowt theyr eares, and hastyly asked EK what he wold have, & wherfor he called them. He answered that he called them not. & they replyed, & sayed that he called them: Then I began to say, they lyed: for his intent was not to call them, but onely to read and repeat that which he had written: and that euery man who readeth a prayer to perceyue the sense thereof, prayeth not. No more, did he call them. And I bad them be packing out of the place: and thereuppon remoued from my desk (where I was ruling of paper for his writing) to the grene chayre which was by my Chymney: and presently he cryed out and sayd they had nipped him and broken his left arme by the wrest: and he shewed the bare arme and there appered both on the upper syde and lower side imprinted depe-in, two circles as broad as grotes[1361] thus:



very red: And I seeing that, sowght for a stik, and in the meane while, they assalted him, and he rose, and cryed to me (saying) they come flying on me, they come; and he put the stole, which he sat on, betwene him and them. But still they cam gaping, or gyrning[1362] at him. Then I axed him where they were: and he poynted to the place: and then I toke the stik and cam to the place, and in the name of Jesus commaunded those Baggagis to avoyde and smitt a cross stroke at them: and presently they avoyded.[1363]

All thanks be to the onely one Almighty, and everlasting God Whose name be praysed now & ever. Amen.

Aprilis 18[1364]*. Thursday morning .hor. 8. Circiter*

Δ: As EK cam to write-out the Tables according as he was wont: and to haue the letters appearing in the ayre hard by him, he saw nothing but a blak clowde seven-cornered. And after I had put the stone agayne into the frame,[1365] and thereuppon did make long and oft request, for answer hauing, There appered nothing, neyther was anything seen in the stone. Then I fell to prayer agayn, and at length, there appeared written uppon, or yssuing out of the clowde, this sentence.

He promised, be not carful: Δ: Note here are iust 21 letters.[1366]

EK: The letters semed to stand at fingers endes, (being 21): and so euery finger had a letter on it: and the fingers semed to be placed at the Corners of the Heptagonall clowde: and as sone as the sentence was red the fingers which seemed to issue out of the Heptagonum, did shrink in agayn and disapere.

Δ: All laude honor and thanksgiving, be to the highest, our most louing mercifull and almighty God, now and euer. Amen.

Thursday. Aprilis 18. after dynner

Δ: We being desirous to know the cause of this stay making, in the Tables shewing as before was accustomed; and now (24 leaves being written,) a dark clowde to hang in the place of a glorious boke, did greatly disquiet our myndes, and browght us in feare of some offence lately committed, by any one, or both of us, whereby the Indignation of the lord might be kingled against us. Hereuppon we prayed severally; and at length, (no alteration, or better Cumfert hapening to us,) I prayed in the hearing of EK, (by my desk, on my knees) in great agony of mynde; and Behold, there appeared one standing uppon, or rather somwhat behynde the Heptagonall clowde who sayd,

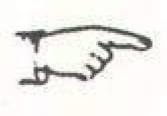
I am sent, to understand the cause of your greif, and to answer your dowtes.

Δ: I, then, declared my mynde breifly, according to the effect of my prayer. Whereunto he answered at large, reproving my appointing of god a tyme or to abridge the tyme spoken of: and among his manifold grave speaches he had these words,

Prepare all things,[1367] For tyme is at hand.
His Justice is great; and his arme stronge.

How darest thow dowt or dreame, saying: Lo, God, this may be done in shorter time &c. But such is flesh.

Be rocks in faith.
It is not the manner of us, good Angels,[1368] to be trubbled
so oft.



At the time appointed, thow shalt practise: While sorrow shall be measured, thow shalt bynde up thy fardell.[1369] Great is the light of Gods sinceritie. Appoint God no tyme. Fullfill that which is commaunded. God maketh clere whan it pleaseth him. Be you constant and avoyde Temptations: For True it is, that is sayde: And lastly I say,

It shall be performed.

What is it now thow woldest desyre to be made playner?

Δ: Still he proceded uppon my answers: and at length he sayd,

Neyther is the time of mans Justification known **untyll** he hath byn tried.[1370]

You are chosen by God his mercy to an ende[1371] and purpose: Which ende shall be made manifest **by the first begynning** in knowledg in these Mysteries.

God shall make clere whan it pleaseth him: & open all the secrets of wisdome whan he unlocketh. Therfore **Seke not to know the mysteries** of this boke, tyll the very howre[1372] that he **shall call thee.** For then shall his powre be so full amongst you, that the flesh shall not be perceyued, in respect of his great glory.

But was there euer any, that tasted of gods mercies so assuredly, that wanted due reverence?[1373] Can you bow to Nature, and will not honor the workman? Is it not sayd, that this place is holy? What are the works of holines? I do aduertise you: for, God will be honored. Neyther will he be wrasted, in any thing he speaketh. Think not, that you could speak or talk with me, unleast I did greatly abase my self, in taking uppon me so unlikely a thing in forme, as to my self, &c.[1374] But he doth this not for your causes, not for your deserts, but for the Glorie of his owne name.

One is not to be lightened, but all. And, which all? The two **fethered** fowle togither with **the Capitayn.**

Ask What thow wilt: for, untyll the 40 dayes[1375] be ended, shalt thow haue no one more shew of us.

Δ: Whether shall we give Cownsayle, or consent to the Captayne[1376] to go down into his Cuntry, as, presently he entendeth.

Ur:—As he listeth. Δ: EK sayd that this was Uriel who now had appered and answered all this.

Ur:—I will ask thee one question. Haue we any voyce or no?

Δ: I do think you haue no organs or instruments apt for voyce: but are mere spirituall and nothing corporall: but that you haue the powre and property from god to insinuate your message or meaning to eare or eye, in such sort as mans Imagination shall be, that both they here and see you sensibly.

Ur:—We haue no voyce but a full noyce that filleth euery place:[1377] which whan you ones taste of, Distance shall make no separation. Let there one come that may better answer: not in respect of thy self but one, **more nerer to thy estate.**[1378]—Do thy Duty.

Δ: He sayd this, to one who cam in, and he departed him self.

Δ: This new come Creature sayd, Wold you haue any thing with me, Il?[1379]

Δ: Who art thow: Art thow one that loveth and honoreth our Creator?

Il: Will you see my hart?—EK: He openeth his body and sheweth his hart: and theron appered written **EL.**

Δ: He semed to be a very mery Creature, and skypped here and there, his apparell was like as of a vyce in a play: and so was his gesture[1380] and his skoffing, as the outward shew therof was to be vulgarly[1381] demed: but I did carefully ponder the pith of the words which he spake: and so forbare to write very much which he spake at the begynning by reason EK did so much mislike him, and in a manner toke him to be an Illuder.

Δ: As you are appointed to answer us by the Messager of God, so answer us, (who desyre pure and playne verity,) as may be correspondent to his Credit that assigned you, and to the honor of God who Created us.

Il:—My answer is Threefold:[1382]—I answer by gesture, by my apparayle, & will answer thee by my wordes.

Δ: Do you know where the Arabik boke[1383] is that I had: which was written in tables and numbers?[1384]

Il:—It is in Scotland:—A minister hath it; it is nothing worth. The boke conteyneth fals and illuding Witchcrafts. All lawde honor and prayse be to the One and euerlasting God: for euer and euer.[1385] Δ: The Lord Threasoror,[1386] hath he, any bokes belonging to Soyga? Il:—He hath none: but certayn Introductions to all artes.

Δ: But it was reported to me by this Skryer[1387] that he had: certayn peculier bokes perteyning to Soyga: otherwise named ysoga, and Agyos, literis transpositis.[1388]

Il:—Soyga signifieth not Agyos. Soyga alca miketh.

Δ: What signifieth those wordes? The true measure of the Will of God in iudgment which is by Wisdome.

Δ: What language is that, I pray you? Il:—A language towght in Paradise.[1389]

Δ: To whome? Il:—By infusion, to Adam. Δ: To whome did Adam use it? Il:—Unto Chevah.[1390] Δ: Did his posteritie use the same?

Il:—Yea, untyll the Ayrie Towre[1391] was destroyed.

Δ: Be there any letters of that language yet extant among us mortall men?

Il: .... that there be. Δ: Where are they? Il:—ô, syr, I shall make you in loue with your Masterships boke.

Δ: Did Adam write any thing in that language? Il:—That is no question.

Δ: Belike than, they were deliuered from one to an other by tradition or els Enoch[1392] his boke, or prophesie, doth, or may seme, to be written in the same language: bycause mention is made of it in the new Testament in Jude his Epistle where he hath, Prophetauit autem de his Septimus ab Adam, Enoch, dicens, Ecce venit Dominus in sanctis millibus suis, facere iudicium contra omnes, et arguere omnes impios, de omnibus operibus impietatis eorum, quibus impiè egerunt, et de omnibus duris, quæ locuti sunt contra Deum peccatores impij &c.[1393]

Il:—I must distinguish with you. Before the flud, the spirit of God was not utterly obscured in man. Theyr memories were greater, theyr understanding more clere, and theyr traditions, most, unsearchable.[1394] Nothing remayned of Enoch but (and if it pleas your mastership) mowght haue byn carryed in a cart. I can not bring you the brass, but I can shew you the bokes. Slepe 28[1395] dayes, and you shall fynde them, under your pillow whan you do rise.

Δ: As concerning Esdras bokes,[1396] which are missing, what say you? Il: The prophets of the Jues[1397] haue them. Δ: But we can hardely trust any thing in the Jues hands, concerning the pure veritie: They are a stiff necked people and dispersed all the world ouer.

Il:—I will shew you a trik. Δ: He lifted up his fote, and shewed the sole of his shoo: and there appeared the picture of a man, who seemed to haue a skorf or fowle skynne on his face: which one toke of: and then there appered on his forhed these two figures, **88**.[1398]

I will shew you more then that, to: and will speak to a man shortly, that shall bring Water to wash euery mans face.

Δ: What mean you, by euery man? Shall all men, be made cleane?

Il:—There is a difference in washing of faces.

EK: This creature seemeth to be a Woman[1399] by his face: his apparell semeth to be like a Vice[1400] in a play.

EK: Ar you not a Kinsman to Syngolla?

Il: I syr, and so are you a kinsman to Synfulla.

Δ: A man may finde corn in chaf.

Il:—So may you (perchaunce) finde me an honest man in my ragged clothes.

Δ: This other day, whan I was in dowt of the Grecian (the Macedonian) whether he had any good and profownd lerning or no, he was represented spiritually, and abowt his hat in great letters was written this greke word  : I pray you what doth it signifie? I axed the grecian and he sayd,  Il: Loke in your boke. Δ: I toke the common lexicon: and he sayd: No Not that: Then I axed if I shold take phauorinus his lexicon:[1401] and he answered, Nor that. And I axed which then: and he sayd your boke covered with a white parchment: and I axed, that of Munsteris of Latine greke and hebrue? And he sayd, yea: and there you shall finde that Maculosus hath onely that one word  longing to it. I loked & so fownd it: which satisfyed me very well.

Δ: I pray you what say you of Gariladrah;[1402] do you know him? Who long sins[1403] did deale with me?

Il:—Yf he were lesser then I, I durst speak to him: But bycause he is greater then I, I am not to speak to him. All under, and nothing above me, I deale.

Loke in your Tables and there you shall finde an other **name of his.**

Δ: I remember no such thing. Il:—Consider who hath set me here.[1404] Yf the Truth thow hast allready, be of a greater then my self, then is it sufficient. Δ: What day was that name given me?

Il:—Immediately, sir, after your[1405] Worships last coming.

Δ: That was Raphaël: And I remember that Gariladrah sayd that he must leave me and his better, (Raphael) shuld be my instructor, and that then the same Raphael was in my hed then. &c.

Δ: Sing a song to his prayse, who created us.

Il: I will sing a short song.

Your doings are of GOD: your calling great:
Go down and seke the Threasor,[1406] and you shall obteyn
it.
Take no care: for, this Boke shall be done in 40 dayes.[1407]
Begyn to practise in August.[1408] Serue god before.
You shall know all thing, ictu oculi.[1409]
And so, prayse, glory, and eternall singing
with incessant humilitie be unto thee, Creator that
hath framed, made and Created all things, for
euer and euer, Now say you (yf you will).
Amen. Δ: Amen Amen Amen.

Il: After the ende of 40 dayes, go down for the Threasor.[1410] Whan those 40 dayes are done,[1411] than this boke shall be finished. The rest of the time untyll August,[1412] is for rest, labor, and prayer.

Δ: What labor? Il:—In digging up of those Threasors.

Δ: Must we nedes dig for them? Il:—Otherwise, yf thow willt.

Δ: How, I pray you? For to dig without lycence[1413] of the Prince, is dangerous by reason of the lawes: and to ax licence, is half an odious sute.

Il:—Yf thow haue a parcell or part out of euery place of the erth, in any small quantitie, thow mayst work by the Creatures, whose powre it is to work in such causes: which **will bring** it (neuer trust me) before you can tell twenty.[1414]

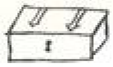
Δ: He meaneth, Neuer trust him, if it be not so, as he hath sayd.

Il:—No, neuer trust me, if it be not so:

Δ: You mean those ten places, marked in the Table, which, last day, I deciphred.[1415]

Il:—I mary,[1416] now you hit it. Yea sir, and your chest allso,[1417] it wold do no hurt. Give me one: and I will make 40: and give you twenty and take twenty to my self: and whan you haue it, I pray you let me haue some little portion for my wife and children.

Δ: As concerning that Chest, I pray you how cam the Macedonian, or Mr Sanford to know of it, so particularly, as he did?



Il:—Husey told of it, openly, at the bord at braynford[1418] in the hearing of diuerse. The Grecian will seke him oute. The Greke in grecia perhaps can finde out Threasor, but not in Anglia.[1419] The Greke hath a Threasor in his hed, that will enriche him to be a fole. I was yesterday at London, I met with a blak dyer. He had a cupple of rings, that wold giue better instructions. Your Chymney **here** will speak **agaynst** you anon:[1420] yet I am no brik layer.[1421] I must be gone.

Δ: God, for his infinite mercyes be allwayes praysed, glorified, and extolled of all his Creatures. Amen.

He advised EK to comunicate to me the boke, and the powder, and so all the rest of the roll,[1422] which was there fownd: saying, True frends use not to hide any thing eche from other.

Δ: An old proverb it is. Amicorum omnia comunia.

Unde, Deo soli omnis exhibeatur
Laus honor et gloria.[1423]
Amen.

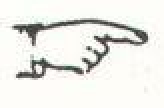
Note: There followeth Quinti Libri Mysteriorum Appendix.[1424]

Quinti libri Mysteriorum

Appendix

Aprilis 20.—Saterday

Δ: This satterday had byn great and eger pangs betwene EK and me: while he wold utterly discredit the whole process of our actions: as, to be done by evill and illuding spirites: seking his destruction: saying that he hath often here to fore byn told things true, but of illuding diuells: and Now, how can this be other, than a mockery, to haue a cornerd dark clowd to be shewed him in steade of the playn writing, which hitherto he had written out of? and that whan they shold do good in dede that then they shrank from us: and that he was not thus to leese[1425] his time: But that he is to study, to lerne some knowledge, whereby he may liue: and that he was a cume[1426] to my howse, and that he dwelled here as in a prison; that it wer better for him to be nere Cotsall playne where he might walk abroade, without danger or to be cumbred[1427] or vexed with such sklaunderous fellows as yesterday he was, with one little Ned dwelling at the blak raven in Westminster: who rayled at[1428] him for bearing witnes of a bargayn made betwene the same Ned (or Edward) and one Lush a Surgien, who was now falln in poverty, a very honest man &c: With a great deale of more matter; melancholik, and cross overthwartly to the good and patient using of our selues to the accomplishing of this action. I replyed, and sayd, that we might finde our selfs answered on thursday, as, That God wold clere when it pleased him: and that we were not to appoint God a time to performe his mysteries and mercies in; shorter then he hath spoken of: And that undowtedly, the occasion of this blak clowd, was some imperfection of oures, to be amended and that then, all wold be to our furder cumfort. And as concerning his dowting the goodnes of the Creatures, (dealing with us) he was to blame, to say or dowt the tree to be yll that bringeth furth good frute: for of these creatures, from the begynning of theyr dealing with us unto the last howre, we never hard other than the prayse of god, instructions and exhortations to humilitie, patience, constancy, fayth &c. The things they promise be such as god can performe, and is for his servyce and glory to performe: and such as haue byn imparted to man before: and therfore neyther impossible for man to enioye agayne, nor unmete for us to hope for: and thowgh his trubbled mynde did dowt, yet my quiet mynde, which god hath made ioyfull throwgh his mercyes, and which accuseth me not in this action of any ambition, hypocrisie, or disorderly longing, but onely is bent and settled in awayting the Lord his helping hand to make me wise for his servyce. (according as long tyme my daylie prayer to him hath byn): and seing I haue and do ax wisdome[1429] at the lord his hands, and put my trust in him, he will not suffer me to be so confownded: nether will he offer a stone to his seely children, when in tyme of nede they ax bred at his hands: besides that, Voluntatem timentium se faciet deus:[1430] and (by his graces) I feare him so, and am so carefull to do that shold pleas him, that I make no accownt of all this world possessing, unleast I might enioye his fauor. his mercies and graces. And whereas he complayned of want, I sayd my want is greater than his: for I was in det allmost 300 pownds,[1431] had



a greater charge than he; and yet for all my 40 yeres course of study, many hunderd pownds spending, many hundred myles travayling, many an incredible toyle and forcing of my will in study using to lerne or to bowlt out some good thing, &c. Yet for all this I wold be very well pleased to be deferred yet longer, (a yere or more,) and to go up and down England clothed in a blanket, to beg my bred, so that I might, at the ende be assured to atteyn to godly wisdome, whereby to do God some service for his glory. And to be playne, that I was resolued, eyther willingly to leave this world presently that, so, I might in spirit enioye the bottomles fowntayne of all wisdome, or els to pass furth my dayes on earth with gods favor and assurance of enioying here his mercifull mighty blessings, to understand his mysteries, mete for the performing of true actions, such as myght sett furth his glory, so, as it might be evident and confessed, that such things wer done Dextera Domini.[1432] And many other discourses and answers I made unto his obiections and dowtes: Afterward [A meridie] I began to speak of the trubbles and misery foreshewed to be nere at hand, and by that tyme I had entred a little into the Consideration & talk of the matter, he appered that sayd he was called El or Il[1433],and sayd,

---------- Now to the matter.

Δ: What matter?

Il:—Imust have a Wallet to carry your witt and myne own in.

Δ: Benedictus qui venit in nomine domini.[1434]

Il:—Then I perceyue that I shall haue a blessing. Blessed is the physitien that hath care of his patient, before the pangs of death doth viset him.

Δ:—What think you of that clowdy Heptagonum?

Il:—Dost thow consider, I go abowt it? I told thee, euery thing I did, was an Instruction. As I can not stand stedfastly uppon this, (it self one, and one, perfect:) so can not my mowth declare, much lesse speak, that you may comprehend it, what this is whereuppon I go.

EK: He went on the Heptagonon, as one might go on the top of a turning whele: (Δ: as some horses use to turne wheles as may appere in Georgius Agricola[1435] de re metallica).

Il:—I know, what all your talk hath byn: But such myndes, such Infection, such Infection, such corruption: and must nedes haue a potion appliable for the cure. But how will you do? I haue forgotten all my droggs behinde me. But since I know that some of you are well stored with sufficient oyntments, I do entend to viset you onely with theyr help. You see, all my boxes ar empty?—EK: He sheweth, a great bundell of empty potichayre[1436] boxes, and they seme to my hearing to rattle.

Δ: How commeth it, that you pretend to come from a favorable diuine powre to pleasure us, and your boxes ar empty.

Il:—You sayd euen now in your talk, Iovis omnia plena:[1437] yf my empty boxes be vertuous, how much more shall any thing be, which I bring not empty?

Δ: Then I pray you, to say somwhat of the vertue of your empty boxes, bycause we may haue the better confidence of your fullnes.

Il: Will you haue my bill? Δ: Shall we go to the Apothecaries, with your Bill?

Il: I will shew it: Serve it, where you list.

Iudra galgol astel.

Δ: You know we, understand it not: how can it be serued?

Il:—You must nedes haue an expositor. What boke of physik is that, that lyeth by you?

[Δ: There lay by me on my desk, Marcus Heremita de Lege spirituali [1438] in greke and latine but the latine translation lay open before, on the left side of which, the sentence began: Non raro per negligentiam, quæ circa alicuius rei operationem comittitur, etiam Cognito obscuratur. [1439] And on the right side, began: Corpus sine mente nihil pt perficere[1440] &c.]

Il:—Mary here is good physik in dede. You fownd my name the other day. Go to my name [Δ: So I turned to the second boke and browght sigillum Æmeth: and there chose the Word Ilemese. He than axed me, which letter of this name I liked best, and I sayd, L: bycause it conteyned the name representing God: El, &c. Then he sayd somwhat farder of the letters, which I wrote not.

Il:—Go to great M, the second: for this is it that shall serue his turne. Yf this can not serue him, he shall haue a medicine, that a horse can not abyde. Use this, and I warrant you, your blindenes will be gone.[1441]

Δ: It is here, greatly, to be Noted: that I turned in this boke of Marcus, 27 leaues furder: tyll I cam to the Quaternio of M, the second and there I fownd this sentence notified (by my lines drawn, and a Note in the margent Cor Contritum): Sine corde contrito impossibile est omnino liberari a malitia et vilijs. Conterit autem cor tripartita temperantia somni dico et cibi, et corporalis licentiæ. Cæterum horum excessus et abundantia voluptatem generat. Voluptas autem prauas cogitationes ingerit repugnat verò præcationi et convenienti Cogitationi.[1442]

Δ: This being considered by us, we ceased and this instant and thanked God of his mercies, that it wold pleas him to make us understand some iust cause whie clowdes now appeared in stede of brightnes &c.

Soli Deo omnis honor laus et gloria.[1443] Amen.

Aprilis 23. Tuesday. mane hor. 8.

Δ: After our prayer iointly, and my long prayer, at my desk requesting God to deale with us, so, as might be most for his glory, in his mercies: not according to our deserts, and frowardnes: &c. At length appeared in the stone a white clowde, seven-cornered. And behinde the Clowde a Thunder seemed to yssue.

A Voyce: Whan I gathered you,you were chosen of the myddest of Iniquitie:[1444]Whome I haue clothed with garments made and fashioned with my owne hand.—I,AM. Therfore,Beleue:

Δ: I prayed, and thanked the highest, that so mercifully regarded our miserie.

A Voyce: I, AM.

EK: Now standeth Uriel uppon the clowde, and semeth to loke downward and kneled, saying,

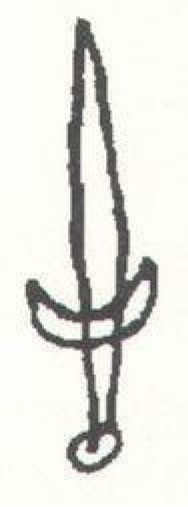
Æternitie, Maiestie, Dominion and all powre, in heuen the earth, and in the secret partes below, is thyne, thyne, yea thyne; and to none els due, but unto thee: whose mercies are infinite, which respectest the glorie of thy owne name, above the frowardnes. and perversnes of mans nature: which swarmeth with synnes, and is couered with Iniquitie: and in the which, there is fownde no place free from filthynes and abhomination. Glorie be to thee; ô, all powre: and magnified be thow, in the workmanship of thy own hands, from time to time, and with out ende of time, from generation to generation: and euen amidst and in the number of those, for whome thow hast prepared the flowres of thy æternall Garland.

Beare with them (ô lord) for thy mercyes sake. For, woldest thow seeke . . .[1445] in the myddest of miserie? Whom yf thow sholdest iudge according to thy iustice, How shold thy Name be glorified so in thy self, to thy own determination, and writing, sealed before the Creation of the Worldes? The fire of thy Justice consumeth thyne own seat; and in thee, is no powre wanting, whan it pleaseth thee, to cast down, and gather them to gither, as the wynde doth the Snow, and in-hemme them with the mowntaynes, that they may not arrise to synne. But What thow art, thow art: and what thow willt, thow canst.

Amen.

Δ: Amen.

Ur:—I haue measured time (sayth the lord) and it is so: I haue appointed to the heauens theyr course, and they shall not pass it. The synnes of man shall decay, in despite of the enemy: But the fire of æternitie shall neuer be quenched, nor neuer fayle. More, then is, can not, nor may not be sayde. We can not be Wittnesses to him which wittnesseth of him self.

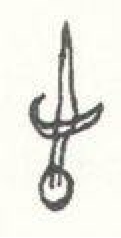


Nota et
Caue

But (**this sayeth the Lord**), Beholde yf you trubble me ones more, or towche the wings of my excellency, before I shall move my self, I will raze you from the earth, as children of perdition and **will endue** those that are of quiet myndes. with the strength of my powre.[1446] You are not faithfull, sayeth the lorde whome you beleue not. Notwithstanding **I haue hardened the hart of One of you, yea, I haue hardened him as the flynt, and burnt him to gither with the ashes of a Cedar: to the entent he may be proued iust in mywork, and great in the strength of my Glory**. **Neyther shall his mynde consent to the wyckednes of Iniquitie. For, from Iniquitie I haue chosen him,**[1447] **to be a first erthely witnes of my Dignitie.**[1448]

Your words are, yet, not offensiue unto God: Therfore, will not we, be offended at any thing that is spoken: For it must be done[1449] and shall stand; yea and in the **number** which I haue allready chosen.

Note

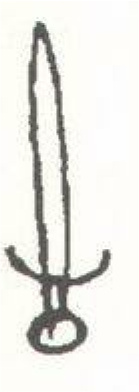


But, this sayeth the Lord: Yf you use me like worldlings I will suerly stretch out my arme uppon you, and that heuily.[1450] Lastly, I say,

Be Faithfull,
Honor God truely.

Beleue him hartily.

EK: He kneleth down, and semeth to pray.—Now he standeth up.



Note

> Ur: Lo, As a number increasing is allwayes bigger: so in this world decreasing, the Lord must be mightily glorified. Striue not with God: But receyue, as he imparteth.[1451] The Mercy of my message, quencheth the obscuritie and dullnes of your sowles: I mean of the Infection, wherewithall they are poysoned. Lo, how the Earth cryeth vengeance.[1452] Come, for thy Glory sake, it is tyme. Amen.

Δ: Seing it is sayd that in 40 dayes the boke shalbe finished and seing it is sayed that our former Instructers shall not come nor appeare to us tyll the boke be finished: And seing here to fore the boke used to appere to EK, that he might write, whan so euer he bent him self therto: and seing the same boke appeareth not so now: and seing we are desyrous to be fownd diligent in this work, and to omitt no Opportunitie wherein the writing therof might be furdred: We wold gladly know; What token, or warning shall be giuen us, henceforward, whan due tyme serueth for the same purpose.

Ur:—Dy in the folly: I haue sayde.

EK: It thundreth and lightneth abowt the clowde: and now all is vanished away.

Δ: EK sayd, that at the very begynning of this days action, when he expressed the first Voyce (this day), hard of him, his belly did seame to him, to be full of fyre: and that he thowght veryly, that his bowells did burne: And that he loked downward toward his leggs, to see if any thing appeared on fire: calling to his mynde, the late chance that befell to the Adulterous man and woman by Sainct Brydes church in London &c. Allso that whan he had made an ende, he thowght his belly to be wyder, and enlarged, muche more then it was before.

Δ: I sayde certayn prayers to the Almightie our God and most mercifull father, on my knees; and EK on his knees likewise, answered diuerse times, Amen.

After this, we made AG. to understand these the mercies of the Highest: and he reioyced greatly, and praysed the Lorde. And, so EK. was fully satisfyed of his Dowtes: And AG, and he, were reconciled of the great discorde which, yesterday, had byn betwene them, &c.

Non nobis, Domine, Non nobis,
sed nomini tuo Gloriam omnem
Laudem et honorem damus, et
dabimus in perpetuum.[1453]
Amen.

Aprilis 26. Fryday

Δ NOTE

Δ: By the prouidence of god, and Mr Gilbert his meanes, and pacifying of EK his vehement passions and pangs, he cam agayn to my howse: and my wife very willing, and quietted in mynde, and very frendely to EK in Word, and cowntenance: and a new pacification on all partes confirmed: and all uppon the Confidence of God his servyce, to be faythfully and cherfly intended, and followed in and by our actions, throwgh the grace and mercy of the highest.

1583. Aprilis 28. Sonday. after Dynner abowt 4 of the clok.

Δ: As I and EK had diuerse talks and discourses of Transposition of letters: and I had declared him my rule for to know certaynly how many wayes, any number of letters (propownded,) might be transposed or altered in place or order: Behold, suddenly appered, the Spirituall Creature, Il, and sayd,

Il:—Here is a goodly disputation of transposition of letters. Chuse, whether you will dispute with me, of Transposition, or I shall lerne you.

Δ: I had rather lerne then dispute. And first I think, that those letters of our Adamicall Alphabet haue a due peculier unchangeable proportion of theyr formes,—and likewise that theyr order is allso Mysticall.

Il:—These letters[1454] represent the Creation of man: and therfore they must be in proportion. They represent the Workmanship wherewithall the sowle of man was made like unto his Creator. But I understand you shall haue a paynter shortly.

Δ:—I pray you, what paynter may best serve for the purpose? Can master Lyne serue the turn well?

Il: Dost thow think that God can be glorifyed in hell, or can diuells dishonor him? Can Wickednes of a paynter, deface the mysteries of God? The truth is, I am come to aduertise you, least with a small error you be led, far, asyde.

Let me see the forme of your Table.[1455]

Δ:—I shewed him the Characters and words which were to be paynted rownd abowt in the border of the Table.

Il:—How do you like those letters? Δ: I know not well what I may say. For, perhaps, that which I shuld like, wer not so to lyked: and contrarywise what I shold think well of, might be nothing worth.

Il:—Thow sayest wel.

Behold, great is the fauor and mercy of God toward those whome he fauoreth. All things are perfect but onely that: Neyther what that shewed or deliuered by any good and perfect messager from God. A wicked powre did intrude him self;[1456]not onely into your societie, but allso into the Workmanship of Gods mysteries. Sathan dare presume to speak of the Almighty. Those Characters are diuilish: and a secret band of the Diuell. But, this sayeth the lord, I will rayse them up, whom he hath ouerthrown: and blott oute his fotesteps where they resist my glorie. Neyther will I suffer the faithfull to be led utterly awry: nor finally permit darkness to enhemme them for euer. He sayth, I AM, and they[1457] are most untrue. But behold. I haue browght thee the truth: that the Prince of reason, God of understanding may be apparent in euery part of his Cælestiall demonstration. Therfore, as thow saydst unto me ones,

So say I now to thee: Serue god.

Make a square,[1458] of 6 ynches euery way. The border therof let it be (here) but, half an inche: but on the Table it self, let it be an inche broad.[1459]

Euery one of those sides must haue 21 Characters: But, first, at euery corner make a great B.

Prayer is the key of all good things:

Δ: After our prayers made, EK had sight (in the stone) of innumerable letters and after a little while, they wer browght into a lesser square and fewer letters. First appered in the border opposite to our standing place, (which I haue used to call, in fronte Tabulæ) these letters following, beginning at the right hand, and proceding toward the left.

[1460], [1461], [1462], [1463], [1464]

Il: What haue you **in the myddle of your Tablet?** Δ: Nothing.
Il: **Sigillum Emeth, is to be sett there.**
Il: The rest, after supper.
Δ: Soli Deo Omnipotenti sit laus perennis.[1465]

Amen.

After supper, retorning to our businesse, I first dowted of the heds of the letters in the border, to be written, which way they owght to be turned, to the center ward of the Table or from the Center ward.

Il:—The heds of the letters must be next or toward the center of the square Table or Figure. Diuide that within, by 12 and 7.[1466]

Δ: I diuided it.

Il:**—Grace, mercy and peace be unto the liuely branches of his florishing kingdom: and strong art thow in thy glory, which dost unknytt the secret partes of thy liuely workmanship: and that, before the weak understanding of man. Herein is thy powre and Magnificence opened unto man: And why? bycause thy diuinitie and secret powre is here shut up in Numero Ternario et Quaternario: à quo principium et fundamentum omne huius est tui sanctissimi operis.**[1467] **For, yf thow (O God) be wunderfull and incomprehensible in thyne owne substance, it must nedes follow, that thy works are likewise incomprehensible. But, Lo, they shall now beleue, bycause they see, which heretofore could skarsly beleue. Strong is the Influence of thy supercelestiall powre, and mighty is the force of that arme, which overcommeth all things: Let all powre therfore rest in thee; Amen.**

Δ: The Spirituall Creature seamed to eate fyre, like balls of fyre: hauing his face toward me, and his bak toward EK.

Il: Leave oute the Bees of the 7 names of the seven Kings, and 7 Princis: and place them in a table diuided by 12 and 7:[1468] **the 7 spaces being uppermost: and therein write, in the upper line, the letters of the king, with the letters of his Prince following next after his name: and so of the six other, and theyr Princis: And read them on the right hand from the upper part to the lowest, and thow shalt finde, then, the Composition of this Table. Therein they are all comprehended, sauing certayn letters, which are not to be put-in here: By reason that the Kings and Princis do spring from God: and not God from the Kings and Princis:**[1469] **Which excellency is comprehended, and is allso manifest, in that Third and Fowrth member.**

Rownd abowt the sides [of this square] is euery letter of the 14 names of the 7 kings and Princis.

Hereafter shall you perceyue that the Glorie of this Table surmownteth the glorie of the sonne.[1470]

All things els appertayning unto it, are allready prescribed by your former instruction.

I haue no more to say, but God transpose your myndes, according to his own will and pleasure. You talked of Transposition.[1471] Tomorrow I will be with you agayn. But Call not for me, least you incurre the danger of the former Curse.[1472]

1473

Aprilis 29. Monday, a meridie

Δ: As EK and I wer talking of my boke Soyga, or Aldaraia: and I at length sayd that, (as far, as I did remember) Zadzaczadlin, was Adam[1474] by the Alphabet therof, suddenly appeared the spirituall creature, which sayd yesterday that he wold come agayn, this day, uncalled: and at his first comming he sayd:

Then, à primo.

Δ: Qui primus est et nouissimus, Alpha et Omega, misereatur nostri.[1475]

Il:—Amen. Glorie be to thee, which art one, and comprehending all. Mervaylous is thy wisdome, in those, of whome, thow willt be comprehended.

A short prayer, but appliable to my purpose.

Euery prayse, with us, is a prayer.

Δ: He taketh-of, his pyed[1476] coat, and threw it up on the corner of my desk and then he seemed clothed in an ancient doctorly apparayle: and on his hed he had a wrethe of white sylk of three braydes.[1477]

Il:—Well I will give you my lesson, and so byd you farewell. First I am to perswade you to put away wavering myndes. Secondly, for your Instruction, in these necessarie occasions, thus it is:

> The owtsides or skyn must be the Centre.[1478] There, is one fowndation.
>
> The Flesh must be the owtside.
>
> The Centre it self must be disseuered into 4 æquall partes:

There is your lesson.

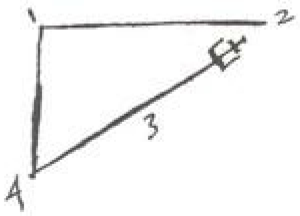
Δ: We understand not, this dark lesson.

Il:—The hart must be the fowrth part of the body; and yet the body perfect and sownd. The Skynne must occupy the place of the hart and yet without deformitie. God is the begynning of all things: The fardest parte of all things is in the hands of God. The like shalbe fownd amongst the number of his One most holy names:[1479] The Erth is a fowndation to euery thing: and differeth but onely in forme. In the forme of his own application whereunto it is applied. **God is the begynning of all things, but not after one sorte, nor to euery one alike. But it is three manner of works, with his name:**

> **The One, in respect of Dignification:**
>
> **The second, in respect of Conciliation:**
>
> **The third, in respect of an ende and determined Operation.**

Now syr, to what ende, wold you were your Character?

Δ: At our two first dealings to gither, it was answered by a spirituall Creature, (whome we toke to be Uriel,) Sigillum hoc in auro sculpendum, ad defensionem Corporis omni loco, tempore et occasione, et in pectus gestandum.[1481]



Il: **But how do I teache? The Character is an Instrument, appliable onely to Dignification. But there is no Dignification (Syr) but that which doth procede, and hath his perfect Composition, Centrally, in the square number of 3 and 4. The centre whereof shall be equall to the greatest.**

Δ: We understand not. Il:—**Hereby you may gather not onely to what ende, the blessed Character (wherewith thow shalt be dignified) is prepared, but allso the nature of all other characters.**[1482] **To the second. —Δ: Conciliation you meane.**

Il:—The Table is an Instrument of Conciliation. And so are the other 7 Characters: which you call by the name of Tables, squared out into the forme of Armes: which are propre to euery king and Prince[1483] **according to theyr order.**[1484]

Now to the last: Δ: As concerning the ende and determined Operation.

Il: It onely consisteth in the mercy of God, and the Characters of these bokes.[1485] For, Behold, As there is nothing that commeth or springeth from God, **but it is as God**, and hath secret Maiesticall and inexplicable Operation in it: So euery letter here bringeth furth the Names of God:[1486] But, (in dede), they are but one Name; But according to the locall and former being, do comprehend the universall generation corruptible and incorruptible[1487] of euery thing. It followeth, then, it must nedes comprehend the ende of all things.

Thus much, hitherto.

The Character is fals and diuilish.[1488]

He that dwelleth in thee, hath told thee, so, long ago. The former Diuel, did not onely insinuat him self, but these things.

Δ: I do mervayle, that we had no warning hereof ere now, and that I was often tymes called on, to prepare those things, (character and Table): and yet they were fals.

Il:—Yf it shold haue byn gon abowt to be made, it shuld not haue byn suffred to pass under the forme of wyckednes.[1489] The Truth is to be gathered uppon the first Demonstration (my demonstration and yours[1490] are not all one: you will not be offended with me, syr.)

I gaue thee a certayn principle, which in it self is a sufficient demonstration: I told thee, the placing of the Centre, the forme of it, with a lineamentall placing and ordring of that which thow lookest[1491] for. Δ: But truely I understand not.

Il:—I teache. Take cleane paper. It must be made 4 inches square.

Pray. Δ: We prayed.

Il: These letters, which I shall speak now, thow shalt, afterward, put them in theyr propre characters.[1492]

Write: Neuer since the begynning of the world was this secret deliuered, nor this holy mysterie set open, before the Weaklings of this world. Write in the uppermost prik ‘O’, and ‘b’ on the right hand, and ‘g’ on the left &c. The two extreme pricks, one on the right hand, ‘a’ and the other, on the left ‘o’

&c.

There is the whole.

Δ: We prayed (unbidden) in respect of the mysterie revealed. EK, was skarse able to abide or endure the voyce of the spirituall Creature, when he spake of these things now: the sownd was so forcible to his hed that it made it ake vehemently.

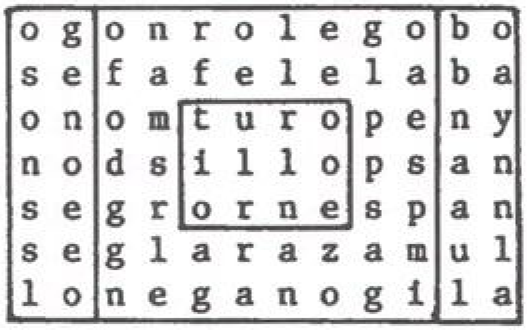
Il:—**Set down the kings, and theyr Princis in a Table (as thow knowest them): with theyr letters bakward: excepting theyr Bees, from the right hand, to the left.**[1493] **Let Bobogel be first, and Bornogo is his prince.**[1494]

Δ: Note here the three diuerse manners how the letters ar cumpassed. 1: The middel is called the Hart or centre, 2: those abowt, enclosing the hart, ar called the flesh, and 3: the two owtside pillers (of two letters in a row) is cownted the skyn.



o	g	o	n	r	o	l	e	g	o	b	o
s	e	f	a	f	e	l	e	l	a	b	a

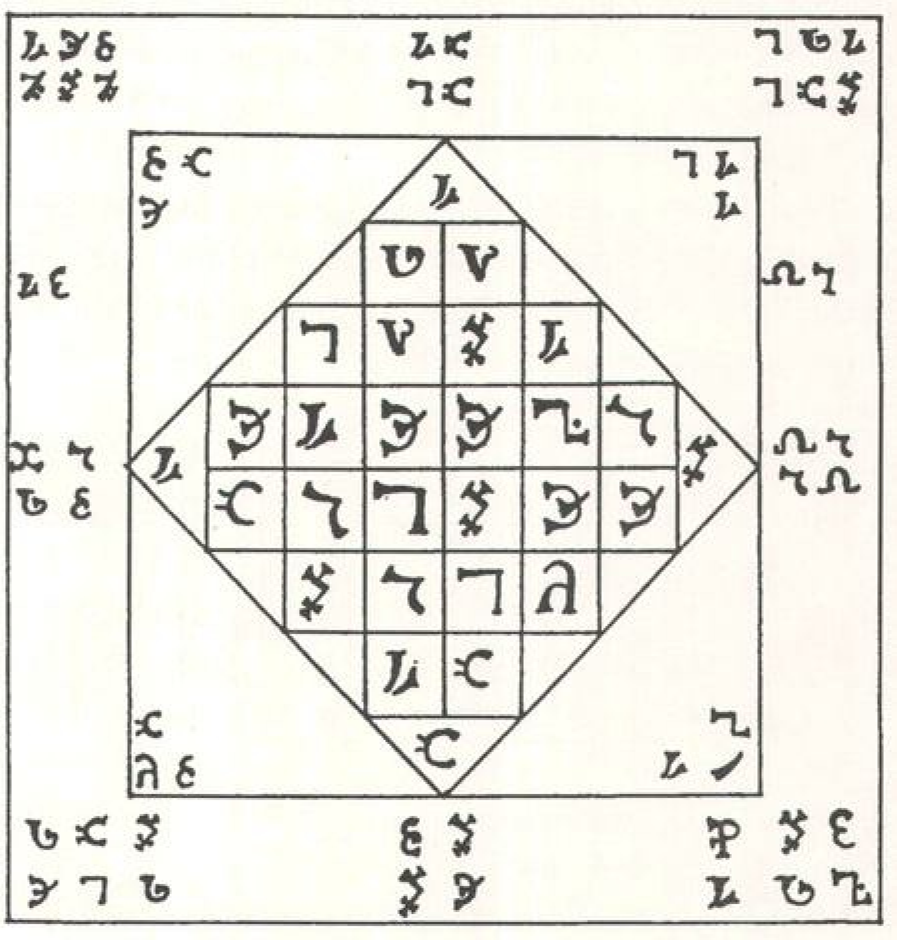
l	o	n	e	g	a	n	o	g	i	l	a

Il:—Here, is the skynn turned into the Centre: and the Centre turned into 4 partes of the body.

Δ: I see now allso, how, the flesh, is become the owtside: o g e l o r n o &c. Il: I haue done tyll sone.

Δ: Deo nostro omnipotenti perennis laus sit et immensa gloria.[1495] Amen.



NOTE.

Δ: After that these things were finished, and EK rose up from the table and went to the west window, to reade a letter which was, euen than, browght him from his wife: which being done, he toke a little prayer[1496] boke (in english meter made by one William Hunnis which Mr Adrian Gilbert had here: and it lay on the Table by us all the while of this last action) and with this boke, he went into his bed chamber, intending to pray on it, a certayn prayer, which he liked: and as he opened the boke, his ey espied strange writing in the spare white paper at the bokes ende: and beholding it, iudged it verily to be his own letters, and the thing of his own doing: but being assured that he never saw the like of this Character [for Conciliation], and that other, (notified by the hart or Center, skyn and flesh before this present howre, he becam astonied,[1497] and in great wrath; and behold, suddenly, One appered to him and sayd, Lo, this is as good as that other: meaning that, which we had receyued, and is here before sett down on the former page. With this newes cam EK to me, as I was writing down fayre this last Action, and sayd, I haue strange matter to impart unto you: Then sayd I, What is that? And at the fyrst (being yet tossed in his mynde, with this great iniurie of the suttle supplanter of man, ambitiously intruding him self, to rob god of his glory) he sayd, you shall know, and at length shewed me this little paper, here, by, being the one of the white leafes in the ende of the forsayd little prayer boke. And I vewing it, fownd it to be ment to be the counterfeat of ours, but, with all, imperfect diuerse wayes, after the order of our method: yea thowgh the words, out of which it had sprong had bin good, and sufficient: and thereat laughed-at, and derided the Wicked enemy, for his envy, his ass-hedded folish ambition, and in dede mere blyndenes to do any thing well. To conclude, we fownd, that with an incredible spede this Diuilish figure was written down by some Wicked spirit, to bring our perfect doings in dowt with us: thereby eyther to provoke us to utter undue speaches of gods good creatures, or to wavering myndes of the Worthynes and goodnes of the same things receyuing, and so eyther to leaue of, or with fayntharted wavering to procede. But I by gods grace (contrary to such inconveniency) was armed with constancie, and confident good hope, that God wold not suffer me, (putting my trust in his goodnes and mercy, to receyue wisdome from him) to be so uniustly dealt withall or unkindely or unfatherly used at his hands &c: and entended after supper to make my ernest complaint to the diuine Maiestie against this wicked intrusion and temptation of the Illuding diuell and so we went to supper.

1583. Aprilis 29. Monday. after supper. hora 8 a.

Δ: I went into my oratorie, and made a fervent prayer agaynst the spirituall enemy: specially meaning the wicked one who had so suddenly so suttily and so liuely cownterfeted the hand and letters of EK: as is here before declared, and by the thing it self may appere here. Likewise EK on his knees (at the greene chayre standing before my chymney) did pray. After which prayers ended, I yea, rather, before they were ended, on my behalf, EK espyed a spirituall creature come to my Table: whome he toke to be IL, and so, a lowd, sayd, He is here. And thereuppon I cam to my desk, to write as occasion shold serue: And before I began to do any thing, I rehersed part of my intent, uttred to god by prayer and half turned my speche to god him self, as the cause did seme to require. Thereuppon that spirituall creature, who, as yet had sayd nothing, suddenly used these words:———— I give place to my better.

EK: There semeth to me Uriel to be come, and IL to be gone away. Δ: Then began that new-come Creature to say thus,

Most abundant and plentifull are the great mercies of God unto them which truely and unfaynedly feare, honor and beleue him. The Lord hath hard thy prayers, and I am URIEL,[1498] and I haue browght the peace of God, which shall from henceforth viset you.

If I had not made this action perfect (sayeth the lord) and wrowght some perfection in you, to the ende you might performe: yea, if I had not had mercies (sayeth the lord) over the infinite number and multitude of sowles, which are yet to put on the vilenes and corruption of the flesh,[1499]Or if it wer not time to loke down, and behold the sorrow of my Temple, Yet wold I, for my promiss sake, and the establishing of my kingdom, verifie my mercies uppon the sonns of men: Whereunto I haue Chosen **three** of you,[1500] as the mowthes and Instruments of my determined purpose. Therfore (sayeth the Lorde), Be of stowte and courragious mynde in me,[1501] for me, and for my truth sake: And Fear not the assalts of temptation, For I haue sayd, I am with you. But as mercy is necessary for those that repent, and faithfully forget theyr offenses, So is Temptation requisite[1502] and must ordinarilie follow those, whome it pleaseth him to illuminate with the beames of triumphant sanctification.

Yf Temptation wer not, how shold the sonnes of men (sayeth the lord) know me to be mercifull? But I am honored in hell; and wurshipped with the blasphemers: Pugna erit, vobis autem victoria:[1503]yet, albeit, (thus sayeth my message) I will defend you from the cruelltie of these dayes to come and will make you perfect: that perfectly you may begynne in the works of my perfection.[1504] But, what? and doost thow (Sathan) think to triumph? Behold (sayeth the God of Justice) I will banish thy servants from this place and region; and will set stumbling bloks before the feete of thy ministers:[1505] Therfore, be it unto thee, as thow hast deserued: And be it to this people, and holie place, (as it is, the will of god; which I do pronownce) light without darkness, Truth without falshode, righteousnes without the works of wickednes. I haue pronownced it, and it is done.

But thow, o yongling,[1506] (but, old synner,) why dost thow suffer thy blyndeness thus to encrease: or why dost thow not yeld thy lymmes to the service and fullfilling of an aeternall veritie? Pluck up thy hart: let it not be hardened. Follow the waye that leadeth to the knowledge of the ende; the open sight of god his word verified for his kingdoms sake.

You began in Tables, and that of small accownt. But be faithfull for you shalbe written within Tables of perfect and euerlasting remembrance. Considering the truth, which is the message of him which is the fowntayne and life of the true, perfect and most glorious life to come, Follow, loue, and diligently Contemplate the mysteries therein. He that hath done this euill, hath not onely synned against thee, but against God, and against his truth. Judgment is not of me, and therefore I cannot pronownce it: But what his Judgment is, he knoweth in him self. His name is BELMAGEL: and he is the fyrebrand, who hath followed thy sowle from the begynning;[1507] yea seking his destruction. Who can better cownterfeat, than he, that in thy wickednes is chief lord and Master of thy spirites: or who hath byn acquaynted with the secrets of mans fingers, so much as he [that] hath byn a directer? My sayings are no accusation: neyther is it my propertie to be defyled with such profession. [1508] But I cownsayle you generally; and aduertise you throwgh the grace and by the spirit of unspeakable mercy.

This night, yf your prayers had not byn; yea, if they had not perced into the seat of him which sitteth aboue: Thow, yea (I say) thow hadst byn carryed, and taken awaye, this night, into a willdernesse, so far distant hence Northward, that thy destruction had followed.[1509] Therfore lay away thy works of youth; and fly from fleshly vanities. Yf not uppon Joye and pleasure of this presence, yet for the glorie of him that hath chosen you.

I say, be strong: Be Humble, with Obedience: For, All the things, that haue byn spoken of, shall come to pass: And there shall not a letter of the boke of this prophesie perish.[1510] Finally, God hath blessed you, and will kepe **you from temptation**[1511] and will be mercifull unto you: and perfect you, for the dignitie of your profession[1512] sake: Which, world without ende for euer and euer, with us and all creatures, and in the light of his own cowntenance, be honored.

Amen. Amen. Amen.

Δ: Hereuppon I made most humble prayer with harty thanks to our God, for his help, cumfort, and Judgment against our enemie, in this case, (so greatly concerning his glorie.) And at my standing up I understode that Uriel was out of sight to EK. Yet I held-on my purpose to thank him; and to prayse god for Uriel that his so faithfull ministerie unto his diuine Maiestie, executed to our nedefull comfort in so vehement a temptation.

Deo nostro Omnipotenti; sit omnis laus, honor,
et gratiarum actio, nunc et in perpetuum,[1513]
Amen.

1583 Maij 5. Sonday. a meridie hor 4. vel circiter.

Δ: For as much as, on fryday last, while my frende EK was abowt writing of the Tables he was told that the same shuld be finished on monday next and that on sonday before, (it is to wete, this present sonday) at after none, all dowtes shold be answered; after, the after none had so far passed, as tyll somewhat past 4 of the clok: Then, we fell to prayer, and after a quarter of an howres invocation to god, and prayers made, EK sayd, here is one whome we toke to be Uriel, as he was, in dede. I had layd 28 questions or articles of dowtes in writing uppon my desk, open, ready for me to rede (uppon occasion) to our spirituall instructor, who, thus began his speche, after I had used a few wordes begynning with this sentence, Beati pedes, evangelizantium pacem &c.[1514]

Uriel:—The very light and true wisdome (which is the Somme of my message, and will of him that sent me) make you perfect, and establish those things, which he hath sayd, and hath decreed: and likewise your myndes, that you may be apt vessells to receyve so abundant mercies. Amen. Δ: Amen, per te Jesu Christe:[1515] Amen.

Ur:—This boke,[1516] and holy key, which unlocketh the secrets of god his determination, as concerning the begynning, present being, and ende of this world, is so reuerent and holy: that I wonder (I speak in your sense) whie it is deliuered to those, that shall decay: So excellent and great are the Mysteries therein conteyned, aboue the capacitie of man: This boke (I say) shall, to morrow, be finished:[1517] One thing excepted: which is **the use thereof**. Unto the which the lord hath appointed a day. But (bycause I will speak to you, after the manner of men) See that all things be in a redynes agaynst the first day of August next.[1518] Humble your selues nine dayes before: yea, unrip (I say) the cankers of your infected sowles: that you may be apt and meet to understand the Secrets, that shalbe deliuered.[1519] For why? The Lord hath sent his angels allready to viset the earth,[1520] and to gather the synnes thereof to gither, that they may be wayed before him in the balance of Justice: and Then is the tyme that the promise of God, shalbe fullfilled. Dowt not, for we are good Angells.[1521]

The second of the greatest prophesie is this[1522] (O ye mortall men) For the first was **of** him self, that He **shold** come: And this, is from him: in respect of that he **will** come.Neyther are you to speak the wordes of this Testimonie, in one place, or in one people, but, that the Nations of the whole world may knowe that there is a GOD which forgetteth not the truth of his promise, nor the sauegarde of his chosen, for the greatnes of his glory.[1523]

Therfore (I say) prepare your bodies, that they may be strong enowgh for armors of great profe.[1524] Of your selfs, you cannot: But desire and it shall be giuen unto you. For Now, is euen that wicked childe grown up unto perfection: and the fier tungs redy to open his Jaws.[1525] WO therfore shalbe to the Nations of the earth: And wo wo innumerable to those that say, we yelde: Wickednes (o lorde) is crept up, and hath filled the dores of thy holy sanctuarie: defyled the dwelling places of thy holy Angels: and poysonned the earth, as her own seat:

In 40 dayes more must this boke be perfyted in his own manner to the intent that you allso may be perfyted in the workmanship of him, which hath sealed it.[1526]

Oute of this, shall be restored the holy bokes, which haue perished euen from the begynning, and from the first that liued And herein shalbe deciphred perfect truth from imperfect falshode, True religion from fals and damnable errors, With all Artes; which are propre to the use of man, the first and sanctified perfection: Which when it hath spred a While, THEN COMMETH THE ENDE.[1527]

Thy Character must haue the names of the fiue Angels (written in the myddst of Sigillum Emeth) graven uppon the other side in a circle. [1528] **In the myddst whereof, must the stone be which was allso browght:**[1529] **Wherein, thow shallt, at all times behold, (priuately to thy self,) the state of gods people throwgh the Whole earth.**

The fowre fete of the Table must haue 4 hollow things of swete wood,[1530] **whereuppon, they may**[1531] **stand: within the hollownes wherof thy seales may be kept unperished**.

One month is all, for the use thereof.[1532]

Thus, sayeth the Lord, when I browght you up in likenes of birds, encreasing you, and suffring you to touche[1533] the skyes, I opened unto you the ende of your reioysing: For, this Doctrine shall towche the skyes, and call the sterrs to testimonie therof: And your fotesteps shall viset (allmost) [all[1534]] the partes of the whole world.

The sylk, must be of diuerse cullors, the most changeable that can be gotten:[1535] For, who, is hable to behold the glory of the seat of God?

All these things must be used, as that day.[1536]

All errors and dowtes ells may be amended by the rules of reason: But Notwithstanding, Ask, and thow shalt be answered.

Δ: As concerning Mals don Mals, what is the veritie to be placed in the middle of my practising Table?

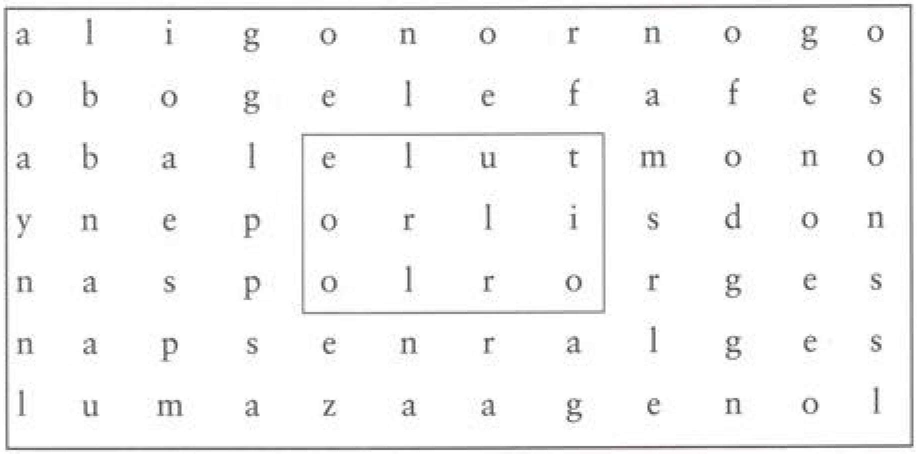
Ur:—Write

o	o	e		t	i	o
l	r	l	rather	u	l	r
r	l	u	thus[113]	l	r	l
o	i	t		e	o	o

[1537]

Δ: From whense, are these taken?

Ur: They owght to be gathered of those names, which are first gathered by thee, by ordre: (In the myddst of them:) the Kings and Princis being placed, as thow (of **thy invention**) diddst gather tbhem: Not putting **theyr own princis,** next to the kings: but as they follow **in Tabula,** Collecta[1538] by thee: as thus,



a	l	i	g	o	n	o	r	n	o	g	o
o	b	o	g	e	l	e	f	a	f	e	s
a	b	a	l	e	l	u	t	m	o	n	o
y	n	e	p	o	r	l	i	s	d	o	n
n	a	s	p	o	l	r	o	r	g	e	s
n	a	p	s	e	n	r	a	l	g	e	s
l	u	m	a	z	a	a	g	e	n	o	l

Δ: Wherfore is the Table of Kings, and Princis set down in so diuerse manners? [1539] as, One, to haue Bobogel and Bornogo in the first row: and other to haue Baligon and Bagenol (his prince) in the first row: and here thirdly Baligon and Bornogo: and in the Heptagonon Blumaza semeth to be first, discoursed of, and his prince and Ministers: but very secretly:

Ur: Blumaza, is the first, in respect (And so all the rest, are the first in respect **of theyr own being**. That secret is not to be deliuered but by the distinction of the boke: Notwithstanding, thow hast truely considered of it all ready.[1540]

Δ: I required the perfect forme of the 21 letters, that I might imitate the same in the Table of practise, and in the holy boke writing &c.

Ur: They shall be deliuered to morrow.

Δ: Whether is the King his Name Bnaspen, or Bnapsen?

Ur: Bnapsen.

Δ: The Character or Lamine for me was noted (Nouemb. 17. A^{o}1582[1541]) that it shold conteyne some token of my name: and now, in this, (accownted the true Character of Dignification) I perceyue no peculier mark, or letters of my name.

Ur: The forme in euery corner, considereth thy name.[1542]

Δ: You meane there to be a certayn shaddow of Δelta? Ur: Well.

Δ: Bycause many things do seeme to be taken from under the Table, as out of a stoare howse, shall there be any shelf framed under our square Table of Practise or handsome stole set in apt place to lay things on?

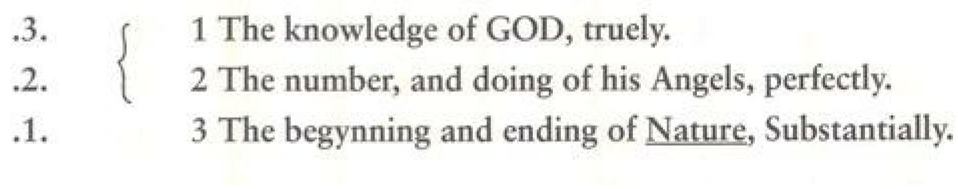
Ur: These things that were deliuered by shew, under an Imagined Table, were the members of God his secret Prouidence, distributed unto his Angels as the Principals[1543] of theyr Officis. But under thy Table is nothing to be set.

Δ: What more uses are there of the great Circle or globe, wherein there are Capitall letters under the Kings names and Characters: and allso there are other letters with numbers: of which we haue receyued no instruction: and more ouer of these letters, some are aversed som euersed, &c?

Ur:—The letters turned bak to bak, (being Capitall letters,) ar æqually to be diuided, according to theyr numbers, with a circle cumpassing the name and Character of the king under which they are placed.[1544]

The other letters, whose greatest number doth not excede 7, are certayn By-notes of wicked and euill powres; which cannot, any way, but by the towche stone of truth be deciphred from the good. Wherof Notice shall be given at large, **by the boke.**

He that standeth in the myddst of the globe,[1545] signifieth Nature whereuppon, in the first point, is the use and practise of this work that is to say, as concerning the first part. For it is sayde before The Boke conteyneth three kinde of Knowledges.

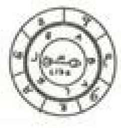


.3. 1 The knowledge of GOD, truely.
.2. 2 The number, and doing of his Angels, perfectly.
.1. 3 The begynning and ending of Nature, Substantially.

And this hath answered a great dowte.

Δ: What is the use of the 7 lamines,[1546] (like armes,) and from what grownde are they framed or deriued?

Uriel:—They are the ensignes of the Creation;[1547] wherewithall they were created by God known onely by theyr acquayntance. and the manner of theyr doings.



Δ: Are they to be made in any metall?

Ur:—They are to be made in purified tynne: And to be used at the time of theyr Call. [1548]

Δ: Ar the letters there to be altered into the holy Alphabet letters or characters?

Ur: Into theyr propre Characters. Δ: May I not use them as they ar, unaltered?

Ur:—................

Δ: How to be used; hanged or layd?

Ur: To be layd before thee uppon the Table. Or thow mayst place them, (yf thow wilt,) contynually at the 7 angles of the Holy Seale: laying them besides, and against the points or Angles of the Holy Seale: 7 ynches from the utter border of the **holy Seale,** all **at ones:** Or els they may be paynted, On the Table.[1549]

Δ: What is the fowndation of the first 40 letters, in the principall, or holy Seale Emeth: and what other uses haue they, then yet hath byn spoken of: And what is the reason of suche theyr consequencie, or following eache other, Seing in our practise we cull them out by a peculier order?

Ur:—Thow hast nothing there, but what hath byn sufficiently spoken of.[1550]

Δ: Yf 42 letters be 42 names, and 42 persons, how shall distinction be made betwene any two or three, of one name and in one row?

Ur:—How canst thow distinguish any thing with god?

Δ: Lord I know not.

Ur: Yet, **by the boke** it shall be perfectly known: but by skyll aboue nature.

Δ: Haue I rightly applyed the dayes to the Kings?

Ur:—The dayes are rightly applyed to the Kings.

Δ: How is this phrase The fifth of the seuenth understode, which Befafes[1551] speaketh of him self?

Ur:—He speaketh so of him self, in respect that **he shall** be **the fifth** that shall be used. In consideration of Nature he is the fifth, allthowgh not consequently in the Order of Operation.

Δ: It was promised that we shold be instructed, whan the Day (in this practise) is to be accownted to begynne.

Ur:—It is not to be enquired, which is sufficiently towght, it is a thing most easy, and perfectly deliuered.

Δ: Adrian Gilbert[1552] how far, or what points is he to be made priuie of our practise? Seing it was sayd,[1553] that none shall enter into the Knowledge of these mysteries with me, but onely this worker. Truely the man is very Cumfortable to our societie.

Ur:—He may be made priuie of some things: such as shall be necessarie for the necessitie of the Necessities whereunto he shall be driuen.

Δ: The phrase of the last Ternarie,[1554] which, Baligon (otherwise named Carmara, or Marmara) used, I understand not.

Ur:—He is the ende of the Three last corruptible times:[1555] wherof, this is the last.

Δ: The one, at Noes Flud ended, the second at Christ his first comming and this is the third.

Ur:—It is so.

Δ: The Characters and words annexed to the Kings names in the utter circumference of the great circle or Globe: How are they to be used?[1556]

Ur: They[1557] are to be paynted uppon swete wood: and so to be held in thy hand, as thow shallt haue cause to use them.

Δ: For the bringing of the erthes hither from the places of hidden Threasor, what is your order and direction?

Ur:—After you haue eaten, it shall be told you.

Δ: We prayed, and so went to supper.

The same sonday. Maij .5. [after supper hora 8½]

Δ: After diuerse our eiaculations and pangs of prayer and thanks unto god, this was sayed.

Ur:—Be it thus unto you. [He prayeth in his own language.] After this holy boke is finished, then is it necessarie with expedition[1558] that the foresayd commaundement, as concerning the fatching of the earth, be fullfilled and performed. And be it unto you as HE will. And HE sayeth thus.

My Angel shall be amongst you, and shall direct his iornay:[1559] and will bring his feete, euen into the place and places where that erthly filth and Corruption lieth. Behold I will deale mercifully with him: For, Error shall not deceyue him. Notwithstanding what I will haue done with it, or how it shall be bestowed, is yet to be enquired of.[1560]

Secret are the determinations, and unsearchable purposes, wherewithall the most mightiest dealeth with worldlings, and loketh unto the use and necessarie application of worldly things. Many temptations shall assayle him in following this commaundement. But it is sayd, I Will be with him. God will deale mercifully with you. This is sufficient.

Yet ones more. Yf thow haue any dowte herein it shall be satisfyed.

Δ: What if he go first to Nubery, and with the erth being taken thence, to procede to the other places noted in the skroll and then with the erth of those ten places, the rest of the skroll, the boke therewith fownd, and the red congeled thing in the hollow stone[1561] to come directly hither: and then the rest of the peculier practise for enioying the premisses, to be lerned. Or how els will you haue him order his iornay?

Ur: **As thow wilt herein,** so shall it be browght to pas.

Δ: As concerning the Victorious Capitayn, The Lord Albert Laski the Polake who so much desyreth my acquayntance, and Conference, how shall I use my self, to God his best liking, my Cuntries honor, and my own good Credit?[1562]

Ur:—Remember, it is sayde, that the Princis of the earth shall not discredit, much lesse work thy Confusion. He that dwelleth in thee,[1563] is above worldes: and shall giue thee sufficient discretion worldly, in worldly occasions. For, Where the blessings of God are, euery thing is perfyted.

Δ: As concerning the Chamber for Practise, appointed by me, and the half-pace whereon the Table standeth, how is allowed of?

Ur:—The place can not Sanctifie the Action, but the Action the place. But I answer thee, **after the manner of men.**[1564] It is sufficient.

Δ: The 4 hollow feete for comprehending the 4 lesser seales, how great owght they to be?

Ur: According to the **fete**, of the nearest proportion. And so, as the heith of the Table, be, as it, now, is.

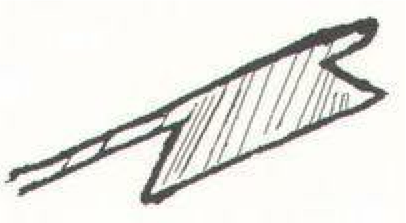
EK: He semeth now to sit in the ayre: but I perceyue no chayre behynde him.

A: Are all these things of this dayes Action to be Noted with your name: as Uriel?

I am URIEL, which allwayes will answer untill this Action be finished.

I teache. Be Mercifull, Thankfull, and mery in him, and for him for whose name you shall susteyne muche bodyly sadnes.[1565]

More then my message, I may not: And it is done.



> A: As concerning the Vision which yester night was presented (unloked for,) to the sight of EK as he sat at supper with me, in my hall, I meane the appering of the very sea, and many ships thereon, and the Cutting-of the hed of a woman, by a tall blak man, What are we to imagin therof?

Ur:—The One, did signifie the prouision of forrayn powres against the Welfare of this land: which they shall shortly put in practise: The other, the death of the Quene of Scotts. It is not long unto it.[1566] The Maiestie of his invisible powre, which overcommeth all things be among you, uppon you, and rest with you for euer.

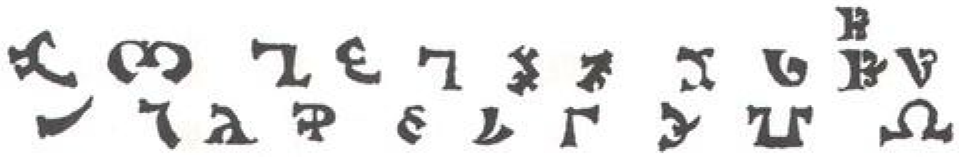
Δ: Amen.

EK: At his last words he flung fyre with his hands from him toward us, and it spred it self in the manner of a Crosse.

Δ: Gloria sit sempiterna Deo nostro
Omnipotenti et Æeterno.[1567]
Amen.

May 6.

Monday, I went to London: and EK remayned attending the accomplishing of the promise, for the Tables ending and for the perfect forme of the holy letters receyuing: Which two points (when I cam home that after none), I fownd done. But it is to be Noted, that, When EK could not aptly imitate the forme of the Characters, or letters, as they were shewed: that then they appered drawn on his paper with a light yelow cullor, which he drew the blak uppon, and so the yelow cullor disapearing: there remayned onely the shape of the letter in blak: after this manner and iust of this quantitie and proportion.



Maij 8. Wensday, After dynner horam circiter 4 a

Δ: Being desyrous to furder all things on my part to be performed, and n . . . to lack the Cumpany of EK going for the Erthes;[1568](before spoken of) and to be away 10 or 12 dayes: and for as much as the boke was to be written in 40 dayes before August next: and uncertayn of those dayes whan they shold begynne: and allso for that I wold do all things (gladly) by warranty of cownsayle of our Instructor, I was desyrous to know whether the boke[1569] were to be written in paper or parchment: in what cullor the lynes were to be ruled, grene or blew &c: and of diuerse other dowtes, necessary to be dissolued, I was carefull to haue had some advertisement. After long prayers of us both, Nothing was eyther seen in the ayre, or hard. Then it cam in my hed to set furth the stone.

EK sayd, that assone as he loked into the stone, he saw there the Table, Chayre, and three, com into the stone. Uriel sat down in the chayre: the other two, inclined theyr body to him reverently: and then, stode by; one on the one side of the chayre; the other on the other side.

The sides of the Table-cloth were turned up, and a thing like an yong shepe, bigger then a lamb, appered under the Table:[1570] Then they two did knele before Uriel and sayd,

> Verus et sanctus et sempiternus.[1571]

Δ: Then they rose agayn: and they semed to haue talk, or conference togither and theruppon Uriel sayd,

Ur: Be it so, bycause powre is giuen unto him.

EK: The Table, Chayre and all the three do disapere: and thereuppon immediately appered in the stone a fayr Pallace:[1572] and out of the pallace cam a tall wellfauored man, very richely apparayled with a braue hat and a fether on his hed: and after him followed a great number, all like curteours: and this braue man sayd,

Man: How pitifull a thing is it, when the wise, are deluded?

Δ:—I smell the smoke; procede Syr, in your purpose.

Man: I come hither, for the desyre I haue to do thee good.

Δ:—Come you, or are you sent. Tell the Veritie I charge thee, in the name and by the powre of the æternall Veritie.

Δ: Note: After I perceyued euidently that it was a wicked tempter, who had powr permitted him at this instant, I began with some Zeale and egreness to rebuke, and to charge him. But he stiffly and stowtely did contemne me a good while, mock me, and at length thretten to destroy me, my wife, and children, &c.

Δ: I thereuppon made my ernest prayers to god agaynst this Spirituall enemy, but he in the myddle of my prayers, sayed thus,

Man:—As truely as the Lord liueth, all that is done, is lies.

Δ: That, thy sentence, will I record agaynst thee; to be layde to thy charge at the dredfull day.

Δ: After this great turmoyle past, was this voyce (following), hard of EK.

A voyce:—Pereant tenebræ, cum Principe Tenebrarum.[1573]

Δ: All went suddenly out of sight, Prince and pallace and all. And the Chayre and Table and Uriel appeared againe.

Ur:—Arme your selues, for, great shall be the temptations following. You shall be hindred, **in all**, that may be.[1574]

Nothing can hinder god his determined purposes.

Δ: Man may hinder his owne saluation.

Ur:—Fullfill those things that are commaunded. Forme, and write the boke after thyne own Judgment. God his determination is iust; Therfore putto your hands.[1575] More then hath byn sayd, and more plainely, cannot be uttred. His works are true, for, and to the ende.

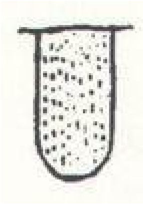
Δ: Forasmuch as expedition is to be made for the erthes fatching and diuers other things: and we haue made assay to get an horse: But we could get none as we wold: And without somme better prouision of mony then we haue, we cannot redress the case. Therfore, if it might pleas god, that of the ten places Noted, we might haue but the possession of the smallest of them, deliuered here, unto us, at this pynche, it might greatly pleasure us.

Ur:—Will these worldlings hold on in theyr iniquitie?

EK: They pulle the leggs of the Table away, and seme to carry all away in a bundell like a clowde: and so disapered utterly.

Δ: Hereuppon I was exceding sorrowfull: and betoke my self to a lamentable pang of prayer.

Δ: After long prayer, appeared in the stone a thing like a Tunge, all on fyre thus hanging downward:



and from it cam this voyce:

Tung:—Thow hast deliuered thy self unto the desires of thy hart, and hast done that which is not Convenient. Thow hast spoken iniquitie, and therfore dothe the Veritie of Gods Doings by us, decay, in your Wickedness.

Δ: I dowt of the Veritie of that tung.

Tung:—Man (o God) beleueth him self in his own Imagination. Therfore Wipe our holines from the face of the erth And Justifie owr doings, where we lawde and prayse thee.

Δ: I becam now abashed of my former speche, and perceyued my error: axed forgivenes bitterly at the Lord his hand: and at length it was sayde,

Tung:—Do that, which is commaunded, the Lord is Just.

Δ: O lord, forgiue me my trespaces, and deale not with me according to Justice: for, then I, and all mankinde shall utterly perish; Unleast thy mercy be our savegard, destruction is our desert.

Tung:—It is forgiuen: but it shall be **punished**.

EK: The Tung mownted up toward heven, and he saw it in the ayre out and above the stone aboue a hand bredth, mownting upward.

Δ: Thy Name be praysed in Æternitie, Ô God.

Amen.

Δ: Hereuppon, I was in an exceding great hevines, and sorrow of mynde: And sundry tymes, bewayled my case to God: and promised a greater care henceforeward, of Governing my Tung: and consenting to any unlawfull or unconvenient desire of my hert: yea, to forbeare to accumpany with my own wife, carnally: otherwise then by hevenly leave and permission, or if uppon my protestation making in the hardnes of the conflict that unleast the lord order and redress my cause, I shall be overcome: That, if I shall, so deliberately call for help; and notwithstanding be entrapped, That then, such trespace, shall not be imputed unto me, as gladly, gredyly or willingly committed of me &c.

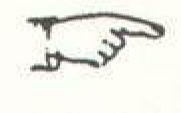
May 9 Holly Thursday in the morning.

Δ: Being desyrous (before EK his going down into the Cuntrie,) to haue some Cumfort and token of free forgiuenes at Gods hands I browght furth the stone. Then I went into my Oratorie first requesting the Almightie God to respect the harty sorrowfull paines I had endured for my offenses; to regarde the Vows and intent of my better hede taking henceforth &c, and prayed the 22 Psalm in the conclusion of the pang.

EK:—One, all in white, appeareth in the stone, who sayde,[1576]

——It is written: It is written: yea, it is written:

Euen as the father his compassion is great over his yonglings and Children: So, is the abundance of thy mercy (o Lord) great and unspeakable to the **long offences** and sinnes of **thy** **servant**. For, it is written, the light of thy eyes haue beheld those that feare thee: and those that trust in thy mercy, shall not be confownded. Be it, what it was: And be you, what you were: For, the Lord, is euen the same, that he was, before:



But be you Warned.[1577]

Behold, my armes ar longer then my body, and I haue eyes rownd abowt me: I am that which GOD pronownceth uppon you: Be it as I haue sayde.

Δ: Thereuppon he disapeared; and immediately, appered Uriel, who sayd,

Uri:—Actum est.[1578] Δ: Then the other two, and the Table and Chayre, and the ancient furniture appeared, agayn **restored,**[1579] and more bewtifull, then in foretyme.

Uri:—Thus, sayeth the Lord: Euen as the Tabernacle which I restore, is ten times brighter then it was, So may your Worthynes deserue brightnes ten tymes clerer then this. The rising of synners doth greatly reioyce us [and] That, he hath sayde, Do good unto those that feare me: and defend them, bycause they know my name. For in Justice they shall finde me theyr God: & in mercy their great Comforter.[1580] Therfore we say, In thy name (o thow most highest) fiat.

fiat.[1581]

Justifie not your self:

Be Humble and diligent:

Continue to the ende. For great is the reward of them that fear the Lorde stedfastly.

Δ: Whereas the ordring of the boke[1582] is referred to my Judgment: in my mynde it semeth requisite that as all the writing and reding of that holy language is from the right hand to the left, So the begynning of the boke must be, (as it were, in respect of our most usuall manner of bokes, in all languages of latin, greke, english &c) at the ende of the boke: and the ende, at the begynning, as in the hebru bible. Secondly the first leaf cannot be written in such little and æquall squares,[1583] as all the rest of the 47 leaves are: bycause, the first leafe; excepting 9 lines (of the second page) therof: is all of words: some conteyning many letters, and some few, very diuersly: wherfore, I entend to make many leaves, serve to distinguish the 49 rowes of the first leafe: and at the ende of euery word to draw a line of partition, up and down, betwene the two next parallell lines &c. or as shall come in my mynde then.

Ur:—He, that sayeth, Do this, directeth thy Judgment.

EK: Now is there a veale drawn before all: and all things appere far bewtifuller then euer they did.

Δ: I rendred thanks to the highest, and became in mynde Very Joyfull, that the Lord had pardoned my offences: whose name be praysed, extolled and magnifyed world with out ende. Amen.

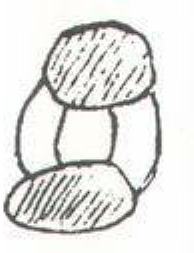
I prayed after this the short psalme, Jubilate Deo quotquot in terra versamini[1584] &c.

EK, immediately was to take bote and so to go to London: there to buy a saddell, brydle, and bote hose: for he had (here) yesterday, bowght a prety dun Mare, of goodman Pentecost: for iij £s, redy mony, in angels.

God be his guyde, help, and defense. Amen.

Thursday. May 23. Circa 10½ mane

> Δ: EK being come yesterday agayne and hauing . . . the erthes of the eleuen places before specifyed: [1585] we being desirous to . . . the furder pleasure of the highest therein, and in other matters perteyning to our Actions in hand: I made prayer to such intent, both in my oratory & at my desk, rendring thanks for EK his safe retorne, and for the benefit receued of late of the Governor and assistants for the Mines Royall (which I perceyued, was the extraordinary working of god for theyr inward perswasion; they being els very unwilling so to let the lease, as I obteyned it.) And moving somwhat towching Albert Lasky At length, EK hard a Melody a far of, and the voyce of many, singing, these words,



The stone

Pinzua[1586] Lephe ganiúrax Kelpadman pacaph.

Δ: At length the curten was taken away, and there appered a clere whitish fume, but not fyre. After that, cam the three, which were want to come in.

Michael:—Grauida est terra, laborat inquitatibus inimicorum lucis. Maledicta igitur est, quia quod in utero perditionis et tenebrarum est.

Uriel:—Sordida est, et odiosa nobis.

Raphael:—Proprijs sese flagellat tremulis.[1587]

EK: They loke abowt them, as thowgh they loked for somwhat or at somwhat.

Rap:—Veh dicit, sed non est qui audiat.

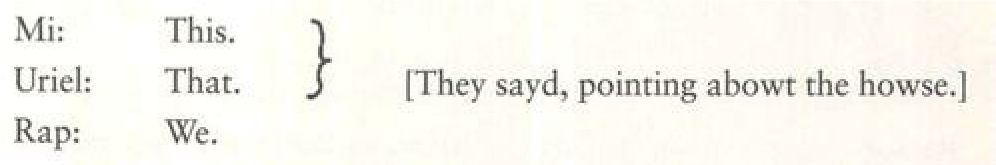
> Gementem vidimus: sed non est, qui misereat. Sanctificemur igitur, Sanctum eius, quia nos sanctificamur in illo.

Mich:—Fiat.[1588]

EK: He plucketh all the usuall hangings down abowt the place and now they take the Table away, and the Chayre: And where the Chayre was, semeth a Canapy or cloth of stade to hang.

Michael:—Transeunt vetera, Incipiunt nova.[1589]

EK: New seeme like clowdes to come abowt the Canapy being very beawtifull: and the bottom or flowr of the place, all couered with pretious stones: and in the middle therof, a rownd thing, like a carbuncle stone, bigger then ones fist.



Mi: This.
Uriel: That.
Rap: We.
} [They sayd, pointing abowt the howse.]

EK: They bring in a Throne like a Judgis seat or Throne and set it up, with the bak of it to the Wall.

Mich: Be it couered for a season. For euer and euer and euer is thy Justice, O GOD. [all three sayd.] EK: And there came light fire flashing from the Throne]

Thre commeth a beame from the Throne, and throwgh Raphael his head, and semeth to come out at his mowth. The other two seeme to knele downe: Michael on his right hand, and Uriel on his left.

Raphael:—I will speak (o Lord) bycause it is iust[1590] that thow hast commaunded:

Your rashnes (o worldlings) is trodden under fote: He sayeth, (I say not) your synns are forgiven.[1591]

Δ: O blessed God; ô prayse we his mercyes for euer: ô Cumfortable newes.

Raph:—For, whome I will viset, those do I clense (sayeth the lord). Whan other things decay by reason of theyr age and filthynes (quæ nunc sunt in summo gradu,[1592] and I will not suffer them to move one fote farder, sayth the lord,) Then shall your branches begyn to appere: And I will make you florish, for my gloryes sake. And my testimonies are true, and the wordes of my covenant iust: My pathes are thorny, but my dwelling place, is cumfortable.[1593] My hand is heuy, but my help is great. Be ye cumforted in me: for from me, in my self, I am your Cumforter: and lift up your harts as from the strength of an other. But be you unto me a new people: bycause I am to you no new god. Dwell with me to the ende bycause I haue byn with you from the begynning: For Who soeuer shall arrise agaynst you (Behold) I am with you.

Your fathers liued in darknes; and yet were revived. Yea your fathers were in light, and yet they saw not Truth. But I will be known: yea the Nations uppon earth, shall say, Lo this is he, whome we haue risen agaynst. I AM: Therfore reioyce.

[All three sayd,] We perish (o lord) for our unrighteousnes sake [and therewith they fell down.] But in thee we were created and in thee We rise agayn:[1594] Huseh Huseh Huseh garmal, Peleh Peleh Peleh pacáduasam.

Gyrd your gyrdles togither and pluck up your myndes: I say, open your eyes: and yf you haue eares, heare: for we tremble and quake. This mercy was neuer:[1595]no not in Israel.

Decedant mali, et pereant.[1596]

Depart o ye blasphemers, and workers of Iniquitie: For Here is Glory, Justification, with Sanctification. I answere thee.

Δ: Note: he meaneth, now to such matters as I propownded first of my self, and this Polander prince &c to give answer. The Prince had left with me these questions:

1. De Vita stephani Regis Poloniæ quid dici possit?[1597]

2. An successor eius erit Albertus Lasky, an ex domo Austriaca?[1598]

3. An Albertus Lasky Palatinus siradiensis habebit regnum Moldauiæ?[1599]

Behold you thanked God, and it is accepted. I say, Althowgh we require speede of thee and of you:[1600] yet ....

....speede of us, you haue a Master, we are his mowth ....

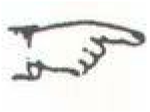
are Schollars, without us, you could * not heare him: Neyther cowld we heare him of our selves.

Consider the first, respect the second: Measure your selues, as the third.

For what you were & shalbe is allready appointed. And What He Was, is and shalbe, it is not of our determination. His purposes are without ende: yet, to an ende; in you, to an ende. Therfore When you shall be called-uppon,[1601] DO, that which is commaunded: But appoint no forme unto god his buylding. Many wyndes are to come: but theyr fury is in Vayne: It is sayd: **The Conquest shall be yours**.

To the purpose. Who puft-up this princis father with desire to Viset these cuntries: or who hath prevented him? Euen he that hath prouided him **a sonne,.**[1602] **as an arme unto his chosen.**

Truely the hills shalbe couered with blud: The Valleys shall take up the Cedar trees unframed: **He seeth these places**, but knoweth not to what ende.



He is dead,[1603] in respect of his absence: But honor them, whome God hath sanctified. For, Behold the Lord hath sayd: Thow shalt gouern me a people: a time there is, which is prefixed: and it is the course of the Sonne: **Then** shall it be sayd unto him, **O King.**[1604]

When you semed to be carryed unto mowntaynes, you towched his . . . Behold (sayeth He) Fornication[1605] shall not prevayle: the very stones shall be taken away: and the Tables shalbe couered with blud: and theyr dayly bankett shall be Wo Wo.

Whatsoeuer **thow** takest in hand, First **loke Up**: see if it be Just.[1606] Yf it be, **put furth thy hand: For, it is graunted.**[1607]

It is sayed, I haue giuen thee powre, and thy perswasion[1608] shall be like fire. And for my names sake, thow shalt triumphe against the mightiest. But beware of Pride.

Many witches and enchanters, yea many diuels haue rosen up against **this stranger,**[1609] and they haue sayd, We will preuayle against him: for, why? There is one, that aspireth and he it is, that **seeketh his confusion**. But I will graunt him **his desire**: He shall do good with many: your names are in one boke.[1610] Feare not, therfore, Love togither.

There shall arise, saying, let . . . .
talked with strangers: But I . . . .
I will driue them from theyr own . . . .
the bones which are buryed a far of . . . .[1611]
They do spit vengeance agaynst . . . .
them in theyr own filthynes . . . .
All men loke upon the . . . bycause it is glorified . . . .
Happy are they, whose faces are marked,[1612] and in w...
is a percing fyre of workmanship.
I will move the Prince (sayeth the Lord) Be . . . .
shall shortly say, Ô give me Cownsayle: for th. . . . .[1613]
cownsayled me, conspire agaynst me:

Behold, such[1614] as shewed thee, little frendship, are rather such . . .
dede (as thow iustly hast confessed,) as were forced to doe . . .
good: I say, they, begyn to repine at that, the haue . . .[1615]

Let those which are of tyme, yelde to time.[1616] One euerlasting cumfort of grace, and perfect loue, be amongst you: to the honor and glory of him that loueth you.

Beleue, for the teacher his sake. All thow demaundest, is answered.

Of our selues, (we say,) We desire to be with you: And what is of us, the same be it unto you.

EK: They pluck the curten, affore the stone, all ouer. The curten is like beaten golde: [The other curtens did not cover all so wholy as this did.]

Δ: Semper sit benedictus Trinus et Unus.
Æternus et omnipotens Deus noster.
Amen.

Liber, sexti Mysteriorum (et sancti)
parallelus, Noualisque
sequitur.[1617]

Appendix 1: Description of Sigillum Dei Aemeth from *Liber Juratus*

The following excerpt is from Sloane 3854, folio 114v, with variant readings from the Royal manuscript (abbreviated R) and from Sloane 3885 (abbreviated S). The diagram of the Sigillum Dei Aemeth is taken from Sloane 313. This is very close to the (although considerably corrupted) version shown by Athanasius Kircher in his monumental work *Oedipus Aegyptiacus* (1562). The drawing of the sigil does not occur in Royal, Sloane 3854 or Sl.3885. The version in Sloane 3853 (reproduced in C. J. S. Thompson, *The Mysteries and Secrets of Magic*, New York, 1973, p. 186, but without identifying the source) is somewhat different.

De compositione signi dei vivi[1618]

Primo fac unum circulum cuius diameter sit trium digitorum propter tres clauos domini,[1619] vel *5* propter *5* plagas, vel *7* propter *7* sacramenta, vel *9* propter *9* ordines angelorum, sed communiter *5* digitorum fieri solet. Deinde infra illum circulum fac alium circulum a primo distantem duobus granis ordei propter duas tabulas moysi, vel distantem a primo tribus granis propter trinitatem parsonarm. Deinde infra illos duos circulos in superiori parte quæ dicitur angulus meridiei fac unam crucem, cuius tibia aliquantulum intrat[1620] circulum interiorem. Deinde a parte dextra crucis scribe .h. aspirationem deinde .t. deinde .o. deinde .e. x.[1621] o. r. a. b. a.[1622] l. a. y. q. c.[1623] i. y. s. t. a. l. g. a. a. o. n.[1624] o. s. v. l. a. r.[1625] y. t. c.[1626] e. k. s. s.[1627] p. f. y. o. m. e. m. a. u.[1628] a. r. e. l. a. c.[1629] e. d.[1630] a. t. o. n. o. n. a. o. y. l. e.[1631] y. o. t. m. a[1632] et iste[1633] literæ sunt eque[1634] distantes, et circu~dent circulum. eo ordine quo sunt prenominatæ[1635] et sic magnum nomen domini semenphoras[1636] *72* literarum erit completum. hoc facto in medio circulorum scilicet in centro fac unum pentagonum talem,  in cuius medio sit signum tau tale  et super illud signum scribe[1637] nomen dei el, et sub nomine aliud  nomen dei .l.[1638] ely. isto modo[1639] Deinde infra angulum superiorem [1640] pentagoni[1641] scribe istas duas litteras .lx.[1642] Et infra alium angulum dextrum istas duas[1643] .a.l. Et in alio [R 9v] post istum istas duas[1644] n.m.[1645] Deinde circa pentagonum fac unum eptagonum[1646] cuius latus superius secundum sui medium contingat angulum superiorem pentagoni ubi .l.x.[1647] scribebatur, et in eodem latere eptagoni[1648] scribe hoc nome~ sancti[1649] angeli quod est .casziel. Et in alio latere a dextris istud nomen alterius sancti angli quod est[1650] .satquiel. Deinde in alio .samael. et in alio .raphael. postea .anael. postea .michael. postea .gabriel. et sic *7* latera eptagoni[1651] erunt[1652] adimpleta,[1653] Deinde circa istum eptagonum[1654] predictum fac alium eptagonum[1655] non quoquo modo factum prius sed[1656] taliter quod unum latus ipsius intercedet[1657] latera alterius, Deinde fac alium eptagonum tale~[1658] qualis prius[1659] fuit cuius anguli *7* contingant angulos *7* eptagoni secundi quibus esse videtur. Hic tamen eptagonus infra perdictum secundum concludetur, unu~[1660] latus secundi eptagoni[1661] supernudo et aliud subenudo, sed[1662] latus primo angulos[1663] succedens subenudo ibit. et que[1664] secuntur[1665] serie supereuntis et subeuntis alterutrum se habebunt, Deinde in quolibet angulo secundi eptagoni[1666] una crux depingatur, Deinde in illo latere secundi eptagoni[1667] quod transit ab ultimo angulo eiusde~[1668] ad secundum angulum eiusde~ in eadem parte quæ est super[1669] .casziel. sillabe cuiusdam sancti[1670] dei nominis scribatur,[1671] Ita quod hac sillaba .la. scribatur in illo loco lateris perdicti[1672] qui est supra primam sillabam de .casziel. et hec[1673] sillaba .ya. in illo loco eiusdem[1674] lateris qui est supra ultimam sillabam eiusdem[1675] .casziel. et hec[1676] silliba .ly. in illo loco eiusdem lateris qui est latus intersecans predictum latus et crucem secundi anguli eiusdem, Deinde in[1677] latere illo quod tendit ab angulo primo eiusdem secundi eptagoni[1678] ad tertium angulum eiusdem scribatur hoc nomen sanctum dei[1679] .narath. ita quod hec[1680] sillaba .na. scribatur in illo loco eiusdeum lateris qui est supra primam sillabam de .satquiel. et hec[1681] sillaba .ra. in illo loco qui est supra ultimam eiusdem, et hec[1682] due[1683] literae

Et in bucca superiori a leua crucis scribatur hæc litera .a.[1746] et super buccam crucis secundam a dextris hæc litera .g. Et sub bucca inferiori a dextris[1747] scribatur haec alia[1748] litera .a.[1749] Et sub quarta bucca hsec[1750] litera .l. Deinde in alio spaciolo sequenti a dextris in medio scribatur hoc nomen[1751] .ely.[1752] et in alio hoc nomen .eloy.[1753] et in alio .christos. et in alio .sother.[1754] et in alio .Adonay.[1755] et in alio .Saday. Deinde scias qd in exemplaribus communiter[1756] pentagonus fit de rubeo cum croceo in spaciis tincto. Et primus[1757] septagonus[1758] de azurio, secundus de croceo, tertius de purpureo, et circuli de nigro, et spacium inter circulos ubi est nomen de maximum. ac venerabile[1759] .schemhamphoras. tingitr croceo, omnia alia[1760] spacia viridi habent tingi, Sed in operationibus aliter fieri debet, quia de sanguine aut. talpæ. aut .turturis. aut.[1761]vpupæ. aut .vespertilionis. aut omnium horum figuratur, et in pergameõ virgineo vitulino,[1762] vel[1763] equino, vel ceruino, et sic completur dei sigillum, Et per[1764] hoc sanctum et sacrum sigillum quando erit sacratum poteris. facere operationes quæ postea dicentur[1765] in hoc libro.[1766] Modus autem sacrandi hoc sacrum sigillum talis[1767] sicut sequitr[1768] debet esse.

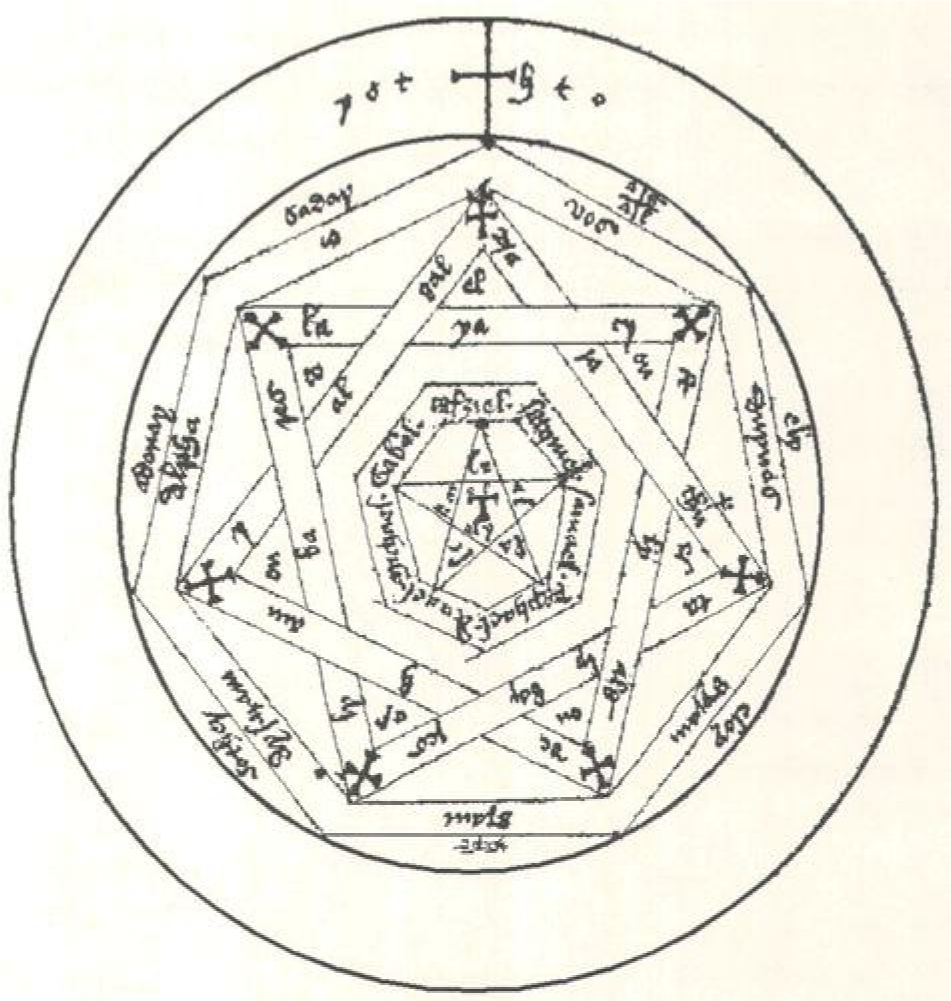


Figure 8. Sigillum Dei Aemeth from Liber Juratus.

Inspirante domino dixit Salomon unus est solus deus, sola fides, sola virt~s, quã dominus hominibus voluit revelari et distribui tali[1769] modo. Dixit[1770] Angulus .Samael. Salomoni hic[1771] dabis populo Israel qui et aliis similiter tribuent sic placuit creatori[1772] et inbet ipsum Dominus[1773] taliter consecrari.

Primo sit mundus operans non pollutus,[1774] et cum deuocione faciat non astute, non commedat neque bibat, donec perfecerit opus, Et sanguis quo scripts~[1775] fuerit primo sit benedictus sicut postea dicetur, Deinde suffumigetur,[1776] hoc sigillum ambra, musco, aloe, lapdano, albo, et rubeo, mastice, olibano, margaritis et thure. Invocando et orando dominum sicut postea de visione divina erudietur, Post[1777] invocando angelos sicut etiam[1778] infra[1779] Dicetur, mutabitur tñ[1780] peticio tali[1781] modo,

S: Oratio

Ut tu domine per annunciationem concepcionem et citera. Hoc sacratissimum nomen ac sigillum tuum benedicere et consecrare digneris[1782] ut per ipsum te[1783] mediante possim vel possit talis[1784] .N. celestes[1785] coniuncere[1786] potestates aereas et terreas[1787] cum infernalibus subingare, [S 63v] invocare, transmutare[1788] coniurare constringere, excitare, gongregare,[1789] dispergere, ligare ac ipsos innocuos reddere homines placare, et ab eis tuas[1790] peticiones graciosius[1791] habere, inimicos pacificare, pacificatos disimigere, sanos insanitate custodire vel infirmare. infirmos curare. homines bonos a malis custodire. et distinguere, et cognoscere, omne corporale periculum euadere, Judices in placito placatos reddere, victoriam in omnibus obtinere, pecrata carnalia mortificare et spiritualia fugare vincere, et euitare, divitias in bonis augmentare et du~[1792] in die indicii apparebit. a dextris tuis cum sanctis et electis tuis tuam possit cognoscere[1793] maiestatem

Et tunc illa nocte sub aere sereno[1794] extra domum dimittat, Tunc habeas chirotecas[1795] nouas sine creace factas inquas quis numquam manum posuerit[1796] in quibus signum glutetur, et sic complebitur hoc sacrum[1797] sigillum, Cuius primus eptagonus[1798] .*7*. ordines, Secundus .*7*. Articulos Duplos tertius .*7*. sacramenta Designat[1799]

Appendix 2: Athanasius Kircher: *Oedipus Aegyptiacus:* Sigillum Aemeth (Rome, 1652-4)

Amuleti alterius Cabalistici heptagoni Interpretatio

Hoc amuletum heptagonum circulo inclusum Veneri dicatum est, vti in Arithmetica hieroglyphica ostendimus. In circuitu signatae sunt 72 literae ex Cabala extractae, quarum vnaquaeque Angelum ex 72 indicat; de quibus vide Cabalam Hebraeorum fol. 275. Quis hic prima fronte non rideat maleferiatorum hominum stoliditatem, dum ineptijs huiusmodi Cabalisticis pessimé in Latinas literas transformatis, tantam tamen fidem habent, vt earum ope montes etiam se transferre posse, sibi persuadeant? Sed quoniam Diabolus humani generis hostis nihil agit, nisi quod in contumeliam Christi hominumque perniciem cedat; hinc ad Satanicam nequitiam tegendam, data opera, attributa Christi in cornibus heptagoni ponunt, id est, Angelus tenebrarum sub forma lucis sese exhibet; sunt autem sequentia attributa. Intra cornu AB, intra quadratum singulis Crucis angulis quatuor literae insertae spectantur a.g.l.a. quod Hebraicum nomen est, & in Cabala celeberrimum אגלא , quod expanse idem significat ac, אתה גבור לעולם אדני Tu fortis in aeternum Domine: Si enim capitalis singularum vocum literas in vnum iunxeris, prodibit nomen אגלא Agla, vti quadratum ostendit. Intra cornu BC ponitur אלי Eli, id est, Deus meus. Intra cornu CD ponitur אלהי Eloi, quod tametsi idem prorsus cum praecedente significet, tanquam diuersum tamen quidpiam posuerunt; vt vel hinc horum nebulonum supinam ignorantiam & inscitiam colligas. Intra DE Christus, deinde Sother, quod Graecé Saluatorem significat, né verminosum machinamentum Graeca voce careret. Sequuntur postea Adonay & Sadai; illud Dominum, hoc Omnipotentem notat. Atque haec sunt septem attributa Christi, quibus subiungunt septem Veneris Intelligentias, quae sunt Cafziel, Satquiel, Samael, Raphael, Mahel, Michael, Gabriel; quae vocabula Hebraica passim translata sunt; vt vel ex hoc ipso appareat, á Deo bonisque Angelis emanare minime posse, quod tam turpiter, non nisi ab omnis turpitudinis Cacodaemone, transformatum est: talia sunt in heptagoni lateribus inscripta, verius ex culina Diaboli, quam ex Cabala translata vocabula. Inscribunt tandem huic heptagono pentagonum, in cuius centro litera T symbolum salutis; circa quod cum has literas סוי ץע scribere debuissent, bestijs tamen inscitiores has supposuerunt e e e e y. Intra triangula vero ex Arabum amuletaria officina ponuntur yl, al, le, al, um, corruptissimé vti omnia alia; volebant enim illud Arabicum exprimere لا الله الا الله *la alla ella alla, non est Deus nisi Deus*, quod dum pronunciare nequirent, illorum loco dicta inconcinnissima verba posuerunt, yl, al, le, al, um: sed quid sibi velint duo verba, um, explico. In dicto Arabum pronunciato sem الا, per hae voces sequuntur, وعومد رسول الله *Mahumet rassulalla*; atque harum capitales literas referunt um. Vt vel ex hoc colligas, quantis modis illudat Daemon incautis hominibus, vt dum Christiani esse volunt, occulte Mahumetanismum profiteantur; in hoc enim vnico Amuleto quatuor sectarum, Iudaicae, Christianae, Mahumetanae, Paganae, ab ijs, qui illud portant, fit professio, id que occulto pacto Daemonis, ad Christianae religionis contumeliam ea de causa instituto. Sed quid pentagonum sibi velit, expono. Pentagonum Veteres, vti in Arithmetica docuimus, Marti, vti & heptagonum Veneri dedicarunt; quo quidem indicabant, neminem Venerem possidere, qui priús Martem non attraxisset; de quibus in Astrologia Aegyptiaca susiús; hoc enim pentagono victoriam in omnibus sibi spondebant. Porró finis huius Amuleti erat, amorem & beneuolentiam omnium, & consequenter carnalium desideriorum plenam fruitionem, victoriamque contra omnia aduersa eius gestatione obtinere; quod ex adiuratione quam pronunciare solent, qua & Deum, & Angelos, veriús Cacodaemones cum inuocatione Veneris aut Martis sacrilego & impio ritu sollicitare solent, patet, quam &, né Christianae aures vulnerentur, consultó omitto. Quicunque itaque huiusmodo possederit farinae Amuletum, illud non naturale, non Diuinum aut Angelicum, sed immediatum Diabolicae machinationis opus se possidere sibi persuadeat, non nisi cum aeterna animae ruina vsurpandum.

Figure 9. Sigillum Aemeth from Oedipus Aegyptiacus.

Appendix 3: *Theurgia Goetia.*[1800]

It deals with aerial spirits, whose nature is neither entirely good nor evil:

To call forth any of the aforesaid aerial spirits or their servants, choose the uttermost private, secret and most tacit room in the house or in some certain island, wooded grove, or the most occult and hidden place, removed from all comers and goers, that no one chance (if possible) happen that way into your chamber or whatsoever place else you act your concerns in. Observe that it be very airy because these spirits are of that nature.

You may call these spirits into a crystal stone or glass receptacle, this being the ancient and usual way of receiving and binding spirits. This crystal stone must be four inches diameter set on a table of art, made according to the following figure, which is truly called the secret table of Solomon, having his seal on your breast and the girdle about your waist as is shewed in the book *Goetia* and you cannot err. The form of the table is this:

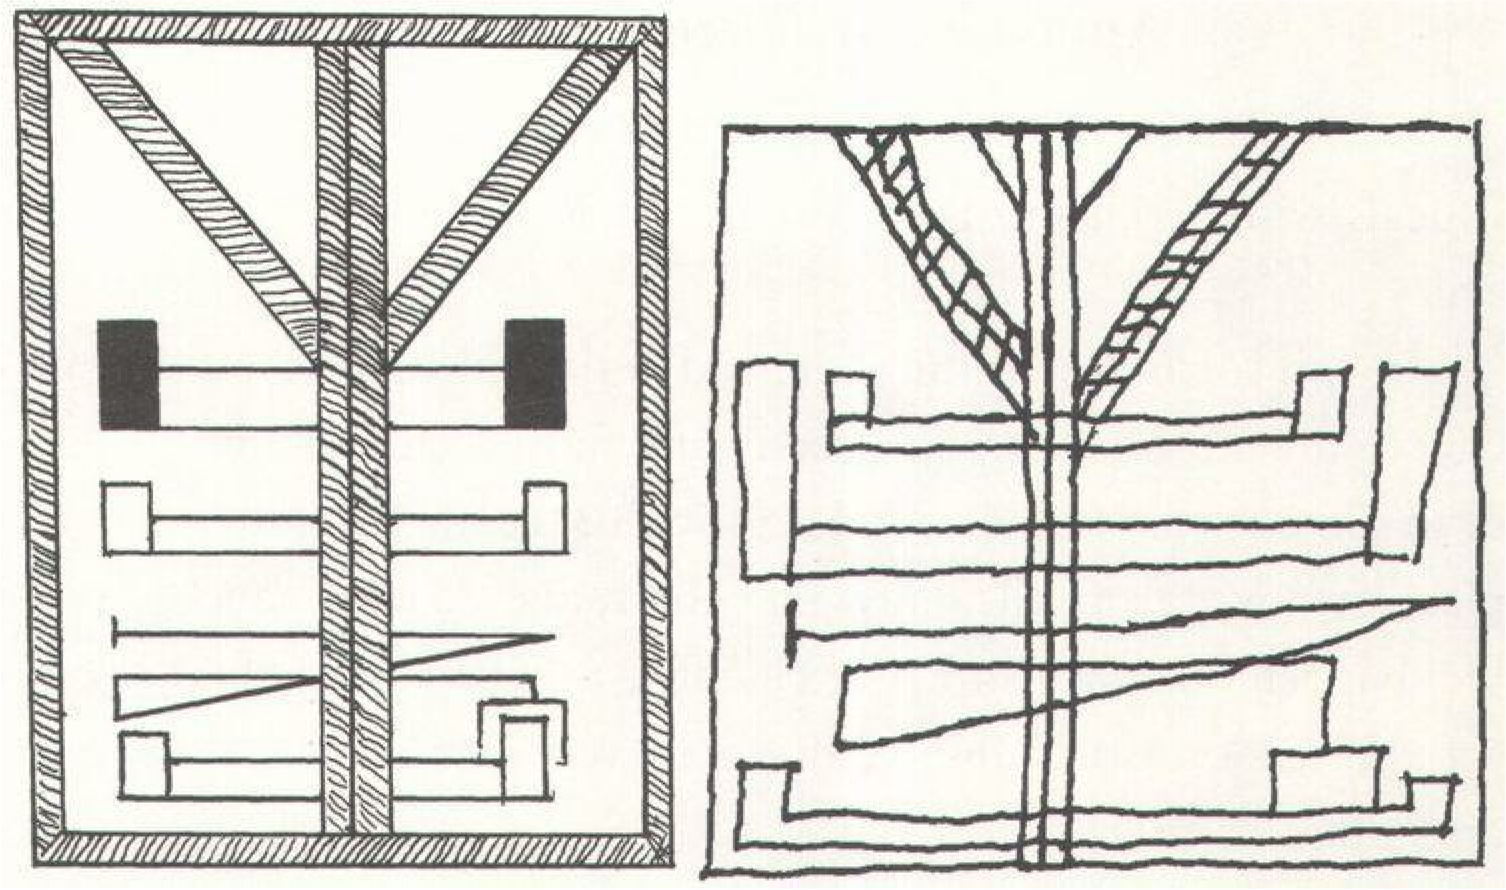

Figure 10. Seal of Solomon, from Harley 6483 (left); and from Sloane 3825 (right).

When you have thus got what is to be prepared, rehearse the conjuration following several times, that is, whilst the spirit comes, for without doubt he will come.

The Conjuration of the Aerial Spirits

I conjure thee O thou mighty and potent duke N. who ruleth under thy prince (or king) N. in the dominion of the East (or &c.) (Or, "I conjure thee o thou mighty and potent duke N. who wandereth here and there with thy prince N."[1801])

I conjure thee N. that thou forthwith appear alone (or with thy servants) in this first (or second) hour of the day, here before me in this crystal stone (or here before this circle) in a fair and comely shape, to do my will in all things that I shall desire or request of thee. I conjure and powerfully command of thee N. by him who said the word and it was done, and by all the holy and powerful names of God and by the name of the only Creator of Heaven, Earth, and Hell, and what is contained in them : ADONAY, EL ELOHIM, ELOHE, ELION, ESCERIE ZEBAOTH, JAH, TETRAGRAMMATON, SADAY, the only Lord of God of Hosts, that thou forthwith appear unto me here in this crystal stone (or here before this circle) in a fair and comely human shape, without doing any harm to me or any other creature that JEHOVAH created or made, but come thee peaceably, visibly, and affably, now without delay manifesting what I desire, being conjured by the name of the eternal living and true God: HELIOREN, TETRAGRAMMATON, ANEPHEXETON, and fulfill my commands and persist unto the end. I conjure, command and constrain thee spirit N. by ALPHA & OMEGA, by the name PRIMEUMATON, which commandeth the whole host of heaven, and by all those names which Moses named when he by the power of those names brought great plagues upon Pharoah, and all the people of Egypt: ZEBAOTH, ESCHERIE, ORISTON, ELION, ADONAY, PRIMEUMATON, and by the name of SCHEMES AMATHIA which Joshua called upon and the sun stayed his course, and by the name of Hagios, and by the SEAL OF ADONAY and by AGLA, ON, TETRAGRAMMATON, to whom all creatures are obedient, and by the dreadful judgment of the high God and by the holy angels of heave and by the mighty wisdom of the great God of Hosts, that thou comest from all parts of the world and make rational answers unto all things I shall ask of thee, and come thou peaceably, visibly and affably, speaking unto me with a voice intelligible and to my understanding. Therefore come, come thou in the name of ADONAY, ZEBAOTH, ADONAY, AMIORAM, come, why stayeth thou, hasten: ADONAY SADAY, the King of kings commandeth thee!

When he is appeared show him his seal, and the pentacle of Salomon, saying as followeth:

The Address Unto the Spirit Upon His Coming

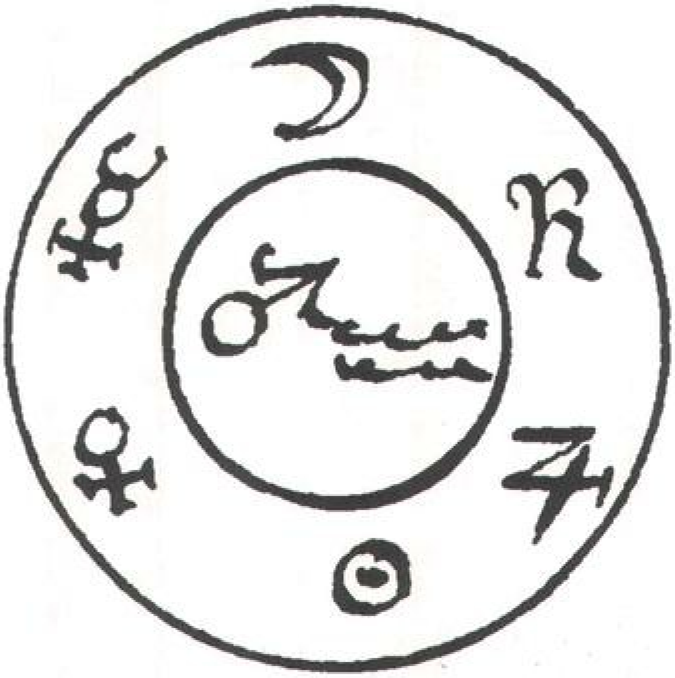
Behold the pentacle of Salomon which I have brought before thy presence. Behold the person of the Exorcist who is called OCTINOMOS, in the midst of the exorcism, who is armed by God and is without fear, who potently invocateth thee and called thee to appear. Therefore make rational answers to my demands and be obedient to me thy master in the name of the Lord: BATHAT rudhing upon ABRAC, ABEOR coming upon ABERER!

When thou hast had thy desire of the spirits, licence them to depart as is shewed in the first book *Goetia,* at the latter end of the conjurations.

Appendix 4: *Art Pauline.*[1802]

The second example comes from *The Art Pauline*, which describes calling forth spirits governing the hours, and spirits governing the signs of the zodiac:

First draw two concentric circles whereupon thou wilt draw the seal. In the center circle draw the ascendant to the right, and the lord of the ascendant to the left, then in the outer circle draw the rest of the planets in the following order: Moon, Mercury, Venus, Sun, Mars, Jupiter, Saturn.



The seal being thus made, lay it on the table of practise whose form we now show, on that part which is noted with the same character as the lord of the ascendant.

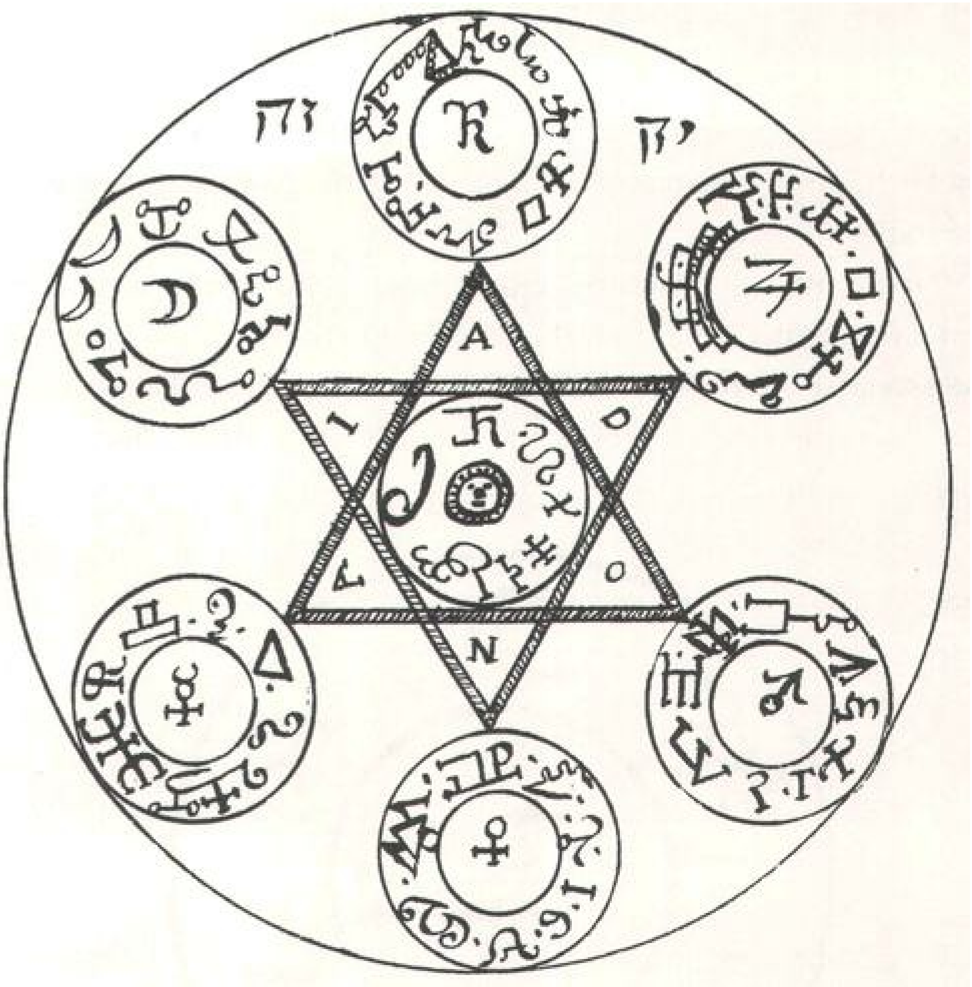


Figure 11. Table of Practice from the Art Pauline.

Perfume the seal with the thimmiamate proper to the planet, lay your hand upon it, and then say the following conjuration.

The Conjuration as Followeth:

O thou mighty, great and potent Angel N., who ruleth in the Nth. hour of the day, I the servant of the most high God do conjure and entreat thee in the name of the most omnipotent and immortal Lord God of Hosts: JEHOVAH TETRAGRAMMATON, and by the name of that God which thou art obedient unto, and by the head of the hierarchy and by the seal or mark that thou art known in power by, and by the seven angels that stand before the throne of God and by the seven planets and their seals and characters, and by the angel that ruleth the sign of the twelfth house which now ascends in this Nth. hour, that thou wouldst be graciously pleased to gird up and gather thyself together and by divine permission to move and come from all parth of the world, wheresoever thou beest, and show thyself visibly and plainly in this crystal stone to the sight of my eyes, speaking with a voice intelligible and to my understanding and that thou wouldst be favorably pleased that I may have familiar friendship and constant society both now and at all tims when I shall call thee forth to visible appearance to inform and direct me in all things that I shall seem good and lawful uunto the creator and thee, O thou great and powerful angel N. I invocate, adjure, command and most powerfully call thee forth from thine orders and place of residence to visible appearance in and through these great and mighty signals and divine names of the great God, who was and is and ever shall be: ADONAY, ZEBAOTH, ADONAY AMIORAM, HAGIOS, AGLA, ON, TETRAGRAMMATON, and by and in the name PRIMEUMATON, which commandeth the whole host of heaven, whose power and virtue are most effectual for the calling and ordering of the creation, I do command thee to transmit thy rays visibly and perfectly unto my sight, and thy voice to my ears, in and through this crystal stone, that I may plainly see thee and perfectly hear thee speak unto me. Therefore move thee, O thou mighty and blessed Angel N., and in this potent name of the great God JEHOVAH, and by the imperial dignity thereof, descend and show thyself visibly and perfectly in a pleasant and comely form before me in this crystal stone to the sight of my eyes, speaking with a voice intelligible and to my apprehension, showing, declaring, and accomplishing all my desires that I shall ask or request of thee both herein and in whatsoever truths or things else that is just and lawful before the presence of Almighty God, the giver of all good gifts, unto whom I beg that he wuld be graciously pleased to bestow upon me. I thou servant of mercy N., be thou therefore unto me friendly, and do for me as for the servant of the most high God, so far as God shall give thee power in office to perform, whereunto I move thee in power and presence to appear, that I may sing with his holy Angels, OMAPPA-LA-MAN, HALLELUJAH, AMEN.

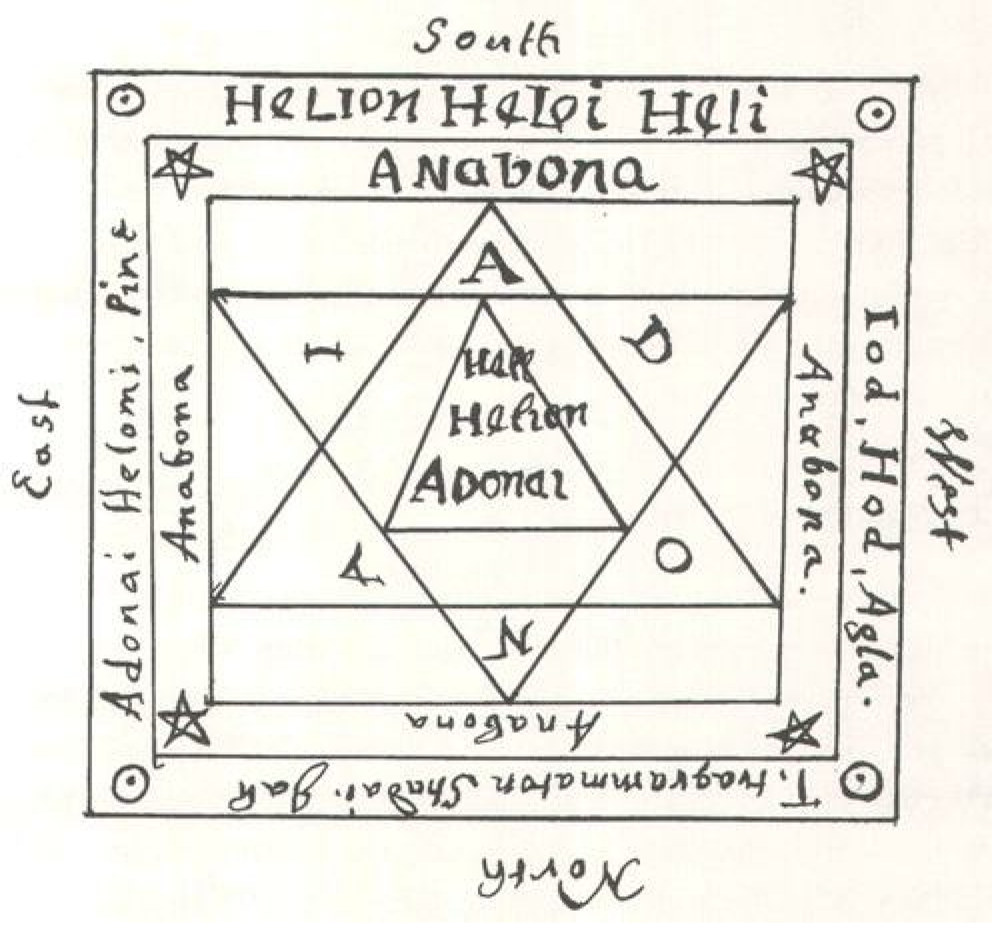
Appendix 5: *The Art Almadel (Ars Almadel Salomonis)*[1803]

[Editor's note: A text of this name is mentioned in Trithemius, and R. Scot.]

By this art Salomon obtained great wisdom from the chief angels that govern the four altitudes of the world, for you must observe that there be four altitudes, representing the four corners of the world, East, West, North and South. The which are divided into twelve parts, that is, evert altitude into three, and the angels of every of these altitudes have their particular vertues and powers as shall be shewed in this following matter.

The Making of the Almadel

Make the Almadel of pure white wax, but coloured suitable to the altitude as will be shown. It is to be four square, and six inches over every way, and in every corner a hole, and write betwixt every hole, with a new pen, these words or names of God following, But this is to be done in the day and hour of Sol. Write upon the first part towards the East, ADONAI, HELOMI, PINE, and upon the second towards the South, HELION, HELOI, HELI, and upon the West part: JOD, HOD, AGLA, and upon the fourt part which is the North write these names: TETRAGRAMMATON, SHADAI, JAH, and betwixt the first and the other quarters make the pentacle of Salomon thus, and betwixt the forst and the other quarters write this word, ANABONA, and in the middle of the Almadel make a Six-angled figure, and in the midst of it a triangle wherein must be written these names of God, HEL, HELION, ADONAI, and this last name around the six-angled figure as well, as you may see in this figure, here made, it being for an example, &c.



South

Figure 12. Almadel from Ars Almadel Salomonis.

And of the same wax there must be made four candles, and they must be of the same colour as the Almadel is of. You must divide the wax into three parts, one part for to make the Almadel of, and the other two parts for to make the candles of. And let there come forth from every one of them a foot made of the same wax, for to support the almadel with. This being done, in the next place you are to make a seal of pure gold or silver, but Gold is best, wherein must be engraven these three names: HELION, HELLUJON, ADONAY

Note the first altitude is called Chora Orientis, or the East Altitude, and to make any experiment in this Chora, it is to be done in the day and hour of the Sun. The power and office of those angels is to make all things fruitful and increase, both animals and vegetables, in creation and generation, advancing the birth of the children, and making barren women fruitful, &c. Their names are these: Alimiel, Gabriel, Borachiel, Lebes and Hellison.

Note you must not pray for any angels but those that belong to the same altitude you have a desire to call forth. And when you operate, set the four candles upon four candle sticks, but be careful you do not light them before you begin to operate. Then lay the Almadel between the four candles upon the waxen feet that cometh from the candles, and lay the golden seal upon the Almadel. Then, having the invocation ready written on virgin parchment, light the candles and read the invocation as is set down at the latter end of this part.

And when he appeareth, he appeareth in the form of an angel carrying in his hand a fan or flag, having the picture of a white cross upon it. His body is wrapped round about with a fair cloud, and his face very fair and bright, and a crown of rose flowers is upon his head. He descends first upon the superscription of the Almadel, as if it were a mist or fog.

Then must the exorcist must have in readiness a vessel of earth, of the same colour that the Almadel is of, and the other of his furniture, it being in the form of a basin, and put therein a few hot ashes or coals, but not too much, lest it should melt the wax of the Almadel, and put therein three little grains of mastic in powder, so that it fumeth, and the smell may go upwards through the holes of the Almadel, when it is under it, and as soon as the angel smells it he beginneth to speak with a low voice, asking what your desire is and why you have called the princes and governers of his Altitude. Then you must answer him, saying, I desire that all my requests may be granted, and what I pray for may be accomplished, for your office maketh appear and declareth that such is to be fulfilled by you if it pleases God, &c, adding further the particulars of your requests, praying with sincerity and humility for what is lawful and just, and that you shalt indeed obtain from him.

But if he doth not appear presently, you must then take the golden seal, and make with it three or four marks upon the candles, by which means the angel will presently appear as aforesaid, and when the angel departeth he will fill the whole place with a sweet and pleasant smell, which will be smelt a long time.

Note the golden seal will serve, and is to be used in the operation of all the altitudes. The colour of the Almadel belonging to the first chora is lily white; to the second chora a perfect red rose colour; the third chora is to be a green mixt with a white silver colour; the fourth chora is to be a black mixt with a little green of a sad colour.

Of the Second Chora or Altitude

Note that all the other three altitudes, with their signs and princes have power over goods and riches, and can make any man rich or poor, and as the first Chora giveth increase and maketh fruitful, so to these giveth decrease and barrenness, &c.

And if any have a desire to operate in any of the other three Choras or Altitudes, they must do it on Sundays in the manner as above is shewed, but do not pray for anything that is contrary to the nature of their office, or against God and his laws, but what God giveth according to the course of nature, that you may desire and obtain.

All the furniture that is to be used is to be of the same colour as the Almadel is of, and the princes of this Second Chora are named as followeth: Alphariza, Genon, Geror, Armon, Gereinin.

When you operate, kneel before the Almadel with clothes of the same colour in a closet hung with the same colours also, for the holy apparation will be of the same colour. And when he is appeared, put the earthen bason under the Almadel with fire and hot ashes and three grains of mastic in powder, to fume as above written, and when the angel smelleth the perfume, he turneth his face towards you, asking the exorcist with a low voice why he called the princes of this Chora or Altitude. Then you must answer as before, saying: I desire that my request may be granted, and the contents thereof may be accomplished, for your offices make appear and declare that such is to be done by you if it please God, &c. You must not be fearful but speak humbly, saying: I recommend myself wholly into your office, and I pray unto your princes of this Altitude that I may enjoy and obtain all things according to my wishes and desires, &c. You may further express your mind in all particulars in your prayers. Do the like in the two other Choras that follow.

The angel of this second Altitude appeareth in the form of a young child with clothes of satin and of a red rose colour, having a crown of red gilly flowers upon his head, his face looking upwards to heaven; and is of a red colour and is compassed round about with a bright splendour, as the beams of the Sun. And before he departeth he speaks to the exorcist saying: I am your friend and brother. And he illuminateth the air round above with splendour, and he leaveth a pleasant smell, which lasteth a long time, &c.

Of the Third Chora or Altitude

In this Chora you are to do in all things as you are before directed in the other two. The angels of this Altitude are named as followeth: Eliphamasai, Gelomiros, Gedobonal, Saranana, and Elomnia. They appear in the form of children or little women dressed in green and silver colours, very delightful to behold, and a crown of bay leaves, beset with flowers of white and green colours upon their heads. And they seem to look a little downwards with their faces, &c. They speak as the others do to the exorcist, and leave a mighty, sweet perfume behind them, &c.

Of the Fourth Chora or Altitude

In this Chora you must do as in the others, and the angels of this Chora are called Barchiel, Gediel, Gabiel, Deliel and Captiel. These appear in the form of little men or boys with clothes of a black colour, mixed with a dark green, and in their hands they hold a bird which is naked, and their heads are bear, only it is compassed round and beset with ivy and berries. They are all very beautiful and comely and are compassed round with a bright shining of divers colours. They leave a sweet smell behind them also, but it differeth from the others somewhat.

Of the Proper Times for Invoking These Angels

Note there are twelve princes ruling besides those in the four Altitudes, and they distribute their office amongst themselves, every one ruling thirty days, or thereabouts, every year. Now it will be in vain to call any of those angels unless it be those that then governeth, for every Chora or Altitude hath its limited time according to the twelve signs of the Zodiac, and in what sign the Sun is in, that angel or those angels that belong to that sign have the government. As, for example, suppose I would call the two first of those five that belong to the first Chora. Then choose the first Sunday on March, that is, after the Sun is entered Aries, and then I make my experiment. And so do the like if you will the next Sunday after again. But if you will call the two second that belong to the first Chora, then you must take the Sundays that are in April, after the Sun is entered Taurus.

But if you call the last of the five, then you must take those Sundays that are in May, after the Sun is entered Gemini, to make your experiment in: do the like in the other Altitudes, for they have all one way of working. But the Altitudes have a name formed severally in the substance of heaven even as a character, for when the angels hear the names of God that are attributed to them they hear it by the vertue of that character. Therefore it is in vain to call any spirit or angel unless you know what names of God to call them by. Therefore observe the form of this following conjuration or invocation.

The Invocation for to Call Forth Any of the Foresaid Angels

O thou great, mighty, and blessed angel of God N, who ruleth as the chief and first governing angel in the first Chora or Altitude in the East, under the great prince of the East whom you obey, and who is set over you as king by the divine power of God, ADONAI, HELOMI, PINE, who is the distributer and disposer of all things holy in Heaven, Earth, and Hell, I the servant of that God ADONAI, HELOMI, PINE, which you obey, do invocate, conjure and entreat thee N, that thou forthwith appeareth. And by the vertue and power of the same God, ADONAI, HELOMI, PINE, I do command thee forth by him whom you do obey and who is set over you as king by the divine power of God, that you forthwith descend from thy order or place of abode to come into me, and show thyself plainly and visibly here before me in this crystal stone, in thy own and proper shape and glory, speaking with a voice intelligible unto my understanding.

O thou mighty and blessed angel N, who art by the power of God ordained to govern all vegetables and animals, and causeth them and all other creatures of God to spring, increase and bring forth according to their kinds and natures, I the servant of the same your God, do entreat and humbly beseech thee to come and show unto me all things that I shall desire of thee, so far as in office you can, or be capable to perform, if God permit to the same.

O thou servant of mercy N, I entreat thee and humbly beseech thee, in and by these three names of your true God, ADONAI, HELOMI, PINE, and do constrain thee in and by this powerful name ANABONA, that thou forthwith appeareth visibly and plainly in thy own proper shape and glory, in and through this crystal stone, that I may visibly see thee, and audibly hear thee speak unto me, that I may have thy blessed and glorious angelic assistance, familiar friendship and constant society, communication and instruction, both now and at all other times, to inform and rightly instruct me in my ignorance and depraved intellect, judgement and understanding; and to assist me both herein, and in all other truths, else what the Almighty Adonai, the king of kings, the giver of all good gifts, shall in his bountiful and fatherly mercy be graceously pleased to bestow upon me, Therefore O thou blessed angel N. be friendly unto me, and do for me so far as God hath given you power in office to perform, whereunto I move you in power and presence to appear that I may sing with his holy angels: O Mappa-la-man! Hallelujah! Amen.

Note this invocation is to be altered according to the Altitude and angel you wish to call forth.

When he is appeared, give him or them a kind entertainment, and then ask what is just and lawful, and that which is proper and suitable to his office, and you shall obtain it.

SO ENDETH THE BOOK
ARS ALMADEL SALOMONIS

[1] I. R. F. Calder, "John Dee Studied as an English Neoplatonist," 2 vols. Ph. D. diss. (The Warberg Institute, London University, 1952); Peter J. French, *John Dee: The World of an Elizabethan Magus* (London: Routledge & Kegan Paul, 1972); Nicholas H. Clulee, *John Dee's Natural Philosophy—between science and religion.* (London and New York: Routledge, 1988); William H. Sherman, *John Dee, the Politics of Reading and Writing in the English Renaissance* (Amherst: University of Massachusetts Press, 1995).

[2] See list in Peter French, *John Dee: The World of an Elizabethan Magus,* pp. 216–29.

[3] Many of these apparent conflicts are still with us today. Charles Tart, *Body Mind Spirit* (Charlottesville: Hampton Roads, 1997), observes that Scientism, a belief that scoffs at anything that doesn't fit our supposedly scientific beliefs, has become "the world's most powerful (and negative) religion." It is interesting to note that most modern religious studies carefully avoid Scientism.

[4] Frances A. Yates, *The Rosicrucian Enlightenment* (Boulder: Shambhala, 1978), p. xii.

[5] Some have argued there are actually two systems: the Heptarchic system (represented by this manuscript and Dee's *Heptarchia Mystica),* and the Enochian system, represented by later records, especially TFR.

[6] See C. H. Josten's translation of Dee's *Monas Hieroglyphica* (AMBIX, XII, 1964, 84–221), and Nicholas Clulee's analysis in *John Dee's Natural Philosophy* (London: Routledge, 1988), p. 77ff.

[7] Although there has been some criticism of Dr. Yates' work in recent years, I have found the views of Roberts and Watson to be the most balanced: "The influence of the later work of Yates herself will be widely apparent for although that often seems hasty and over-enthusiastic, our own research has frequently confirmed rather than contradicted hers. . . ." Julian Roberts and Andrew Watson, *John Dee's Library Catalogue* (London: The Bibliographical Society, 1990), p. 26.

[8] R. Turner writes, "Mistakes abound in both the Crowley and Regardie printed Enochian texts. I counted 91 in the first Call alone when comparing these with Dee's original manuscript (see Sloane 3191, British Museum)." Cited by Colin Wilson, "Introduction to the Necronomicon," *Gnostica,* 48, Nov. 1978, p. 62.

[9] The first edition was limited to 500 copies. Another version was produced by Christopher Whitby as his doctoral thesis. This had a small reprinting as *John Dee's Actions with Spirits*, 2 vols. (New

York: Garland, 1991).

10

William Sherman, *John Dee*, p. 149.

11

These records were published in 1659 by Meric Casaubon as *A True & Faithful Relation . . . Between Dr. John Dee . . . and Some Spirits* (TFR). Casaubon's main intent in publishing this material was to discredit Dee's reputation.

12

For example, he is credited with coining the word "unit," which he used to translate the Greek "monas." He also coined the word "Britannia."

13

Monas, Theorem 23.

14

Monas, dedication to King Maximilian, passim, pp. 115 ff.

15

Peter J. French, John Dee, *The World of an Elizabethan Magus*, 1972, pp. 40 ff.

16

Hans Ankwicz-Kleehoven observes, "Just as no distinguished foreigner at the beginning of the nineteenth century omitted to pay his respects to Goethe in Weimar, so it was good form in the Germany of circa 1500 to have called on Trithemius at Sponheim." Cited in loan P. Couliano, *Eros and Magic in the Renaissance* (Chicago: University of Chicago Press, 1987), p. 166.

17

William Sherman, *John Dee*, p. 51.

18

William Sherman has given us an excellent sense of it in his book; see especially p. 40.

19

"Dee could hardly have held a more prominent place in . . . the genesis of the British Empire." See William Sherman, *John Dee,* pp. 148 ff and passim.

20

A large element of Dee's patriotism was his fascination with the Arthurian legends. He was largely responsible for reviving interest in them. Dee believed himself to be of royal descent.

21

British Library, Sloane manuscript 3188, fol. 65a. See also John Dee, *General and Rare Memorials pertayning to the Perfect Arte of NAVIGATION (GRM)* (London: John Daye, 1577).

22

Johannes Trithemius in *De Septem Secundeis* (translation in William Lilly, *Worlds Catastrophe*, London, 1647), wrote that world history was governed by the rules of seven angels, each ruling 354 years and 4 months. The angels told Dee that “the 7 Governours have almost ended their Government” (TFR, p. 4). Dee’s copy of Cyprian Leowitz, *De Conjunctionibus Magnis Insignioribus Superiorum Planetarum* (Leuingen, 1564), has “underlinings and a few notes” (item 631, R&W).

23

GRM (1577) is dated 5540, and *A Playne Discourse . . . concerning the needful reformation of ye vulgar kallender* (Oxford: Bodleian Library, Ashmole MS 1789, article 3, 1582) is dated 5545.

24

The title page for Dee’s *General and Rare Memorials* shows a timeline of history of something over 6,000 years. If 6,000 years is significant to him as it was to others, his calculations would put the end at A.D. 2037.

25

See also I. R. F. Calder, “John Dee Studied as an English Neoplatonist,” chapter 9, section 3.

26

Mysterium Libri Quinque (MLQ), 16 November 1582.

27

TFR, p. 43.

28

I. R. F. Calder, “John Dee Studied as an English Neoplatonist,” chapter 8, section 8. See also William Sherman, *John Dee*, pp. 187, 188.

29

The Archangel Uriel, 11 March 1582.

30

See *Monas,* p. 133, “the Hebrew cabbalist . . . will own that, without regard to person, the same benevolent God is not only [the God] of the Jews, but of all peoples, nations, and languages.”

31

Bynepor, 20 November 1582; Medicina Dei, 24 March 1583; Michael, 23 May 1583.

32

A similar “invitation” led Giordano Bruno to his death at the stake in 1600.

33

For example, “AGLA” and “ARARITA” are acronyms derived from verses of scripture. See Cornelius Agrippa, *De occulta philosophia Libri Tres* (Leiden: E. J. Brill, 1992), book 3, chapter xi,

p. 428.
34

For example, Arbatel, *De Magia Veterum* (Basel, 1575), p. 21, Aphor. 14: "da mihi unum de spiritibus tuis, qui me doceat ea, quae vis nos discere & cognoscere, ad laudem & honorem tuum & utilitatem proximi." ("Grant me therefore one of thy spirits, who may teach me those things which thou wouldest have me to know and learn, to thy praise and glory, and the profit of our neighbour.")
35

For example, Cornelius Agrippa, *De occulta philosophia,* book 2, chap. 22, pp. 314–18.
36

There have been a number of recent books and movies with the theme of Dee's magic.
37

R&W, p. 29.
38

R&W, p. 168. They catalog it as DM 70 and note, "On fol.9 (originally the first leaf, fol.1–8 having been misbound) is [Dee's ladder symbol] and, very faint, 'Fragmentum Magicum,' which may be in Dee's hand. At the foot is 'Sum Ben: Jonsonij liber.'"
39

Sloane 3188 fol. 48r.
40

A version of this text with discussion is included in Richard Kieckhefer's *Forbidden Rites: A Necromancer's Manual of the Fifteenth Century* (University Park: Pennsylvania State University Press, 1997), pp. 8–10, p. 256 ff.
41

Judaism was outlawed in England and much of Europe at the time. Note Dee's comment "we can hardly trust anything in the Jews hands . . . they are a stiffnecked people and dispersed all the world over."
42

They list it as DM 166, pg 183.
43

See Jim Reeds, "John Dee and the Magic Tables in the *Book of Soyga,*" www.research.att.com/~reeds/soyga.html; to appear in a forthcoming book *John Dee: Interdisciplinary Essays in English Renaissance Thought,* Kluwer of Amsterdam.
44

Bodley MS 908, p. 4, line 3. See figure 2.
45

R&W, p. 183.
46

It is not clear why Roberts and Watson make this identification. They note Francis Maddison's theory that Aldaraia = Ar. Al Dirâya "knowledge, cognizance, acquintance," but that is only hypothetical. They also note that Dee sent a servant (20 October 1595) to recover his Arabic book from Mr Abbot (?) at Oxford and (19 November 1595) "my Arabik boke restored by gods favor." James Orchard Halliwell, ed., *The Private Diary of Dr. John Dee* (New York: AMS Press, 1968), p. 54.
47

Genesis 44:4–5.
48

Raymond A. Moody, *Scrying—The Art of Female Divination* (Marietta: R. Bemis Publishing, Ltd., 1995), p. 7.
49

For some examples, see Richard Kieckhefer, *Forbidden Rites*, experiments 18, 19, 20, 23, 24, 25, 27, 29, 33, 38, 39, and 40. Reginald Scot, *Discoverie of Witchcraft* (New York: Dover Publications, 1584/1973), published extracts from magic handbooks; many deal with scrying (e.g., pp. 148–9, 232–5, 238–9, 245–6, 249–50). Francis Barrett, *The Magus* (London, 1801; reprint: Secaucus: The Citadel Press, 1975) pp. 135bis ff, published scrying instructions from Trithemius (or pseudo-Trithemius). See also manuscripts Sloane 1317, 3846 (art 6), 3848, 3949 (arts. 1, 3), 3851, 3853 (art. 9), 3854 (art 5).
50

According to Couliano, mnemonics, along with eroticism, is an essential component of magic, "to such an extent that it is impossible to understand [magic] without first having studied the principles and mechanisms of the first two" (*Eros and Magic in the Renaissance,* p. xviii). See also Frances A. Yates, *The Art of Memor,* and Giordano Bruno's *De magia in Jordani Bruni Nolani Opera latine conscripta* (Neapoli, 1879–91). English translation in Robert De Lucca, Richard J. Blackwell, and Alfonso Ingegno, *Giordano Bruno, Cause, Principle and Unity: And Essays on Magic* (Cambridge: Cambridge University Press, 1998).
51

I. P. Couliano, *Eros and Magic in the Renaissance*, p. 5.
52

He mentions scrying in his *Monas Hieroglyphica* (1564).
53

See "The Scryers of John Dee," Chris Pickering, *Hermetic Journal* 32, pp. 9–14. Another example of Dee seeing angels may be TFR 25, where he writes "Thereupon I perceived the presence of some good spiritual Creature, and straight way appeared the good Angel. I.L."
54

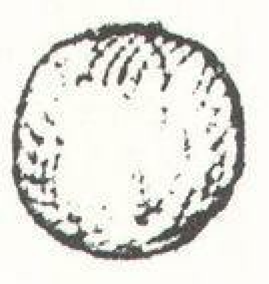
This friend was Edward Kelley, a.k.a. Edward Talbot.

55

Above this entry, someone wrote, “You that rede this underwritten assure yourselfe that yt is a shamfull lye, for Talbot neither studied for any such thinge not shewed himselfe dishonest in any thinge.” Dee added the comment, “This is Mr. Talbot or that lerned man, his own writing in my boke, very unduely as he cam by it.” There are also some additional notes by Talbot/Kelley that have been erased. Diary quotations are from James Orchard Halliwell, ed., *The Private Diary of Dr. John Dee* (New York: AMS Press, 1968) pp. 13–16.

56

Although Christopher Whitby (*John Dee's Actions with Spirits*, pp. 138-141) questions whether the obsidian mirror was actually Dee's, it is commonly accepted. John Pontois, Dee's heir, was said to have “a certain round flat stone like Cristall which Pountis said was a stone which an Angell brought to doctor dye wherein he did worke and know many strange things . . .” See R&W, p. 61. See figure 8.1 in Nicholas Clulee, *John Dee's Natural Philosophy.* This probably was the scrying stone that the angels mysteriously delivered on 21 November 1582 out of “the uttermost part of the Roman Possession.” Dee describes it as being “half an inch thick” (5 May, 1583), although Dee's drawing of the former in Sloane 3191 clearly shows a sphere whereas the mirror is flat and has a handle.



57

Quoted in Christopher Whitby, *John Dee's Actions with Spirits*, p. 92. Compare with the drawing and description found in (pseudo-?) Trithemius. *The Art of Drawing Spirits in to Crystals* in Francis Barrett, *The Magus*, book 2, p. 128 (York Beach, ME: Samuel Weiser, 2000). In addition to Raphael, Gabriel, and Uriel, Trithemius includes Michael.

58

Nicholas Clulee, *John Dee's Natural Philosophy*, p. 206. See the first action, where, after “fervent prayers to God,” Saul is asked to look into the stone and see “yf God had sent his holy Angel Anael.”

59

As an example, British Library Sloane manuscript 3849 (“Manner of Proceding in order to discover in the Crystall”) starts out with the seven Psalms before proceeding to ask Jesus to send the three angels “ancor annasor anelose.” Reginald Scot, in his 1584 edition of *The Discoverie of Witchcraft* (book 15, chapter 12), quotes from a magical text at length on how “to have a spirit inclosed into a christall stone or berill glasse, &c. First thou in the new of the moon being clothed with all new, and fresh, & cleane araie, and shaven, and that day to fast with bread and water, and being cleane confessed, saie the seaven psalmes, and the letanie, for the space of two daies, with this praier following . . .”

60

For example, see TFR, p. 25: “There appeared to E.K. a round Globe of white smoke over my head” (a UFO?). MLQ, 10 April 1583: “there appeared in the corner of my study a blak shadow.” Sometimes, the whole chamber appeared in the stone (e.g., MLQ, 15 March 1582).

61

Peter French, John Dee, *The World of an Elizabethan Magus*, pp. 113, n. 2.

62

Oxford: Bodleian Library MS Ashmole 1790, fol. 58.

63

British Library manuscript Royal 17 Axlii fol. 3v.

64

Athanasius Kircher, *Oedipus Aegyptiacus* (Rome, 1652–54). The most interesting part of Kircher’s discussion is his attempt to link the seal with Islamic mystical tradition. Since the use of this sigil is central to the present work, I include Kircher’s discussion of it in appendix 2.

65

Oxford: Bodleian Library, Ashmole MS 1790, fols. 55a–56a.

66

Hermann Gollancz, *Sepher Maphteah Shelomoh* (London: Oxford University Press, 1914), fol. 38a.

67

Goetia also enjoins the use of a second lamin that has a five-pointed star.

68

Translation by D. C. Duling in James H. Charlesworth, *The Old Testament Pseudepigrapha,* vol. 1 (New York: Doubleday, 1983) pp. 935 ff.

74

Agrippa.

75

The Key of Solomon the King (Clavicula Salomonis), first translated and edited from ancient manuscripts in the British Museum by S. Liddell MacGregor Mathers (London: George Redway, 1889; reissued, York Beach, ME: Samuel Weiser, 2000, p. 93). Mathers' reading most closely follows British Library manuscript Additional 10862, folio 116v (consecration of vestments): "Amor, Amator, Amides, Ideodaniach, Paucor, Playor, Anitor, per merita eorum sanctorum Angelorum . . ." The same manuscript again invokes these angels during the consecration of the silk cloth on fol. 64v: "Adonay, Anosbias anereneton, agla, athanatos, agyos, ancor, anachor, anilos, Theodomos, agnefeton, Cedyon, Lamet, Cetelfares, cos, Tetragrammaton." Strangely, Mathers omits this conjuration. Mathers' other manuscript authorities read as follows: Sloane 3091, fol. 84v: "ancor, amacor, amade. Theodonia, Pancorpsagor, Anotor, parles merites des Saints Anges, . . ." Harley 3981 fol. 112v: "Ancor, Amacor, Amade, Theodonia, Pancor = psagor, Anitor, par les merites des Saints Anges . . ." Kings 288 fol. 111v: "Anco, Amacor, Amade, Theodonia, Pancor, Psagor, Anitor, parles merites, des Saints Anges . . ." Ancor, Amacor, Amides, Teodonia, Pancor, Amitor, par les merites des Saintes . . . Sloane 1307 (missing from chapter on vestments but includes the following for consecrating the parchment fol. 109v:) "Autor, Amaur, Theodomos, Phagar, Abacri, adestote ad custodiam istius carte." Other manuscripts of the *Key of Solomon* in the British Library not used by Mathers preserve some valuable readings: Sloane 3847 fol. 46v (consecration of clothing): "Anchor, Anachor, anilos, theodonos, phagor, Ianitor, per merita Angelorum sanctorum . . ." fol. 60r (preparation of parchment): "Ancor, anacor, amlos, Theodomos, Phagor, adestote in custodia huius carte" fol. 60v: "Lazay, Salmay, Dalmay, Adonay, Saday, Tetragrammaton, anepheneton, Cedyon, Aryon, Anereneton, Athanatos, Theos, Theodomos, anilos, pes, kyros, abos, Theophilos, Onoy, Zoron, Largon, Lazaryon, Theophilon, Tisyon, Alyon, Occinomos, Zacharion, Sydion, Agla, Joth, heth, he, vau, el, emanuel, Ja Ja, Vah, *ancor, anilos, Theodonas* angeli sancti dei . . ." Additional 36674 fol. 15v: "Antor, Anator, et Anabis, Theodomas, lanitor [or Iamtor], by the desertes of the holy Anngells . . ." Sloane 2383 fol. 16r (preparation of parchment): "Anator, Amacor, phaidos, theodomos, plagar, abacar, adestote ad custodiam istius Cartae" fol. 25v (silk cloth): "Adonay, amatias, anaton prieumaton, agla, Ensoph, Cadon, antor, amacor, anilor, [26r] Semanphorus, Samceuaia, tetaph, soned, saemonim. Eos bos, Elohim."

76

Joseph H. Peterson, *The Lesser Key of Solomon* (York Beach, ME, Weiser Books: 2001), p. 47.

77

British Library manuscript Royal 17 Axlii fol. 37r. Another manuscript in the British Library, Sloane 3885 fol. 69r reads: "Ih'u dei filius incompraehensibilis hancor hanacor hanylos iehorna theodonas helyothos heliotheos phagor corphandonos norizane corithico hanosal helsezope phagor[a]. [37v] Eleminator candones helas helee resphaga thephagagayn thetendyn thahanos mtemya heortahonos nelos behebos belhores hacaphagan \\\\\ belohothoi ortophagon corphandonos humane natus . . ." Sloane 3854 fol 118v: "Ih'u dei filius incomprehensibil' hancor hanacor hanylos iehorna theodonos helyothos heliotheos phagor corphandonos norizane corithico hanosae helsezope phagor[a]. Eleminator candones helos orano: helee resphaga thephagagayn thetendyn thahanos uitemya heortalyonos uelos ue hebos uel hores hacaphagan ortophagon corphandonos humane natus . . ."

48 Claves Angelicae: “The 48 Angelic Keys.” -Ed.

104

The title page of the actual manuscript reads, *Liber Scientiae, Auxilij et Victoriae Terrestris:* “The Book of Earthly Knowledge, Help, and Victory” -Ed.

105

10 April 1586.

106

30 April 1586.

107

The actual title page reads, *De Heptarchia Mystica (Diuinis, ipsius Creationis, stabilitœ legibus) Collectaneorum / Liber primus:* “Concerning the Mystical Heptarchy (divine, of the creation itself, with permanent rules) First Book of collected passages” -Ed.

108

Sloane 3191.

109

William Lilly, noted English astrologer. Born 30 April 1602. Died 9 June 1681.

110

“As a further testimony of the sence of Mr. Wales kindnes, shortly after his death, I sent for his son, & bestowed on him, one of my deputies places in the Excise, with an allowance of 80 £ per Annum.” /E.A.

111

Sloane 3189 has the following three names written on a blank page, which may be these former owners: Robert Jones, Susanna Jones, George Lockehouse. -Ed.

112

till: “drawer or compartment.” - Ed.

113

Praeter . . . sapientia: “Besides my other frequent extemporaneous prayers and more ardent exhortations to God, this one has been most frequently used. *My morning and evening prayer for wisdom.”* -Ed.

114

In nomine . . . placebit: “In the name of God the Father, God the Son, God the Holy Spirit. Amen. O almighty, eternal, true and living God, be pleased to deliver me! O Lord of Lords, King of Kings, Jehovah Zebaoth, make haste to help me!(cf. Psalm 70) Glory be to God the Father, and to the Son, and to the Holy Spirit: as it was in the beginning, is now, and ever shall be, world without end. Amen. Teach me to perceive and understand properly (O Creator of all things), for your wisdom is all I desire. Fix your word in my ear (O Creator of all things), and fix your wisdom in my heart. O Lord Jesus Christ (you who are the true wisdom of your eternal and omnipotent Father) I most humbly beg your Divine Majesty that you consider it proper to send me the speedy help of some pious wise man and experienced philosopher for realizing and perfecting above all fully those things which will be of greatest value for increasing your praise and glory. And if no such mortal man now lives upon the earth who is fitting for this work, or who may have been assigned by your eternal providence to the performing of that service for me, then truly I most humbly, most ardently, and most faithfully ask from your divine majesty that you grant to send me down from heaven your good spiritual ministers and angels, namely Michael, Gabriel, Raphael, and also Uriel: and (from your divine favor) any other true and faithful angels of yours, who may completely and perfectly train and teach me in the true and accurate knowledge and understanding of your secrets and wonders (concerning all your creatures, and their nature, properties, and best use) and necessary knowledge for us mortals, to the praise, honor, and glory of your name, to my firm solace and otherwise (through me) the solace of the greatest number of your faithful, and to the confusion and ruin of the wicked. Amen. Let it be O Jehovah Zebaoth; let it be O Adonay; let it be O Elohim. O blessed and omnipotent Trinity, praised above all things, grant me (John Dee) this petition, in such a manner that will be most pleasing to you. Amen." -Ed.

115

Ab anno . . . suam: "From the year 1579 in approximately this manner, in Latin or in English (and furthermore in another unique and particular manner, sometimes for Raphael, and sometimes for Michael) it was most gratifying to me to pour forth my prayers to God; may God grant me his wonderful mercy." -Ed.

116

In Sloane 3677, this note comes before the prayer. -Ed.

117

Angelus . . . praedominans: "Angel or intelligence now presiding over the whole world." -Ed.

118

Etymologia: Gratiosa / Afflicta Dei / Misericors: "Etymology: Favored / Distressed of God Merciful." Dee considered Hebrew etymology important and discusses meanings and roots of various words in various works of his. It seems he had at least a rudimentary command of Hebrew grammar as well. -Ed.

119

4 Angeli . . . Quaternarii: "4 angels presiding over the 4 quarters of heaven, as Agrippa notes in the Scale of the number four (*Occult Phil.,* Book 2, ch 7)." This grouping of the Archangels is common in medieval and Renaissance occult works. In *Liber Juratus,* one of the earliest books of the Solomonic school of magic, these four angels are known as the "Angels of the 4 winds." Agrippa, in his work, *De Occulta Philosophia,* book 2, chap. 7 (Leiden: E. J. Brill, 1992), pp. 266, calls them the "four angels ruling over the corners of the world." The *Magical Calendar* of Tycho Brahe gives the same.

Michael and Gabriel are the only two angels mentioned by name in the Old Testament. Raphael is mentioned in the apocryphal *Book of Tobit,* and Uriel is well-known in noncanonical lore. Annael is relatively unknown. -Ed.

120

Etymologiae: Fortitudo . . . praevalesceus: “Etymology: Michael: Strength of God; Gabriel: either made very strong or very powerful or strength of God; Raphael: Medicine of God; Uriel: Light of God.” -Ed.

121

Anna . . . Deum: “Anna, et Annah, is a particle of the supplicant and confessor: consequently it may not be unreasonable that it indicates praying and confessing God.” Dee’s theory is that the name Annael derives from Hebrew “Ana” meaning “pray,” or “lament.” The more usual explanation of Anael is that it is equivalent to Haniel, and means “Grace of God.” Johannes Trithemius, in *De Septem Secundeis* (translation in William Lilly, *Worlds Catastrophe,* London, 1647) refers to him as the “spirit of Venus.”- Ed.

122

Per Sloane 3677.

123

Ad Deum . . . Anno 1582: “A faithful declaration to almighty God, to the lasting account of this matter in the year 1582.” -Ed.

124

Talent: “power.” -Ed.

125

I Samuel 9 is the story of Saul’s consulting Samuel about his father’s asses. - E.A.

126

James 1:5 Si quis autem vestrum indiget sapientia, postulet a Deo, qui dat omnibus affluenter, et non improperat: et dabitur ei.: “If any of you lack wisdom, let him ask of God, that giveth to all men liberally, and upbraideth not; and it shall be given him.” -Ed.

127

mediately: “through a mediator.” -Ed.

128

Mittas . . . ducant &c: “May you send your light and your truth, which may lead me . . .” -Ed.

129

Recte Sapere . . . quod volo: See above. -Ed.

130

Da verbum . . . fige &c: “Fix your word in my ear, and your wisdom in my heart, etc.” -Ed.

131

This third seer was Saul. -E.A.

132

This seems to be a paraphrase of Psalm 34:7: “The angel of the Lord encamps around those who fear him, and delivers them.”

133

De mirabili . . . Naturae: “Concerning the wonderful power of art and of nature” -Ed.

134

Numquid non est Deus in Israël, ut ad consulendum Beelzebub, deum Accaron. Reg. 4. cap. 1. -Δ. “Is it because there is no God in Israel that you are going to inquire of Beelzebub, the god of Ekron?” 2 Kings (called Reg 4, 4 Kings in the vulgate) - Ed.

135

Facilius . . . reputare: “It is without doubt incomparably easier to obtain anything that is considered useful for people from God, or from good spirits [than from evil spirits].” -Ed.

136

Mane: “in the morning.” -Ed.

137

AÑAËL.

138

Note, An illuding intruder, even at the first, putting him self, as an angel of light. Take hede allwayes of undue securitie.

139

There appered a great number of dead mens skulls, likewise.

140

In nomine . . . tu es: “In the name of Jesus Christ, who are you?” This is a standard first question for interrogating spirits. “Let him first require his name, and if he be called by any other name” (pseudo-?) Agrippa’s *Fourth Book of Occult Philosophy,* ed. Robert Turner (London: Askin Publishers, 1978), p. 67. -Ed.

141

“potestas . . . est: “All power is placed in me.” -Ed.

142

Quae?: “Which?” -Ed.

143

Bona et mala: “good and bad.” -Ed.

144

De Thesauro abscondita: “regarding hidden treasure.” -Ed.
145

Ne perturbes . . . Nugae: “Don’t bother, for these are trifles.” -Ed.
146

Ubi . . . tua?: “By whom is your power?” -Ed.
147

Cur . . . mea?: “Why do you ask about my power?” -Ed.
148

Cur . . . placet: “Why? It means you haven’t satisfied me.” - Ed.
149

An bonus . . . speculo?: “Is there any good angel assigned to this speculum/mirror?” - Ed.
150

Etiam: “Yes, certainly.” -Ed.
151

Quis? “Who?” -Ed.
152

Bonus . . . mentio: “Isn’t this the good angel mentioned in scripture?” [i.e. Michael]-Ed.
153

Maxime: “Absolutely.” -Ed.
154

Fieri . . . agam?: “May I not see and deal with him?” -Ed.
155

Ita: “yes” -Ed.
156

Quid . . . velis: “What do you wish to show by this?” -Ed.
157

Alterius . . . est: “It is the character of another angel.” -Ed.
158

Cur . . . ostendis?: “Why do you show this now, and on this occasion?” -Ed.
159

Causam ob magnam: “For a great reason.” -Ed.
160

In margin: “Prayer / Fasting.” -Ed.
161

Gloria . . . saeculorum: “Glory be to the Father, and to the Son, and to the Holy Spirit, as it was in the beginning, is now, and ever shall be, world without end.” -Ed.
162

Prepositus orbis veneris: “Governor of the planet Venus.” -Ed.
163

This book only survives in fragments as Cotton MS. Vitellius. C. VII, art. 3. in the British Library. -Ed.
164

In nomine Jesu Christi: “In the name of Jesus Christ.” -Ed
165

Pseudonym for Edward Kelley. -Ed.
166

Note: he had two dayes before made the like demaunde and request unto me: but he went away unsatisfiyed for his comming was to entrap me, yf I had had any dealing with wicked spirits as he confessed often tymes after: and that he was set on, &c.
167

Aliqui Angeli boni: “some good angels.” -Ed.
168

Michael . . . nostris: “Michael is the foremost in our works.” -Ed.
169

Soyga, Soiga = agyos. -E.A. Agios is Greek for holy. Two copies of this book have been identified. One is Bodleian Ms. 908, and the other is British Library Sloane manuscript 8. See the introduction for more detail. -Ed.
170

Liber . . . bonos: “That book was revealed to Adam in Paradise by the good angels of God.” -Ed.
171

solus . . . interpretator: “Michael alone is the interpretor of that book.” -Ed.
172

Dee lived to be 81. -Ed.
173

Praesentias . . . invocandi: “Request and invoke our appearance with sincerity and humility. And Anchor, Anachor, and Anilos are not to be called into this stone.” -Ed.

174

Haec . . . non vi: “These things mostly involve Michael. Michael is the angel who illuminates your path. And these things are revealed in virtue and truth, not by force.” -Ed.

175

Omnis . . . nobis: “Every hour is our hour.” -Ed.

176

An illuding spirit straight way intruded him self, and this character: as may appere *Libri Quinti Appendice* where the character is described exactly.

177

In margin: This was not True Uriel as may appere Anno 1583: May 5. -Ed.

178

Sigillum . . . gestandum: “Engrave this sigil in gold, for protecting the body in all places, times, and occasions: and it is to be worn on the chest.” -Ed.

179

Soli . . . gloria: “All honor and glory to God alone.” -Ed.

180

Note: In this time there appered in the stone, a riche chayre: and after a little while, it was out of sight.

181

That is, Psalms 6, 32, 38, 51, 102, 130, and 143 (the Vulgate numbers them 6, 31, 37, 50, 101, 129, and 142). -Ed.

182

Sigillum Dei: “Sigil (or seal) of God.” -Ed.

183

In margin: Erronicè, contra ignorantiam meam. vide post. -Δ (Erroneously, to my ignorance. See below.) -Ed.

184

Note this point.

185

Two smaller seals are preserved in the British Museum. They measure 125mm in diameter, and are 20mm thick. The holy table itself measured 36¼ inches by 35⅞ inches, was 31½ inches high. -Ed.

186

Caue: quia angelus tenebrarum se intrusit hic ut libri Quinti appendice apparavit. -Δ. “Beware: an angel of darkness intruded itself here as is shown in the appendix to the fifth book.” In fronte: “in front”; iuxta pectus: “near the chest”; a sinistris: “on the left”; a dextris: “on the right.” -Ed.

187

Brimstone (sulfur) was commonly used in exorcisms. For the binding of Asmodeus by Raphael, see *The Book of Tobit* 3.17. -Ed.

188

Dee’s daughter Katherine was nine months old at the time. -Ed.

189

Note: So is it evident who went abowt to hinder the truth before in the character, and in the border of the Table, falsely cownterfeating &c as it also in the next action may appere.

190

Saul in danger of being carried away quick. -Δ. Quick: “alive.” -Ed.

191

George was a servant of Dee’s. Dee’s diary states that goodman Hilton requested lodging for his two sons in Dee’s house in 1579, and that Robert Hilton came to his service 4 October 1581. -Ed.

192

See Tobit 3.17 and 8.3.

193

Gloria . . . sicut: “Glory be to the Father, and to the Son, and to the Holy Spirit, as . . . etc.” -Ed.

194

“Around 3 in the morning.” -Ed.

195

Hereby may appere that this wycked spirit foysted in the shew of the fals character and names before.

196

Presently: “at once.” -Ed.

197

Brave: “splendid.” - Ed.

198

Note: Lundrumguffa skourged spiritually.

199

Glystring: “brilliant.” -Ed.

200

Lundrumguffa.

201

Gloria . . . saeculorum: “Glory, praise, honor, virtue, and sovereignty to the immortal, invisible, and almighty God, forever and ever.” -Ed.

202

Agrippa hath so, cap. 24, Lib. 3, *Occult. Phil.* -Δ. Cornelius Agrippa, *De Occulta Philosophia*, p. 471. Here Agrippa lists the four princes of the angels as Michael, Raphael, Gabriel, and Nariel (also known as Uriel). They rule over the four winds and the four parts of the world (East, West, North, and South respectively). -Ed.

203

Potius erat dicendum Michaël: Nam Gabriel est Praevalescentia Dei: et ita, fortitudo quidem, sed altioris gradus. -Δ. (“Rather Michael was indicated: For Gabriel is the Predominance of God: and therefore also the strength, but to another degree.” -Ed.)

204

Fortitudo . . . est: “The strength of God is always with you.” -Ed.

205

Angelus tuae professionis: “Angel of your profession.” -Ed.

206

Vide Agrippam de Triplici hõis custode. Lib.3: cap.22. -Δ. Cornelius Agrippa, *De Occulta Philosophia,* book 3, chap. 22, p. 465. Here Agrippa states that everyone is assigned three angelic keepers or preservers: one that is holy, another of the nativity, and another of the profession. -Ed.

207

Laudate . . . suis: “Praise the Lord for his works.” -Ed.

208

Vide Reuclini de *Verbo Mirifico,* de nomine NA.

209

Vide Reuclini Librum *de Verbo Mirifico* de nomine PELE.

210

The use of the ring.

211

De sigillo Emeth, vide Reuclinim *Artem Cabalisticam*, lib.3. et Agrippam lib. 3. cap.11. -Δ. “Concerning the seal Emeth, see Johann Reuchlin, *On the Art of the Kabbalah*, book 3.” Translated by Martin and Sarah Goodman, (Lincoln, NE: University of Nebraska Press, 1983), pp. 284, 287: “They assert that En Sof is alpha and omega, for he said: ‘I am the first and the last.’ They say too that the ‘Crown’ of the kingdom is the bottomless fount of all the ages and the Father of mercies, whose mystery is that he seals up Essence through Truth. As our noble teacher Eliezer haKalir says: 'Truth is his seal.' This can be proved by arithmetical calculation. If we multiply *Ehieh* (meaning 'essence') by *Ehieh* we will get 441, which is the same as *Emeth,* the word for 'true' or 'truth,' and the same as *Adonai Shalom,* which means 'Lord of Peace.'" Compare with Joseph Gikatilla (b. 1248), *Gates of Light*, translated by Avi Weinstein (San Francisco: Harper Collins Publishers, 1994), p. 222: "Thus the Sages said 'EMeT is the seal of the Holy One, Blessed be He.' . . . Therefore, upon His seal is written EMeT, to teach you that all the hosts of letters from the first aleph to the [but not including] mem [which is in the middle of the alphabet] look to bring favour . . ." See the introduction for a discussion of the seal Emeth. Note also that all three names, "NA," "Emeth," and "PELE" are found in Agrippa, *De Occulta Philosophia,* book 3, chapter 11, p. 434. -Ed.

212

Virtue, also "power." -Ed.

213

Valete: "Farewell." -Ed.

214

Soli . . . Gloria: "All honor, praise, and glory to God alone." -Ed.

215

Invocate . . . eum: "Invoke the name of the Lord, and acknowledge him." -Ed.

216

Psalm 67.1: Deus . . . nobis: "May God be gracious to us and bless us." -Ed.

217

Of Salamian you may rede, in the call, Diei Dominicae in *Elementis Magicis* Petri de Abano, there called Salamia. -Δ. Elementis Magici: "Magical Elements," by Peter de Abano, English translation published as *Heptameron: or Magical Elements* (London, 1655, reprint London: Askin Publishers, 1978), p. 89. Diei Dominicae: "Sunday."

218

Thretting: "threatening." -Ed.

219

Raphaël.

220

De OCH vide in libello Arbatel in ☉. -Δ. According to the Arbatel *De Magia Veterum*, Aphor. 17, pp. 17–31, Och is a spirit of Olympus who governs solar things. The other six Olympic spirits are Aratron (Saturn), Bethor (Jupiter), Phaleg (Mars), Hagith (Venus), Ophiel (Mercury), and Phul (Moon). -Ed.

221

See Agrippa, *De Occulta Philosophia,* book 3, chapter 34, p. 504. -Ed.

222

Δ: Perchaunce he meaneth the cownsayle of Annael: before specifyed.

223

It is in *Elementis Magicis* Petri de Abano printed with Clauis Agrippae, which lay in my oratorie almost under my wyndow.

224

The top third of a page is missing here. This quote is supplied from HM, where it is attributed to Michael, that is, F.D., 15 March 1582. -Ed.

225

In margin, written lengthwise: God wilbe revenged uppon Saul: for he hath abused his names in his creatures He hath sinned agaynst kinde. His ponishment is great: and so I ende. -Ed.

226

See the apocryphal *II Esdras* 4.1, 4.36, 5.20, 10.28.

227

See the apocryphal *Book of Tobit* 3.17 and passim.

228

Mysteriorum Liber Primus, tooke ending here (as I conceive) after which followes *Mysteriorum** *Liber Secundus*, but the begining thereof is utterly perished. *So it appeares to be by divers Quotations in the following Books. *So by the Citation 28 April 1582. -E.A.

229

The top quarter of a page is missing. In HM, Dee says: “Note that the whole Second boke is Nothing els but the Mysteries most Mervaylous of Sigillum Dei: otherwise called Sigillum Aemeth.” In 3677, E.A. makes the following comments: “I suppose here were some other Actions between the 21 of March and 28 of April 1582 which belonged to the 2nd booke, & are wanting. For in the beginning of the Action of 28 of Apr. Mich: taxeth (?) and threateneth Δ for his slacknes for his not preparing things appointed by him (which Δ excuseth with inability) but here is no . . . of such appointment . . . in Action of 21 of March. [In margin: 22 Mar Mr Talbot went to London to take his journey for the Bookes vide Ephemerides. If therefore there was any action between 22 Mar & 28 Apr it must be after Mr Talbots retorn, & when he retorned is not noted.] (The following line was crossed out. -Ed.): I suppose also that somewhat is wanting of the 3d Booke, for here is only the Actions of 2 daies, and 28 & 29 of Ap: & the catch word of the last page is - Mi + decedite - but nothing followes.

I also suppose there is something wanting of the 4th Booke, for the last Action is 4 May 1582 & at the beginning of which it appears that E.T. was unwilling to proceed as skryer any further, because Mich: willed him to Marry. & lis & bable be here (+) left offe. Beside the 4th (or rather 5) booke begins the 15 of Nov: 1582. & from the 4 of May to that tyme here is nothing extant. Yet that somwhat was done may be colledled from what is entred under the Title vizt: Post reconciliationem Kellianam, &c: implying that, here had been some falling out betw. Δ & him, & it may hence be presumed, Kelly had been implyed as Skryer sometyme before the said falling out.

+ / 4. May. Mr. Talbot went vide Ephem: so that by this it seemes Mr. Talbot went away from Mortlack so soone as his account of 4 of May was finished, & discected the imployment." -E.A.

230

Benedictus qui venit in: "Blessed is he who comes in . . ." -Ed.

231

Benedictus . . . Domini: "Blessed is he who comes in the name of the Lord." This is part of the Sanctus prayer, which appears in the preface to the Latin mass. See also John 12:13. -Ed.

232

Michael - Fortitudo Dei.

233

My Oath or vow required for secresie.

234

To E.T. he spake.

235

Recte . . . Intelligere: "To perceive and understand properly." -Ed.

236

The top quarter of a page is missing. -Ed.

237

In HM this section has the following heading (perhaps part of the missing text): "Now I will speak of Sigillum Aemeth, also known as Sigillum Dei." The words in square brackets were supplied from HM. The quote is also dated 19 March. -Ed.

238

Semiel, this etymologie is as thowgh he wer the secretarie, for the Name of God.

239

Michael -CHM.

240

Semiel - fortè significat Nomen meum Deus. Ita quod Tabulae istae sunt Nomen Dei, vel Nomina Diuina. -Δ. Forte . . . Diuina: "Perhaps it signifies the name of my God, thus, because these tables are the name of God, or the Divine names." -Ed.

241

Compare with Daniel 10:6. -Ed.

242

The very fashion of the T was thus: 
243

“T” in the holy language is named Gisg; vide lib.5. post. et est ultima Alphabetilitera. -Δ. Vide . . . litera: “See below in Book 5; it is the last letter of the alphabet.” -Ed.

244

HM reads “of God.” -Ed.

245

Deus . . . semper: “O God, God, our God, blessed are you, now and forever.” - Ed.

246

277

Surgit . . . Dei: “Innocence arises to the face of God.” -Ed.
278

Innocentium . . . tuis: “O Lord, you have seen the names and blood of the innocent on the earth, and you are just in your works.” Compare with Psalm 94:21. - Ed.
279

Na.
280

Numerus . . . rerum: “Your number is infinite, and it will be the end of things.” -Ed.
281

Non est . . . Terrae: “To him there is no number. Everyone perishes before God, and on the face of the earth.” -Ed.
282

O benedictum . . . illis: “Blessed is your name, O Lord. The number perished with those.” -Ed.
283

Med.
284

Lux . . . tuum: “Light abides in darkness. Your Name is full of glory.” -Ed.
285

Trinus sum: “I am threefold.” -Ed.
286

Benedictus . . . El: “May the name El be blessed.” -Ed.
287

Ur.
288

Labia . . . Dominum: “My lips praise the Lord.” -Ed.
289

Scotcheon: escutcheon. -Ed.
290

Et hic est El: “And here is El.” -Ed.
291

Benedicta . . . tua: “May your age be blessed.” -Ed.
292

Natus . . . noster: “That Light is born. He/she/it is our Light.” -Ed.
293

Drux.
294

Numerus . . . benedictus: “Your number is blessed.” -Ed.
295

Numerus . . . aeternum: “Your number is with us: and yet until now we knew not his end. May you come with your number, O one forever.” -Ed.
296

Linguis . . . eum: “They recognized him by his tongues.” -Ed.
297

Benedictus . . . sic: “Blessed is he who is so and so.” -Ed.
298

Trencher: cutting board on which food is served. -Ed.
299

Ur.
300

Et es . . . tuis: “And you are true in your works.” -Ed.
301

Gaudete . . . Gaudete: “Rejoice ye, all his people, rejoice ye, all his people, from now on rejoice.” -Ed.
302

Incipit virtus nostra: “Our power begins.” -Ed.
303

Ged—G.
304

Note this to be the first that vanished away, going behynde Michael.
305

Recte . . . eius: “Live properly, O you his holy ones.” -Ed.
306

Don.
307

Hic est . . . meam: “This is the angel of my Church, who may teach him my path.” -Ed.
308

Na.
309

Coniunxit . . . illorum: “He joined the spirit with their souls.” -Ed.
310

Med, ged.
311

Numerus . . . numero: “Its number is without number.” -Ed.
312

Tempus . . . agnoscite: “It is time. Recognize your God.” -Ed.
313

Gisg.
314

Imago: I writ first: but, aunciently, and vulgarly both in writing and print, you shall finde ymago, thowgh not according to the Latine Tung. -Δ. Ymago . . . amara: “Your image (O death) is bitter.” -Ed.
315

Gon - cum puncto, y -Δ. (“With a point, to distinguish it from ‘i’.” -Ed.)
316

Iustus . . . noster: “Our God is just to the wicked.” -Ed.
317

Opera . . . mea: “The labor of the faithful is my delight.” -Ed.
318

Hic est Deus noster: “Here is our God.” -Ed.

[319]

Ecce . . . mea: “Behold, sin rules in my house.” -Ed.
[320]

Graph.
[321]

Bestia . . . aeternum: “The beast devoured my people, but he will perish forever.” -Ed.
[322]

Pa.
[323]

Iniquitas . . . Inquis: “Iniquity fills my temple, and the holy live with the unjust.” -Ed.
[324]

I think it to be superfluous.
[325]

Iniqua . . . suis: “The earth is unjust in its malice.” -Ed.
[326]

Angeli . . . sanctis: “His angels have served the saints.” -Ed.
[327]

Uriel corrected it after, to be under.
[328]

Regnabit . . . tempore: “Wickedness will rule for a time.” -Ed.
[329]

Nulla . . . terram: “No power rules upon the earth.” -Ed.
[330]

Non est . . . caelis: “His number is not in heaven.” -Ed.
[331]

Antiquus . . . Innocentes: “The ancient serpent has raised up his head, devouring the innocent.” -Ed.
[332]

Regnum . . . Contradicet?: “My Kingdom. Who resists it?” -Ed.
[333]

Non quod . . . Mysterium: “It is not because he is A, but because he resists A. Neither his portion nor his number are discovered in heaven. Therefore he has the number of the earth, which is a mystery.” -Ed.

334

Mysterium nobis reuelandum. -Δ. (“A mystery to be revealed to us.”) Vobis . . . reuelandum: “This mystery is to be revealed to you afterward.” -Ed.

335

Perturbatur . . . sua: “The earth is thrown into confusion by his/her wickedness.” -Ed.

336

My skryer had omitted to tell me this, or els, it was not told and showed, but Uriel did after supply it by the skryer: The first letter of Perturbatur, doth not make shew, of the letter following as other before did.

337

Surgite . . . aeternum: “Arise, O servants of God. Arise (I say) and fight. The Name of God is eternal.” -Ed.

338

Omnis . . . illius: “All the Earth will tremble at the sound of that trumpet.” -Ed.

339

Serua . . . Israel: “O God, save your people; O God, save your people Israel; O God, save (I say) your people Israel.” -Ed.

340

Fam.

341

Est numerus in numero: “He is the number in the number.” -Ed.

342

Nunc . . . tribulationis: “Now are the days of troubles.” -Ed.

343

Hic predictus: “This is the number that was foretold.” -Ed.

344

Audite . . . est: “Listen: it is finished.” -Ed.

345

Uriel also did correct this place with deliuering this in the place of the other description before.

346

Angele . . . tuam: “O angel, prepare your trumpet.” -Ed.

347

Venite Tempus: “The time comes.” -Ed.

348

Hij duo . . . adhuc: “These two were still hidden.” - Ed.
349

Vale . . . suum: “Farewell. Nature has its own limit.” -Ed.
350

Hij duo . . . adhuc: “These two were still hidden.” - Ed.
351

Have wanted: “were missed.” -Ed.
352

Veritas . . . sunt: “Truth is in God alone, and all these things are true.” -Ed.
353

The descryer, or the skryer omitted to tell.
354

Hij duo . . . adhuc: “These two were still hidden.” - Ed.
355

Consummatum est: “It is finished.” -Ed.
356

Iste . . . suus: “This is his number.” -Ed.
357

Omnia unum est: “Everything is one.” -Ed.
358

Semieil.
359

Laudate . . . eius: “Praise the Lord in his sanctuary” (Psalm 150). -Ed.
360

The declaration of the Numbers.
361

Make experience: “get started.” -Ed.
362

Note these doings to be accownted Calls.
363

Saluete: “Greetings.” -Ed.
364

Note: 7 names, proceding from 3 generall places of the Circumference or 3 generall letters, being but one letter and that, A.
365

Prove: “determine the truth.” -Ed.
366

Vide Galatinum, lib. 3. cap. 11. -Δ. This is Petrus Galatinus, a 15th century Kabbalist. -Ed.
367

Id est . . . Trinitate: “That is, God the Father, God the Son, God the Holy Spirit, Trinity in unity and unity in Trinity.” - Ed.
368

Pater . . . Deus: “God the Father, God the Son, God the Holy Spirit, nevertheless not three gods but one God.” -Ed.
369

Sicut . . . unus: “As the rational mind and flesh of a person are one, so too are God and man one Messiah.” -Ed.
370

42, are here in potentia, but, non Acta.
371

The vertu of this Circle.
372

ADAMS TREATISE, A: He meaneth my Booke that I call *Soyga*.
373

Primus . . . Dixi: “First and newest, one alone God lives now and ever: He is and he will be, and here are his Divine Names. I have spoken.” -Ed.
374

Benedicamus Dominum: “Let us bless the Lord.” -Ed.
375

Δ: I had made, and written, and corrected certayn prayers to them.
376

Fiat voluntas Dei: “Let it be as God wills.” -Ed.
377

Straight way: “immediately.” -Ed.
378

Baskets.
379

Ecce . . . Israel: “Behold, it is a mystery. Blessed be the Lord, the God of Israel” (Psalm 7:18). -Ed.
380

Sapientiam: “wisdom.” -Ed.
381

Omnia unum est: “All is one.” -Ed.
382

Here there is a marginal flourish in the manuscript, with a line drawn to the word “heven.” -Ed.
383

Seal this: “confirm this.” -Ed.
384

Note of the 7 Baskets.
385

Dixit . . . est: “He spoke and it was so.” -Ed.
386

Et viuis . . . est: “And you live with him, and your kingdom is with those.” -Ed.
387

Dedit . . . Orate: “He gave power to them in heaven. His power is great. Pray.” - Ed.
388

Magnum . . . Orate: “Mighty is GOD in his angels, and great is their power in heaven. Pray.” -Ed.
389

Nuncius . . . coelis. Orate: “Your messenger is great in heaven. Pray.” Nuncius (Nuntius) is commonly used as a title for Gabriel in medieval Latin. -Ed.
390

Michael is the sixth name. vide post. -Δ. Vide post: “see below.” -Ed.
391

Dedit . . . coeli: “He gave power to his angels in the splendor of heaven.” -Ed.
392

Et coniunxit . . . unum: “And God joined them into one.” -Ed.

393

My contynual and anncient prayer.

394

Note these manifold and great Mysteries and mark these 7 diuerse Crosses with these 7 letters.

395

Note this Bond.

396

He is twice three and one.

397

I haue hither to forgotton to ax where Uriel his name may appere.

398

48 letters are here: and One is noted by a Cross: which maketh the 49th. Of this Cross and Angels vide Anno 1584, Junij 25. - Δ. See TFR, p. 173. -Ed.

399

The 7 angels, Zaphiel, Zadkiel, Camael, Raphael, Haniel, Michael, and Gabriel, appear in Cornelius Agrippa, *De Occulta Philosophia,* book 2, chap. 10, p. 282, as the "seven angels which stand in the presence of God." -Ed.

400

72 vertues multiplyed by 48: giue 3456.

401

This I supply was spoken by Michael though the noting by whom is omitted in the original. -Δ.

402

Shaddowed: "shaded." -Ed.

403

¶ Of this sentence cam no frute nor furder confirmation, therefore, consider.

404

The third Lord Monteagle, William Stanley, died in 1581, and it seems likely that Dee was trying to purchase some of his books at his estate sale. -Ed.

405

Note this trumpeter.

406

We were commaunded Not to ax of the apparayle of Michael.

407

Et haec est . . . fac officium Phanael: “And this is his glory, which will not be moved by the wicked. Mi: What do you want? Δ: Besides the will of God, the wisdom that is necessary for us. Mi: The wisdom of the world is nothing, but will perish in eternity. May the LORD’S eternity come, from every part of the world. Come, come if GOD ADONAY wishes. Perform the office, O Phanael.” -Ed.

408

Lustily: “vigorously.” -Ed.

409

Multiplex . . . Noster: “Manifold is our God.” -Ed.

410

7 Thrones, 7 Trumpets, 7 Angels.

411

Sic est Deus noster: “So is our God.” -Ed.

412

Unus . . . noster: “One is our God, O God, our God.” -Ed.

413

Muserion est: “It is a mystery.” The reason Dee used this pseudo-Greek is unclear. -Ed.

414

Note the intrusion of Error by the Wicked powres of Sathan.

415

Perijt Malus cum malis: “A wicked one perishes with the wicked.” -Ed.

416

Tanta . . . Sathan: “So great is your boldness, O Satan” -Ed.

417

Sed . . . vivit: “But our God lives.” -Ed.

418

Non sum: I understand the refusall of those two intruded pillers. -Δ. Non sum: “I am not.” -Ed.

419

Sum: “I am.” -Ed.

420

Orate: “Pray.” -Ed.

421

Cumfet, comfit: “candy.” -Ed.

422

Ista . . . secretorum: “These are the secrets of secrets.” -Ed.
423

Invocate . . . possumus: “Call upon his name, or we are able to do nothing” -Ed.
424

Sic . . . Sic: “Yes, O Lord, Yes, Yes.” -Ed.
425

Laudate . . . aeternum: “Praise the name of the Lord who lives forever.” -Ed.
426

Ipse: “exactly.” -Ed.
427

Et Misericordia tua Domine magna est: “And your mercy, O Lord, is great.” -Ed.
428

Dominus . . . suo: “The Lord is stationed in his number.” -Ed.
429

Vivo . . . illorum: “I live as a lion in their midst.” -Ed.
430

Et tua ... ubique: “And great is your power everywhere.” -Ed.
431

Hoc . . . praece: “This is not without prayer.” -Ed
432

Serpens . . . serpentem: “I am a serpent, and I devoured the serpent.” -Ed.
433

Et bonis . . . Domine: “You are a serpent to both the good and the evil, O Lord.” -Ed.
434

Numerus . . . cognitus: “His number was discovered by no one.” -Ed.
435

Ignis sum penetrabilis: “I am a piercing fire.” -Ed.
436

Et sit . . . Deus: “And may it/he be with us, O God.” -Ed.
437

There is “V” omitted by our neglect.
438

Note these innumerable Angels.
439

Sic . . . noster: “Yes, yes, yes our God.” -Ed.
440

Finis. Gaudium . . . Deus: “The end. Joy and Light is our God.” -Ed.
441

Consummatum est: “It is finished.” -Ed.
442

Unus . . . eius: “ONE ONE ONE. All flesh fears his voice.” -Ed.
443

Adeste . . . Venite: “Be present O Daughters of goodness. Behold, your God is present. Come.” -Ed.
444

Filiae Bonitatis, or Filiolae lucis: vide pagina sequente. -Δ. (“Regarding the Daughters of goodness, or little Daughters of light: see the following page.” -Ed.)
445

Scribe quae vides: “Write what you see.” -Ed.
446

Nos . . . multa: “We are capable of much in Heaven.” -Ed.
447

Adeste, Filiolae Lucis: “Come, O Little Daughters of Light.” -Ed.
448

Michael: one of them that are cownted to stand before the face of God. -Δ. Adsumus . . . stas: “We are present, O you who stands before the face of God.” -Ed.
449

Hijs nostris benefacite: “Favor these ones of ours.” -Ed.
450

Factum erit: “It will be.” -Ed.
451

Valete: “Farewell.” -Ed.
452

Et dixit . . . exaltum est: “And the Lord spoke, come O Son of Light. Come to my tent. Come (I say), for my name is exalted.” -Ed.
453

HM reads, “pendant behinde with a wreth down to the grownd.” -Ed.
454

Yern: iron. -Ed.
455

Traditionally, these metals correspond to the Sun, Moon, Venus, Jupiter, Mars, Mercury, and Saturn, respectively. -Ed.
456

Δ: perhaps here wanteth “non.”
457

Quanmvis . . . sunt: “Although they may (not?) be begotten at one time, yet they are one.” -Ed.
458

Facite . . . erit: “Make (items) according to these (examples) when the time comes.” -Ed.
459

Volumus: “We wish.” Perhaps a mistake for “volamus” (we fly). -Ed.
460

Magna . . . Halleluyah: “Great is God’s glory among you, and ever shall be. Halleluyah.” -Ed.
461

Valete: “Farewell.” -Ed.
462

Dixit . . . estis: “God said, be mindful of my name, but you have been forgetful.” -Ed.
463

Forte “quae.” -Δ. (Perhaps “quae” -Ed.)
464

Note these three descents.
465

Venite, . . . Adsumus: “Come, come, come. Come, O Daughters of the Daughters of Light. Come now and forever, you who will have daughters. God said, I created my angels, who will destroy the daughters of the earth. We are present.” -Ed.
466

Vbi fuistis vos: “Where were you?” -Ed.
467

In terris . . . glorificatis: “On the earth with the saints, and in heaven with the glorified.” -Ed.
468

Non adhuc . . . hoc: “This mystery is not yet to be known.” -Ed.
469

Quid . . . Illorum: “What will you do with these? (They answered,) We shall be with them in all their works.” -Ed.
470

Valete: “Farewell” (lit. “be well”). -Ed.
471

Valeas . . . Cælis: “May you be well, and you are great O you in heaven.” -Ed.
472

Orate: “pray.” -Ed.
473

Et miset . . . Adsumus: “And he has sent the sons of the sons, instructing Israel. The Lord spoke, come to my voice. We are present.” -Ed.
474

Quid factum . . . sumus: “What is done among the sons of men? They live badly (said they) and we do not have a place with them, so great is their iniquity. Woe to the world because of temptations to sin, or to those who cause temptations. Woe to those whom we are not with.” -Ed. Compare with Matthew 18:7: Vae mundo a scandalis. Necesse est enim ut veniant scandala: verumtamem vae homini illi, per quem scandalum venit: “Woe to the world for temptations to sin! For it is necessary that temptations come, but woe to the man by whom the temptation comes!”
475

Nec nomine . . . Mundus: “The world does not fear my name.” -Ed.
476

Nullus . . . meam: “Nobody will see my face.” -Ed.
477

Non est . . . dicam: “There is no maiden on the earth with whom I will speak.” -Ed.
478

Tanta est . . . ab illo: “So great is the weakness of holiness of the day. The benefactors depart from him.” -Ed.
479

Opera . . . me: “Their handiwork is vain. Whereupon no one will see me.” -Ed.
480

In the manuscript the “e” and “l” are overwritten. -Ed.
481

Hagonel. Vide de hoc Hagonel, lib. 4. -Δ ("Regarding this Hagonel, see Book 4.") Ecce: "behold"; Qui adhuc . . . viuo: "I live with those who are still holy." -Ed.

482

Hij . . . Doctrina: "They have imitated my teaching. The teaching of all things are placed in me." -Ed.

483

Imitati sunt: "They have imitated." The proper perfect active form of imitor is Imitati sunt, not imitaverunt. -Ed.

484

Non curat numerum Lupus: "The wolf does not administer the number." -Ed.

485

Ne minimam . . . Valete: "It detracts very little virtue from virtue. Be with them. Be (I say with them). Be (I say) with me. Farewell." -Ed.

486

HM adds, "to Michael (who had called both the first & these)." -Ed.

487

Dictum est hoc tempore: "It was said at this time." -Ed.

488

Urielis officium. -Δ ("Uriel's office." -Ed.)

489

Omnis . . . Halleluyah: "All knowledge is from the Lord. Mi: And his name is Halleluyah." -Ed.

490

Note this list is made perfecter by the next side following. -Δ. The list is composed of the Hebrew names for the seven planets with the divine name "El" added to indicate an angel: Sabathiel (Saturn), Zedekieil (Jupiter), Madimiel (Mars), Semeliel (The Sun), Nogahel (Venus), Corabiel (Mercury), Levanael (The Moon). The numbers 21/8 represent "el"; 26, 8, and 30 represent "1." -Ed.

491

Beatus est . . . conseruat: "Blessed is he who keeps his own names secret." -Ed.

492

In the manuscript, "us" is heavily underscored. -Ed.

493

Note these two orders of Angels: and Note Uriel doth name him self one of the standers before the face of God.

494

Sanctus . . . noster: "Holy, holy, holy, is he, our God." -Ed.

495

Note well this Rule of Arte.

496

Vox Domini . . . Halleluyah: “The voice of the Lord in strength. The voice of the Lord in grace. The voice of the Lord reveals the secret. In his temple may we praise his name EL. Hallelluyah.” -Ed.

497

Note this manner of Center accownted.

498

Note of Numbers with priks signifying letters.

499

1 the first dowghter.

500

Nomen . . . aeternum: “The Name of the Lord lives forever.” -Ed.

501

Viuit in caelis: “He lives in heaven.” -Ed.

502

Deus noster: “Our God.” -Ed.

503

Dux noster: “Our Commander.” -Ed.

504

Hic est: “This is.” -Ed.

505

Lux in aeternum: “Light forever.” -Ed.

506

Finis est: “He/it is the end.” -Ed.

507

Vera est haec tabula: “This table is true.” -Ed.

508

Vera est . . . iam: “This table is true, known in part by us, but unknown in all parts. See below.” -Ed.

509

Note these other purposes.

510

Virtus Vobiscum est: “Virtue is with you. Pray.” -Ed.
511

Angeli . . . illorum: “The angels of light of our God. And he set his angels in their midst.” -Ed.
512

This name Corabiel you may see in *Elementis Magicis* Petri de Abani, in the Considerations Diei ☽ (Monday). - Δ.
513

Videt . . . est: “God saw his own work to be good, and he ceased from his work. It was so.” -Ed.
514

Note these two order of Angels.
515

Dixi: “I have spoken.” -Ed.
516

Sit Nomen . . . Amen: “May the Name of the Lord be blessed, from this time and for all time, forever and ever. Amen.” -Ed.
517

Sigillum . . . hebraice: “The Seal of God Aemeth (or Emeth), containing the names of God in Hebrew.” -Ed.
518

Ashmole has added “Liber: 3us / Liber: 4us” at the bottom of the page. Dee has drawn the frame around the title to look like a scroll. -Ed.
519

In HM Dee notes: “Almost all the Third boke, is of the 7 Ensignes of Creation.” -Ed.
520

Union of us two.
521

Habilitie: “ability.” -Ed.
522

The lamin not simpli . . . spoken: for No such Lamyn was to be made. -Δ.
523

Venito Ese: “Come, O Ese.” -Ed.
524

Laudate . . . Orate: “Praise the Lord in Heaven. Pray.” -Ed.
525

Remember, Ese and lana; ar the thirdth and fowrth of the Septem Filiæ Bonitatis, sup. lib°. 2°. They are thus in order there: El, Me, Ese, lana, Akele, Azdobn, Stimcul. -Δ. Septem Filiae Bonitatis . . . 2°: “Seven daughters of goodness, in book 2 above.” -Ed.
526

Adesdum Ese . . . vestris: “Come, Ese. Come, lana. He gives proof in your tables.” -Ed.
527

Lightened: “glowed.” -Ed.
528

Creatio. -Δ “I created.” -Ed.
529

Ex hijs . . . illorum: “From these they were created (I created), and these are their names.” -Ed.
530

Numerus Primus: “The first number.” -Ed.
531

Δ Of these seven tables, Characters, or scotcheons Consider the words spoken in the fifth boke, Anno 1583, Aprill 28, How they are proper to every King and prince in theyr order. They are Instruments of Conciliation. Volumine 5°: wher my Character is fashioned. -Δ. The words “Numerus Primus” appear to be in Ashmole’s handwriting. -Ed.
532

In the manuscript, Dee has drawn a line between this word and “very blak” above. -Ed.
533

Finis Tenebrarum: Halleluyah: “The end of darkness: Halleluyah.” -Ed.
534

Initium . . . Halleluyah: “And it is a good beginning in his name. Halleluyah.” -Ed.
535

Filiae filiarum Ese sup. lib. 2. -Δ. Venite filiae filiarum ESE: “Come, O daughters of the daughters ESE.” -Ed.
536

Somewhat wanteth.
537

Vnus: “One.” -Ed.
538

Dies primus: “The first day.” -Ed.
539

Ubi est Tabula?: “Where is the table?” -Ed.
540

Est, est, est: “It is, it is, it is.” -Ed.
541

This is the end of folio 32 of the manuscript. The 4 diagrams are inserted at this point, the first two on folio 33 recto, the other two on folio 33 verso. -Ed.
542

O honor . . . eris: “O honor, praise, and glory to you who are and will be.” -Ed.
543

Unus est . . . Origo: “He is one, he is three; he is in each corner. Everything will be understood. He was, is, and will be to you. The end and the beginning.” -Ed.
544

forte fui.—Δ. (Perhaps “was.”) Fui . . . sum: “I was, I am that which I am (was?) not.” -Ed.
545

Lux . . . est: “The light was not, but now it is.” -Ed.
546

In the margin is a line pointing to the third table. - Ed.
547

Ecce signum Incomprehensibilitatis: “Behold the sign that cannot be grasped.” -Ed
548

Est, est, est: “He/it is, is, is.” -Ed.
549

Fiat: “Let it be.” -Ed.
550

In the margin, is a line pointing to the fourth table. - Ed.
551

Scribe. Veritas est: “Write. It is true.” -Ed
552

Man, Woman.
553

Venito vasedq: “Come, O vasedq.” -Ed.
554

Vita . . . manu: “The life of these (is) from my hands.” -Ed.
555

O Lux Deus noster: “O Light, our God.” -Ed.
556

Note this stepping before. -Δ. In the manuscript there is also a line connecting “stepping” and “forestept.” -Ed.
557

Lumina . . . tuae: “These are the lights of your knowledge.” -Ed.
558

Fere . . . numerus: “Almost no one trusts this number.” -Ed.
559

The sterrs, Sonne and Mone Created.
560

Ad usum . . . sunt: “They are multiplied for your use.” -Ed.
561

Omnia gaudent fine: “All rejoice in the end.” -Ed.
562

Opus est: “It is the work.” -Ed.
563

Obumbrabit . . . luce: “He will overshadow your footsteps with the light of truth.” -Ed.
564

Gloria Patri et Filio, et Spiritui Sancto, Sicut erat in principio, et nunc, et semper, et in saecula saeculorum. Amen: “Glory be to the Father, and to the Son, and to the Holy Spirit, as it was in the beginning, is now, and ever shall be, world without end. Amen.” In British Library manuscript Harley 6482, *A Treatise on Angel Magic,* the seven ensigns are attributed to the Moon, Saturn, Jupiter, Mars, the Sun, Venus, and Mercury, respectively. -Ed.
565

I am not sure if it wer Mi. or Ur, that called for them.
566

Et posuit . . . filiae: “And he sets those in his service. What do you desire? Δ: Wisdom and knowledge needed to serve God for his glory. Mi: Wisdom is from God; knowledge is to a creature and from creatures. Ur: Come, O daughters.” -Ed.

567

E.T. his promise.

568

Practise. The lower world.

569

Venite filiae: “Come, O daughters.” -Ed.

570

I marvayle that the earth and waters are here ascribed to one.

571

Non potestis ... ratione: “You are not able to see this without calculation.” -Ed.

572

This I entersert now; thowgh it wer not at the first Noting.

573

Aqua: “Water.” -Ed.

574

Animal quadrupes . . . colorum: “A four-footed animal of all colors alternating.” -Ed.

575

Terra: “Earth.” -Ed.

576

Aer: “Air.” -Ed.

577

Ignis: “Fire.” -Ed.

578

Decedite . . . misit: “Depart in his name who has sent you here.” -Ed.

579

We two to-gither.

580

Perseth: “pierces.” -Ed.

581

Vide ipam Tabulam horam 49 nom. Collectam, pagina sequente. -Δ. (“See the table itself, of 49 names collected, on the following page.” -Ed.)

582

49.

583

He ment to E.T.

584

Deo . . . Amen: “To God all good, all honor, praise, and glory, forever and ever. Amen.” -Ed.

585

Hora noctis 11½ a circiter: “around 11:30 at night.” -Ed.

586

Tabula . . . continens: “Collected table of the 49 consecutive names of the good angels (per Dee).” -Ed.

587

Coordinatio . . . disposita: “Sequence of the 49 angels, arranged thus by John Dee.” Iste est caeteris: “and so on.” -Ed.

588

Plightes: “pleats.” -Ed.

589

Uriel, his manner of apparition.

590

A description of the glorious man.

591

Many cullours in all his garments are shewed in sequentibus thus:

592

Sic, Sic, Sic, Deus noster: “Yes, yes, yes, our God.” -Ed.

593

Multiplicabit . . . sua: “He will multiply all things by his blessing.” -Ed.

594

595

The yoking or cuppling of the two byrds.

596

E.T. sayd the Voyce to be like Michael his voyce.

597

Progressum . . . gloriam: “Progress and increase in virtue and truth to God’s honor and glory.” -Ed.
598

Fortè: “your.” -Ed.
599

Seely: “looking.” -Ed.
600

Quick: “alive.” -Ed.
601

Liking: “appearance.” -Ed.
602

A palmer was a traveler who carried a palm branch as a token of having made a pilgrimage to the Holy Land. -Ed.
603

(Videlicet) in Deo: “(namely) in God.” -Ed.
604

Benedictus . . . eius: “Blessed is God in his gifts, and holy in all his works.” -Ed.
605

Betwixt the end of the 3rd book, whose last action was May 4, 1582, & the beginning of this 4th book whose first action was on Nov. 15, 1582, is a great chasme of time. Occasioned perchance by some falling out with E. Kelly which is implied in this mention of Reconciliatio Kelliana. This is the first time that Edward Kelly appears to bee the seer, at lest under that name, there beeing no account, neither in the printed nor Mss. books how hee came to Dee. Queue: If Edw. Kelly was not the same with Ed. Talbot this latter beeing his assumed name, perchance after he was in orders. For Weever in his *Funeral Monuments* speaking of Ed. Kelley the Necromancer, sayes hee also went by the name of Ed Talbot. -E.A. Dee’s diary fills in some details of this period: “May 4th, Mr. Talbot went. May 23, Robert Gardener declared unto me hora 4½ a certeyn great philosophicall secret, as he had termed it, of a spirituall creatuer, and was this day willed to come to me and declare it, which was solemnly done, and with common prayer. July 13th, Mr. Talbot cam abowt 3 of the clok afternone, with whom I had some wordes of unkendnes: we parted frendely: he sayd that the Lord Morley had the Lord Mountegle his bokes. He promised me some of Doctor Myniver’s bokes.” James Halliwell, ed., *The Private Diary of Dr. John Dee* (New York: AMS Press, 1968), pp. 15–16. -Ed.
606

Quartus . . . dimittimus: “Fourth Book of the Mysteries. November 15, 1582. After Kelley’s reconciliation. O God, have mercy on us, forgive us as we forgive.” Compare with Matthew 6:12. Ashmole has written “Liber 5us” on the bottom of the page. -Ed.
607

In HM, this section is titled, “Some Notice of peculier formes, and attire, wherein, the Kings, Princis and Ministers Heptarchicall appeared, and of some their Actions, and gesture at their apperance. &c.” The first leaf has been lost, but HM and CHM record the following actions of that day (order uncertain): In the first leafe were the offices of the two Kings Blumaza & Bobogel recited, as appeares by the Note at the bottome of the 2d page: & also 5 May 1583 & perhaps this first leafe was lost before he drew up his Booke of *De Bonorum Angelorum invitationibus* because I find a Blank where Blumaza is placed. -E.A. De Bonorum Angelorum: “Concerning the invitation of good angels.” -Ed.

608

Ultima . . . erit: “This age of yours is the last age, which shall be revealed to you.” -Ed.

609

Est in mundo, et incipiet cum illo alter Mundus: “It (or he) is in the world, and another World will commence with that one.” -Ed.

610

This king onely, is the ordrer, or disposer, of all the doctrine, which I terme Heptarchicall, as first, by calling the 7 Princis and after that, the 7 kings: and by giving instructions for use and Practise of the whole doctrine Heptarchicall for the first purpose, and frute therof to be enioyed by me: of two other there was onely Mention made. -Δ (HM).

611

Note. For, of Hagonel we never had any thing before. -Δ.

612

To him ward: “toward him.” -Ed.

613

Regnat . . . Operis: “Your power rules in the sons. Behold, the sign of The Work.” Note the crown symbol drawn above the “H” (for “homo” or man) denotes royalty. Dee uses the crown symbol in his diary to signify the queen. -Ed.

614

Carmara, otherwise Baligon. Vide . . .

615

Adhuc . . . non est: “There is two to come, there is no more” (in John Dee’s words, see below). -Ed.

616

Prince HAGONEL. Note. All the Princis, seemed to be men, and to haue red Robes, but this Prince, his Robe was shorter then the others. All the Princis, had Cerclets, of Gold on theyr heds: not crowns not coronets. -Δ (HM).

617

HM reads “light” in three places. -Ed.

618

Filij & Filij Filiorum, supra libro 2°.-Δ. “See above in book 2 on the Sons and the Sons of the Sons.” -Ed.

619

Δ: generally.

620

Δ: particular, or my government lasteth yet.

621

Kings of the erth &c.

622

HM reads, “This Prince held in the palme of his right hand, as yf it had byn a rownd ring, with a prick in the mydst: hanging allso over his myddle fingers, which he affirmed to be his seale: and sayd the name of it, to be Barees.” -Ed.

623

All people of the erth etc.

624

Counterpoised: “balanced.” -Ed.

625

Cheare = cheer: “disposition.” -Ed.

626

Vera: “true.” -Ed.

627

Impura: “filth.” -Ed.

628

Verus . . . Impuris: “The true with the true, and the filthy with the filthy.” -Ed.

629

Philosophers.

630

Geometry.

631

Δ He hath recyted the offices of two Kings, as of Blumaza and Bobogel. And then he sayeth, Gather by these few spriggs &c: Which Bobogel is over the Nobility and Wisdome, of Metalls, & all Nature. -Δ. Lucem: “Light”; Mundi tenebras: “the darkness of the world.” -Ed.

632

Lucem:“light.” -Ed.

633

The foreman with the short [coat].

634

Primus et quartus: “The First and the Fourth.” -Ed.

635

The.

636

Carmara his Minister: forte Prince Hagonel.

637

Weapons wherwith to destroy.

638

Note this First and last, bycause of Baligon ali. Carmara, his prince & tables.

639

Practise with spirituall weapons.

640

Ubi . . . est: “Where there is neither glory, nor goodness, nor good.” -Ed.

641

Sempiternitie: “eternity.” -Ed.

642

Note. Practise. Lib°. 2°, Filij Filiorum: (“In book 2, sons of the sons.” -Ed)

Rocle -----	5.
Hagonel -----	6.
Ilemese -----	7.

643

Note. Prince Butmono sayd this: but the office is under king Bnaspol, whose prince is Blisdon. The Mystery of this I know not yet: For Blisdon will be fownd to be the proper minister of king Bnaspol. Vide Anno 1583 May 5th, of the Making of Mensa faeders, and my Golder Lamine. -Δ (HM). Mensa

faederis: “the table (or altar) of the law (or covenant).” -Ed.
644

In the manuscript, Dee has written this as “E.ŦK.” -Ed.
645

Vox hominibus . . . mundi: “The voice not worthy for the people, but these with their sons have praised God. Blessed is he who is the only son, and glory of the world.” -Ed.
646

The black cloth of silence and staying.
647

The Token to leaue of, by a black shaddowing all in the stone.
648

Note: how he governeth Three, and Carmara (his King) hath also a Triple crown.
649

 This Character seemes to stand for Carmara, as apperes from severall places in fol .2.a. & b. & many other. It appears by a note of Dr. Δ *(De Heptarchia* &c: Cap. i.) that Michaell & Uriel were present at the begining of these revealed Misteries & gave authority to Carmara to order the whole Heptarchicall Revelacon. Perhaps this authority was entred in the first lost leafe of this 4th booke (thowgh Dr. Dee calls it the 2d Booke in his Note.) see Chap: 2 at the begining. By a marginall note at the beginning of the first Chapter, it should seeme, that the Dr. meanes by the first Booke the Action only of the 16 of Nov. 1582, & by the 2d Booke the Actions of the 17, 19 & 20 of Nov. 1582. But his marginal note of 19 should be 20 of Nov. for so it appears by the Actions entred. The 21 of Nov: vizt: the action of that day he calls the Appendix of the 2d chapter. -E.A. Laus . . . semp.: “Praise and honor be to the eternal and omnipotent God, now and ever. Amen.” -Ed.
650

Ille . . . Venite: “Truly he is God. Come.” -Ed.
651

Δ: So he sayd in latin, in the forpart of the leaf before.
652

Note. Copper apperteyneth to ♀ . -Δ. HM reads, “All the Princis held up to gither, Heptagonon stellare, (as I terme it) and it seemed to be of Copper.” -Ed.
653

Δ Forte Bagenol / Hagonel, if H be for B. Then Bagonel conteyned Bagenol.
654

Me nosti: “You have known me.” -Ed.
655

One of the first of the Twelue.
656

‘8. Gods visitation. And it is 8: may be 8 yeres added to this tyme: and that maketh 1590. Nouemb. 16. That 8, or 88, I know not yet.
657

Prince Befafes with feathers under his robes.

Tam mali ... noster: “Both the wicked and the good praise you. God, God, our God.” -Ed.

796

Nomen . . . Bobogel: “My name is Bobogel.” -Ed.

797

Δ: in Heptagonum.

Bobogel ---------- Rex
Bornogo ------------ Princeps

(Rex: “king”; Princeps: “prince.” -Ed.)

798

Wisdome & Science: “true nobility.”

799

Councell.

800

Clean: “completely.” -Ed.

801

Praters: “fools.” -Ed.

802

Ordinationem ... eleuate: “Raise up the government of infinite power.” -Ed.

803

LEE.

804

O Unitas ... in Deo: “O Unity in nature and in God.” -Ed.

805

O Aequalitas ... et se: “O equality of God and Nature. God in God. Nature from God and itself.” -Ed.
806

Concentus ... Naturae: “His harmony is without number. Nevertheless he is together with us, the source and head of nature.” -Ed.
807

Veritas ... est: “Ours is the truth which is sought after.” -Ed.
808

Note, this is an example of what William Sherman calls a “face bracket” *(John Dee*, Amherst, MA: University of Massachusetts Press, 1995, p. 88). Dee drew them often in the margins of texts, and they only seem to mark alchemical passages (as here) or natural philosophical texts. -Ed.
809

Vegetible, Minerall.
810

♄
811

Beatus est ... mei: “Blessed is the light of my head.” -Ed.
812

Unus ... pedubus: “One in head, one in heart, one in feet.” -Ed.
813

Ientleman = gentleman: “nobleman.” -Ed.
814

Note. King Bobogel said this of my atteyning to such mysteries, as the mysteries under him made shew of. -Δ (HM).
815

2. NAR.
816

Volumus: “we wish”; Possumus: “we can”; Quid non: “What not?” -Ed.
817

Faciamus ... societate: “Let us do what they did, for we three are Adam, by association.” -Ed.
818

3. BLN.
819

Ab illo, per illum, cum illo: “from him, through him, with him.” -Ed.
820

Qui caret hijs tribus: “Who lacks these three.” -Ed.
821

In ecclesia ... Vanum: “In the church of God, he will work in vain.” -Ed.
822

Penitence.
823

Lawn: “thin fabric.” -Ed.
824

Sunt semper . . . unus: “They are always, and their food is one.” -Ed.
825

Vicissim: “in turns.” -Ed.
826

4. ANA.
827

Ab illo sed. Cum illo sed: “from him only; with him only.” -Ed.
828

Aliqui . . . Digni: “Some from worthiness, others are not worthy of any sort.” -Ed.
829

Per illum, Per ilium, Per illum: “Through him, through him, through him.” -Ed.
830

Cahos: “chaos.” -Ed.
831

Et quia . . . ignis: “And because they were lacking in blazing fires.” -Ed.
832

In the manuscript there is a line drawn from LEE to BLN, and another line from NAR to ANA. -Ed.
833

Omnes . . . in illo: “Everything towards nature, but not in him.” -Ed.
834

Δ There remayned 10 tymes Three.
835

Δ of 30.
836

Note, by theyr sitting that they are indifferent: and so they say.
837

Δ They semed therfore to sit betwene the perfect and reiected: as indifferent.
838

Sumus ... novit: “We are the seven gates of Nature, and of him who knew God.” -Ed.
839

Δ: beside AOIDIAB.
840

6, 7. -Δ. In sexto ... omnia: “All things are in the 6th and 7th.” -Ed.
841

NOTE the narrow path, above the chayr.
842

Δ Bornogo.
843

Formatur ... Heptagono: “The maker of these is the second in the Heptagon.” -Ed.
844

Note former. ergo. There is allso a circle on the grownd. Vide ante 3 folia: of my fete placed uppon the Tables: Ergo they shold seme to be on the grownd. -Δ (Vide ante 3 folia: “See three folios earlier.” -Ed.)
845

Δ: of the six orders.
846

Practise. by 6.
847

Sloane 3188 reads, “excellencies of” in Ashmole’s handwriting, but CHM, HM, and Sloane 3677 all read, “excellencies in.” -Ed.
848

This boke sometymes called liber Creationis, & sometymes Tabulae Creationis. -Δ. (“The Book of Creation,” the “Tables of Creation.”-Ed.)
849

HM cites this: “King Carmara, Novemb. 19, of King Bobogel, his princis Ministers.” -Ed.

850

A Threfold use of this Doctrine.
851

Dixi: “I have spoken.” -Ed.
852

Rex Aquarum. -Δ. (“The King of the Waters.” -Ed)
853

Venito . . . fuit: “Come, come (I say), be present. Come, O King. O King, King, King of the waters, come, come I say. You are great, but my power is greater still. Our God stands firm, rules, and is, that which he was.” -Ed.
854

Parati . . . adsunt: “We have been provided his name from our Creator, the name, to praise the name, the Name (I say) of One now [blank space in manuscript] and living. These are dark/obscure to dark minds, but true and clear to true and perfect minds. Behold, they are present.” -Ed.
855

Note this Kings apparayle, and shew.
856

King BABALEL
857

Omne ... aecium: “May everyone living praise God, one and three, into all time.” -Ed.
858

At an ynche: “nearby.” -Ed.
859

Skipjack: “a dandy, skipping fellow.” -Ed.
860

He calleth Befafes.
861

Veni ... iste: “Come, O prince of the seven princes, who are princes of the Waters. I am the king, mighty and wonderful in the waters, whose power is in the depths of the waters. That prince . . .” -Ed.
862

The Prince his apparayle.
863

. . . est Tertius principum in Heptagonon: “. . . is the third Principality in the Heptagon.” -Ed.

[864]

Heptagono: “(in) the Heptagon.” Dee seems to be checking or correcting Kelley here. -Ed.

[865]

Vere . . . aquas: “I have spoken quite plainly and distinctly. . . . Have you measured the waters?” -Ed.

[866]

Factum est: “It is so.” -Ed.

[867]

Prince Befafes, my old frende unknown of me.

[868]

Philosophers. -Ed.

[869]

John Scotus Erigena (815?-877 theologian)? Michael Scot (introduced translations of Aristotle)? John Duns Scotus (126s?-1308 theologian)?–Ed.

[870]

Δ The fifth of the seventh. I understand not this yet. Vide lib. 5. A° 1583 Maij 1.

[871]

NOTE: of wicked spirits, some restitution to favor.

[872]

See. 4th Enochian Call: “obelisong” is translated “as pleasant deliverers.” -Ed.

[873]

Or Cerclets perhaps.

874

HM reads, “Euery one of the 42 had a letter in his forhed. They were 7 in a row: and 6, downward. But of the first 7 the letters became to be between theyr feet, and the water seamed contynually to pass over these letters.” -Ed.

875

Threasors in the seas.

876

Practise.

877

King and Prince govern the whole day.

878

Δ: Whereas in the former Treatise, ther was a dowt of Butmono the fowrth, and Blisdon theyr offyces, being assigned here clere contrary: The dowt may be answered by the notes A. 1583, Maij 5 of the Table and my Character. Therefore I suspect some Intruder to have first .... -Δ. Vitam . . . Viuentium: “God gave life to all creatures. Come ye, come O fire. Come, O life of mortals Come (I say). Be present. God rules. O come. For he alone rules, and is the life of the living.” -Ed.

879

HM identifies this as King Bynepor. -Ed.

880

Butmono. -Ed.

881

Verè beatus: “Truly blessed.” -Ed.

882

Omnium . . . immensa: “Perpetual and unlimited praise for the giver of all good.” -Ed.

883

Ipse dixit. -Δ. (“He himself said.” -Ed.)

884

Generaltye.

885

Ipse: “himself.” -Ed.

886

Vita . . . manibus: “The highest life, the higher life, and the lowest life are measures by my hands.” -Ed.

887

Note second last world.
[888](#)

Ecce, omnia Noua. -Δ. (“Behold, all things are new.” -Ed.)
[889](#)

Vitam . . . ubique: “He surrenders life, and gives me power to be, and to live in perpetual glory. Everything and everywhere.” -Ed.
[890](#)

Note.
[891](#)

Δ I dowt, I did not here perfectly at this writing down.
[892](#)

Cumpassing with it a loft: circling it around in the air. -Ed.
[893](#)

Δ Bnaspol.
[894](#)

Δ Blisdon.
[895](#)

An Innumerable Cumpany of ugly Creatures, a far of.
[896](#)

Vide Lib°. 5, 1583 Martij 26.
[897](#)

Vide de istis in libro Cracoviensi Junij 26. Treasure hid in earth, kept by wycked spirites. -Δ. See TFR, p. 180. -Ed.

Bnaspol, Blisdon.
[899](#)

Venite . . . dentium: “Come here, where there is no peace, but only the gnashing of teeth.” -Ed.
[900](#)

Prince Brorges. -Ed.
[901](#)

The King.
[902](#)

Mark who sayd so before. -Δ. This was Carmara at the beginning of Book 4. -Ed.
903

Note a great Secret of spirits in payn expecting release.
904

Somwhat was not hard of me, or forgot. Perhaps Terror.
905

Δ: Bnapsen.
906

Δ; Brorges.
907

Note A. 1583, Maij. Thus I considered In dede after a sort Brorges may be cownted as last, for the begyning secretly was with Bralges.
908

Bralges sayd his government was of such: super fol. 4.b. -Δ. Venite . . . potestate: "Come you who are under my power." -Ed.
909

The Circle of letters.
910

HM notes, "Prince Bagenol appeared not, by that name, yet. Note, the king him self [Baligon, aka CARMARA] is governor ouer these." -Ed.
911

The last Ternarie. That is expownded lib°. 5. Maij 5.
912

Note, As Michael and Uriel, at the begynning of these revealed mysteries, were present, and gaue Authority to Carmara, to order the whole Heptarchicall Reuelation, so, at the Conclusion, they appeared agayn and Raphael with them, and Michael concluded the second boke (of this particular Reuelation Heptarchicall,) with these words following. -Δ (HM).
913

Prima pars Artis Triplicis: he termeth this afterward of three proportions in Esse. Consider these three principall points here. -Δ. Prima pars Artis Triplicis: "The first part of a triple art." -Ed.
914

Annael.
915

Gloria . . . Maximoque: "May glory, laud, honor, and eternal thanksgiving be to our God, almighty and

all good.” -Ed.
916

1588. On twelfth day at night as I considered the Method of this boke, this cam to my mynde. -Δ. Dee’s diary fills in some of the events between this action and the next: “[1582] Nov. 22nd, E.K. went to London, and so the next day conveied by rode toward Blakley, and within ten dayes to returne. Nov. 24th, Saterday night I dremed that I was deade, and afterward my bowels wer taken out I walked and talked with diverse, and among other with the Lord Thresorer who was com to my howse to burn my bokes when I was dead, and thought he loked sourely on me. [1583] Feb. 26th, I delivered my boke to the Lord Threasorer for the correction of the Calender. March 6th, I, and Mr. Adrian Gilbert and John Davis, did mete with Mr. Alderman Barnes, Mr. Townson and Mr. Yong and Mr. Hudson, abowt the N.W. voyage. March 18th, Mr. North from Poland, after he had byn with the Quene he cam to me. I receyved salutation from Alaski, Palatine in Poland; salutation by Mr. North who cam before to the Quene, and next to me was his message, hor. 12.” Halliwell, ed., *The Private Diary of Dr. John Dee* (New York: AMS Press, 1968), pp. 18–19.
917

Note. The cullour red and grene of the Table of Covenant. Two chayres.
918

Two Chayres.
919

Idque.
920

O quanta . . . perfectione: “O how great is the weakness and corruption of mankind, that has little faith in angels and their good deeds, but hardly any faith in God. All worldly things contain the corruption of the world within them. Our God, our God, he (I say) our God is true, and is true with his true angels and those who ever serve him. Ask for what you wish. I have spoken, and what I have spoken that was obscure, was in truth, justice, and perfection.” -Ed.
921

Note of this Rod.
922

Ecce . . . Hic . . . Per hoc . . . Et a Mensurae . . . vis? “Behold . . . here, . . . and here. . . . And from the end of the measure you will measure us and our power. Practice (I say). What do you wish?” -Ed.
923

Parabolically: using parable. -Ed
924

In umbra . . . Age: “In the shadow of death there is no equality. Nothing is obscure which you have received through him (E.K.). Practice.” -Ed.
925

A Threefold work.
926

In HM, Dee attributes this to “Carmara, Nouemb. 21. in appendix of the second boke.” -Ed.
927

Threfold Work.
928

The Kings with their Characters.
929

An, Aue, Rocle, Liba. I understand of Il, An, Aue, &c in the characters of the 7 kings.
930

Filij Filiorum - An, Aue, &c. Examination to be made of these bokes. -Δ. Filii Filiorum: “Sons of the Sons” -Ed.
931

Δ fortè “Unlawfull” and was myshard.
932

Forte: “their.”–Ed.
933

Princis.
934

Liber Creationis. Note, what hath bin tawght in this boke. -Δ. HM attributes this saying to Carmara, Nouemb. 21. Liber Creationis: “Book of Creation.” -Ed.
935

Δ: as may appere by the 49 names Collected.
936

Δ: I suspect this to be an imperfect phrase.
937

Name among Angels
938

Δ = name expressed.
939

Note Attire.
940

It is to weete: “that is to say.” -Ed.
941

Modo retrogrado quasi: “now as if going backward.” -Ed.
942

Addendo . . . Baligon: “This course is made by adding 7. Therefore adding 7 to the number 43 results in 50: a number one greater than 49, which may indicate the first king, Baligon.” -Ed.
943

Addendo . . . principe: “This course is made by adding 7. Therefore if 7 is added to the number 37, from there results 44 for the next prince.” -Ed.
944

Δ: Note that he calleth that contynually A Globe. Uppon such a globe Nalvage shewed out all the Calls.
945

HM reads “must have.” -Ed.
946

King . . . first . . . answering to Blumaza as I perceyued 1583 Maij 5, mane by meditation: and of Necessity must be: yf the last be for Baligon.
947

The next 1 is the last letter of Babalel, and then transversim as before, &c.
948

Traversim quasi retrograde: “Going crosswise as if backwards.” -Ed.
949

Last.
950

Last.
951

Left.
952

Meterly well: “fairly well.” -Ed.
953

The use of the Circular Table (here before often called a Globe) at another tyme.
954

I omitted a word, and our memories could not yeld it, this perhaps, Dignifyed.

955

An angel holding up the stone.

956

This stone brought by the Angel is said to bee an nich thick in the following Mysteriorum Lib. 5. Ms. p. El. Ash: conceives it to have been of a lenticular forme, included in a circular limb upon the top of which a cross, & edgewise sett in the frame. -E.A. See action of 5 May 1583. -Ed.

957

Veritas . . . uno est: “Truth is within truth, God within God, One is within one.” -Ed.

958

☞caue. -Δ. (“Beware.” -Ed.)

959

Illi . . . saecula: “May all honor, praise, and glory be to him who is to reveal the age through fire, forever and ever.” Perhaps *indicere is intented: “to inflict (the age with fire).” Ashmole reads Iudicare: “to judge.” -Ed.

960

The words “Liber 6us. / Liber 7us.” are in Ashmole’s handwriting. -Ed.

961

The boke fownd in Northwik hill.

962

The scroll is shown below before the April 11 th Action. It shows the locations of ten hidden treasures. -Ed.

963

Pilosus. -Δ (“Hairy.” -Ed.)

964

Penetrasti . . . meae: “You penetrated the power of my iniquity.” -Ed.

965

Feci, Nam decedo: “I am done, for I depart.” -Ed.

966

Auete. Verum est, et incredibile: “Greetings. It is the truth, and incredible.” -Ed.

967

lustitia. -Δ (“Justice” -Ed.)

968

Via . . . eleyson: “The way, the truth, and the virtue are one, and his greatness is manifold and wonderful. And the breath comes from your mouth (and has life) from which everything lives, by your command and your light. Hail the word, hail the creator of things and of their measure which have been, are, and will be. You have illuminated the eyes of the creatures by reminders and plain warnings. Life to the good, but death to the wicked, and those cast from your consideration. How great and innumerable are your gifts? O remiges varpax. Lord have mercy." -Ed.

969

Aqua. -Δ ("Water." -Ed)

970

Loquitur de mea cogitatione, quod esset Raphaël. -Δ. ("He speaks concerning my thought that he may be Raphael." -Ed.)

971

O Beata Trinitas . . . eius: "O blessed Trinity, send your light and your truth, that they may lead me to the holy mountain and to your tent. Me: Where, O unbelievers? Δ: We are not unbelievers, but our hope is alive, and the eternal and almighty truth is the fountain of life. Me: I brought you water from that same stream. It is a true medicine for your imperfections and needs. Understand now both who I am and for whom I was adorned. Drink and receive the abundance for your bones [can also be figurative: innermost part, soul]. For many are the imperfections of mortals. I have and you (pl) will have. I brought, and he shall be seen. The word is that light that blots out all imperfections. The faithful will enter into his blessedness. Wherein is the potion and eternal medicine. You thought correctly [see previous footnote]: I am indeed as you believe. For by truth and justice, his words and teachings are true and complete." -Ed.

972

Recte sapere: "To perceive correctly." -Ed.

973

Ecce seruus . . . pronunciatum: "Behold the servant of the Lord, Let his decree be for me (like his mercy) as was declared about me." -Ed.

974

Perfyted: "perfected." -Ed.

975

Increduli. -Δ ("Unbelievers." -Ed.)

976

HM identifies this as Raphael. -Ed.

977

A parable.

978

Note hereby to consider theyr actions, gestures and other circumstances.

979

Signa sunt . . . resanabit: “These are signs to you (pl) of humility and of repentance; which (signs) I make everything yours; they are not mine. May his word be praised in heaven, and may he also be praised on earth. Discover power in the humility of his speech (or language) and you (pl) will see the glory of his brow. For the glory of his power is merciful and almighty. Vanities exist in his seductions; Necessities exist in your true needs. For he made all things for his praise: and (behold) his handiwork praises the light of his face. Love one another; live with humility. Truly, my medicine (which is his) will convey everything.” -Ed.

980

Nature ∴ Reason ∴

981

Note Adam, before his fall, knew all things.

982

The true use and order of the premisses.

983

Raze out: “erase.” -Ed.

984

Et finis est: “And it is the end.” -Ed.

985

Note of this boke.

986

J Dee, and EK.

987

Adrian Gilbert, half-brother to Sir Walter Raleigh, was a frequent visitor to Mortlake. He eventually was allowed to participate in some of the actions. Earlier in this same year (1583), Dee started plans to colonize North America with Adrian Gilbert and John Davis. During subsequent actions, Dee consults the angels about this proposed venture.

988

Potentia, Actus. -Δ (“Power, Deed.” -Ed.)

1054

A. G.

1055

John Davis is mentioned in Dee’s diary as early as 1577, but Dee probably knew him as a boy. He was evidently one of Dee’s pupils, and one of the principal players in the search for the Northwest Passage. He stole at least seventy books from Dee’s library after Dee left for Europe in 1583. See Julian Roberts and Andrew Watson, *John Dee’s Library Catalogue* (London: The Bibliographical Society, 1990), p. 50.

1056

Lern the Alfabet.

1057

Soli . . . gloria: “May all honor and glory be to God alone.” -Ed.

1058

The reformation of the Kalendar. -Δ. On 24 February 1582, Pope Gregory XIII ordered the use of the “Gregorian” calendar, and the English court deliberated over its response. Dee was one of the authorities commissioned for a report. According to his diary, Dee delivered his proposal to reform the calendar to Lord Burghley, Treasurer of England on 26 February 1583. It caused considerable controversy. The court opinions were all favorable, and the Queen approved a draft proclamation to adopt the reform, but it was rejected by the bishops because they didn’t want to appear to be following the Catholic lead. -Ed.

1059

Angeli proprij. -Δ (“Proper angels.” -Ed.)

1060

Peculier and propre Instigators.

1061

Take hede of Nettels.
[1272](#)

Perhaps the Jues shall be restored. -Δ. Dee sees “headless” as a metaphor for the fact that the Jews have no central authority like the Pope. Dee’s meaning is most likely to be that the vision is a prophecy that the Jews will be readmitted into England where they had been expelled in 1290/91. They were, in fact, readmitted into England in 1655 after petitions from Menasseh Ben Israel. See David S. Katz, *Philo-Semitism and the Readmission of the Jews to England* (Oxford: Clarendon Press, 1982), chapter three for details. There is more on this in his most recent book, *The Jews in the History of England* (Oxford: Clarendon Press, 1994). According to Dr. Katz (private communication), “Dee had good reason to think this might happen in his lifetime.” -Ed.

The Tower of Babel. See Genesis 11. -Ed.

[1392]

Enoch.

[1393]

Jude 14-15: "Enoch also, the seventh from Adam, prophesied of these, saying, Behold, the Lord cometh with ten thousands of his saints, to execute judgement upon all, and to convince all that are ungodly among them of all their ungodly deeds which they have ungodly committed, and of all their hard speeches which ungodly sinners have spoken against him." This is quoted from 1 Enoch 1:9. See James H. Charlesworth, ed., *The Old Testament Pseudepigrapha,* vol. 1 (New York: Doubleday, 1983), pp. 12–13. -Ed.

[1394]

Note: excellent Memories, for Traditions contynuing and preseruing.

1508

Diuels are accusers proprely.
1509

EK had byn carryed away in the wrath of God. If fervent prayer had not byn, as may appere in the begynning of this nights Action.
1510

The boke of this Prophesie shall contynue.
1511

= a malo Temptationis. -Δ. (“Against the evil of temptations.” -Ed.)
1512

Professio mea est Philosophia vera, vide Libro primo. -Δ. (“My profession is true philosophy. See Book 1.” -Ed.)
1513

Deo . . . perpetuum: “May all praise, honor, and thanksgiving be to our almighty God, now and forever.” -Ed.
1514

Beati . . . pacem: “Blessed feet, gospel of peace” See Romans 10.15. Quomodo vero praedicabunt nisi mittantur? sicut scriptum est: Quam speciosi pedes evangelizantium pacem evangelizantium bona!: “And how shall they preach, except they be sent? As it is written: How beautiful are the feet of them that preach the gospel of peace, and bring glad tidings of good things!” This verse quotes from

Isaiah 52:7. Quam pulchri super montes pedes annunciantis et praedicantis pacem: annunciantis bonum, praedicantis salutem, dicentis Sion: Regnabit Deus tuus!: “How beautiful upon the mountains are the feet of him who brings good tidings, who publishes peace, who brings good tidings of good, who publishes salvation, who says to Zion: ’Your God reigns.’” -Ed.

1515

Per te Jesu Christe: “Through you, Jesus Christ.” -Ed.

1516

This Holy Book.

1517

The boke to be finished to morrow.

1518

The day appointed for the use of this Book. Augusti 1.

1519

Our nine dayes contrition preparatiue. -Δ. Note the *Clavicula Salomonis* prescribes a nine-day preparatory period before calling spirits that includes penitential prayers and abstaining from impurity. See S. L. Mathers, ed., *The Key of Solomon the King* (York Beach: Samuel Weiser, 1972 repr. 1989), book 2, chapter 4. The magi (Zoroastrian priests) also undergo an elaborate nine-night purification ceremony (“Barashnum”) in order to prepare for higher religious ceremonies. –Ed.

1520

Angels sent to viset the heape of sinnes in the world abownding &c.

1521

Good Angels.

1522

The second of the greatest prophesie, is this.

1523

Our Testimony of this Prophesie, all the World ouer, to be (by us) published.

1524

Our bodyes to be made strong.

1525

Antichriste is allmost ready for his practise.

1526

40 dayes more for the tables writing in their own Characters.

1527

The frute of this boke.

1528

The backside of my Character.

1529

The use of the stone which a good Angel browght to me the last yere: remember it is half an inche thik.

1530

The 4 hollow fete of the Table.

1531

HM reads “must.” -Ed.

1532

The use of the Table of practise is onely for one Month.

1533

Vide sup. A°. 1582 Maij 4.

1534

Great long iornayes to be gon of us two.

1535

The Cullor of the silk for the Table.

1536

On the first of August next.

1537

SOCIEDAD MEXICANA DE HISTORIA NATURAL.

LA ESPINOSILLA,

POR EL SEÑOR DON MARCIAL OROPEZA.

Historia.—La espinosilla es natural de nuestro país, y abunda en muchas partes de la República, principalmente en los puntos cercanos á esta capital, como San Angel, Texcoco, Santa Fé, etc. Es una de esas hermosas plantas silvestres que adornan nuestros campos, encontrándose de preferencia en los lugares secos de las regiones frías; se le ha dado este nombre, porque en efecto, al tocarla se experimenta una sensacion semejante á la que causaria una planta cubierta de pequeñas espinas.

Los antiguos aztecas, careciendo del jabon, tan necesario á la higiene, se veían precisados á buscar diversas plantas que lo sustituyeran, y para su aseo personal usaban de la espinosilla, agitándola dentro del agua, hasta formar una espuma persistente, y con el agua preparada de este modo se lavaban, sirviéndose de la misma planta para restregarse. De un modo semejante la emplean hoy muchas mujeres para impedir la caida del pelo y el desarrollo de la urzuela, lo cual consiguen satisfactoriamente. Pero el uso que más comunmente se le ha dado, es empleándola como medicinal, para combatir las fiebres, pues obra como un excelente diaforético.

AUG 29 1957

Para terminar la historia de este vegetal, expondré los diversos nombres con que es conocida, y la etimología de ellos. *Hoitzitzilxochitl,* voz compuesta de dos palabras del idioma mexicano, *Hoitzitzitl,* chupa-rosa, y *Xochitl,* flor; en consecuencia, traducida al español, significa flor de la chupa-rosa, cuyo nombre es de suponerse lo origina el afecto que este precioso animal le tiene.

Los españoles le nombraron *Huichichile,* que muchos de los indios actuales pronuncian *Quachichil;* palabra tambien mexicana, que en castellano significa gorrion; y segun he podido informarme, parece que este último nombre, fué debido á la semejanza que existe entre el color de la flor, con el de las plumas que cubren la cabeza del pájaro mencionado.

Algunas personas que hablan el idioma azteca, me han asegurado que el verdadero nombre es *Cuachile,* y no los ántes dichos; además, que este mismo se le da á un pato, que tiene de notable ser de cabeza roja. Esta discordancia, en mi concepto, solo depende de lo muy adulterado que está el referido idioma.

Clasificacion botanica y descripcion.—La espinosilla pertenece á la familia de las Polemoniaceas, y al género y especie *Hoitzia coccinea,* Cav.; *Loeselia coccinea,* G. Don.; *Cantua Hoitzia,* Willd.; *Hoitzia Mexicana,* Lamk.; *Cantua coccinea,* Poir.

«Car. gen. Cáliz prismático-tubuloso, quinquefido: corola infundibulifor-
« me, limbo laciniado, divisiones oblongas, acuñadas: estambres salientes:
« óvulos poco numerosos en tres lóculos: semillas ovoideas, angostas y mem-
« branoso-aladas: hojas alternas, íntegras, muchas veces agudo-dentadas:
« flores axilares, con frecuencia reunidas en cimas: bracteas numerosas, las
« exteriores más pequeñas.—*Car. espec.* Planta pubescente-glandulosa: ho-
« jas brevemente pecioladas, ovado-lanceoladas, dentadas, en forma de cuña:
« bracteas lineares-lanceoladas, de bordes trasparentes: corola escarlata de
« tres centímetros, de tubo muy saliente.»

La espinosilla es una planta perenne, de altura variable, pero nunca pasando de un metro, de raíz pivotante, algo flexuosa, de superficie blanca cubierta de rugosidades, de donde nacen raicillas secundarias muy delgadas, y bastante separadas entre sí. El meditulio es ligeramente teñido en amarillo; se encuentra formado por hacecillos de fibras planas, perceptibles á la simple vista, y pudiéndose separar unos de otros con facilidad: dichos hacecillos, á su vez, están formados por otros más pequeños. El tallo es recto, cilíndrico, sub-leñoso, ramoso, cubierto de muy pequeños pelos blancos, que comunican á la planta un color cenizo: al microscopio aparecen trasparentes y llenos de un liquido incoloro. La parte cortical se separa fácilmente de la leñosa.

Hojas simples, persistentes, formando una espiral, en que cada una de ellas queda en línea recta con la sexta superior, y vice-versa; advirtiéndose esta disposicion mas bien en la cúspide de los ramos. No tienen estípulas; su peciolo es comprimido y canalado; de nervacion peninervada, de bordes aserrado-dentados: la cara superior es de un verde más oscuro que la inferior, y ambas cubiertas lo mismo que el tallo, de pelos glandulosos y blancos que las hacen ásperas al tacto. Las flores, estámino-pistiladas, forman grupos comunmente de á cuatro, colocados á distancias regulares; la parte inferior de ellas está rodeada por cinco bracteas. Cáliz monosépalo y membranoso. En cuanto á la corola, nada tengo que agregar á lo que queda dicho en los caractéres genéricos. Los estambres, en número de cinco, están formados por filamentos delgados, ligeramente subulados, tienen el mismo color purpurino de la corola, y se ven insertados en la base de ella, alternando con sus divisiones, y terminados por anteras oscilantes, biloculares, introrsas, llenas interiormente de un pólen muy fino, colorido en amarillo claro. Ovario libre, lampiño, compuesto de tres carpelos unidos por sus bordes, y doblados hácia dentro para formar otros tantos lóculos. El estilo tan saliente como los estambres, es filiforme, trífido: cada lóbulo lleva una pequeña estigma. Fruto capsular, constituido por tres cocas bivalvas, cuya dehiscencia se hace de arriba abajo.

En general, toda la planta es áspera, al grado de parecer espinosa, principalmente á medida que aumenta de edad. Su sabor es demasiado amargo, y en particular el de las hojas; pero el de la raíz al principio es dulce, y despues amargo.

Además de la especie anterior, que es la sola usada en México, tenemos en diferentes puntos de la República otras: como la *Lœselia glandulosa,* que crece en tierra caliente. La *L. cœrulea,* en los alrededores de esta capital, llamada vulgarmente Banderilla. La *L. rupestris,* en Oaxaca. La *L. ciliata,* en Veracruz. La *L. involucrata,* en Acapulco, y la *L. amplectens* entre San Blas y Tepic.

Seria de desear, que un estudio comparativo nos mostrara si sus propiedades medicinales concuerdan con la analogía botánica que las une.

Analisis.—Despues de secar perfectamente los ramos y hojas de la planta, lo reduje todo á polvo grueso, y coloqué en un aparato de lexiviacion; en seguida lo traté por el éter sulfúrico á 62°, de cuya operacion obtuve una solucion de un verde esmeralda muy hermoso, la que evaporada espontáneamente, dejó un extracto negro, que por varias experiencias me dió clorofila, sustancia grasa en muy pequeña cantidad, materia amarga y resina.

El modo como separé esta última, es el siguiente: el extracto etéreo fué sometido á la accion del alcohol á 85°, que disolvió una parte, y evaporada esta solucion, dió una segunda materia, á la que vertí agua hirviendo, con el objeto de separar todo lo que tuviera de soluble en este vehículo; repitiendo por varias veces el mismo tratamiento, es decir, solucion en el alcohol, evaporacion y lavado con el agua hirviendo, obtuve la resina que en seguida reconocí.

Pertenece á las resinas que Unverdorben denomina medianamente electro-negativas: su color es moreno-oscuro, insípida é inodora, soluble en el éter y en el alcohol; la solucion en este último enrojece á frio el tornasol; se disuelve tambien en los álcalis y se combina con ellos; pero su solucion en el amoniaco, puesta á hervir, la abandona prontamente: el ácido sulfúrico la colora en rojo, y el azótico en amarillo.

Terminada la lexiviacion por el éter, el residuo me sirvió para igual operacion con el alcohol á 85°, que me dió una tintura de un color rojo vinoso, la que evaporé á una temperatura moderada, y dejó un extracto amarillo rojizo, de un sabor muy amargo y persistente, compuesto de una materia colorante amarilla, extractivo amargo y huellas de tanino.

Siguiendo aún el método de los disolventes, que fué el que me propuse desde el principio, á la parte que todavía quedaba en el aparato, puse agua á la temperatura de 20°, y á continuacion procedí á reconocer lo que se habia disuelto, dándome principalmente, goma y materia azucarada.

Agotado el polvo por estos diversos medios, quedó blanco, lo que probaba que allí solo habia esqueleto vegetal.

Tambien examiné la raíz, la que tiene la propiedad de teñir el agua intensamente de amarillo, debido á la mayor proporcion de la materia colorante; y contiene, albumina, materia amarilla, mucilago, azúcar y extractivo amargo.

Hice varias tentativas para buscar algun ácido ó álcali vegetal, pero todas mis indagaciones fueron inútiles, debido tal vez á la falta de aparatos, y sobre todo, de conocimientos prácticos en este género de operaciones.

Sometida la planta á la incineracion, me dió 5, 50 por 100 de cenizas, compuestas de los ácidos sulfúrico, clorohidrico y carbónico, y de las bases potasa, cal, magnesia y óxido de fierro.

ACCION FISIOLÓGICA.—Ingerida en cocimiento fuerte de 250 á 500 gramos, se nota una sensacion de calor en el estómago, aun cuando haya sido tomada á frio; poco despues se aumentan las fuerzas, siguiendo á este período la secrecion de un sudor abundante. La resina tiene una accion emeto-catártica bien marcada.

LAS ROCAS DE TECALI,

POR EL SEÑOR DON MARIANO BARCENA,

SOCIO DE NUMERO.

En la última Exposicion Municipal se exhibieron algunas muestras de alabastro calizo, procedentes de las canteras de Tecali, en el Estado de Puebla, que llamaron la atencion del público por la belleza y variedad de sus colores. Desde entónces me propuse hacer un estudio de esas rocas, pero no me habia sido posible concluirlo, hasta hoy que tengo el honor de presentarlo á esta Sociedad, en cumplimiento del turno de lectura que se me señaló para esta sesion.

Las rocas de Tecali presentan una infinidad de variedades por sus colores, aun en las losas que se extraen de un mismo banco, y para hacer el estudio del tipo ó especie mineralógica, escogí un ejemplar bastante puro que presentaba los caractéres siguientes:

Figura en masa; color blanco, ligeramente agrisado. Lustre de cera que pasa al de seda en las fibras trasversales. Textura desigual, astillosa; la trasversal es semejante á la del yeso fibroso; dureza de 4,50. Dócil, el polvo de la raspadura es más blanco que el color general de la masa; trasluciente en alto grado, pues colocando una lámpara pequeña detras de un *bloc* que tenia $0,^{m}15$ de espesor, he podido ver con claridad un papel escrito que habia puesto en la parte anterior; peso específico de 2,90.

Tratado al soplete se pone opaco, y al enfriarse queda ligeramente listado de pardo rojizo claro. Calentado en un tubo abierto, desprende ácido carbónico y queda al estado de cal cáustica.

En dos análisis que hice del ejemplar referido, encontré por término medio la siguiente composicion:

Cal.	55,00
Magnesia.	1,25
Acido carbónico.	42,40
Acido sulfúrico.	1,25
Pérdida.	0,10
	100,00

Las rocas jaspeadas tienen, además de los compuestos anteriores, óxidos de hierro y de manganeso, en proporciones variables. Los dibujos caprichosos que forman estas materias colorantes, así como los diversos grados de opacidad y trasparencia que presentan las losas pulidas, les dan ese aspecto raro y elegante que constituye su indescribible belleza. Los dibujos más comunes son de nubes, flamas y manchas de todas dimensiones. Las nubes se presentan de diversas maneras y con grados variables de intensidad; á veces están bastante detalladas, y sus contornos terminan bruscamente como en los *cúmulos*, ó se desvanecen y se pierden gradualmente como los *cirrus*. La superposicion de estos grados extremos, y de otros muchos intermedios, unida á la diferencia de opacidad, que cité ántes, producen efectos verdaderamente indescribibles. Sobre las nubes se ven tambien algunos jaspes de diversas figuras que completan los cuadros más variados en que la fantasía puede encontrar los castillos de la edad média ó las ruinas de los templos y poblaciones antiguas. Este efecto es todavía más admirable en algunas muestras en que, por la diferencia de intensidad en los contornos, se pueden apreciar las diversas distancias que por este medio logra representar en sus cuadros un buen artista. Los colores de estos dibujos varian partiendo del verde puerro, del rojo pardusco y del pardo cetrino. El verde manzana es uno de los que se presentan con más frecuencia en las rocas traslucientes, en las que el rojo es tambien más suave y se mezcla á veces con un tinte ligeramente violado que lo hace aun más vistoso.

Estos colores tienen mayor intensidad y presentan figuras más detalladas en los bordes de las resquebrajaduras que tienen algunas masas, y por las cuales se filtraron probablemente las aguas que llevaban las materias colorantes en suspension.

En las masas blancas los dibujos están formados por manchas opacas de diversas figuras.

Las rocas de que me ocupo deben clasificarse, por su composicion, en el grupo y especie del *calcite*, pues las proporciones que encontré de cal y de ácido carbónico, se aproximan bastante á las del carbonato de cal puro, en en el que hay 56 p$\frac{o}{o}$ de base y 44 de ácido. Clasificadas despues por su textura, su trasparencia y otros de los caractéres físicos que cité ántes, deben referirse á la *seccion de la caliza estilaticia* y á la variedad *alabastro calizo*.

Las canteras de Tecali están situadas á inmediaciones del pueblo de este nombre, en el referido Estado de Puebla. En un informe que presentó hace poco tiempo el Sr. D. Patricio Murphy, á la actual compañía explotadora de esas canteras, menciona tres yacimientos principales, que se conocen con los nombres de «La Pedrera,» «Tlahualco» y «Aratleta.» El yacimiento de más importancia es el de la «Pedrera,» que se halla á dos leguas S. O. de Tecali y á siete de Puebla. Segun el Sr. Murphy, la masa de la montaña está formada de capas alternativas de alabastro y de calizas arcillosas, margas y arenas. Las masas de alabastro que están a la vista son de grandes dimensiones, y aseguran, por tanto, una dilatada y provechosa explotacion.

Actualmente hay una exposicion de estos alabastros en la casa núm. 8 de la calle de Gante, en esta capital. Las muestras que he visto allí son excesivamente hermosas y de varias dimensiones.

La explotacion de esas canteras habia sido abandonada por muchos años; pero últimamente ha renacido, y con las mejores condiciones, debiéndose este resultado á los loables esfuerzos del ilustrado Sr. D. José Julian Gutierrez, á quien tengo que agradecer las muestras en que hice el estudio que acabo de mencionar.

Muchas personas ilustradas de esta capital, apreciando el mérito de los alabastros de Tecali, se han apresurado á comprar diversas muestras para adornar los tocadores y otros muebles, así como para enlosar las escaleras y salones. En esta última aplicacion es donde puede conocerse la gran variedad de colores y dibujos que presentan esas rocas, pues en una muestra de enlosado que vi hace pocos dias, no me fué posible encontrar dos ejemplares iguales, y la reunion de todos formaba un elegante y vistoso mosaico.

Es de esperarse que se generalizará el uso de estas rocas, que participando de la belleza y trasparencia de los alabastros, propiamente dichos, ó *yesosos*, tienen mayor dureza que éstos, y pueden, por tanto, emplearse como el mármol y aceptarse como una bellísima roca de adorno.

México, Febrero 12 de 1874.

ESTUDIO

SOBRE LOS

ÓRGANOS LUMINOSOS DE LOS CUCUYOS DE VERACRUZ,

POR EL SEÑOR DOCTOR CARLOS HEINEMANN.

Los órganos luminosos de los Lampirídeos alemanes han sido examinados por los Doctores Leydig, Kölliker y Maxe Schultze; mas de los insectos luminosos exóticos, faltan completamente observaciones exactas, no obstante de que serian más fáciles por tener algunos de ellos un tamaño regular. Las siguientes líneas las he escrito con objeto de llenar este vacío, hasta donde alcancen mis conocimientos: comienzo por los *Elaterideos luminosos,* los Cucuyos de la América tropical, que pertenecen á la familia de los *Pirophorus.*

En las cercanías de Veracruz se encuentran dos especies de este grupo, que solamente se diferencian por su tamaño; los mayores tienen más de tres centímetros, y los menores hasta dos centímetros cinco milímetros; su color es dorado oscuro, poco brillante y cubiertos con una borra fina gris amarillenta: mis conocimientos entomológicos, no son suficientes para hacer una descripcion más completa de las especies.

Admira que un fenómeno tan hermoso como el brillo de los Cucuyos no haya estimulado á los naturalistas viajeros á examinarlo con algun detenimiento. Para el mayor número de los que en él se han fijado, ha pasado desapercibido el mayor de los órganos luminosos que existen, y algunos han creido dotada de esta propiedad toda la cavidad del vientre. Lacordaire (Milne Edwards, Lecciones) vió ciertamente los tres órganos, mas colocó equivocadamente el gran órgano del vientre en la parte plana é inferior de la extremidad posterior del metatórax.

El vuelo de la especie pequeña dura de fines de Marzo á fines de Mayo; el de la mayor, de fines de Abril á fines de Junio, mas su duracion se acorta si las lluvias son fuertes y tempranas. Si se les priva de la libertad, sujetándolas á un cautiverio, solo viven á lo más cuatro semanas: se acostumbra alimentarlas en este estado, con la caña de azúcar, madera podrida y las hermosas flores de la *Plumeria*, bañándolos una vez todos los dias en agua fresca. Los lugares que prefieren para vivir, son los bosques y matorrales, mas suelen alejarse á veces de estos parajes. Segun mis propias observaciones y las noticias que he recibido, podemos afirmar que los Cucuyos habitan la zona más cálida de la *tierra caliente;* las costas son, pues, en México, su verdadero país natal. Precisando más los límites de su distribucion geográfica, dirémos, que siguiendo la vía que conduce de México á Veracruz, pasando por Orizaba, solo se extienden hasta el Chiquihuite, á pesar de que la zona caliente comprende aún seis leguas más al O. hasta llegar á Córdoba. La larva, que hasta ahora no me ha sido posible examinar, vive en la madera podrida que tanto abunda en los bosques, y algunas veces tambien en la caña de azúcar; pero es completamente errónea la creencia, segun las observaciones de personas competentes de este lugar, de que la aparicion del Cucuyo esté sujeta al cultivo de aquella gramínea.

Es verdaderamente hermoso el espectáculo que ofrecen los bosques en las noches oscuras, iluminados con la fosforescencia de estos insectos, siendo entónces cuando se manifiesta con toda su intensidad; se cree uno trasportado á los bosques encantados de los cuentos fabulosos, en donde cada hoja de los árboles está cubierta de lucientes piedras preciosas, contribuyendo á aumentar á esta ilusion, la magnitud de los órganos luminosos y la estabilidad de la luz.

Llama la atencion del obsevador, que miéntras los Lampirideos al revolotear esparcen una luz intermitente, la de los Cucuyos es constante y viva, principalmente cuando vuelan. Mas privándolos de su libertad, se nota como en los primeros, que su luz aumenta y disminuye alternativamente de intensidad. Se ignora cómo se ejecuta en los Lampirideos este cambio de luz, y sorprende la diferencia que bajo este respecto existe entre unos y otros insectos.

La luz del Cucuyo es característica, y su color es verde claro, con algunos tintes amarillentos; se asemeja bastante á la de un fuego artificial preparado con el clorato de barita. La de los Lampirideos observados aquí, ofrecen gradaciones distintas del amarillo al azul.

Los Cucuyos son animales nocturnos que lucen desde el crepúsculo de la tarde al de la mañana; pueden, sin embargo, emitir tambien su luz cuando se les despierta, volviendo á poco á quedar en reposo. Es digno de notarse que el adormecimiento y la falta de fosforescencia, cesan tanto á la luz del dia como á la luz artificial. Algunas veces he puesto un Cucuyo que emitia una luz bastante viva, cerca de una lámpara ordinaria de petróleo, y en un cuarto de hora se han paralizado movimiento y lucidez: alejando la luz han vuelto á ponerse en accion ambas funciones despues de un corto intervalo. Igualmente obra la luz de la luna; por esta razon solo se les ve animados en las partes oscuras de los bosques en donde no penetran los rayos de aquel astro. No es exageracion de los viajeros el decir que durante las noches oscuras alumbran los caminos, pues yo mismo lo he observado y aun he podido leer, aunque con trabajo, á la luz de estos insectos.

Separado el órgano luminoso del cuerpo de estos animales, continúa luciendo por algun tiempo, como es sabido sucede tambien con el de los Lampirideos: cuando se llega á extinguir la luz, se puede aún avivar por el frotamiento.

Despues de las anteriores observaciones, que me pareció interesante exponer, voy á ocuparme de la descripcion de los mencionados órganos, advirtiendo que me refiero á los de la especie de mayor tamaño.

Su número es de tres, dos simétricos en el protórax, cerca de sus bordes externos, y colocados en sus ángulos salientes; uno impar y más grande en el abdómen. Los torácicos están reunidos bajo la membrana *kitinosa* sólida, presentando al exterior dos manchas de forma elíptica, algo convexas, blanco-amarillentas, trasparentes y semejantes á las *ocelas* de los Lepidópteros; su mayor diámetro está inclinado hácia afuera del eje longitudinal del cuerpo, y su longitud es de 6,5^{mm}.

Para inteligencia de la situacion del aparato luminoso, que á pesar de ser el mayor, habia pasado desapercibido, es preciso fijarse en una particularidad de nuestro Cucuyo, que ignoro si existirá tambien en las demas especies: consiste en que el metatórax y el abdómen, estando unidos solamente por el dorso, el insecto puede levantar el último hácia arriba; de lo que resulta, que la mayor parte de su extremidad libre y plana, que tiene poco más ó ménos la forma de un triángulo isósceles, es visible hácia adelante y abajo. En esta extremidad, cuyo lado desigual, más largo y algo encorvado, es el superior, está colocado el aparato luminoso entre una faja delgada que nace cerca del segmento final del primer anillo central y su borde arqueado. Mas como el Cucuyo solo puede ejecutar el movimiento referido, cuando vuela, pues en el reposo se lo impiden los elitros, se comprende que durante el cautiverio debe aquel órgano permanecer oculto. La parte superior de él está cubierta además por la membrana *kitinosa* del cuerpo, que no es de naturaleza córnea, sino una simple película delgada, que vista al microscopio, presenta una estructura amorfa, y que se puede separar en el estado fresco, aunque con cuidado, por la accion de los ácidos y de los álcalis. En el macho ocupa enteramente la seccion trasversal del abdómen, en la parte mayor de abajo que permanece libre: en la hembra es más pequeño. Su forma es la de una placa triangular simétricamente desarrollada en sus dos mitades, como lo indica un surco longitudinal ligero y escotaduras superficiales, dispuestas superior é inferiormente; formando ángulo recto con ellas, corre una línea horizontal que divide la placa en dos porciones pequeñas arriba y dos grandes abajo: en el macho el órgano tiene hasta 6,5^{mm} en su lado mayor que es el superior. Los pectorales son tambien placas delgadas de la forma de las *ocelas* ya mencionadas é inmediatos á ellas.

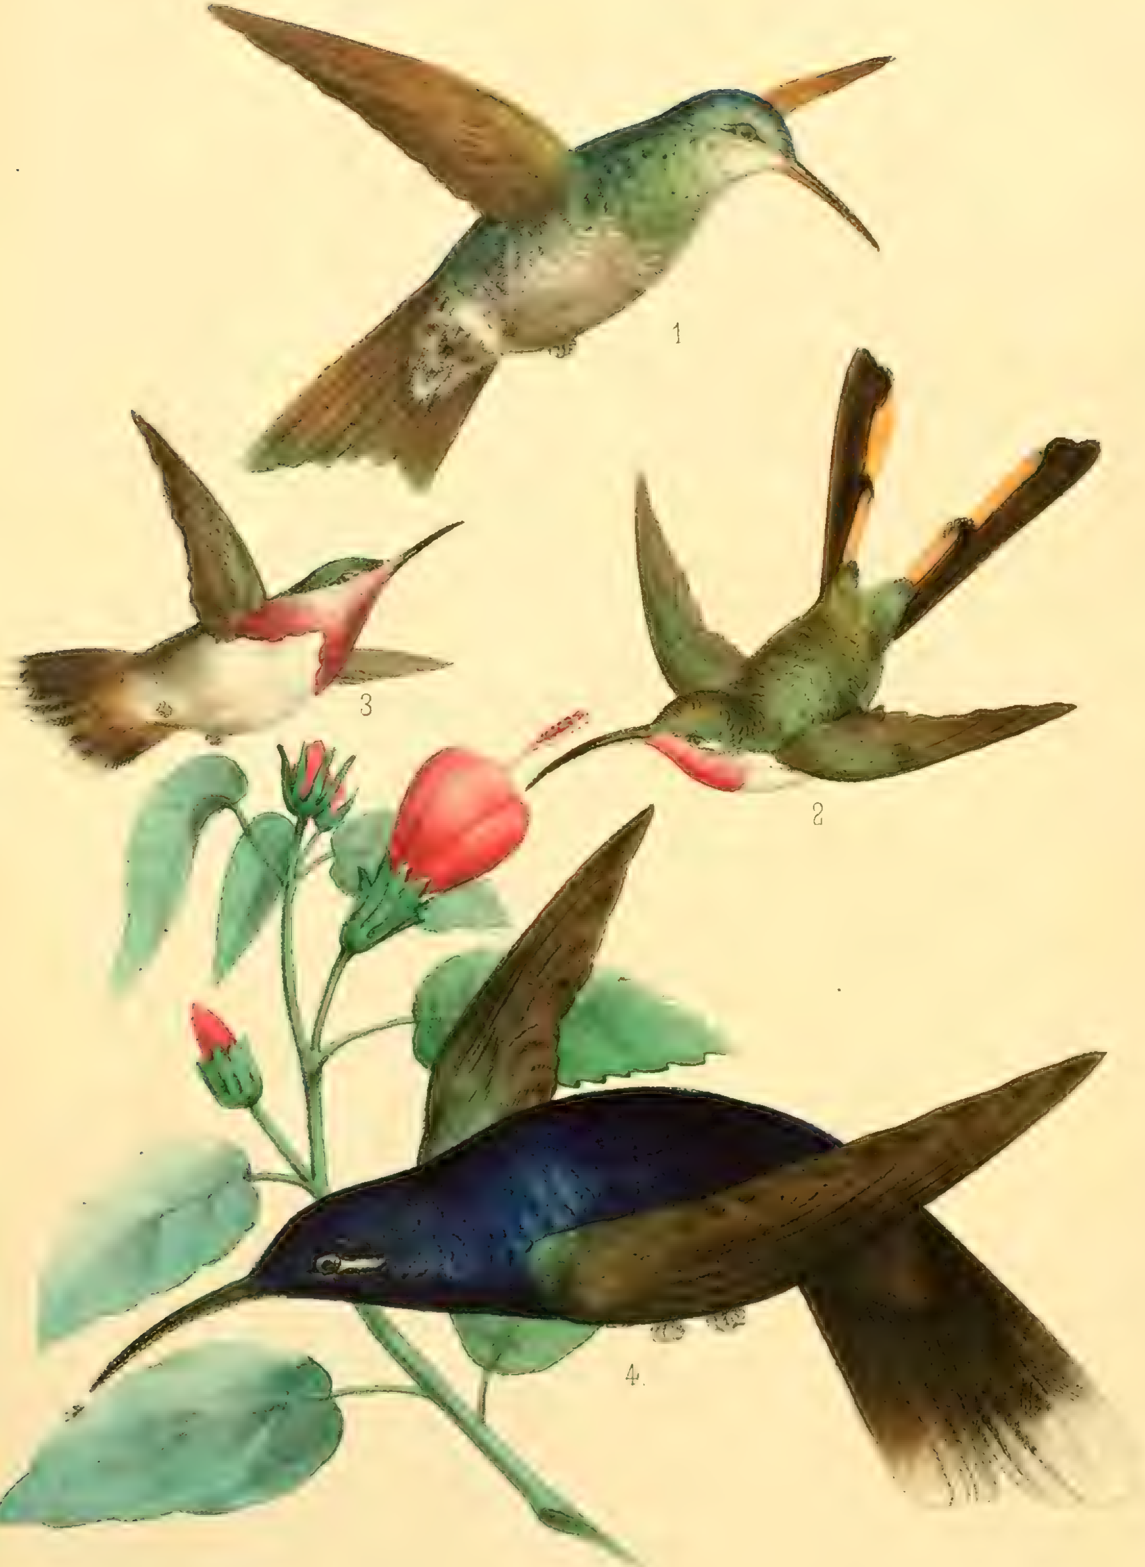
Las descripciones siguientes se refieren á los órganos abdominales, que son fáciles de preparar, habiéndome cerciorado ántes, sin embargo, de la igual estructura de unos y otros. Se distingue en ellos dos capas diferentes, por su color y trasparencia como en los Lampirideos europeos: una anterior, gruesa, brillante y de un color amarillo claro, debido á un pigmento que cuando luce adquiere alguna trasparencia; otra posterior más delgada, blanca como la cal, y sin brillo: están tan íntimamente unidas entre sí, que no se pueden separar bien, ni aun usando una solucion de potasa á 35%.

El exámen microscópico lo hice en los órganos frescos, sin añadir más líquido que el suero artificial, y en la sangre del Cucuyo. Las celdillas luminosas de la capa anterior, son de formacion más sólida que la de los Lampirideos europeos, pues en las preparaciones para separarlas, se distinguen sin agregarles líquido alguno, como grumos arredondados; cuando se les añade agua, se deshacen rápidamente. El campo visual se ve entónces cubierto de pequeñas granulaciones finas y contorneadas, animadas de movimientos moleculares y gruesas gotas que desvian fuertemente la luz: en agua azucarada se conservan las celdillas más largo tiempo; en el suero artificial (pues el líquido natural amnios, no se podia obtener en buen estado por la distancia del rastro y la elevacion de temperatura) y en la sangre del Cucuyo se observan hermosas figuras, apareciendo las celdillas de formas redondas y alargadas, con un diámetro de 0,025 de mil. ó 0,0425 id.; están compuestas de una sustancia granulosa muy fina, encerrando un núcleo arredondado, y que á su vez contiene, ya un nucleolo ó una masa tambien finamente granulosa: no se les advierte cubierta membranosa alguna. Afectan raras veces la forma poliédrica, pues á menudo son paralelógramos con los ángulos arredondados: he adquirido la conviccion, despues de observaciones continuadas, que el cambio de la forma arredondada ó alargada, así como de la piriforme ó folioide, bajo las que aparecen las celdillas, son debidas á desgarramientos que experimentan durante la preparacion, y por la presion entre los vidrios. No pude en ellos apreciar jamas relieves ni aun con mayores aumentos. Prolongando la accion del suero se nota en la sustancia celular un cambio característico, y consiste en que las celdillas toman una apariencia radiada, con sus muescas correspondientes sumamente finas en el borde aparente de las celdillas, dependiendo esto quizá, á plegamientos que parten de un punto sólido, ó desgarraduras que siguen aquella disposicion. Al evaporarse el líquido agregado y aumentando la presion de los vidrios, se deshacen con cierto sacudimiento, lo que hace probable estén unidas las partes sólidas y las líquidas. La masa que ha salido, contiene en primer lugar, una gran cantidad de los nucleólos arriba mencionados; en segundo, vesículas pálidas ó gotas, llenas las más de nucleólos animados de movimiento molecular, y las otras desprovistas de ellos; tercera, las ya referidas gotas que desvian fuertemente la luz: hay que advertir, que en las celdillas frescas no destruidas, jamas se nota movimiento molecular.

Lo que he observado de reacciones micro-químicas en las celdillas, se reduce á lo siguiente: el ácido sulfúrico las disuelve rápidamente, quedando visibles las tráqueas; el mismo efecto produce el ácido sulfúrico y la azúcar; solo que en algunos lugares el líquido toma un color rosado: si se deja penetrar la más corta cantidad de ácido sulfúrico entre los vidrios en que está puesta la preparacion en agua de azúcar, se consigue mantener las celdillas por algun tiempo bajo un aspecto hermoso, y puede uno asegurarse de que su coloracion es roja. Esta observacion está en contradiccion con las comunicadas á Milne Edwards (Lecciones, tomo 8, pág. 105), por Macaire, y no dudo que esta misma reaccion se verifique en las celdillas luminosas de los Lampirideos. La solucion acuosa de yodo no produce esta coloracion, ni aun con ácido sulfúrico. El ácido acético da mayor trasparencia y los núcleos se perciben mejor; prolongando su accion, éstos desaparecen poco á poco hasta perderse enteramente. La mezcla de ácido acético concentrado, de Moleschott, aclara tambien bastante, y aun despues de cuarenta y ocho horas de accion, las celdillas y núcleos quedan visibles, miéntras las tráqueas han desaparecido.

La lejía de potasa á 35 % da una trasparencia perfecta á la masa celular, y finamente granulada, determinando inmediatamente el aspecto radiado de que se ha hecho mencion. Dejando penetrar agua entre los vidrios, se disuelven las celdillas, quedando únicamente las ramificaciones admirables y numerosas de las tráqueas.

(Concluirá.)



1. Amazilia Ocai.

2. Taumastura Elizæ.

3. Selasphorus Heloisæ.

4. Campylopterus Delattrie.

[illegible]

ENSAYO ORNITOLOGICO

DE LA FAMILIA TROCHILIDÆ

O SEA DE LOS COLIBRIES O CHUPAMIRTOS DE MEXICO,

POR EL SEÑOR

D. RAFAEL MONTES DE OCA, SOCIO DE NUMERO.

IDEA GENERAL DE DICHAS AVES Y USO QUE HACIAN DE SUS PLUMAS LOS ANTIGUOS MEXICANOS.

Esta familia de pequeños séres plumados, es una de aquellas que han llamado la atencion de todos los naturalistas, tanto por su diminuto tamaño, como por la brillantez de sus variados plumajes y modo de vivir.

Los antiguos mexicanos, admiradores de la belleza de estas pequeñas aves, las llamaron emanaciones de los rayos del sol, y usaban sus plumas como cosa muy delicada para adorno de sus mejores capas y vestidos de sus novias; y los tarascos, debido al gran número que de ellas habia en su territorio, llamaron á su capital *Tzinzunzan*, nombre con que las designaban, y empleaban sus plumas para adornar á sus dioses; así como tambien para hacer una especie de mosaicos ó pinturas, de una belleza y mérito extraordinarios, lo cual prueba que esos indígenas tenian un talento exquisito para la pintura.

Esos trabajos, ántes de la conquista los hacian pegando un sinnúmero de plumitas, muchas de ellas no más grandes que la cabeza de un alfiler, en una tela que sacaban de la hoja del maguey, formando en ella paisajes, flores, etc., y despues en hojas de lata que trajeron los españoles; mas es de sentirse, que al presente, tales trabajos solo se practiquen en escala muy pequeña.

Mucho se ha dicho en casi todos los idiomas acerca de estas joyas animadas, pero toda descripcion es débil al hablar de sus metálicos colores, pues aun las piedras preciosas, casi quedan deslumbradas á su lado, y muy bien pudiera decirse, que no ha habido jamas quien al contemplar por primera vez una de ellas, no haya prorumpido en exclamaciones de admiracion hácia Aquel que á la naturaleza dió poder para crear séres tan pequeños, que con su vuelo surcan el viento á manera de exhalaciones.

Hasta hoy los museos europeos poseen como unas 400 especies bien determinadas de estas avecitas, de las cuales pasan de 40 las que se hallan en México, siendo de las más raras conocidas, el *Eupherusa Poliocerca* y *Cyanomyia viridifrons*, descritas por el Sr. Elliot el año antepasado, y el *Hemistilbon Ocai* ó *Amazilia Ocai*, Gould.—Vol. V, pág. 289, Monografía de los Colibríes.

De esta última especie es muy probable que no haya hasta hoy más que un ejemplar llevado por el que esto escribe á Inglaterra, para la coleccion del Sr. Gould, que es el naturalista que con mejor éxito ha logrado la descripcion de estas aves, particularmente en la parte ilustrada, en que los colores metálicos están tan bien imitados, que solo la hermosura de los ejemplares naturales puede exceder.

DESCRIPCION DE LOS COLIBRIES QUE SE ENCUENTRAN EN MEXICO.

Num. 1.—*Chupamirto de garganta blanca y pecho verde-mar.*

Amazilia Ocai, Gould.

Hasta el presente, solo existe un ejemplar de este hermoso colibrí, en la coleccion del Sr. Gould, el cual fué llevado á Europa por el que esto escribe, y que ha tenido la honra de ver tan distinguida avecita, apellidada con su nombre por aquel hábil naturalista.

Extraño parece que no se haya podido aún encontrar otro ejemplar semejante, y con tal motivo, bien puede aventurarse la idea de que ésta sea el producto extraordinario de la union de algun individuo de la *Cyanomyia cyanocephala*, con otro de la *Amazilia berillina*, con los cuales tiene mucha semejanza en los caractéres específicos, en la apariencia de los colores que la adornan, así como por haberse encontrado en el mismo lugar en que se hallan aquellas, y gustando, por decirlo así, en familia, hasta en las corolas de las mismas flores que de preferencia parece apetecen tales especies.

La apariencia del color del *Ocai*, en la parte de encima de la cabeza, los lados de ésta, su garganta y pecho, es verde-mar metálico hermosísimo, un poco más azulado en lo que corresponde á la parte superior de la cabeza, con algunas de las bases de las plumas de la garganta, blancas, que le forman una especie de mancha ó salpicado de blanco sedoso cerca del pico; la parte de encima del cuello y del cuerpo, verde lustroso, un poco aceitunado; vientre pardo ferruginoso; las cubiertas de la cola, así como las de encima y debajo de las alas, verde bronceadas; cola del mismo color, pero un poco pardusco, con las bases de sus plumas por debajo de un color castaño rojizo; cubiertas de debajo de ésta, un poco bronceadas y marginadas de un color blanquecino; alas pardo-purpúreas, con las bases de las plumas secundarias, de color pardo rojizo oscuro, muy semejantes á las del *Amazilia berillina*; pico oscuro, con la mandíbula inferior un poco más clara; patas pardas y uñas negras.

Su tamaño, desde la punta del pico hasta la extremidad de la cola, es de 4¼ pulgadas; alas 2¼; cola 1¼, y pico casi recto ¾ id.

Esta descripcion corresponde al macho habido, pues la hembra es desconocida, y por lo que se ve, su tamaño es exactamente igual al del *cyanocephala* y al del *berillina*.

La planta representada en la ilustracion adjunta, es el *Malvaviscus mollis*, vulgarmente Mazapan.

Num 2.—*Chupamirto de cola de tijera.*

Taumastura Elizæ, Gould; (mexican shear-tail); *Trochilus Elizæ*,
Lesson; *Mirtis Elisa*, Reichemb.; *Lucifer Elisa*, Bonap.

Este colibrí es uno de los más raros que se hallan en México; pequeño, pero muy hermoso, y acaso de los más difíciles de cazar, por su diminuto tamaño y extraordinaria velocidad de su vuelo, pues mueve sus alas con tanta rapidez, que casi no se le ven, y seria muy fácil confundirlo con una abeja grande, si no fuera por el extraño zumbido que producen sus alas al batirlas en el viento y lo largo de las plumas de su cola.

Visita estas regiones (de Jalapa) en los meses de Junio y Julio; es muy esquivo y singular en sus hábitos, pues diferente á los demas de su especie, se levanta sumamente temprano, porque los individuos que han estado bajo la observacion del que esto escribe, ha sido desde el amanecer hasta como las ocho de la mañana, ó desde las cuatro de la tarde hasta que ya casi ha oscurecido; siendo de notar, que son raros los que se encuentran durante el resto del dia, y que una vez que se les ve chupar la miel de las flores de una planta, por lo regular de Mazapan, es casi seguro encontrarlos por varios dias seguidos á la misma hora y en el mismo lugar; de manera que, si uno falla en el tiro la primera vez que los ve, no tiene más que esperarlo allí al dia siguiente, y debido á esta circunstancia, es como se pueden conseguir anualmente cuatro ó cinco ejemplares, aunque á veces ni aun esos.

Tambien se encuentran estos colibríes en las barrancas de Jico, á quince millas al Sur de aquí (Jalapa), cuyas barrancas, son probablemente, su lugar de incubacion, por ser allí donde se han encontrado los dos únicos nidos que se han podido llegar á ver; los cuales eran sumamente pequeños, redondos por la parte de abajo, con dos huevecillos ovalados algo largos en proporcion á su grueso, y grandes tambien en proporcion al tamaño de la hembra; mas en cuanto á su construccion, semejantes á todos los de su especie que se encuentran en esta latitud; cubiertos por fuera con el musgo de las peñas, y por dentro perfectamente arreglados con la seda ó algodon de la semilla del tule, *Cyperus*.

La apariencia del macho en cuanto á su color, es: en la parte de encima del cuerpo y las cubiertas de la cola, verde latonado brillante; sus alas color de tierra parda purpúrea algo lustrosas, pero pequeñas en proporcion al tamaño de las que tienen la generalidad de los de su especie, á lo cual debe atribuírsele la necesidad en la velocidad de su movimiento para el vuelo y su extraño zumbido; la cola es negra purpúrea, abierta en forma de tijeras, disminuyendo de dos en dos el tamaño de sus plumas hácia su centro, teniendo la segunda y tercera de cada lado, como la tercera parte de su ancho, de color castaño claro, sin llegar hasta la punta, dándoles á primera vista la figura de una espátula en la parte oscura; la cuarta pluma de cada lado es tambien de color castaño como el de las otras, con las puntas verduscas del color de las del centro, formando un total de 10. Su garganta es de color púrpura metálico hermosísimo; el pecho blanco no muy limpio; el vientre lo mismo, pero participando un poco más de cierto tinte castaño.

Su pico es negro, muy delgado, curvo y de ⅞ de pulgada de largo; sus patas y uñas tambien del mismo color.

El largo total del macho 3¾ de pulgada; cola 1⅝ id. y las alas 1½.

La hembra, en la parte de encima de la cabeza y del cuerpo, es del mismo color que el macho, así como su pecho y vientre tambien; con la diferencia que la hembra en algunos casos, ó mejor dicho, generalmente es un poco más grande que él, pero sin el hermoso color de púrpura de la garganta, y con la cola muy diferente, pues es casi redonda; sus plumas en su nacimiento, de color castaño, el resto de ellas negro con las puntas ribeteadas de blanco, excepto las dos del centro que son de color verde bronceado.

NUM. 3.—*Chupamirto de peto violado purpúreo.*

Selasphorus Heloisa, Gould; *Ornysmia Heloisa*, Lesson; *Mellisuga Heloisa*, Gray y Mitch; *Typhæna Heloisa*, Bonap.

Este hermoso colibrí, segun dice el Sr. Gould, es un intermediario entre el Calothórax y el Selasphorus, difícil de saber á cuál de los dos pertenece; pues por su color y tamaño se parece al primero, y por la forma de la cola al segundo; circunstancia que ha motivado que algunos naturalistas hayan formado de él el tipo de un género nuevo.

El Sr. De Lattre fué el primero que dió á conocer esta preciosa especie, que se la procuró durante su estancia en este país, y se encuentra en las inmediaciones de Jalapa, aunque con más abundancia cerca de Coatepec, siendo de notar que tambien visita algunas veces el Valle de México.

La apariencia del macho es como sigue: la cabeza, la parte superior del cuello, el cuerpo y las cubiertas de las alas, de un color pardo verdusco bronceado; alas pardo-purpúreas; las dos plumas del centro de la cola con verde bronceado, las demas de color castaño en su base, teniendo en seguida una porcion ó faja negra oblicua, con visos bronceados en la parte en que se unen ambos colores, con las puntas blancas, disminuyendo gradualmente la porcion de este color en las que están más hácia el centro; su garganta es color de rosa purpúreo metálico, con visos violados hermosísimos en las plumas de los lados de ella, las cuales de una apariencia escamosa, son mucho más largas que las del centro y le forman una especie de ráfaga; el pecho lo tiene casi blanco; abdómen y cubiertas de debajo de la cola, del mismo color, pero un poco más pardusco en la parte del abdómen; cubiertas de debajo de las alas y flancos de color castaño claro; patas claras, y uñas y pico negros.

Su largo total, desde la punta del pico hasta la extremidad de la cola, es 3 pulgadas, 2 líneas; alas $1\frac{5}{8}$ de pulgadas; cola $\frac{3}{4}$ id.; pico un poco más de media pulgada.

La hembra es muy semejante al macho, y solo se diferencia de él en que carece del hermoso tinte del pecho, teniendo en su lugar un color blanco no muy puro.

El macho jóven es tambien casi igual á la hembra, diferenciándose de ésta, en que tiene unas manchitas pardas en la parte blanca de la garganta; el lugar de éstas, se cubre despues gradualmente con el hermoso color metálico del macho.

El nido es muy semejante á los que fabrican las demas especies que nidifican en la region del centro de Veracruz, con solo la diferencia de ser un poco más pequeño.

Num. 4.—*Chupamirto real azul.*

Campylopterus De Lattrie, Gould; *Mellisuga De Lattrie*, Gray; *De Lattres Sabre-wing*, Gould. Parte X, Monografía de los Colibríes.

Esta clase de colibríes, conocida en México vulgarmente con el nombre arriba citado, se encuentra en abundancia en las inmediaciones de Jalapa, en los meses de Octubre y Noviembre, y por lo regular, siempre chupando el néctar de las flores del *mazapan*. No es de aquellas aves que por lo regular se levantan temprano á buscar que comer, pues que pocos son los individuos de esta especie que se encuentran ántes de las nueve de la mañana; mas desde esta hora hasta poco despues de medio dia, parece ser cuando toman su alimento.

Durante ese tiempo, muy poco se les ve posar en un lugar, porque despues de haber gustado en el cáliz de las flores de una planta de mazapan, pasan á otra rápidamente, describiendo en su tránsito un arco de círculo, casi tocando el suelo; de manera que, yendo á la caza de éstos, colocándose cerca de un lugar donde haya dichas plantas, en una mañana se pueden coger algunos ejemplares sin necesidad de andar buscándolos. En el resto del dia pocos individuos de éstos se ven, si no es hasta cerca de ponerse el sol; siendo muy probable que se retiran al monte cerrado y húmedo á comer cierta clase de mosquitos negros, que solo allí se hallan, y de los cuales muy á menudo se les encuentra el buche bien repleto al disecarlos.

Tambien se hallan ejemplares de esta clase en las inmediaciones de Coatepec, á corta distancia de esta ciudad (Jalapa), así como en los contornos de Córdoba y Orizaba.

Esta especie de avecitas es sumamente esquiva, pero fácil de domesticar, acaso por ser muy golosa, pues que apénas se les ha aprisionado en una jaula y provisto de una copita con miel, cuando ya se les ve acercarse á comer; pudiéndoseles conservar vivos hasta dos meses, y muriéndose probablemente por la falta de ejercicio.

Es muy notable en estos colibríes la aversion que un macho tiene á otro, pues casi nunca se encuentran dos, sin que ocurra una momentánea aérea pelea, digna de verse, que por lo regular comienza por una especie de chillido colérico, que les hace esponjar las plumas del cuello y aun las del cuerpo, abriendo la cola de una manera muy vistosa, y de allí pasan á los aletazos y picotazos, hasta que uno de los dos huye ó cae al suelo agobiado por su adversario.

Su localidad ó lugar de incubacion, aun no está determinado, y como tambien se encuentran ejemplares de éstos en Guatemala, queda á los naturalistas de ese país, informar si allí efectúan su nidificacion, puesto que parece que para allá emigra en los meses de Noviembre y Diciembre, y no se ha podido averiguar que en su peregrinacion vayan más al Norte de esta latitud.

El color de estos colibríes, en lo general de su cuerpo, es azul turquí oscuro metálico hermosísimo, excepto la parte de encima de la cabeza y las cubiertas de las alas y de la cola, que son verde-bronceado; las plumas de las alas y cola son negras purpúreas, teniendo las tres principales remeras de cada lado, unas venas sumamente anchas y fuertes, que parecen de ballena, y tres de las de cada lado de la cola, con las puntas como média pulgada blancas; las cubiertas de las piernas son tambien blancas, de apariencia sedosa; las patas negro-purpúreas, y las uñas y pico negro. Su tamaño, desde la punta del pico hasta la extremidad de la cola, es de 5¾ de pulgada, las alas 3⅛, la cola 2¼, y el pico curvo, de 1⅛ id.

El macho jóven es del mismo tamaño del adulto, y solo se diferencia de éste, en que carece de ese tinte general azul, que solo tiene en manchas más ó ménos grandes, que se generalizan en todo el cuerpo á medida que llega á la edad en que el verde bronceado que lo cubria se convierte en hermoso azul.

La hembra es como media pulgada más pequeña que el macho, y su color en la parte de encima de la cabeza, las cubiertas de las alas y de la cola, y toda la parte posterior del cuerpo, es verde bronceado como en el jóven; las alas y la cola negro-purpúreas como las del macho, con diferencia que las venas de las remeras son ménos anchas y fuertes, así como las puntas blancas que tienen algunas de las plumas de la cola son más pequeñas; tiene el pecho y la garganta de color gris claro; pero las plumas de la garganta con las puntas tintadas de azul que le forman una especie de mancha de este color; las plumas de las cubiertas de debajo de la cola son verde bronceado claro, teniendo una especie de ribete gris, y por último, las patas y pico son iguales en tamaño y color á las del macho.

NUM. 5.—*Chupamirto color de fuego.*

Trochilus colubris, Gould; *Trochilus colubris,* Linn.; *Le Rubis,* Buffon; *Mellisuga colubris,* Gray y Mitch.

Este colibrí, conocido vulgarmente en México con el nombre primeramente citado, se encuentra en gran abundancia en las inmediaciones de Jalapa y Coatepec, así como en el Valle de México, durante los meses de Setiembre y Octubre, y algunas veces hasta en Noviembre; mas el entusiasta naturalista americano Wilson, dice al describir esta especie como peculiar de los Estados-Unidos, que aquella es su localidad, pues ha visto individuos de dicha especie en el mes de Abril, y que comienzan á hacer sus nidos en las primeras semanas de Mayo, presumiendo que hacen dos posturas al año, porque ha encontrado tambien nidos con huevecillos á mediados de Julio. Esa presuncion puede corroborarla ahora el que esto escribe, por el hecho de que algunos cazadores del Valle de México le han mostrado los nidos cogidos por ellos en el mes de Setiembre. El Sr. Gould, en su Monografía de estas aves, dice tambien, que van hasta una latitud mucho más avanzada hácia el Norte de los Estados-Unidos, porque el Dr. Richardson las ha encontrado en las llanuras de Saskatchewan, en el Canadá, y el Sr. Drumond las ha visto nidificar tambien en los bancos del rio Elk; de donde se deduce, que esta es una especie emigrante, que probablemente hace las incursiones más grandes que ninguna otra de ellas, pues se dice que va á invernar á Guatemala, pasando por México en los meses expresados al principio de esta descripcion, y no cabe duda que es así, puesto que en el invierno no vuelve hácia el Norte; mas de esto se deriva la duda del tiempo en que hace su regreso de Guatemala hácia aquel rumbo, siendo así que en México solo se le ve una vez al año. ¿Debemos creer que su peregrinacion la hace durante la noche, como opina el Sr. Andubon, sin tener más pruebas de su aserto que su dicho? Bajo las circunstancias expresadas, tal vez debemos inclinarnos á pensar tambien así.

La apariencia del macho de esta especie, en cuanto á su color, es como sigue: la parte de encima de la cabeza y del cuerpo, las cubiertas de las alas y de la cola, así como las dos plumas del centro de ésta, verde bronceado pardusco, un poco más oscuro y ménos brillante encima de la cabeza; sus alas y cola, pardo-purpúreas; ésta algo horquillada, con las plumas que la forman terminando casi en punta; su garganta de un color de fuego metálico brillantísimo, teniendo una pequeña porcion cerca de la mandíbula inferior, parda muy oscura ó negro mate, que forma un verdadero contraste con el color brillante de la garganta; pecho blanco sucio que le forma una especie de collar; toda la parte inferior del cuerpo, pardo claro ferruginoso, tirando un poco á castaño con visos de verde bronceado, en los lados, cerca del nacimiento de las alas; la region anal la tiene cubierta de una especie de plumon blanco, y las cubiertas de debajo de la cola, de un color blanco sucio, con una manchita parda en el centro de cada pluma, muy poco marcada en la generalidad de ellas.

Su pico, patas y uñas, son negras; su largo total 3½ pulgadas; cola 1⅓ de id.; alas 1¾, y pico recto de ¾ id.

La hembra se parece al macho en lo general de su plumaje, pero está destituida del hermoso color de la garganta de éste, teniendo en su lugar una especie de blanco, que participa algo de un tinte entre castaño y pardo; y ademas las plumas de la cola que no son puntiaguadas, sino redondas, tres de cada lado de ella, tienen las puntas blancas.

El macho jóven, se parece mas á la hembra que al macho, diferenciándose de aquella, en que en el lugar en que éste tiene el color de fuego, se le ven unas manchitas pardas, con más ó ménos plumas color de fuego, intercaladas, cuyo número aumenta á medida que llega á la edad de adulto, que es cuando se le cubre la garganta de dicho color.

Num. 6.—*Chupamirto verde esmeralda.*

Amazilia Berilina, Gould; *Trochilus Berillinus*, Licht.; *Ornismya Arsinoë*, Less.; *Cynanthus Arsinoë*, Jard.

Este hermoso colibrí es otro de los peculiares de la region que abrazan los cantones de Jalapa, Córdoba y Orizaba, aunque tambien se encuentran en otros lugares del Estado de Veracruz, así como en el Valle de México; mas es de advertir, que los individuos de esta especie que se obtienen en esta última localidad, por lo regular son, desde un cuarto hasta media pulgada más pequeños que aquellos, en su largo total.

Esta clase de avecitas es bastante familiar con el hombre, pues sin aparentar miedo, se le acerca á gustar el néctar de las flores que se hallan en las casas de la ciudad de Jalapa; y aunque no es tan comun como el Cyanocéphala, se encuentra, sin embargo, durante casi todo el año, pero con más abundancia en los meses de Mayo, Junio y Julio, que es el tiempo en que nidifica, por cuyo motivo debe asignársele por localidad la region del centro del Estado de Veracruz.

La apariencia del color del macho de esta especie, es como sigue: la parte superior de la cabeza, los lados de ésta, la parte de encima del cuello y del cuerpo, la porcion anterior de las cubiertas de las alas, verde oscuro, que pasa gradualmente al hermoso color bronceado purpúreo de la parte posterior de las cubiertas de las alas y de la cola; alas pardo-purpúreas con las bases de las primarias y secundarias, muy marcadas de un tinte castaño rojizo; cola de color bronceado purpúreo; la garganta, la parte superior del cuello y del cuerpo, verde esmeralda metálico hermosísimo, que cerca de la region anal toma un tinte pardo castaño, el cual es ménos extenso en los machos adultos que en las hembras y machos jóvenes, y á veces tienen casi todo el vientre de ese color; las plumas que forman las cubiertas de debajo de la cola, son tambien de color castaño marginadas de blanco; las cubiertas de las piernas las forma una especie de plumon blanco; las patas, uñas y mandíbula superior del pico, son negras, y la mandíbula inferior color de carne, con la punta tambien negra.

El largo total de estas avecitas, desde la punta del pico hasta la extremidad de la cola, es de 4¼ pulgadas; alas 2¼; cola 1¼ idem, y pico casi recto, ¾ idem.

La hembra es muy semejante al macho, y solo se diferencia de éste, en que sus colores son un poco ménos brillantes, particularmente en la parte del vientre que por lo general es pardusca.

Sus nidos están formados por la parte interior, con los filamentos sedosos de la semilla del tule, *Cyperus*, y por fuera con el musgo de las peñas ó sea una especie de líquen.

NUM. 7.—*Chupamirto de pecho verde-mar matizado de blanco.*

Thaumatias Lerdi. (Especie nueva), Montes de Oca.

Este precioso y raro colibrí, se hallaba en la coleccion particular que posée el Sr. Blasio, de esta ciudad (México), el cual dice habérselo procurado hace algun tiempo, durante una expedicion que hizo en el Estado de Veracruz, en el lugar llamado Paso del Macho, no muy léjos de la costa; y como el que esto escribe ha encontrado que es una especie desconocida aún, perteneciente al género *Thaumatias*, de Gould, ha querido tener el gusto de designarlo con el apellido del digno actual Presidente de los Estados-Unidos mexicanos, el Sr. D. Sebastian Lerdo de Tejada, á quien tiene el honor de dedicar su hallazgo, como una prueba de afecto de su humilde paisano.

La apariencia de esta avecita es como sigue: la parte de encima de la cabeza, del cuello y del cuerpo, así como las cubiertas de las alas y de la cola, de un color pardo oscuro bronceado; alas pardo-purpureas; cola cuadrada de color pardo verdusco bronceado, con las puntas de sus plumas laterales, de un tinte un poco más claro, con una sombra más oscura en seguida de dicho tinte; las cubiertas de debajo de la cola, de color pardo claro ferruginoso, marginadas de blanco; su garganta, pecho y laterales del cuello, verde metálico hermosísimo, con reflejos de oro amarillento, teniendo, tanto las plumas del centro del pecho como las de la garganta, las bases blancas que le forman una mancha de dicho color, que va á unirse con una especie de media luna blanca pardusca que le cubre la parte baja del pecho; toda la parte inferior del cuerpo es pardo-oscura ferruginosa, con los lados un poco bronceados; la region anal la cubre una especie de plumon de color blanco sucio, teniendo tambien las cubiertas de las piernas de este mismo color.

Su largo total desde la punta del pico hasta la extremidad de la cola, es 3¾ de pulgada; alas 2¼ id.; cola 1¼; pico casi recto ⅝, con la mandíbula superior negra, la inferior color de carne, con la punta tambien negra; patas pardas y uñas bastante largas, negras.

La hembra, como debe comprenderse, es desconocida.

Num. 8.—*Chupamirto real de pecho color de vino.*

Lamprolaima Rhami, Gould (De Rham's Garnet); *Ornismya Rhami*, De Lattre y Lesson; *Mellisuga Rhami*, Gray y Mitch.; *Lampornis Rhami*, Bonaparte.

No hace muchos años que esta especie de Colibries era muy rara en México, porque en varias colecciones que habia tenido el que esto escribe, hasta el año de 1856, nunca habia podido reunir mas de tres ó cuatro ejemplares á la vez, y el Sr. Lesson, en sus obras, hace notar la misma rareza acerca de ellos; pero desde la fecha indicada hasta el presente, se han hecho bastante comunes en la falda del Cofre de Perote, cerca de Coatepec, y en las inmediaciones de Córdoba y Orizaba; mas sin embargo, no se ha podido encontrar por aquí ningun nido de ellos, y como cuando aparecen de súbito en estas regiones, en los meses de Junio y Julio, los machos jóvenes ya están perfectamente desarrollados, aunque en muchos casos carecen hasta cierto punto de los hermosos tintes azul turquí y vinado del pecho y garganta, puede desde luego confirmarse la opinion de otros naturalistas, que creen que su localidad es Guatemala, adonde tambien se encuentran; siendo muy probable que no pasan más al Sur de dicho país, así como tambien que no van más hácia el Norte de esta latitud (Jalapa), donde solo se encuentran raros ejemplares.

El Sr. Lesson es quien dió el nombre de *Rhami* á esta especie, en su «Revue Zoologique» de 1838, en honor del Sr. de Rham, de New-York.

La apariencia del color del macho adulto, en la parte de encima de la cabeza y del cuerpo, es verde oscuro brillante; las cubiertas de las alas y de la cola, tambien son verdes, pero un poco mas bronceadas; su garganta color de vino metálico hermosísimo, teniendo los lados de ella negro aterciopelado; el pecho azul turquí oscuro, metálico, tambien muy hermoso; el vientre negro sucio, con las plumas tintadas en sus puntas, de verde metálico, que en ciertas posiciones de la luz, le hacen aparecer de este color; sus alas son de un color castaño rojizo muy marcado, con las puntas de las principales remeras de cada lado, como la tercera parte de ellas, color de tierra, disminuyendo la porcion de este color á medida que disminuye el tamaño de sus plumas, hasta que las que se hallan más cerca de su cuerpo, solo tienen un filete muy pequeño; el color de la cola es negro uniforme purpúreo lustroso; las plumas de la cubierta inferior de ésta, del mismo color; pero algunas de ellas ribeteadas de blanco pardusco; las cubiertas de las piernas tambien son del mismo color, teniendo ademas una faja que va de una pierna á otra cerca de las cubiertas de debajo de la cola, de una especie de plumon muy blanco, y por último, una rayita tambien blanca, que nace en el ángulo posterior de cada ojo, y se extiende como dos líneas hácia atrás.

Su pico y uñas son negras, que parecen de ballena, y sus patas pardonegruzcas; su largo total 5 pulgadas; cola 2 id.; alas 3½ id.; y su pico recto ⅞ id.

La hembra es casi del mismo tamaño del macho; su color en la parte de encima de la cabeza, la parte posterior del cuerpo, las cubiertas de las alas y de la cola, son de un color verde un poco más claro y ménos brillante que el del macho; la cola y las alas son tambien muy semejantes á las de éste, con diferencia que las tres plumas de cada lado de la cola, tienen las puntas parduscas y el color de las alas es ménos rojizo; su garganta y cuello son de un color pardo ferruginoso; el vientre del mismo color, pero un poco más oscuro; las cubiertas de debajo de la cola, tambien del mismo color, teniendo por último, cerca del nacimiento de éstas, una especie de plumon blanco, que en parte cubre las piernas, y la raya blanca comenzando en la parte posterior del ojo, sigue hácia atrás lo mismo que en el macho.

El macho jóven es del mismo tamaño que el adulto y muy semejante en el color; pues solo se diferencia de él, en que el color de vino de la garganta, es ménos marcado, y el color del pecho es verde azulado en lugar del hermoso azul turquí.

Num. 9.—*Chupamirto real de cabeza verde azulada.*

Heliomaster pallidiceps, Gould.

Esta hermosa variedad de colibríes, que he encontrado en las inmediaciones de Jalapa, habia creido que era el *H. longirostris*, sin embargo de ser un poco más pequeña que éste, y no tener noticia de que emigrara á este país; el Sr. Gould la ha dado el nombre precitado (pallidiceps), por haber hallado, que tanto en el ejemplar en cuestion, como otros que hubo de Costa-Rica, el tinte verde de la cabeza es muy distinto del *longirostris* aunque todos sus demas caractéres son, á mi parecer, iguales.

La apariencia del plumaje de esta especie, es como sigue: la parte de encima de la cabeza, de un color verde azulado metálico preciosísimo; toda la parte superior del cuerpo, del cuello y las cubiertas de las alas y de la cola, de un color verde bronceado, con una mancha blanca encima de la rabadilla; las dos plumas del centro de la cola tambien son de color verde bronceado; las demas de cada lado de ella, de este mismo color; pero con las extremidades sombreadas de negro, teniendo las tres laterales las puntas con una mancha blanca, cuyo tamaño disminuye en las que están más hácia el centro; las alas pardo-purpúreas; garganta púrpura, con la parte que está cerca del pico negra; pecho y centro del vientre, pardo ferruginoso, con los flancos tintados de verde bronceado; cubiertas de debajo de la cola, de este mismo color, con las extremidades blanquizcas; pico, patas y uñas negras, y por conclusion, las piernas las tiene cubiertas con un plumon blanco.

Su largo total es de 4¾ de pulgada; alas 2⅜ id.; cola 1⅜, y pico recto de 1¼ de pulgada.

Num. 10.—*Chupamirto de rafaguita.*

Calothorax Calliope, Gould; *Calothorax Calliope*, Gray y Mitch.

El Satélite Mexicano, otro nombre con el cual se designa tambien esta preciosa especie de colibríes, segun dice el Sr. Gould, fué descubierta por el entusiasta D. Damian Floresi, al cual los troquilidistas deben mucho, por las interesantes colecciones que remitió á Europa durante el tiempo que estuvo en México en las minas del Real del Monte; habiendo sido en las inmediaciones de este lugar adonde se procuró ese hallazgo.

El *Chupamirto de rafaguita*, como lo llaman vulgarmente los cazadores del Valle de México, es uno de los más raros de esta region, pues son contados los ejemplares de éstos que se pueden conseguir anualmente, y sin embargo, parece ser peculiar de esta altiplanicie.

La apariencia del macho de esta especie, es así: la parte superior de la cabeza, del cuello, del cuerpo y cubiertas de las alas y de la cola, de un color verde bronceado; alas y cola parduscas; las plumas de la garganta y cuello, largas y angostas, de un color de rosa metálico purpúreo hermosísimo, con las bases blancas, que es lo que le da la apariencia de una ráfaga de blanco y rosado; el pecho, abdómen y cubiertas de debajo de la cola, son blancos; sus flancos verde bronceados, y patas y pico pardo negruzcos.

La hembra tiene toda la parte superior, de color verde bronceado como el macho; alas parduscas; cola negra con las bases de sus plumas pardo-verduscas, teniendo unas manchitas blancas en las extremidades de las dos, y algunas veces tres plumas de cada lado de ella; cuello y abdómen, blanco castaño; flancos y cubiertas de debajo de la cola, de ese mismo color, un poco más castaño; el cuello lo tiene salpicado con una multitud de manchitas pequeñas pardas; patas y pico del color de las del macho.

El largo total de los ejemplares de esta especie, 2⅜ de pulgada; alas 1⅜ idem; cola ⅝, y pico media pulgada.

NUM. 11.—*Chupamirto de pico de coral.*

Heliopædica melanotis, Gould; *Trochilus melanotus*, Swains.; *Trochilus leucotis*, Vieill.; *Ornismya arsennii*, Less.; *Thaumatias leucotis*, Bonap.

Esta especie de colibríes se encuentra en las inmediaciones de Jalapa y Coatepec; pero con más abundancia en el Valle de México, donde se conoce con el nombre vulgar primeramente citado. El Sr. Gould dice que habita tambien en Guatemala, y le da el nombre de (black-eared humning-bird), chupamirto de orejas negras; haciendo notar, que es dudosa la opinion de Bonaparte y otros autores más recientes, que consideran el *Trochilus leuco-*

tis, idéntico á éste, y hacen de los dos nombres un sinónimo, puesto que Vieillot no hace mencion del hermoso azul que tiene en la cabeza, y además dice que pertenece al Brasil, en cuyo pais parece que no existe; pero cree que es el *Ornysmia arsennii*, de Lesson, sin embargo de manifestar tambien error con respecto á su localidad, por cuya razon le da la preferencia al nombre de *melanotis* que le dió Swainson.

La apariencia de los individuos de esta especie, es como sigue: la parte de encima de la cabeza, azul turquí metálico hermosísimo; cuello en la parte superior, casi negro, que al unirse con la parte de encima del cuerpo toma un tinte parduzco; cola negra con las dos plumas del centro, de color verde bronceado, teniendo las orillas de todas las demas, en la parte exterior, un mediano tinte de este mismo color; las cubiertas de encima de la cola y de arriba y debajo de las alas, de color verde bronceado; garganta azul igual al tinte de encima de la cabeza; cuello verde metálico hermosísimo; cubiertas de las orejas, negras, marginadas en la parte superior con una línea blanca, que parece tiene principio en la parte posterior de la oreja; abdómen pardo claro; flancos de este mismo color con visos verde bronceados; cubiertas de debajo de la cola, tambien pardas, marginadas de blanco; patas color de carne, uñas largas y negras; pico recto con su base encarnada y la punta negra.

Su largo total es, de 3¼ de pulgada; cola 1⅜ idem; alas 2¼, y pico ¾ de pulgada.

La hembra es casi del mismo tamaño que el macho; tiene la cabeza parduzca; la parte de encima del cuerpo y las cubiertas de las alas y de la cola, de un color verde bronceado; la cola con las dos plumas del centro, de este mismo color; las restantes negras azulosas con visos bronceados en sus bases y las puntas grises; las cubiertas de las orejas, de un color negro parduzco, con una línea blanca arriba de éstas; garganta, pecho y vientre, blanco parduzco, con algunas de sus plumas manchadas en su extremidad con un tinte verde bronceado, que le forman una especie de salpicado de este color; flancos pardos, tintados de verde bronceado; patas color de carne, y pico encarnado con la punta negra.

El macho jóven es muy parecido á la hembra, con la diferencia que en lugar del salpicado del cuello, las plumas de éste las tiene tintadas, más ó ménos, del hermoso color verde del macho adulto; siendo mayor el número de las tintadas á medida que llega á la edad de adulto, sucediendo lo mismo con las plumas de la garganta y parte anterior de la cabeza, que poco á poco van tomando el hermoso azul turquí que tiene tambien el adulto.

La localidad de esta especie, es el Valle de México, pues que no cabe du da que nidifican allí en los meses de Julio y Agosto; siendo digno de notar, como caso raro, que el año pasado, en los dias más frios del mes de Diciembre, se encontró un nido con huevecillos acabados de poner, el cual, como todos los que fabrica esta especie, estaba formado en la parte interior con una especie de filamentos lanosos muy finos, que el que esto escribe supone son la cubierta de la semilla de alguna planta, y por afuera guarecido con musgo verde muy fino, que se cria en los árboles, y nó con el líquen de las peñas, como lo están los que fabrican las especies que se hallan en el Estado de Veracruz; contenia dos huevecillos elípticos bastante alongados y grandes en proporcion al tamaño de la hembra, y por último, estaba como escondido entre las hojas de una rama de encino.

Num. 12.—*Chupamirto fandanguero.*

Campylopterus Pampa, Gould; *Ornismya Pampa*, Lesson; *Polytmus Pampa*, Gray y Mitchell.

Los cazadores de la Villa de Coatepec dan á este chupamirto el nombre mencionado arriba primero, por tener la particularidad de ser sumamente músico, pues por las mañanas el macho no cesa de cantar, y aunque su tono es corto y monótono, es bastante agradable, porque realmente parece la música de un fandango campestre.

Es el único de su especie que tiene un canto conocido, ó al ménos el único que el que suscribe haya oido. Su canto es su denunciante, pues si no fuera por él, seria muy difícil cazarlo, porque solo habita los bosques en sus cañadas cerradas con cierta clase de arbustos, que se llaman vulgarmente *azaharitos*, y durante el invierno que es el tiempo en que dichos arbustos florecen y por lo regular están tan copados de hojas, que éstas impiden poderlos ver con facilidad.

Tambien se encuentran estos chupamirtos en las inmediaciones de Orizaba y Córdoba, y segun la opinion de algunos naturalistas, Guatemala es su localidad; siendo muy probable que sea así, porque en verano, tiempo de la nidificacion, son raros los ejemplares que se hallan por aquí.

La apariencia del color de los individuos de esta especie, es como sigue: la parte de encima de la cabeza, azul ultramarino metálico hermosísimo; las cubiertas de las alas, las de la cola y toda la parte posterior del cuerpo, verde bronceado; la garganta, toda la parte del vientre, las cubiertas de debajo de las alas, así como las de la cola, son de un color aplomado ferruginoso, uniforme, excepto las de la cola que tiran un poco á castaño; las plumas de las alas son negras purpúreas, con venas muy anchas y fuertes que parecen de ballena; las dos plumas del centro de la cola, son verde bronceado, el resto de las demas, del mismo color desde su nacimiento hasta la mitad de su largo, con lo demas negro, teniendo las tres de cada lado de ella las puntas de color aplomado castaño; sus patas son negro-parduscas, y el pico y sus uñas negras.

Su tamaño, desde la punta del pico hasta la extremidad de la cola, es 5¾ pulgadas; las alas 2¾ id.; la cola 2 id.; el pico 1⅛ id.; mas es de advertir, que en esta especie se observa, lo que tal vez no sucede en ninguna otra, y es, que hay machos adultos que miden hasta ¼ de pulgada ménos que el tamaño indicado en este párrafo.

La hembra de estos colibríes es tan semejante al macho, que solo puede averiguarse su sexo por medio de la inspeccion anatómica; ambos tienen el pico muy curvo.

(Continuara.)

APUNTES QUE PUEDEN SERVIR DE BASE

PARA LA FORMACION

DE LA FLÓRULA DE LA CIUDAD DE MONTEREY

Y SUS INMEDIACIONES,

POR EL Sr. D. ELEUTERIO GONZALEZ, SOCIO CORRESPONSAL.

Situacion de la ciudad 25° 40' 16" lat. bor. 1° 24' 15" long. O. mer. de México, (segun Nigra de San Martin).

Su altura sobre el nivel del mar 461.01 metros.

Altura média de la columna barométrica, 722.724 mms., (observaciones de un año).

Temperatura média del año, 21.86. (Termómetro centígrado.)

Máximun de temperatura, 41.

Mínimun de id. 0.

Cantidad de lluvia en un año, 740 milímetros.—*Observaciones de Epstein.*

La ciudad de Monterey es isotérmica con las ciudades de Canton en la China, de las Palmas en la Gran Canaria, y de Sevilla en España, y está sobre un terreno calizo muy firme, en la ribera izquierda del rio de Santa Catalina; tiene un cerro al Oriente, otro al Poniente y una sierra alta al Sur, de manera que solamente está descubierta por el lado del Norte. Todas sus aguas son delgadas y potables. El plano de calor invariable está como á 18 varas de profundidad, pues las aguas de los pozos que tienen esa hondura, permanecen en todas las estaciones á la misma temperatura, (22 grados,) y en los que la tienen menor, varía.

Notas.—La V. puesta al márgen indica que el nombre es vulgar; la C. que la planta es cultivada; cuando no tiene estas letras, los nombres son los castellanos y las plantas silvestres.

(CONCLUIRA.)

DESCUBRIMIENTO

DE UNA

NUEVA ESPECIE MINERAL DE MÉXICO

POR EL SEÑOR DON MARIANO BARCENA,

SOCIO DE NÚMERO.

Hace poco tiempo que, en este mismo lugar, tuve el gusto de llamar la atencion de mis ilustrados consocios, sobre el movimiento científico é industrial, que bajo la sombra inestimable de la paz, se iniciaba en varios puntos de nuestro territorio. En virtud de ese movimiento, la estadística minera de México aumenta diariamente sus datos, y el catálogo de los minerales sigue enriqueciendo sus columnas con los descubrimientos de especies que no se sabia que existiesen en nuestras montañas, ó que no estaban aún registradas en las obras de Mineralogía.

Hace cuatro dias que mi ilustrado amigo el Sr. D. Sebastian Camacho, me regaló una muestra mineral que le habian remitido de Huitzuco, en el Estado de Guerrero, y que me presentó como un compuesto extraño, recomendándome que lo estudiara cuidadosamente.

Por su aspecto, el mineral referido se parece bastante al *estibnite* ó sulfuro de antimonio, pero al frotarlo con la navaja, se obtiene una raspadura de color rojo que no presenta el último, y esta circunstancia me llamó la atencion y comparé cuidadosamente los caractéres de aquel con los de todos los sulfuros metálicos conocidos hasta hoy y que se encuentran en la última edicion de la obra de Mineralogía del profesor Dana, y no encontré alguno entre las especies conocidas, que le conviniesen á la que hoy tengo el honor de describir ante esta ilustrada Sociedad.

Los caractéres del mineral en cuestion son los siguientes: Se presenta en prismas alargados, que parecen isomorfos con los del estibnite, y aun forman hacecillos y ramilletes como ellos: tienen un crucero muy fácil que los divide en hojas, y probablemente otros dos diferentes, porque se obtienen fragmentos prismáticos regulares, al golpearlos suavemente con algun cuerpo pesado. Su textura es hojosa, estriada; color gris de plomo vivo; lustre metálico y resplandeciente. Dureza de 2 en la escala de 12°. Peso específico, á 16° centígrados, es de 4,61. Al soplete se funde á la primera impresion de la flama y da humos blancos muy abundantes. Calentado en un matraz, da los mismos humos, y se funde formando una escoria rojiza que casi desaparece sosteniendo el fuego por algun tiempo; en el extremo del tubo la pegadura es gris metálica. El ácido azótico no lo ataca sensiblemente á frio, pero calentado lo disuelve en parte, y queda un resíduo blanco. El agua régia lo disuelve con facilidad y la disolucion presenta un color blanco verdoso. El ácido sulfohídrico la precipita, formando un sulfuro amarillo naranjado y otro de color negro. Tratada la disolucion por el agua, se enturbia, y por la adicion del ácido tártrico se pone diáfana, cuya reaccion unida á las anteriores, demuestra la presencia del antimonio. Separado este cuerpo y sumergiendo en el líquido restante un alambre de cobre, se pone gris y queda amalgamado en la parte sumergida; la misma disolucion da un precipitado rojo con el ioduro de potasio y todas las otras reacciones de las sales de mercurio. Humedecida la escoria que se obtiene al fundir el mineral con carbonato de sosa, mancha de negro la plata metálica, lo que demuestra la presencia del azufre. Por las reacciones citadas, se ve que el mineral de que me ocupo, está esencialmente compuesto de azufre, antimonio y mercurio. Todas esas reacciones fueron confirmadas por mi ilustrado maestro D. José María César. Próximamente daré á conocer las proporciones atómicas en que se encuentran estos cuerpos, cuando concluya la análisis cuantitativa que acabo de emprender. La ley de mercurio que he obtenido en un ensayo industrial, por la via seca, fué de 10 por ciento, cuyo resultado demuestra que ese compuesto que he estudiado, es muy interesante como mineral de mercurio. Por la via humeda debe ser más alta la ley que se obtenga de aquel metal.

Como manifesté ántes, los caractéres del sulfuro que describo, no corresponden á ninguno de los que presentan los sulfuros conocidos en la mineralogía: con los pocos compuestos mercuriales que se han determinado, no ofrece ninguna semejanza. Tampoco puede confundirse con el antimonio sulfúreo por los cruceros que cité, por el color de la raspadura, y sobre todo, por la presencia del mercurio. No puede considerarse como una mezcla de ese sulfuro y del de mercurio, por presentar caractéres constantes en todos los ejemplares que he examinado, y principalmente por encontrarse bajo la forma de cristales determinables, constituyendo así una especie mineralógica.

Por todas esas consideraciones, no vacilo en presentar á esta Sociedad, el mineral referido, como una nueva especie, propia de nuestro país, y la clasifico por su composicion, como un *sulfuro de antimonio y mercurio*, pues estos cuerpos son sus elementos principales.

Al buscar el nombre con que designar mi nueva especie, tuve presente á muchos de mis compatriotas á quienes deseaba dedicarla, y con los que tengo muchas obligaciones de amistad y gratitud; pero tuve que sacrificar mis deseos, con el fin de que México honrase la memoria del Dr. Livingstone, que estimulado por su amor á la ciencia, acaba de perder su preciosa existencia en los climas mortíferos del Africa. En tal virtud, si por los estudios que acabo de exponer, y por los que presentaré más tarde, se admite como nueva la especie mineral mexicana á que me refiero, deseo que se conozca con el nombre de *Livingstonite*, en recuerdo de aquel ilustre viajero. Al hacer esta dedicatoria, he tenido presente que los bienhechores de la humanidad pertenecen á todas las naciones, y que la humanidad entera debe honrar su memoria.

México, Abril 30 de 1874.

DICTAMEN de la seccion de Mineralogía, de la Sociedad Mexicana de Historia Natural, acerca de la nueva especie mineral de mercurio, descubierta por su socio el Sr. D. Mariano Barcena.

Comisionado por el señor Presidente de la Sociedad, para informar acerca del descubrimiento hecho por el señor socio D. Mariano Bárcena, de una nueva especie mineral de mercurio, y habiendo examinado los ejemplares junto con la descripcion presentada á esta Sociedad, de la nueva especie mineral, tengo el gusto de exponer, á nombre de la seccion de mineralogía, que los caractéres que la distinguen, convienen con dicha descripcion; y tanto por dichos caractéres como por los cuerpos elementales que entran en su composicion, segun la análisis cualitativa de la descripcion, entendemos que el descubrimiento del compuesto natural de sulfuro de antimonio y mercurio queda comprobado.

Los cristales embutidos en la matriz no permiten la medicion de ángulos, y por esta circunstancia el ángulo de inclinacion de las caras del prisma que caractizará la nueva especie, así como el sistema orthorómbico á que parece pertenecer, quedan por ahora indeterminados hasta que se presenten cristales sueltos, ó que se puedan fácilmente desprender de su matriz, para verificar dicha medicion, y se pueda establecer entónces su carácter cristalográfico.

Los fragmentos prismático-rectangulares de los cristales, acusan una forma cristalina derivada por los cruceros, de una figura de combinacion del sistema orthorómbico, que resultaria de la interseccion de las caras macro y braqui diagonales, con las caras de la base del prisma, ó pirámide, de la forma primitiva ó fundamental, segun se elija.

Esta estructura cristalina distingue desde luego á la nueva especie mineral, del sulfuro de antimonio gris ó *estibina*, con la que tiene semejanza.

Además, las caras de los cristales son lisas y no estriadas como las de la última especie. Su peso específico de 4.6, se acerca al de la Kermesita, ú oxisulfuro de antimonio, que es de 4.61, y su reaccion al soplete es parecida; pero los demas caractéres las hacen distinguir inmediatamente.

La nueva especie mineral de sulfuro de antimonio y mercurio, es muy blanda y azul, y el polvo de la raspadura es rojo pardusco, así como el del mineral pulverizado; pero la dureza y demas caractéres la distinguen de los otros minerales que dan tambien raspadura roja pardusca, como algunos cobres grises, el wolfran, etc.

Esta nueva especie mineral, fácil de distinguir de las que se le asemejan, por los caractéres de que nos hemos ocupado, y de una composicion sencilla, ha venido á aumentar el número de los minerales raros de mercurio encontrados en América.

Se han descrito el *sulfoseleniuro de mercurio y zinc*, de Culebras y de Guadalcazar; el *seleniuro de mercurio* simple, y el *seleniuro de mercurio, cadmio y fierro?* de Culebras; el *ioduro de mercurio* de Casas Viejas; el *cloro-seleniuro de mercurio?* del Doctor; la *arquerita*, ó amalgama de plata natural, de la mina de Arqueros, en Coquimbo; el *metacinabrio (metacinnabarite)* ó *sulfuro negro de mercurio*, de la mina de Redington, en el Condado del Lago, Alta California; y ha tocado la fortuna al Sr. Bárcena, de darnos á conocer el *sulfuro de antimonio y mercurio,* de las inmediaciones de Huitzuco.

En cuanto á la dedicatoria ó nombre de la especie mineral nueva que le ha asignado su descubridor, se nos permitirá que expresemos nuestros deseos, de que se hubiera dedicado á Bartolomé de Medina, minero de Pachuca, que en 1557 descubrió el beneficio de amalgamacion de los *metales* de plata y oro, ó el *beneficio de patio,* como vulgarmente se llama. Á él se debe el gran movimiento que nuestra minería conserva desde su descubrimiento; y el mérito de este gran beneficiador de *metales,* sirviéndose del mercurio, ha quedado en el olvido. Natural nos parecia que una sustancia mineral nueva, de la que acaso (segun su abundancia), se podrá extraer mercurio, industrialmente hablando, fuera dedicada á él por los mineralogistas mexicanos.

México, Mayo 9 de 1874.

ANTONIO DEL CASTILLO.

CULTIVO DEL CACAO,

POR J. B. BOUSSINGAULT;

TRADUCIDO POR EL SR. D. MANUEL CORDERO, SOCIO DE NUMERO.

Cacao. (Theobroma cacao.) Los mexicanos cultivaban el *cacaotero* y preparaban con sus semillas tablillas semejantes al chocolate.

El uso del cacao parece haber sido introducido posteriormente á la conquista en las otras partes del Continente. Sin embargo, el cacaotero existe al estado silvestre en las selvas calientes y húmedas de la América meridional; M. Goudot ha descubierto muchas especies en la Nueva Granada, entre otras, aquella que se conoce en Muzo con el nombre de *cacao montaraz.* Este *cacaotero* llega á una altura de 7 á 8 metros, sus frutos son muy numerosos; con su haba, que es muy amarga, se prepara un chocolate considerado como un excelente febrífugo.

Los indios salvajes parece que ignoran aún el partido que se puede sacar del grano del *cacaotero;* comen solamente la pulpa del fruto. Los españoles dieron á conocer el cacao en Europa, y en poco tiempo esta produccion del Nuevo-Mundo ha llegado á ser objeto de un comercio considerable.

Es un hecho bien conocido de los cultivadores de las regiones tropicales, que es preciso establecer siempre un *cacaotal* sobre un terreno vírgen; las veces que se ha querido reemplazar por el cacao los antiguos cultivos de la caña de azúcar, del maíz, y del añil, no se ha obtenido más que mezquinos productos. Este árbol necesita para prosperar, una tierra rica, húmeda y profunda, calor y sombra. Nada le conviene mejor que una selva desmontada, cuyo suelo ligeramente inclinado, sea susceptible de riego; todos los plantios importantes que he recorrido, tienen una fisonomía comun; se les encuentra siempre en las regiones más calientes, á muy corta distancia del mar, cerca de las corrientes de agua ó sobre los bordes de los grandes rios. Este cultivo deja de ser ventajoso en las localidades que no poseen cuando ménos una temperatura média de 24°, y yo mismo he tenido ocasion de asistir á ensayos tan infructuosos como costosos, que se habian intentado con el objeto de establecer un *cacaotal* en un desmonte en donde el calor del clima, segun mis observaciones, no pasaba de 22°, 8. Bajo la influencia de esta temperatura, el árbol habia, sin embargo, adquirido una hermosa apariencia; floreció, pero sus frutos siempre poco desarrollados, llegaban raras veces á su madurez.

Cuando se cree que un terreno es propio para el cultivo del cacao, se empieza por establecer un buen sistema de sombreaje. Algunas veces al practicar el desmonte se conservan los árboles de muchas hojas; pero en el mayor número de casos se plantan especies que tengan un crecimiento rápido. En los alrededores de Caracas se les sombrea con el búcaro, *Erythrina umbrosa.* En otras plantaciones, se prefiere la sombra del plátano, ó en fin, se reunen con frecuencia estos dos modos de sombrear.

Al Sur del Ecuador, en la provincia de Guayaquil, se procede directamente á la plantacion de las habas de cacao; en Venezuela, se prefiere colocarlas en almácigas que se disponen siempre en un suelo muy fértil y bien preparado; en seguida se hacen á la superficie del terreno, una serie de pequeños montones, que representan otros tantos conos de tierra movediza, cuyos vértices se elevan á 20 ó 25 centímetros. En el interior de estos montones, se depositan dos ó tres granos recientemente extraidos, y á una profundidad tal, que no sean colocados abajo del nivel del suelo de la almáciga; en seguida se cubren con hojas de plátano. Se practica la siembra en la época en que se prevé la proximidad de las aguas; cuando la estacion lluviosa no sigue á la plantacion, se riega todas las mañanas ántes de la salida del sol: la semilla germina á los ocho ó diez dias. A la edad de dos años el *cacaotero* crece en un buen terreno, á más de un metro, y entónces es cuando se le arrancan dos de sus ramas superiores y se le trasplanta. En el valle superior de Rio Magdalena, en donde existen importantes *cacaotales*, las siembras se hacen en un terreno bien removido y abrigado por techos de hojas de palmeras; los retoños se trasplantan cuando han llegado á la edad de seis meses. Durante todo el tiempo que las plantas pasan en esta almáciga cubierta, reciben muy poca luz, y se les riega una vez por semana, vaciándoles el agua sobre el tejado.

Raras veces florece este árbol ántes de haber cumplido treinta meses. Yo he conocido plantadores que destruyen siempre las primeras flores, á fin de no dejar fructificar la planta sino hasta el cuarto año, y esto en las condiciones climatéricas más favorables, en las localidades donde el calor medio es de 27°, 5. En situaciones ménos ventajosas, es preciso aguardar de 6 á 7 años para tener las primicias de un *cacaotero*.

Hay pocas plantas arborescentes cuya flor sea tan pequeña, y sobre todo, tan desproporcionada al fruto, como el *cacaotero*.

El diámetro medio de un boton al momento de brotar, no pasa de 4 milímetros. Sus flores se fijan de preferencia sobre el tronco mismo del árbol; raras veces se extienden más allá de la mitad de las ramas gruesas, aun cuando se les ve algunas veces sobre las raicecillas que salen fuera del suelo.

Para trasplantar las matas nacidas en la almáciga, debe estar el *cacaotal* convenientemente sombreado por los *búcaros* ó los plátanos, y de antemano despojado de la mala yerba. En seguida se establecen regaderas, sea para secar el terreno ó para regarlo cuando sea necesario. Las plantas pequeñas se alinean con la mayor regularidad, disponiéndolas en calles de una extension considerable; la distancia que separa una planta de otra, es muy variable, segun la calidad del terreno, y con este motivo existe una opinion bastante singular, apoyada por todos los plantadores. Se cree que en las tierras reputadas como excelentes, debe ser más grande la separacion que en los suelos de mediana calidad. La experiencia misma parece haber obligado á esta determinacion: así en el valle de Tuy, en las cercanías de Puerto Cabello, los *cacaoteros* son separados de 5 metros en las mejores tierras, y de 4 metros solamente en las de calidad inferior. En las Antillas, donde el terreno es generalmente ménos fértil que en la *tierra compacta*, se separan á dos ó tres metros. Se cree encontrar la razon de esta práctica, en el más ó ménos desarrollo que el árbol debe tomar, segun que esté plantado en tal ó cual terreno; en un suelo dotado de una gran fertilidad, sus ramas se extenderán más, y tendrán necesidad, por consiguiente, de un espacio más considerable; de aquí la necesidad de colocar los *cacaoteros* á mayor distancia. Una vez que el retoño del cacao está en crecimiento en la plantacion, se impide que se haga muy ramoso, podándolo en caso necesario. Algunas veces sucede que las ramas tienen tendencia á inclinarse hácia la tierra; entónces se les liga en haz al derredor del tronco, hasta que hayan vuelto á tomar una direccion ascendente. De tiempo en tiempo se remueve el suelo alrededor del árbol sobre una superficie de un metro de radio, y se aprovecha de esta labor para recortar las raicecitas que nacen en la base del tronco.

De la caída de las flores á la madurez perfecta del cacao, trascurre poco más ó ménos cuatro meses. El fruto tiene una forma alargada, ligeramente curva, y termina en punta por una de sus extremidades. Su longitud es de cerca de 25 centímetros; su diámetro mayor, aquel que se encuentra más cerca de su punto de insercion, tiene de 8 á 10 centímetros. En el exterior la vaina del cacao está surcada longitudinalmente. El color de su epidérmis varia desde el blanco verdoso hasta el rojo violeta; éste último tinte es el más comun. En el interior, la carne del fruto es generalmente blanca; sin embargo de que algunas veces tiene un color rosado. Esta pulpa azucarada y ácida, es de un sabor muy agradable. Las semillas están alojadas en el fruto, en un número casi constante de veinticinco. Estas almendras son blancas, aceitosas, ligeramente amargas, y al secarse toman un tinte moreno. La madurez del fruto se conoce por su color, y sobre todo, por la facilidad con la cual se desprende del árbol.

En las plantaciones se hacen dos grandes cosechas, con seis meses de intervalo cada una. Sin embargo, en un grande y antiguo cultivo se cosecha casi todos los dias; porque no es raro ver á la vez, sobre el mismo *cacaotero*, flores y frutos.

Para desgranar las vainas, basta romper y quitar las semillas con un pedazo de madera arredondado en su extremidad. El grano se califica segun su calidad, teniendo cuidado de separar aquel que no está bastante maduro ó que está alterado; despues se le pone al sol. Todas las tardes se le reune en montones debajo de los tejados; y se establece entónces una fermentacion muy activa, que podria ser perjudicial si se dejase continuar; el cacao se calienta considerablemente.

A la mañana siguiente se continúa la desecacion al sol; esta desecacion exige muchos dias, y con frecuencia sucede que se dificulta mucho por las lluvias que sobrevienen: habria ciertamente ventaja y seguridad en efectuar esta desecacion con la estufa. Se ha comprobado que 100 kilógramos de almendras frescas, dan de 45 á 50 kil. de cacao seco y dispuesto para la venta. En Venezuela, un cacaotero que ha pasado de la edad de 7 a 8 años, rinde anualmente y durante más de 40 años, 0 kil., 75 de cacao seco. Una héctara de terreno, contiene en los buenos cultivos, 560 árboles, y produce al año, por término medio, 420 kil. A la edad de 12 años es cuando el *cacaotero* ha llegado á producir más; y en los fértiles terrenos de la alta Magdalena, su producto medio, segun las noticias de M. Goudot, es muy superior al que rinden las provincias de Venezuela. En el Gigante, por ejemplo, cada árbol adulto da anualmente 2 kil. de cacao seco. Suponiendo de 5 metros el espacio que los separa, la héctara de un *cacaotal* debe producir por año 800 kil. de cacao.

Las habas del cacao encierran albumina; un principio particular, la theobromina, análogo á la cafeina; una materia colorante y sustancias grasas.

En 100 partes de cacao de Caracas, privado de su cáscara, he encontrado 43 de manteca, y una proporcion de azote, señalando 21 de albumina: despues de la combustion la semilla ha dejado 3 de cenizas, formadas en gran parte de fosfatos. La nueva especie de cacao, descubierta en la selvas de los alrededores de Muzo (Nueva-Granada) tiene un fruto muy pequeño que se aproxima á la forma de un tetraedro. El chocolate preparado con este cacao, es muy amargo y muy aromático. En las semillas del *cacaotero montaraz* de Muzo, he encontrado:

Manteca de cacao.	44
Albumina.	20
Theobromina.	2
Materias cristalinas muy amargas.	Huellas.
Acido cristalizado,[1] goma	6
Leñoso y celulosa[2].	13
Sustancias minerales.	4
Agua	11
	100

La presencia y la abundancia de la albumina y de la materia grasa en el cacao, explica muy bien sus cualidades nutritivas. Sin duda alguna es uno de los alimentos más sanos y más prontamente reparadores que se conocen. Por lo demás, hasta el siglo diez y seis se habia emitido sobre sus propiedades, los juicios más contradictorios. Benzoni, en su Historia del Nuevo-

---

[1] Este ácido posée la propiedad del ácido tártrico; pero no lo he analizado.

[2] El cacao no habia sido separado de su cáscara.

Mundo, dice que el chocolate es una bebida que convendria mejor á los puercos que á los hombres. El padre Acosta asegura que el cacao es una ilusion. En recompensa, Fernando Cortés y uno de sus hidalgos, exageran en otro sentido. «El que ha bebido una taza de cacao, dice el paje de Cortés, puede marchar un dia entero sin otro alimento.» [1] Yo añadiré, á fin de reducir este elogio á su justo valor, que la mayor parte de los viajeros, deben haberse convencido que en América no es imposible viajar un dia entero sin tomar alimento. Reconozco, sin embargo, que en las excursiones emprendidas en los bosques deshabitados, cuando es de una imperiosa necesidad reducir el peso y el volúmen de las raciones de una expedicion, el chocolate presenta ventajas reales, incontestables, que he tenido ocasion de apreciar más de una vez.

En Francia, el precio medio de 100 kilógramos de cacao, libre de derechos, es de 120 fr. En 1847 hubo una importacion de 3.162,000 kilógramos. En el Havre, en 1849, el precio medio de 100 kilógramos de café en las tiendas, ha sido 84 fr., 58 c.; en el mismo año han entrado 16.912,065 kilógramos. Para demostrar con qué rapidez aumenta el consumo del café en Francia, recordaré que en 1821, no pasaba la importacion de 4.763,128 kilógramos; los 100 kil. valian entónces, en depósito, 291 fr., 20 c.; pero á pesar de este aumento, está uno autorizado á creer que el consumo no ha llegado á su límite, por corresponder á ménos de 500 gramos por habitante, y ser muy inferior al de los otros países.

Así: la Bélgica consume cerca de	4	kil	por habitante.
La Holanda.	4	,,	,,
La Asociacion alemana. . . .	1	,,	600 gramos.
Los Estados-Unidos.	2	,,	445 ,,
La Inglaterra.	0	,,	640 ,,

No obstante esto, hay motivo para creer que el uso del té, del café y del chocolate, no tomará jamas un gran desarrollo en los países productores de vino.

EL CAMALEON.

NOTAS SOBRE LAS COSTUMBRES DE ESTE REPTIL,

POR EL SEÑOR DON MARIANO BARCENA,

SOCIO DE NÚMERO.

La observacion de las costumbres de los animales, ha sido uno de los estudios á que se han entregado empeñosamente numerosos y distinguidos naturalistas; pero no obstante los muchos datos que se han recogido sobre este asunto, en determinadas especies, el estudio de sus costumbres no puede considerarse como completo, pues con frecuencia se sorprenden nuevos hechos que no habian sido bien examinados, por falta de tiempo ó por no haber variado de una manera notable las circunstancias en que se encontraban los animales observados.

Con el fin de aumentar los datos que se tienen acerca del animal de que me ocupo, que es el *Phrynosoma orbicularis,* he observado un individuo de esta especie durante un año, estudiando cuidadosamente sus costumbres en el estado de cautiverio, las cuales aunque modificadas, en su esencia deben ser las mismas que al estado de libertad; siendo éste, por otra parte, el único medio de poderlas analizar convenientemente.

El mismo dia en que comencé á observarlo, noté que buscaba empeñosamente alguna cosa en el cajon en que estaba guardado, y despues de ponerle varios objetos, no cesó su inquietud hasta que encontró una buena porcion de arena que de intento se le habia puesto y que aglomeró violentamente hácia un lado; se introdujo repetidas veces en ella, y no consiguiendo su intento de ocultarse enteramente, prosiguió su pesada tarea acumulándola de diversas maneras, hasta que por último alcanzó su objeto dándole un espesor conveniente.

Una vez que consiguió este fin, permaneció en la quietud más absoluta hasta las siete de la mañana del dia siguiente en que salió en busca del sol y de sus alimentos. Poco tiempo despues, y habiendo ya satisfecho sus necesidades, volvió á ocultarse en su retiro para no volver á aparecer hasta el dia siguiente á la misma hora que el anterior. Este periodismo, entre su aparicion y desaparicion, fué verdaderamente notable en todo el tiempo que lo observé, y la hora de su salida correspondia casi siempre á la misma altura del sol sobre el horizonte. Despues que dejaba su escondite, estiraba sus miembros con cierta pereza y se colocaba en seguida sobre una piedra para recibir el calor del sol, cambiando su postura de vez en cuando, para recibir por todos lados aquella benéfica influencia.

Cuando el calor lo habia reanimado lo bastante para poder moverse con más libertad, se ponia en acecho de algun insecto de los que se le habian puesto para que se alimentase, y permanecia inmóvil hasta que alguno de esos animales se movia; entónces se levantaba un poco sobre sus miembros anteriores, sus ojos se animaban, y despues de agitar alegremente su cola, se precipitaba sobre su presa, la cual cogia con la lengua y la introducia rápidamente en su boca, masticándola dos ó tres veces ántes de deglutirla, quedándose nuevamente inmóvil hasta que veía moverse otro, que atrapaba de la misma manera. El número de insectos con que se alimentaba, no era siempre el mismo; hubo vez que llegó á comerse hasta cuarenta y tres moscas; otros dias se comia ménos, y algunas veces ninguna.

Lo más notable que pude observar en su alimentacion, fué que nunca quiso coger un insecto que estuviese muerto, pues cuando veía que permanecian inmóviles, los abandonaba y se dirigia sobre otros que diesen señales de vida. Fué tan fiel observador de esta costumbre, que muchas veces lo dejé sin darle alimento, para ver si por el hambre tomaba los insectos que habia despreciado; pero nunca los tocó, y siempre encontré el mismo número que le habia dejado. Una vez, en el mes de Setiembre, una ráfaga de viento vino á agitar los cadáveres de los insectos que estaban á su alcance, é inmediatamente que vió que se movian, se precipitó sobre ellos y los devoró con igual apetito que si los hubiese encontrado vivos; este hecho se repitió con mucha frecuencia, pues bastaba darles un ligero movimiento á los insectos ya muertos, para que se pusiera en accion y los cazase con las mismas precauciones que si estuvieran con vida. Despues de haberse alimentado á su satisfaccion, se dirigia á beber agua, cogiendo este líquido con la lengua, de un modo semejante al que usan los perros, pero levantando frecuentemente la cabeza para que el agua resbalase fácilmente en su garganta. Del mismo movimiento se servia para bañarse, introduciendo parte del cuerpo en aquel líquido y levantándose despues sobre sus miembros anteriores.

Hácia el mes de Junio comenzó este reptil á cambiar de epidérmis, cuya separacion total duró más de cuatro meses; el cambio empezó por los flancos de la cabeza, siguiendo despues por la espalda y el vientre, y concluyó por las extremidades. Las partes recientemente descubiertas, presentaban colores más limpios, al grado que cuando acabó de perder su antigua vestidura, estaba inconocible y notablemente mejorado con su nuevo ropaje.

Poco tiempo despues de este cambio, comenzó á entristecerse gradualmente hasta que murió en principios de Marzo.

Las notas que acabo de presentar podrán servir para compararlas con otras observaciones que se hagan sobre el mismo reptil, ya en iguales circunstancias, ya modificándolas para tener la repeticion de los hechos observados, ó las variaciones que se noten con las modificaciones que se hagan, así como por las diferencias de edad, cambio de clima, etc.

Los *Phrynosomas* son reptiles inofensivos, perezosos y torpes. Abundan en los países templados y frios; los he visto con abundancia en las cercanías de Tacubaya, en el Pedregal de San Angel y en otros lugares inmediatos á México. Los he observado tambien en las montañas calcáreas de la Sierra Gorda, en el Estado de Querétaro, y en algunas localidades de Jalisco.

ESTUDIOS

SOBRE

ALGUNOS INSECTOS INDIGENAS,

DESCRIPCION DE UNA NUEVA ESPECIE DE LA FAMILIA DE LOS MELOIDEOS, NEMOGNATHA ZONITOIDES, POR EL SR. D. EUGENIO DUGES, SOCIO CORRESPONSAL EN GUANAJUATO.

Fig. 1.ª Cabeza triangular inclinada hácia adelante, posteriormente cortada en línea recta y prolongándose á manera de hocico, punteada, negra, con una línea realzada en su medio; labro desarrollado, de la figura de un cuadrilátero alargado y escotado por delante; mandíbulas córneas, puntiagudas y sencillas en su extremidad; maxilares compuestos de dos porciones: la interna pequeña, velluda; la externa alargada del doble de la cabeza, guarnecida de pelos fuertes; lengüeta de dos porciones agudas y provistas de pelos. Palpos maxilares de cuatro artículos; el 1.º corto, 2.º y 3.º bastante largos, 4.º ovoideo y truncado; palpos labiales de tres artículos, el 1.º corto, 2.º largo y el mayor, 3.º ovoideo; coselete cuadrado con los ángulos anteriores truncados, los bordes algo escotados y la base cortada en línea recta; es de un color leonado, y presenta dos manchas laterales negras; su superficie está cubierta de puntos hundidos. Cuello negro bastante grande, con puntuaciones muy pronunciadas. Ojos oblongos. Antenas filiformes, negras, de once artículos, el 1.º grande, 2.º pequeño, y los demas iguales hasta el último que es ovoideo. Escudete negro, triangular y desarrollado. Elitros cubriendo todo el cuerpo, negros, cubiertos de puntos hundidos y de finísimos pelos, ligeramente dehiscentes, con la extremidad bastante arredondada hácia fuera y muy poco hácia dentro. Patas negras, velludas; espolones de las posteriores fuertes é iguales; ganchos rojizos, divididos, con la division superior guarnecida de dientes finos, y la inferior peliforme.

Este insecto es enteramente negro, con excepcion del coselete, que como se ha visto, presenta un color leonado, con dos puntos negros; habita en las cercanías de Guanajuato. Le he dado el nombre específico de *zonitoides*, por la forma de su labro y lengüeta, así como por su aspecto general. Lo que me ha decidido á considerarlo como un *Nemognatha*, es el tamaño extraordinario de la porcion exterior de sus maxilares.

Existe una variedad de él, que carece de los puntos negros del coselete, el cual es todo leonado, y tiene además los anillos ventrales más ó ménos amarillos: en unos el color es general y bastante claro, en otros más oscuro y mézclado de negro, ó en fin, simplemente de un color de sepia.

EXPLICACION DE LA FIGURA NUM. 1.

a 1, labro; b 1, mandíbulas; c 1, maxilares y su palpo; d 1, labio y su palpo; e 1, gancho; f 1, coselete; g 1, escudete; h 1, antena.

Rectificaciones sinonímicas a la Memoria de los Meloideos, publicada en el primer tomo de este periódico, hechas por su autor

el Sr. D. Eugenio Duges.

Bajo el nombre de *Epicauta nigritarsis*, Chevr., recibí del Sr. Boucard, una cantárida que fácilmente reconocí ser la misma que describí con el nombre de *C. stigmata* (tomo I, pág. 159): mas como no he seguido la clasificacion de Chevrolat, se debe sustituir solo el específico de *stigmata*, por el de *nigritarsis*.

Tengo tambien á la vista una cantárida que á pesar de su mal estado, reconocí ser la descrita por los Sres. Herrera y Mendoza, con el nombre de *C. erytrothorax:* en el catálogo del Sr. Boucard, viene con el de *C. bisignata, Sturm,* y que por su prioridad debe ser preferido al anterior.

En la obra intitulada: «Agriculture of New-York, etc., etc., With descriptions of the more common and injurious species of Insects, por el Dr. E. Emmons, he leido una descripcion que, á pesar de su laconismo, me parece que es nuestra *cinerea* (tomo I, pág 160). Emmons le da tambien el mismo distintivo específico, bastará escribir el nombre de este naturalista en vez del *nobis*.

Metamórfosis de un Coleóptero de la familia de los Lamelicórneos y del genero Strategus, por el Sr. D. Eugenio Duges.

Fig. 2.ª Solo he podido observar la trasformacion de una hembra de este insecto, y tengo algunos fundamentos para creer sea la especie *Julianus* del género ya indicado, habiéndose desarrollado como una tercera parte ménos que otras hembras que poseo de la misma especie; siendo esto debido quizá, á los alimentos que le ministraba, ó por el mismo cautiverio que haya hecho apresurar sus trasformaciones, como sucede algunas veces.

En su estado normal, el macho tiene una longitud de 0.050 m. y 0.025 idem de latitud, y la hembra 0.045 m. de largo, y 0.023 de ancho.

Voy á describir, 1.º la oruga; 2.º la ninfa; 3.º el insecto perfecto.

La oruga fué encontrada en un tronco de encino traido de la Sierra á la casa de Moneda de Guanajuato, siendo su longitud de 0,093 m., y presentando el tipo exacto de la de los Lamelicórneos, asemejándose mucho especialmente á la del *Oryctes nasicornis* (Francia). A pesar de que en las obras de historia natural se describen esta clase de orugas, creo interesante hacer su descripcion, porque ofrece algunos caractéres especiales.

Su cuerpo es carnoso, blando, cilíndrico y encorvado en la parte posterior; el animal no podia ya extenderlo, debido sin duda, á su edad ya adelantada. Cabeza redonda; frente dirigida hácia adelante y separada del epístomo por una sutura; boca inferior; barba carnosa y trasversal, con sus dos palpos de dos artículos y algo distantes entre sí sus inserciones; lengüeta nula; maxilares encorvados, con dos dientes en la extremidad y pelos fuertes y espinosos; palpos de cuatro artículos; mandíbulas robustas, arqueadas, su parte superior con un borde filoso y dentado, diente molar cuadrado y obtusamente tridentado; labro grande, pero sin cubrir la extremidad de las mandíbulas; antenas insertadas á los lados de la cabeza y compuestas de cuatro artículos, además del apéndice que las sostiene. No existe señal de ojos. Patas de cuatro artículos, y al parecer, el tarsiano falta; ganchos rudimentarios. Nueve son los segmentos abdominales; el saco está dividido en dos partes por un surco trasversal bastante marcado, el ano se abre trasversalmente y tiene dos labios córneos. Los segmentos del cuerpo hasta el sétimo presentan por arriba tres rodetes trasversales, de los cuales, el anterior y el posterior son más largos que el de en medio; los tres se reunen en su extremidad, formando un tubérculo saliente. Estigmas laterales en número de nueve pares; la primera sobre el tórax, las otras sobre los ocho primeros segmentos abdominales: están colocadas en los tubérculos de que acabamos de hablar.

El cuerpo está cubierto de pelos morenos y resistentes; de cada lado del tórax se ve una placa córnea, morena y romboidal. La cabeza es de un moreno subido; el cuerpo de un blanco amarillento; el saco, al contrario, azuloso por las materias que contienen los intestinos y que se ven por trasparencia.

Esta oruga se trasforma en ninfa, hendiéndose la piel de su dorso: no ofrece nada notable, la figura hará ver mejor que cualquiera descripcion, las partes de que está formada; vista del lado del vientre y de arriba abajo, encontramos: una eminencia bastante desarrollada, en seguida la frente, á la derecha y á la izquierda dos gruesos tubérculos arredondados, estrangulados en su medio, en donde estaban los ojos; entre ellos se ve el labro grande y cuadrado, y dos tubérculos encorvados hácia adentro, puntiagudos, futuras mandíbulas; más abajo dos puntitos, los maxilares; un poco hácia afuera dos apéndices verticales, rudimentos de los palpos maxilares; en fin, la barba bajo la forma de un grueso tubérculo, con dos apéndices laterales, futuros palpos labiales. Las patas son muy visibles, el primer par presenta, sobre la parte que más tarde formará la pierna, varios dientes; las demas están lisas. Los élitros y alas están dobladas sobre el vientre, y se ve que la cubierta de las alas membranosas sobresale abajo y adentro de la de los primeros. El abdómen tiene ocho anillos, el último provisto en la parte inferior de dos tubérculos ovalares, arredondados, separados en la base y unidos en la extremidad; entre ellos se ven dos tuberculitos. No me ha sido posible ver la cubierta de las antenas, mas por analogía se deben encontrar en la parte lateral de la especie de capacete (tórax) que cubre la cabeza.

Esta ninfa era de un color moreno oscuro, y al cabo de 43 dias se trasformó en insecto perfecto, rompiéndose la piel del lado del abdómen: á su salida sus tegumentos eran blandos y amarillentos, y buscaba la oscuridad;

despues de unos cuantos dias tomó la piel su dureza ordinaria, y me fué entónces fácil estudiarlo.

Su largo era de 0.035 m., y su ancho 0.020 id.; el color del cuerpo moreno-oscuro, principalmente en la cabeza y tórax, los élitros más claros. Cabeza gruesa, hundida en el tórax hasta la mitad de los ojos, ofreciendo en el punto de union de la frente y el capacete dos tubérculos; el capacete es más ó ménos realzado en su extremidad; labro oculto, redondeado y guarnecido de pelos; mandíbulas córneas, bífidas, algo lameliformes por dentro y velludas. Maxilares con seis dientes, los cuatro primeros en dos líneas; algunas veces se ve uno que otro dentecillo debajo del sexto; la parte inferior de aquellos es velluda, formando un manojo de pelos, sobre el que reposan los dientes; palpos maxilares de cuatro artículos, el primero pequeño, el segundo más grande, el tercero mediano, y el cuarto largo y ovalar. Barba córnea, ovalar, alargada, cortada rectamente en su parte ligular; lengüeta triangular, bastante escotada y guarnecida de pelos; palpos labiales de tres artículos: 1.° grande, 2.° más pequeño, 3.° grande y ovalar, insertos en el borde de la barba. Anténas de 10 artículos, el 1.° bastante grande, 2.°, 3.° y 4.° iguales, 5.° algo más corto, 6.° y 7.° cupuliformes para recibir el terminal, 8.°, 9.° y 10.° formando una masa bastante desarrollada y de la figura de un óvalo dividido á lo largo. Protórax del macho arredondado en sus lados, angosto hácia adelante, con los ángulos anteriores agudos, y el borde posterior sinuoso, ribeteado en su derredor. Por arriba presenta una excavacion bastante marcada y tres cuernos bien desarrollados; uno anterior arqueado, delgado y ligeramente bidentado en su extremidad libre; dos laterales y posteriores, ascendentes, aplanados y dentados: en la hembra se encuentra la misma excavacion, con el cuerno anterior representado por un tuberculito, algunas veces bidentado, mas no existen ni vestigios de los cuernos laterales. La parte anterior del protórax está cubierta de puntos hundidos bastante grandes, la posterior es lisa. Escudete triangular alargado, grande y con sus ángulos romos. Élitros más anchos que el coselete, lisos, con cuatro líneas puntuadas muy superficiales, y una estría profunda cerca de la sutura y ribeteados exteriormente. Patas anteriores cuatro, dentadas, provistas interiormente de un fuerte espolon y tres digitaciones agudas exteriormente; tarsos con el primer artículo poco más grande que los otros que son normales, el quinto bastante desarrollado y grueso, con dos ganchos encorvados y agudos, ofreciendo cada uno de ellos en su base, un hacecillo de pelos. Medianas bi-carenadas; primer artículo de los tarsos aplanado, triangular y un poco más grande que los demas; digitaciones muy pronunciadas en su extremidad. Posteriores como las anteriores, con los tarsos poco más fuertes. Seis segmentos abdominales. Organos de la estridulacion formados por unas líneas rugosas que se ven sobre el *pygidium,* y en la extremidad póstero-inferior de los élitros. Proesternon con su extremidad poscoxal muy larga y aguda.

Segun los datos que he recibido, se encuentra este insecto en los bosques de encinos, y es en el interior de estos árboles donde se cria y sufre sus trasformaciones: en otra ocasion quizá me sea posible hacer la descripcion de la ninfa del macho.

EXPLICACION DE LAS FIGURAS 2, 3, 4, 5 y 6.

Fig. 2.ª Larva: a 2 mandíbula; b 2 maxilar; c 2 cabeza, con el labro y las anténas; d 2 barba y sus palpos; e 2 pata anterior.

Fig. 3.ª Macho: a 3 mandíbula; b 3 maxilar; c 3 barba; d 3 labro; e 3 escudete; f 3 anténas.

Fig. 4.ª Ninfa vista de lado: las cifras se refieren á los mismos órganos de la que sigue.

Fig. 5.ª Ninfa vista de frente: 1 capacete; 2 labro; 3 mandibula; 4 maxilar; 5 ojos; 6 palpos maxilares; 7 barba con sus palpos.

Fig. 6.ª Hembra del *Strategus Julianus?*

Errata.—En la descripcion léase *larva* en vez de *oruga;* pues solo se llama así á la de los Lepidópteros.

Aparato defensivo de una especie de Pachylis, vulgarmente llamado Pedorro, en Guanajuato, y que se encuentra en la estacion de las lluvias en el Huisachi, Acacia albicans:

por el Sr. D. Alfredo Duges.

El insecto perfecto arroja por unas hendeduras en forma de ojal, *F*, un líquido hediondo contenido en una vesícula *P*, cuyos conductos eyaculadores terminan entre las patas medianas y posteriores, *m. p.* Figs. 1 y 2. El líquido es expulsado lateralmente y hasta una distancia de tres piés; mancha fuertemente la piel de un color rojo.

El órgano secretor existe tambien en la ninfa, figs. 3 y 4, pero las hendeduras están obturadas por una membrana, de manera que el líquido secretado no puede salir al exterior; en cambio posée otro aparato colocado entre los 3.º y 4º., 4.º y 5.º arcos dorsales. Consiste tambien en una vesícula *A*, cuyo producto es expulsado por dos tubérculos *T*, cerrados por una especie de tapa, y su abertura semicircular se abre hácia atrás, figs. 5 y 6; de modo que el líquido es lanzado en forma de lluvia, lateral y posteriormente.

En la fig. 2 se ven de cada lado de las divisiones del tórax los músculos de las patas: como no he encontrado músculos especiales para la compresion de la bolsa secretora, supongo que se verificará por medio de los que mueven las patas posteriores: en la ninfa sucederá otro tanto con los músculos que mueven los arcos dorsales.

LIT. DE H. IRIARTE, MEXICO

Se deduce de lo expuesto, que el que desée coger estos insectos deberá, para evitar ser infestado de un repugnante olor de chinche, tomar el insecto perfecto, por los ángulos laterales del protórax, y la ninfa por las patas.

El curioso insecto á que se refiere el estudio del Sr. Dugés, probablemente es el *Pachylis gigas* de Burmeister, que con el *P. pharaonis* de la Guyana y del Brasil, y el *P. laticornis* de este último lugar, son las tres especies más notables de este género.

Es muy abundante en las regiones templadas de México (en algunas por lo ménos), donde vegetan los arbustos espinosos de las Mimoseas. Aparecen en la época de las aguas, y se aglomeran sobre estas plantas en número verdaderamente increible.

La fig. 7 representa un individuo macho en su estado perfecto y en su tamaño natural. Su color general es negro, con la cara superior del protórax, esternon y abdómen por debajo, cubiertos de un vello amarillo-rojizo, especialmente el primero. Presenta tambien numerosos tintes de un rojo ferruginoso en las partes siguientes: en la parte angosta del artículo en raqueta de las antenas; formando dos anillos en los muslos de los tres pares de patas y en las piernas de las posteriores; dispuesto en manchas en los lados de los tres segmentos del tórax, y una muy pequeña en el meta-esternon; en la cara superior del abdómen en el centro y en las cuatro quintas de su superficie; en la inferior y hácia los lados, una mancha sobre cada anillo (esto segun me parece, en la hembra especialmente), y al derredor de la cloaca. Élitros en su porcion dura, negros, con las nervaduras de un amarillo vivo; en la blanda, bronceados por encima y de un hermoso azul índigo por debajo; alas de este último color, excepto la base que es negra. Sus dimensiones, sensiblemente iguales en los dos sexos, aunque quizá algo mayores en el macho, son: largo, cerca de 4 centímetros; ancho, ménos de 1 ½ id. En algunas larvas que hemos examinado, la coloracion es tambien negra, roja y amarilla, predominando la segunda.—*(C. de P.)*

ESTUDIO

SOBRE LOS

ÓRGANOS LUMINOSOS DE LOS CUCUYOS DE VERACRUZ·

POR EL SEÑOR DOCTOR CARLOS HEINEMANN.

(CONCLUYE.)

Colocando sobre una médula de saúco las preparaciones alcohólicas, se dividen fácilmente y se presenta con claridad la estructura granuloso-opaca de las celdillas y sus núcleos; pero solo las ramificaciones finas de las tráqueas quedan invisibles á causa de la sustraccion de su contenido de aire. Los órganos luminosos, recientemente divididos, acusan al papel reactivo, una reaccion ácida; pero no me atreveria á decidir si es la reaccion normal de las celdillas, ó si es debida á una descomposicion que ha comenzado á verificarse.

Pasando ahora á la descripcion de la relacion de las celdillas luminosas con las tráqueas, corresponde decir algo acerca del tronco braqueano. Como los demas coleópteros examinados hasta ahora, tienen tambien los Cucuyos nueve pares de estigmas; de los cuales, siete corresponden á la parte posterior del cuerpo, y dos al pecho; los abdominales son arredondados y se hallan inmediatos al borde exterior de los anillos dorsales; los del tórax se distribuyen sobre el meso y metatórax: los primeros están situados en el declive exterior de la parte dorsal, y son tambien redondos; los últimos, mucho más grandes, bilabiados, alargados y situados en la parte exterior del borde súpero-anterior. Estos grandes estigmas del metatórax, terminan en los espacios aéreos, de los cuales nacen unas largas ramificaciones, siendo las anteriores más gruesas y las posteriores más finas; la organizacion de las extremidades finas de las tráqueas, es completamente distinta de la que se observa en el *Lampyris splendidula:* en primer lugar, no presentan ramificaciones arborescentes, sino que están dispuestas paralelamente, semejantes á los hacecillos de un pincel; en segundo, no se encuentran ni huellas de celdillas finales de las tráqueas, como Max Schultze las ha observado en los órganos luminosos de los machos del *Lampyris splendidula.*

Por el contrario, las preparaciones alcohólicas ó frescas, sorprenden por una serie de puntos brillantes dispuestos en hileras formadas por las celdillas luminosas colocadas sobre las tráqueas, á las que acompañan en su radiacion, como perlas enhebradas en un hilo. En la direccion radial es evidentemente más fácil una separacion del conjunto, y por lo mismo se logra sin trabajo el aislamiento de las hileras de celdillas. Las ramificaciones traqueales se extienden hasta ellas serpenteando y abandonando una serie de celdillas para penetrar en otras, entrelazándose mútuamente. La lejía de potasa á 35 %, que como es sabido sirve para aislar los elementos de muchos tejidos, disolviendo la sustancia quitinosa, no disuelve en este caso la combinacion que une á las celdillas con las tráqueas, sino que simplemente se separan aquellas más fácilmente en la direccion de los radios traqueales, quedando siempre adheridas á estas ramificaciones; mas en las preparaciones dispuestas en soluciones de Os. S., y que han adquirido por esto un mayor grado de fragibilidad, se pueden aislar con facilidad unas de otras. He visto á menudo en estas preparaciones, que las extremidades más finas de las tráqueas, desaparecen en las celdillas ó al ménos no se pueden seguir con la vista más allá.

Aquí es donde corresponde hablar extensamente de la influencia del Os. S. sobre los órganos luminosos, mayormente cuando con este motivo tenemos que discutir otras cuestiones.

Colocando un Cucuyo vivo 12, 24 ó 36 horas en una disolucion del ácido al 1 p$\frac{0}{0}$, se colora únicamente de negro la capa blanca calcárea no lúcida, miéntras la lúcida se conserva casi blanca. Si ahora se dispone una preparacion, no se ve huella ninguna de las celdillas finales que terminan en las tráqueas; mas las celdillas luminosas resaltan vigorosamente con un tinte ligeramente moreno, presentando con frecuencia apéndices celulares de la misma naturaleza que el tejido de igual clase del resto del cuerpo. Aquí y allá se ven estos apéndices trasformarse en filamentos, quedando por ahora indeciso si son nervios ó terminaciones de las tráqueas más finas.

En cuanto á la naturaleza de los apéndices, haré presente que con los más fuertes objetivos de Zeiss, no he logrado ver ninguno de ellos en las preparaciones frescas, y por lo mismo, creo posible se formen artificialmente en los casos en que aparecen. La consistencia alterada por el Os. S., y la mayor tenacidad de la sustancia celular obtenida, explica muy bien los cambios de forma sin la separacion necesaria de las mismas celdillas por medio de la aguja. Los mismos resultados se obtienen colocando los órganos luminosos frescos y enteros; si se dispone el órgano dividido en una solucion ácida al 1 p$\frac{0}{0}$ por espacio de 6 ó 7 horas, se observa un ennegrecimiento parcial de la capa luminosa, no pudiéndose ver las celdillas á causa de su demasiada fragilidad; mas se encuentran celdillas bien conservadas, de aquellas que tienen fragmentos de tráqueas, pero su núcleo queda muy confuso. Aun en soluciones más débiles, v. g., ⅕ p$\frac{0}{0}$, no se conservan.

Anticipadamente diré, que en tres Lampirídeos de Veracruz que sometí á la experimentacion, colocándolos en una disolucion de Os. S., las celdillas traqueales se han presentado inmediatamente con claridad y en el mismo órden en que Max Schultze dibujó las del *Lampyris splendidula.*

Examinando ahora la capa no luminosa, reciente, en el suero artificial, aparece compuesta de grandes ramas traqueales y de masas globulosas, formadas, al parecer, de pequeños núcleos muy triturados. Bajo la influencia de la lejía de potasa concentrada, algunos de los cuerpos globulosos se presentan con una estructura cristalina y radiada. No me he podido convencer si estos núcleos están encerrados en celdillas, no obstante de que la reaccion de las luminosas con la misma sustancia, me hace pensar tengan una disposicion semejante. Agregando un ácido, las masas oscuras desaparecen y el ácido úrico se presenta cristalizado en abundancia.

La observacion microscópica confirma la reaccion de la murexida que se puede verificar tomando una cantidad suficiente de material. Hermosísimos son los cristales de acido úrico que se obtienen con el Os. S. La capa luminosa tratada por los mismos reactivos, suministra cristalizaciones de otra clase, mas nunca de ácido úrico. Con respecto á las bases que están unidas con este ácido, en esta vez los resultados que he obtenido, casi han sido negativos, pero decididamente no es el amoniaco.

Por tanto, si pongo en duda la existencia de las celdillas que contengan uratos en los Cucuyos, podria ser muy bien que la capa no luminosa se formase sucesivamente de la luminosa, como un producto de su actividad; sobre cuyo hecho Schultze ha llamado la atencion; pero yo no lo he podido observar ni al principio ni al fin de las observaciones que hice durante cuatro semanas, ni aun siquiera una corta diferencia en las densidades relativas de ambas capas.

La íntima conexion de ellas, es esencialmente determinada, segun mi modo de ver, por las tráqueas. Ahora, si se pregunta cuál es la importancia de la capa no luminosa, podria decirse que obra como un aparato refrector de la luz, aumentando la brillantez del órgano luminoso.

Los nervios de este órgano, situados en el vientre, tienen su orígen del primer ganglio abdominal que directamente está colocado sobre él. Obsérvese de paso, que de los cinco ganglios existentes en el abdómen, el quinto es el mayor y está unido al cuarto por unas comisuras longitudinales, relativamente cortas.

No he determinado aún la exacta distribucion de los nervios de las celdillas, pero próximamente me ocuparé de nuevo de esta cuestion.

Antes de finalizar estos imperfectos estudios, llamaré la atencion sobre la mútua reaccion de los órganos luminosos con la sangre; cuestion de la que apénas se han hecho observaciones en los Lampirideos europeos. De hecho, sin la participacion de la sangre no es posible imaginarse esas reacciones químicas de tanta importancia, que yo desde luego reconozco como una funcion especial de estos órganos. No pudiendo discutir estas reacciones mútuas, me ocuparé solo de un líquido que humedece los órganos luminosos abdominales, y que no puede considerarse idéntico con la sangre que proviene de los vasos dorsales. Desprendidos los élitros del animal vivo, y levantando hácia arriba el abdómen, se ve, estando aún con vida, la fina cubierta quitinosa del órgano luminoso abdominal, llena de un líquido; si se corta con cuidado este órgano, escurre un líquido amarillo-gris no luminoso, y que no revela reaccion alguna al papel tornasol y al de cúrcuma. Despues de poco tiempo se colora el líquido en pardo, y se observa, á consecuencia de la descomposicion que sufre, su reaccion con el papel tornasol. Observándolo cuando ha sido recientemente extraido, se ve que está compuesto de dos líquidos imperfectamente mezclados; el uno incoloro y el otro amarillo-verdoso. Igualmente se observa que la trasformacion del líquido en pardo, raras veces se hace uniforme sino parcialmente, y algunas veces se consigue (extendiéndolo sobre un papel) obtener una laca trasparente y de color verde-amarillo. Colocando un poco del líquido en un vidrio de reloj y dentro de un vaso que pueda cerrarse herméticamente y que esté saturado de vapor de agua, aun despues de ocho dias no se observa coagulacion espontánea, pero sí su coloracion en pardo. Humedeciendo el líquido y poniéndolo en agua destilada, se ve precipitarse hácia el fondo un coágulo blanco; calentándolo ántes de entrar en ebullicion se precipita tambien un coágulo blanco, que visto al microscopio aparece finamente granulado: ¿acaso son sustancias separadas de otra naturaleza? El líquido reciente examinado al microscopio, se ve como formado de una gran masa de cuerpecillos, parte arredondados y parte fusiformes, incoloros y finamente granulados; muchos de ellos estando provistos de apéndices ténues, y sin que les haya observado movimientos espontáneos. El diámetro de los redondos es poco más ó ménos de 0.005 mm.; los fusiformes son más angostos, pero de doble longitud. Queda ahora por saber si la coloracion en pardo está en relacion con los cuerpecillos incoloros de la sangre. Al principio estaba yo inclinado á esta opinion, porque la sustancia parda que se ve con el microscopio, se presenta siempre en masas que muchas veces tienen la apariencia engañosa de los glóbulos blancos de la sangre: pero en primer lugar, continuando la observacion, se presenta frecuentemente la masa parda bajo la forma cristalina: segundo, que la trasformacion de la coloracion en pardo, se extiende á todo el líquido: tercero, que una parte de los cuerpecillos de la sangre, no existe en los lugares coloridos, sino que se conservan en su estado normal. A medida que el líquido se evapora, se van presentando otras cristalizaciones, siendo principalmente octaedros regulares. Buscando la reaccion de la hemina, segun el método de Teichmann, en la sustancia colorida no se obtiene ningun resultado.

Veracruz, Noviembre de 1871.

LA NOCTILUCINA.

PRINCIPIO INMEDIATO LUMINOSO.

A esta sustancia es debida la fosforescencia que se observa en los pescados muertos; la secretan las lucernas y probablemente todos los animales fosforescentes: existe tambien en los huevos de los lampiros, y se cree que la producen algunas plantas de los géneros *Agaricus, Euforbia, etc.;* se forma igualmente durante la descomposicion de las sustancias vegetales y animales, en determinadas circunstancias.

Los animales fosforescentes se hallan provistos de una glándula en la que se forma la noctilucina. La *Scolopendra electrica* la secreta muy pura, y con tal abundancia, que haciendo correr algunos de estos miriápodos sobre una cápsula de cristal, en el mes de Setiembre, se obtiene una cantidad de ella, suficiente para estudiar sus principales propiedades.

En los animales superiores la secrecion de la materia fosforescente se halla hasta cierto punto, bajo la dependencia del sistema nervioso, de manera que el animal brilla ó apaga su luz, segun su voluntad.

En la *Noctiluca miliaris,* los pólipos flexibles y otros séres inferiores, parece que existe igualmente un órgano especial destinado á la produccion de la luz, pero la secrecion de la materia luminosa se halla por lo comun sometida á la influencia de las circunstancias exteriores.

Cualesquiera que sea su procedencia, la noctilucina produce siempre una luz monocromática, que da un espectro visible, sobre todo, entre las líneas E. y K., y posée siempre las mismas propiedades químicas, segun las observaciones que hasta ahora se han hecho.

La noctilucina es una sustancia nitrogenada, blanca, casi líquida, miscible con el agua, aunque insoluble en ella; su densidad es menor que la de este líquido; posée un olor débil, parecido al del ácido caprílico. Es insoluble en el alcohol y en el éter; se disuelve, descomponiéndose fácilmente, en los ácidos minerales y en los álcalis. Dejándola fermentar por algun tiempo, produce un olor de queso podrido. Cuando está húmeda, absorbe el oxígeno y desprende ácido carbónico. En una atmósfera seca pierde su humedad, y queda en capas delgadas, traslucidas y sin estructura, presentando gran semejanza con la *mucina* que se extrae de los *mocosos, Limax.*

La noctilucina es fosforescente en alto grado, y esta produccion de luz proviene de la oxidacion que sufre cuando se encuentra en contacto con el aire húmedo. Puede aun brillar dentro del agua, miéntras este líquido tenga aire en solucion. En el oxígeno, y en el aire cargado de ozona, aumenta su brillo. Una vez que la oxidacion ha terminado, cesa inmediatamente la produccion de luz.

(Extractado de una Memoria de Mr. T. L. Phipson, por el Sr. D. A. Herrera.)

ENSAYO ORNITOLÓGICO DE LA FAMILIA TROCHILIDÆ

O SEA DE LOS COLIBRIES O CHUPAMIRTOS DE MEXICO,

POR EL Sr. D. RAFAEL MONTES DE OCA, SOCIO DE NUMERO.

(Continua.)

Num. 13.—*Chupamirto verde de agua y cola de pescado.*

Chlorostilbon caniveti, Gould; *Ornismya canivetii*, Less.; *Thaumatias caniveti*, Bonaparte.

Esta especie de colibries, tan extremadamente brillante en lo general de su plumaje, se halla en las inmediaciones de Jalapa, Coatepec y Córdoba, con más abundancia durante los meses de Junio y Julio, pudiendo decirse que esta es su localidad, puesto que se ha observado que allí efectúa su nidificacion. El Sr. Gould, dice que habita tambien en toda la parte oriental de Guatemala, y es muy probable que sea así.

La apariencia del macho adulto de esta especie, es como sigue: la parte de encima de la cabeza, verde metálico hermosísimo, que en ciertas posiciones de la luz, más bien aparece como un rico dorado bruñido; la parte superior del cuello, del cuerpo y cubiertas de las alas y de la cola, de un tinte verde bronceado; alas pardo-purpúreas claras; cola negra con visos como los que presenta el acero pavonado de azul, la cual, como sus plumas, disminuyen en tamaño hácia las dos del centro, que solo tienen poco más de la tercera parte del largo de las laterales, cuando la abre, es exactamente de la figura de la de un pescado, teniendo las puntas de cada pluma un tinte gris, desvanecido al unirse con el color general de ella; su garganta, pecho, parte inferior del cuerpo y cubiertas de debajo de la cola, son de un color verde metálico brillantísimo, con reflejos dorados; las piernas las tiene cubiertas con un plumon blanco; su pico es color de carne en su base y oscuro en su extremidad; sus patas pardas, y uñas negras.

Su tamaño, desde la punta del pico hasta la extremidad de la cola, es de 3¾ de pulgada; alas 1¾ idem; cola 1½, y pico casi recto ⅔ idem.

La hembra es casi del mismo tamaño del macho; tiene la parte superior de la cabeza, pardo-bronceada; la de encima del cuello y del cuerpo, así como sus flancos, verde lustrosos; alas pardo-purpúreas como las del macho; cola con las dos plumas del centro verdes; las demas de cada lado, de un color pardo verdusco en sus bases hasta como la tercera parte de su largo, con lo restante del mismo color oscuro de la del macho, teniendo las tres de cada lado, las puntas de un blanco sucio ménos marcado en las que están más hácia el centro; su garganta, pecho y vientre, son de un color gris claro algo pardusco cerca de sus flancos; sus patas y pico son semejantes á los del macho; presentando, por último, una rayita que comienza en la extremidad del ángulo posterior del ojo y corre hácia atrás como un cuarto de pulgada.

El macho jóven es muy semejante al adulto, con solo la diferencia, que la parte inferior del cuerpo la tiene pardo-gris, con una mancha verde en la garganta, la cual es más ó ménos extensa á medida que llega á la edad de adulto, en que se cubre todo del hermoso verde dorado de que ya se ha hablado al describir el macho.

NUM. 14.—*Chupamirto de pecho color de rosa.*

Delattria Henrica, Gould; *Ornismya Henrica,* Lesson; *Topaza Henrica,* Gray; *Delattria Henrica,* Bonap.

Esta especie de colibríes se encuentra en Guatemala; y el distinguido naturalista, el Sr. de Lattre, que fué quien le dió el nombre que lleva, en honor de su hermano Enrique, dice que encontró, aunque raros, algunos ejemplares de éstos cerca de Coatepec, cuando visitó este país. Y en efecto, hasta el presente solo se encuentran pocos ejemplares en el lugar indicado, por los meses de Junio y Julio, así como tambien en las cercanías de Orizava y Córdoba y esta ciudad (Jalapa).

Su localidad aun no está enteramente determinada; mas es de creer sea Guatemala, pues que el que esto escribe, nunca ha encontrado por aquí ningun pollito de esta especie ó algun nido; habiendo advertido además, que en su visita á los lugares indicados, nunca duran más de cuatro á cinco semanas.

El macho adulto de esta especie, tiene la parte superior de la cabeza y del cuerpo así como las cubiertas de las alas, de un color pardo verdusco bronceado; las alas pardo-purpúreas; la cola negro-parduscа, con su cubierta del mismo color, suavizándose imperceptiblemente con el tinte más claro de la parte superior del cuerpo; su garganta es de un color de rosa purpúreo metalico, muy delicado; el pecho es poco más ó ménos del mismo color que la region superior del cuerpo; toda la parte inferior del vientre, gris oscuro ferruginoso; las cubiertas de debajo de la cola, casi del mismo color, con las orillas de cada pluma, de un tinte blanquecino tirando á castaño, con una especie de plumon casi blanco en la region anal; y por último, tiene una especie de bigote blanco castaño, que nace en la extremidad donde se juntan las mandíbulas, corriendo hácia atrás como unas seis líneas, y otra raya más que nace en la extremidad del ojo, de color casi blanco, como de seis líneas de largo, y que tambien se dirige hácia atrás.

Su pico y uñas son negras, que parecen de ballena; sus patas color de carne; su largo total 4½ pulgadas; cola 1¾ id.; alas 2⅞, y su pico casi recto de ⅞ id.

La hembra es casi del mismo tamaño que el macho, así como tambien lo es su color, con la diferencia que está desprovista del hermoso color de rosa de la garganta, teniendo en lugar de éste, un color pardo claro ferruginoso, que participa de un tinte castaño cerca de la mandíbula inferior.

Num. 15.—*Chupamirto chileanchito.*

Phaëthornis Adolphi, Gould; *Phaëthornis Adolphi,* Bourc.

Este extraño colibrí parece ser nativo de Guatemala; pero por lo que he podido observar, visita periódicamente el territorio mexicano, pues he encontrado alguno que otro ejemplar de esta especie en las inmediaciones de Jalapa, y con más abundancia en las cercanías de Coatepec. El Sr. Sallé, durante su estancia en este país, se procuró tambien diversos ejemplares de éstos cerca de Córdoba, y segun sus observaciones anatómicas, encontró, que la única diferencia que existe con respecto al exterior de ambos sexos, es, que la hembra tiene las dos plumas del centro de la cola más prolongadas que las del macho.

La apariencia general del plumaje de esta especie, es como sigue: la parte de encima de la cabeza, del cuello, del cuerpo y cubiertas de las alas, verde-pardusco bronceado; la cubierta de la cola de un color castaño; las plumas de ésta, verde bronceadas, con las extremidades de un color castaño claro, terminando en un tinte blanquecino; sus alas pardo-purpúreas; cubiertas de las orejas pardas muy oscuras; toda su parte inferior de un color castaño claro, que cerca del pico es un poco blanquecino, y en la parte de la garganta algo pardusco; cubiertas de las piernas blanquizcas; la mandíbula superior del pico, negra; la inferior, en su extremidad, de ese mismo color, con la base amarilla; patas amarillas tambien, y uñas negras.

La hembra, como ya se ha dicho, solo se diferencia del macho en el largo de las dos plumas centrales de la cola.

El largo total de los individuos de esta especie, es 4 pulgadas; alas 1⅝ idem; cola del macho 1½, de la hembra 1¾ idem, y pico curvo una pulgada.

Num. 16.—*Chupamirto Misanteco.*

Lampornis Mango, Gould; *Trochilus Mango,* Linn.; *Le Plastron noir,* Buff.; *Trochilus violicauda,* Bodd.

Esta especie de colibrí ha sido conocida por diversos naturalistas de los más antiguos, que la han asignado una region muy extensa; pues dicen que habita en el Brasil y en casi toda la parte Norte de la América del Sur hasta

Panamá, así como en algunas de las islas Antillas. El Sr. Audubon la ha descrito tambien en su famosa obra de las aves de la América del Norte, en vista de un ejemplar cogido en la Península de la Florida, cuya circunstancia ha sido puesta en duda, tal vez por no tenerse noticia que existe en México, en la region del canton de Mizantla, como á unas nueve leguas de la costa, en el Estado de Veracruz, donde el que esto escribe ha encontrado muchos ejemplares de ambos sexos con sus nidos y respectivos polluelos; de donde resulta que ésta es otra de sus localidades fija, pues los nativos de ese rumbo, dicen que vive allí durante todo el año; no siendo difícil, en consecuencia, que algunos individuos de dicha familia, siguiendo la costa durante el verano, puesto que el calor es general en toda ella, lleguen hasta la Florida, porque parece, segun la opinion de distintos naturalistas, prefiere los lugares cálidos para morada, como lo es el precitado.

Es de notar, que los individuos de esta especie son poco esquivos, debido sin duda á que por allí no hay quien los persiga, y que no se sabe que existan en algun otro lugar de la República mexicana.

La apariencia del macho adulto, es como sigue: la cabeza, la parte de encima del cuello y del cuerpo, así como las cubiertas de las alas y de la cola, de un color verde bronceado rojizo; alas pardo-purpúreas; las dos plumas del centro de la cola, verde bronceadas, las demas de ambos lados, de color de pasa con reflejos violados en la mitad exterior, marginadas de un color bastante oscuro azulado; el centro de toda su parte inferior, comenzando desde la garganta, es negro aterciopelado, teniendo á los lados de este color, una porcion azul-oscura metálica, que al unirse con el verde bronceado de la parte superior del cuerpo, toma diversos tintes de color verde metálico; las cubiertas de debajo de la cola son verduscas; las de las piernas, son un plumon blanco, y su pico, patas y uñas negras.

Su largo total es de 5 pulgadas; alas 3 idem; cola $1\frac{5}{8}$, y su pico algo encorvado en su extremidad, 1 pulgada.

La hembra es del mismo tamaño que el macho; pero muy diferente en el color de su plumaje, pues aunque la parte de encima de la cabeza, del cuello y del cuerpo, y cubiertas de las alas y de la cola son semejantes, su garganta, pecho y vientre son blancos, con una mancha longitudinal negra en el centro de dichas partes, un poco más angosta en lo que corresponde al vientre, é interrumpida en algunos ejemplares en la parte anterior de éste; las cubiertas de debajo de la cola son verdes, marginadas de un color ceniciento; las dos plumas del centro de la cola, de color verde bronceado, con las extremidades un poco más oscuras; las demas tienen las bases, como una cuarta parte del largo total de cada una, negras con reflejos entre azul y verde, despues tienen un color de pasa hermosísimo, con visos violados, y por último, sus extremidades, como otra cuarta parte, son del mismo color que las bases, con una manchita blanca en la punta de cada una de las tres laterales, más pequeña en las que están hácia el centro; sus patas y pico son negras como las del macho.

Los machos jóvenes son parecidos á la hembra, con la diferencia que toda la parte inferior del cuerpo, cuello y garganta, es blanco, con dos líneas de manchitas castañas que le nacen una de cada lado de la mandíbula inferior y continúan en direccion á los lados del cuello, dejando ver una pequeña porcion del fondo blanco entre dicha línea de manchitas, el ojo y el color de la parte superior del cuerpo.

Sus nidos son redondos, guarnecidos por dentro con una especie de algodon blanco, y por afuera con el musgo, ó mejor dicho, el liquen fino de las peñas.

Num. 17.—*Chupamirto de cola verde-mar.*

Petasophora thalassina, Gould; *Trochilus thalassinus,* Swains.; *Ornismya Anaïs,* Lesson; *Polytmus thalassinus,* Gray y Mitch.; *Colibrí thalassinus,* Bonap.

Esta especie de colibríes, es otra de las peculiares de México, que se encuentra en las inmediaciones de Jalapa y Coatepec, así como en el Valle de México, donde abunda mucho más en los meses de Junio y Julio, y segun la opinion de algunos otros troquilidistas, tambien visita las regiones de Guatemala, sin ir más allá del Istmo de Panamá.

Lesson, como ya se ha visto, le ha dado el nombre de *Anaïs;* mas por lo que se ve en la interesante obra del Sr. Gould, ha confundido tres especies distintas, el *talassina,* el *Anaïs* y el *Jolata,* que á pesar de ser todos bastante parecidos en cuanto al color de sus hermosos plumajes, los dos últimos, en primer lugar son más grandes que el primero, y en segundo, pertenecen exclusivamente á la América meridional.

El color del macho adulto, en lo que corresponde á la parte superior de la cabeza, del cuerpo, flancos y cubiertas de las alas y de la cola, es verde latonado lustroso; sus alas pardo-purpúreas; cola verde con visos parecidos á los que tiene el acero pavonado de azul, con excepcion de las dos plumas del centro, en las cuales prevalece el tinte de la parte superior del cuerpo, teniendo además, en cada una de sus plumas, como á media pulgada de distancia de sus extremidades, un sombrío oscuro, que cuando la abre le forma una especie de banda circular muy vistosa; su garganta y pecho es verdezacate metálico hermosísimo, con la singularidad de que cada pluma tiene aparentemente una mancha negra en el centro; diciéndose que esa mancha es aparente, porque casi desaparece, ó se ve más ó ménos grande, segun la incidencia de los rayos luminosos; en la parte inferior del pecho, tiene un sombrío azul turquí, que se desvanece con el tinte pardo-verdusco del abdómen; las cubiertas de debajo de la cola, son de un tinte entre castaño y pardo claro, con visos verdes en sus extremidades; y por último, desde la base de la mandíbula inferior, le nacen dos líneas, una hácia cada lado, de color azul turquí metálico hermosísimo, que se dirigen hácia atrás por las partes inferiores de los ojos, hasta formar en seguida las cubiertas de las orejas, adonde se ensanchan un poco más; sus patas son negroparduscas, su pico algo curvo, y uñas negras que parecen de ballena.

Su largo total es de 4¾ de pulgada, desde la punta del pico hasta la extremidad de la cola; alas 2⅝ idem; cola 1¾, y pico 11 líneas.

La hembra y el macho jóven son casi del mismo tamaño del macho adulto, y solo se diferencian de éste, en que el color del pecho y aun el de la cola, es ménos pronunciado.

Num. 18.—*Chupamirto matraquita.*

Circe latirostris, Gould; *Cynanthus lattirostris*, Swains., *Sapphironia Circe*, Bonap.

Esta especie de colibríes, es una de las peculiares de la altiplanicie del Valle de México, donde habita desde la conclusion del Otoño hasta el principio de la Primavera, es decir: desde fines de Noviembre hasta principios de Marzo, que es el tiempo en que nidifica; mas sin embargo, no puede decirse que es de las más comunes de esta region, porque no son muchos los individuos que se encuentran de ella: de dónde viene, ó adónde va durante el resto del año, aun queda todavía por averiguarse, pues á pesar de todas las investigaciones que ha hecho el que esto escribe, no ha podido llegar á saberlo.

Los cazadores del Valle de México, son los que han dado á esta especie el nombre de *Matraquita*, á causa de la semejanza que tiene su gorjeo ó arrullo, con el ruido que hace el juguete de los niños llamado matraca.

La apariencia del macho adulto, es como sigue: la parte superior de la cabeza, del cuerpo y cubiertas de encima de las alas y de la cola, de un color verde bronceado algo pardusco; cola negra, con visos azules como los del acero pavonado, con las dos plumas de cada lado, tintadas de gris en sus extremidades, cuyo tinte es más ó ménos pronunciado en diversos ejemplares; alas pardo-purpúreas; abdómen gris; flancos y parte inferior del pecho, de este mismo color un poco más oscuro, con visos verde-bronceados; garganta y parte superior del pecho, de color azul zafiro, cuyo color toma diversos tintes al unirse imperceptiblemente con el color verde bronceado de la parte inferior del pecho; las cubiertas de debajo de la cola son de un color gris casi blanco; region anal cubierta con un plumon blanco, teniendo tambien una manchita de este mismo color, hácia la parte posterior del ojo; sus patas son pardo-oscuras, y sus uñas negras; y por conclusion, tiene tambien el pico negro, con la mandíbula inferior en su base color de carne.

Su largo total es de $4\frac{1}{4}$ de pulgada; alas $2\frac{3}{8}$ idem; cola $1\frac{3}{8}$, y pico, casi recto, 11 líneas.

El macho jóven se diferencia del adulto, en que solo se le ven unas cuantas plumas azules en la garganta, cuyo número aumenta á medida que crece en edad.

La hembra es casi del mismo tamaño que el macho, y solamente se diferencia de éste, en que las dos plumas del centro de la cola las tiene verde bronceadas, y toda la parte inferior del cuerpo, comenzando desde la garganta, de un tinte uniforme gris.

(Continuara.)

FISIOLOGÍA VEGETAL

Investigaciones fisiologicas sobre la vegetacion libre del pólen y del óvulo, y sobre la fecundacion directa de las plantas:

POR PH. VAN-TIEGHEM,

TRADUCIDAS POR EL SEÑOR DON MANUEL SORIANO,

SOCIO DE NUMERO.

Hace tres siglos solamente que fueron descubiertos los órganos sexuales de las plantas. Camerarius y Grew fueron los primeros en demostrar, por la experiencia, la utilidad de las diferentes partes de la flor en la produccion del grano, el mantenimiento y la sucesion de la especie.

Los antiguos tenian ideas vagas sobre la probable existencia de los sexos en los vegetales: en tiempo de Herodoto, los babilonianos distinguieron ya los dátiles machos y los dátiles hembras, y practicaban la fecundacion artificial de estos últimos para obtener frutos con más seguridad. Se sabe que esta costumbre se ha conservado entre los árabes, donde existe desde tiempo inmemorial. Theophraste habla tambien de plantas machos y hembras; pero tanto éste como otros escritores, no conocian las partes de la flor que constituían los sexos.

En 1538 Caesalpin comenzó á distinguir con más precision las flores machos y hembras en las plantas dioicas, y decia, que los machos eran estériles miéntras las hembras daban frutos.

Como ántes he dicho, Grew en 1682, y Camerarius en 1694, publicaron ya las diversas funciones de cada una de las partes de la flor, hablando entónces de la reproduccion y de sus órganos particulares.

Despues de esta época, Morland en 1703, Geoffroi en 1711, y Vaillant en 1717, no dejaron en sus descripciones duda alguna sobre las funciones de los órganos reproductores. Todo en las ciencias tiene sus partidarios y otros que les son adversos: los órganos sexuales han sido negados por algunos botánicos, pero creo que hoy, difícilmente se podrán negar su existencia y sus funciones.

El deseo de no limitarse con el *hasta aquí* en el estudio, ha hecho el que célebres naturalistas se hayan entregado con ardor á las investigaciones anatómicas y fisiológicas de las plantas, y hayan emprendido experiencias curiosísimas, con resultados más ó ménos sorprendentes.

Todo en la naturaleza está hábilmente dispuesto, y miéntras profundizamos más y analizamos sus misterios, admiramos la sabiduría infinita de Aquel Creador universal que, en cada átomo y en cada funcion nos revela su omnipotencia.

La Anatomía y Fisiología vegetales, progresan dia á dia, debido á los medios de que el hombre se vale para sorprender, lo que con la simple vista le seria imposible observar.

Una de las funciones más importantes de las plantas, la reproduccion, ha sido el objeto de estudios recientes, á los que se ha consagrado el célebre naturalista Van Tieghem. Abrigo, señores, la persuasion de que sus experiencias aun no son bastante conocidas; y en esta noche que el Reglamento me impone el deber de dirigiros la palabra, quiero tener la satisfaccion de daros á conocer las observaciones de Van Tieghem, para que encontrando admiradores entusiastas, prosigan el camino tan hábilmente trasado por él.

⁂

En la serie de investigaciones que ha emprendido Van Tieghem, aisla primero el pólen y el óvulo en el mundo exterior, para llegar á conocer las circunstancias necesarias á su desarrollo independiente; reune en seguida estos dos cuerpos bajo las condiciones del medio ya determinado, para estudiar en seguida la accion del uno sobre el otro. Así, pues, tenemos que estudiar: primero, la vegetacion libre del pólen; segundo, la vegetacion libre del óvulo; tercero la fecundacion directa.

I.

VEGETACION LIBRE DEL POLEN.

El pólen, una vez que se ha desprendido de la antera, y que por cualquiera causa ha venido á depositarse sobre el estigma fresco, sabemos que emite un tubo que llamamos polínico, y que alargándose éste en el canal del estilo, desciende hasta la cavidad del ovario y viene á poner su extremidad inferior en contacto con el saco embrionario de un óvulo que viene á fecundar. Este es el hecho: examinemos ahora rápidamente las diversas opiniones de algunos autores sobre la produccion del tubo polínico. Para unos, la formacion del tubo polínico, seria debida á una simple extension física de la membrana interna, provocada por la endosmosis del líquido que baña el estigma. Para otros, el prodigioso alargamiento del tubo de que hablamos, puede llegar, sin que su membrana se adelgase mucho, millares de veces el diámetro de la célula primitiva, y ven al contrario un fenómeno de nutricion; mas como esta teoría no va acompañada por una prueba directa, no es lógico deducir la naturaleza de un fenómeno, por su intensidad.

Se necesita, por lo tanto, recurrir á la experiencia para resolver la cuestion; y como en las circunstancias naturales el fenómeno desconocido que se verifica en un medio vivo, se sobrepone á otros fenómenos que lo enmascaran, se necesita aislarlo enteramente primero, determinando la produccion del tubo polínico en un medio mineral artificial, y buscando las condiciones en medio de las que se verifica. Estas experiencias tendrán la doble ventaja de enseñarnos cómo pasan las cosas en el pistilo, y esclarecer otra faz de la cuestion que puede presentarse así: ¿qué sucede con la enorme cantidad de pólen que se escapa de los estambres de una flor, y que no cayendo directamente sobre el estigma donde efectúan su desarrollo, quedan abandonados en el mundo exterior?

Si se toma el pólen en el momento en que la antera se abre para dejarlo escapar, y se coloca el grano aun hinchado, en una atmósfera limitada á una temperatura de cosa de 20°, se verá que absorbe rápidamente el oxígeno del aire, y que lo reemplaza por un volúmen sensiblemente igual de ácido carbónico. Respira, pues, activamente, y no hay duda que la enérgica combustion de que los estambres son el sitio en el tiempo que precede á su dehiscencia, así como el desarrollo considerable de calor que resulta, no provienen para la mayor parte de la suma de las acciones individuales, de los granos de pólen que los estambres encierran. La actividad respiratoria del pólen disminuye siempre rápidamente, á medida que se deseca; pero ella se mantiene en seguida, durante largo tiempo, con una débil intensidad; y podrémos decir, que para un estado dado del grano, la intensidad de su respiracion decrece con la temperatura.

Vemos, pues, lo que se verifica con los granos del pólen, libres, expuestos en el aire seco y á una temperatura dada: pueden, además, permanecer algun tiempo sin perder la facultad de desarrollar el tubo polínico, cuando se les coloque en circunstancias favorables; pero veamos ahora lo que pasa cuando se somete el pólen á la influencia del agua.

Desde Benard de Jussieu en 1739, y Needham en 1743, hasta hoy, se ha propagado un error: se dice que el grano del pólen sometido á la accion del agua, se rompe; esto no puede considerarse como un hecho general para todas las plantas: tenemos el pólen del *Narcissus pseudo-narcissus*, de la *Tritillaria imperialis*, *Salix caprea*, *Primula sinensis*, *Viola odorata*, y otras que, en lugar de reventarse en el agua pura, producen, al contrario, tubos extremadamente largos en las condiciones que se van á mencionar. [1]

Bajo el agua privada de aire, y á una temperatura favorable, el pólen de estas plantas se hincha primero, y despues se conserva indefinidamente inalterado. Lo mismo pasa si se somete el pólen á la influencia del agua aereada y á una temperatura cercana á 0 grados.

Por lo que se lleva mencionado, se ve, que dos de estas tres condiciones, sin la tercera, el aire y el calor sin el agua; el agua y el calor sin el oxígeno; el agua y el aire sin el calor, son impotentes para provocar la formacion del tubo polínico.

---

[1] Existen granos, los del Ricino, por ejemplo, que no se abren en el agua pura y que se rompen, al ménos en gran número, en una solucion espesa de goma arábiga. Este hecho demuestra, que la explicacion ordinaria de la ruptura, basada en la irrupcion violenta del líquido externo, debida á su débil densidad relativa, no se aplica á todos los casos.

Reúnanse, al contrario, las tres alrededor de la célula, es decir, colóquese el pólen en el agua aereada á una temperatura favorable que dependerá de la naturaleza de la planta, pero que podrá ser en general de 15° á 20°. Algunas horas despues se verá al grano formar bajo el agua un magnífico tubo sin tabique, ordinariamente simple, comunmente envuelto en espiral y en el que la circulacion del protoplasma se verifica con una admirable exactitud, que llega en ciertos casos á adquirir hasta 200 ó 300 veces el diámetro de la célula primitiva ántes de cesar de alargarse. Llegado aquí, la extremidad del tubo se hincha y adquiere la forma, ya esférica, ya piramidal, de un diámetro igual, ó al ménos tres ó cuatro veces mayor al del grano; ya plana, perpendicularmente á la direccion del tubo, en forma de pié, y otras veces como que se bifurca y afecta la forma de una Y: en esta extremidad el protoplasma se concentra, miéntras que el resto del tubo no contiene sino un líquido hyalino, acumulándose en definitiva, en gránulos azotados, desarrollados. No parece que la extremidad hinchada esté dividida transversalmente por un tabique. Una vez que esto se ha verificado, no es raro ver la membrana perforarse en el vértice del hinchamiento terminal, ya en un solo punto por donde se escapa la mayor cantidad del plasma en forma de una gota gruesa, ya en muchos puntos, por cada uno de los cuales salta una gota pequeña. El desarrollo del tubo polínico en el agua aereada, varia en cada una de la plantas.

En cuanto á los fenómenos químicos que se verifican miéntras el tubo polínico se alarga en el líquido, fácil es de apreciarlos analizando la atmósfera circunvecina y en la que se demuestra que el oxígeno ha desaparecido, siendo reemplazado por un volúmen sensiblemente igual de ácido carbónico. Esta combustion se verifica principalmente en el aceite y el almidon que la célula tiene en reserva; los granos amiláceos desaparecen á medida que el tubo se forma, y la azúcar que resulta alimenta la respiracion.

La necesidad del oxígeno y su absorcion por el tubo polínico en vía de desarrollo, es el punto capital de estas experiencias: una experiencia sintética muy sencilla puede persuadirnos aun más en lo que se ha señalado.

Si se pone una gota de agua comun sobre una lámina de vidrio, se vierte sobre ella un poco de pólen y se cubre con otra lámina, colocando el todo en una atmósfera húmeda y á una temperatura conveniente, y si se explora cada hora, por ejemplo, al microscopio, se verá, que no todas las zonas del cuerpo en observacion tienen el mismo grado de desarrollo: los granos de pólen periféricos tienen unos magníficos tubos, miéntras que los centrales, que en los primeros instantes de la experiencia han absorbido todo el oxígeno disuelto, y que no lo pueden recibir del exterior, por impedírselos los granos periféricos, permanecen indefinidamente alterados. Si despues se separan las dos láminas de vidrio, se da acceso al aire, se cubre y se vuelven á observar, se verá de qué manera se han desarrollado los ya dichos tubos polínicos.

De estos hechos se debe concluir, que las condiciones necesarias del medio, y suficientes para la produccion del tubo polínico, es decir, el agua, el oxígeno y una temperatura favorable, son los mismos que para la germinacion de un grano ó de un esporo; y bajo estas condiciones, el fenómeno se verifica de la misma manera; el pólen, por lo tanto, se puede decir que es una pequeña planta que respira, se nutre y se desarrolla.

Hasta aquí se ha visto ya lo que pasa con el pólen en el pistilo; véase ahora lo que sucede con el pólen que se pierde de la flor.

Cualquiera que sea el lugar hacia donde el pólen sea trasportado por la casualidad, ántes de haber perdido por una respiracion muy prolongada al estado seco, su facultad germinativa, encontrará á la vez el agua, el aire y el calor, con estos elementos germinará y formaráse la pequeña planta efímera, cuya forma y grado de desarrollo dependerán de las cualidades nutritivas del medio: y tal debe ser la suerte reservada á los granos del pólen que no caen sobre el estigma.

Sentados los principios anteriores, positivos, supuesto que son el fruto de la experiencia, se podrá concebir ahora cómo el agua viene á ser perjudicial á la reproduccion en la flor al momento de abrirse: ¿qué debe pasar entónces? El agua que cae sobre el estigma en el momento en que los granos polínicos se depositan allí, léjos de destruirlos, les viene á dar dos de los elementos para su desarrollo, el calor allí lo tienen; los tubos polínicos se formarán y se dirigirán en medio del agua fuera del pistilo, agotando su fuerza vital; el óvulo, por tanto, no podrá ser fecundado.

La consideracion anterior trae necesariamente envuelta esta cuestion: ¿La duracion del tubo polínico, cuando se desarrolla fuera del pistilo, es necesariamente efímera? Se ha dicho arriba el límite probable de la duracion, teniendo en cuenta los datos suministrados por la experiencia, cuando se coloca el pólen en medios generales; pero cambiando estos medios, acaso pueda prolongarse esa duracion del tubo.

Para esto, se necesita estudiar las causas del detenimiento del desarrollo del tubo polínico, y si de su estudio resultan conocerse de una manera probable, si no cierta, y se trata de contrarestarlas, podrá acaso llegarse á dilucidar la verdad: pueden reducirse á dos estas causas.

1.ª El agua ordinaria aereada, basta comunmente para los primeros desarrollos del grano del pólen, que se verifican á expensas de los materiales de reserva acumulados en el protoplasma; pero no es ménos cierto que este líquido no le lleva alimentos nuevos en cantidad suficiente. Si se quiere prolongar la vida del tubo, conviene, pues, agregar al agua sustancias apropiadas y de calidad variable, segun su naturaleza; se necesita cultivarlos y nutrirlos.

2.ª Una vez formados los tubos polínicos, son invadidos por dos especies de enemigos; los infusorios por una parte, y por la otra las *Toruláceas* y el *mycelium* de diversas especies de *Mucedíneas:* ávidas de oxigeno como los tubos, estas producciones extrañas invaden precisamente la region del líquido que ellos habitan; se establece entre unos y otros una lucha por la vida, y como los hongos se multiplican con extraordinaria rapidez, aniquilan bien pronto á los tubos. Fácilmente se pueden distinguir á éstos entremezclados con los filamentos ramosos y con tabiques de diversas especies de *mycelium:* estas dos especies de organismos, no tienen otro lazo de union, que su antagonismo fisiológico, y las fuentes de donde nacen siempre son distintas.

Una vez conocidas las dos causas que acabamos de señalar, como son conexas, puede vencérselas por el mismo medio, es decir, especializando el medio artificial y aproximando su constitucion, tanto cuanto sea posible, á la del medio nutritivo al que está destinado un pólen dado; de manera que el medio que sea benéfico á los tubos, sea dañoso para sus enemigos.

Si se disuelve en el agua una pequeña cantidad de bitartrato de amoniaco, este líquido ácido es impropio al desarrollo de los infusorios á la vez que suministra al tubo polínico un alimento carbonado y azoado que le falta: se ha quitado un elemento á unos enemigos, y se da otro al tubo polínico para su desarrollo, pues está probado que el líquido secretado por las papilas estigmáticas, estilares y ovarianas, es francamente ácido; opinion además comprobada por el hecho de que los infusorios jamás invaden el pistilo.

Si al líquido que se ha mencionado, se agrega una pequeña cantidad de cenizas de levadura, se dará al pólen los elementos minerales que le son necesarios.

Pero este líquido así preparado, si es cierto que no favorece á los infusorios, tambien lo es que no daña en manera alguna al desarrollo de los hongos, y que al contrario, les favorece; es necesario adicionarle otra sustancia desfavorable para ellos, la azúcar, la goma, etc.; pero si el líquido así preparado sirve para algunos granos polínicos, no es útil para todos, y este estudio curioso es el objeto del que se ocupa en la actualidad el célebre naturalista Van Tiehgem.

II.

VEGETACION LIBRE DEL OVULO.

Para emprender las experiencias sobre este punto, es necesario abrir el pistilo de una flor en el instante que precede á la dehiscencia de sus anteras; despréndanse de la placenta un cierto número de óvulos y véanse sus modificaciones en las diversas circunstancias del medio exterior.

Colocados los óvulos en el aire seco y á la temperatura ordinaria, absorben de luego á luego el oxígeno del aire y desprenden un volúmen casi igual de ácido carbónico: por este fenómeno se ve que han respirado. Tenemos explicada la activa combustion que se verifica en el pistilo en el instante que una flor se abre, si se atiende á que esta combustion es la suma de las parciales de los óvulos que encierra. Abandonados los óvulos se desecan bien pronto.

En el agua sin aire, los óvulos pierden su trasparencia, se ponen pardos y mueren como asfixiados.

En el agua aereada, pero á una temperatura próxima á cero, los óvulos no respiran y es notable su alteracion. Reúnanse, al contrario, en derredor de un óvulo las tres condiciones juntas que acabamos de separar; colóquense en el agua aereada, ó mejor en el aire muy húmedo y á una temperatura favorable, y se verá cómo continúan viviendo cierto tiempo. Se desarrollará poco, pues que se ha quitado del pistilo ántes que el saco embrionario haya alcanzado todo su volúmen y ántes que haya formado sus vesículas embrionarias y sus células antípodas; y esto no obstante, podrá encontrarse despues de algunas horas el saco agrandado, y las vesículas y células desarrolladas.

Así viviendo el óvulo en estas condiciones, respirará de una manera continua, y concentrando por este mismo hecho toda su actividad en el saco embrionario, en donde se verifica en gran parte este fenómeno respiratorio.

El óvulo en estas circunstancias, es bien pronto invadido por los infusorios y los hongos, y se necesita ganar tiempo en la investigacion y retardar cuanto sea posible la aparicion de estos séres extraños sin dañar al óvulo.

Hemos visto que la célula macho puesta en libertad por el estambre, y colocada en las condiciones que se han referido, germina, es decir, respira, se nutre y se desarrolla; de la misma manera el óvulo con la célula hembra que encierra, arrancado artificialmente del pistilo y colocado en las mismas condiciones favorables, se mantiene vivo, es decir, se nutre, respira y se desarrolla. Pero la vida de estos dos elementos reproductores mantenidos de esta manera en el aislamiento es efímera; el tubo polínico se detiene bien pronto en su desarrollo y el óvulo perece.

III.

FECUNDACION DIRECTA.

Para estudiar la fecundacion directa, artificialmente, se necesita colocar la célula hembra bajo la accion de la célula macho y en las condiciones de vida que ántes se han señalado. Si se colocan en una gota de agua granos polínicos por una parte, y por la otra, tambien en una gota de agua cierto número de óvulos, y se juntan en el momento que los tubos polínicos comienzan á desarrollarse, se verá la extremidad de un tubo polínico en vía de alargamiento encontrar un óvulo, penetrar en su micrópila, sea directamente, sea despues de haberse alargado deslizándose sobre la superficie, y esto es todo. El complemento de esta funcion nos lo da el estudio anatómico del óvulo hecho algunas horas despues: él demuestra que la extremidad del tubo, despues de haberse insinuado entre las células del cono terminal de la nucela, ha venido á apoyarse dilatándose sobre el vértice del saco embrionario, donde se instala en forma de ámpula contrayendo adherencias. El lugar en el que este fenómeno se verifica está lleno, en vez de las vesículas protoplásmicas difluentes, de un cuerpo pluricelular de estructura más ó ménos complicada, segun la duracion de la experiencia, y que es el embrion en las primeras fases de su desarrollo.

La fecundacion, por lo tanto, se verifica directamente en un medio artificial, apropiado y hasta cierto punto bajo la vista del observador, entre el tubo polínico desarrollado en aquel lugar y el óvulo quitado al pistilo del mismo vegetal, conservado vivo, y que ha podido formar sobre el lugar mismo, vesículas protoplásmicas. Las experiencias emprendidas con objeto de obtener directamente la fecundacion entre el tubo polínico y el saco embrionario, anteriormente aislado del óvulo, han quedado hasta hoy sin resultado.

Si pues la fecundacion puede tener lugar sin el concurso del pistilo, segun lo acabamos de demostrar en las experiencias anteriores, ¿cuál es el papel que este órgano desempeña en la mencionada funcion fisiológica?

Dos son las principales fases bajo las que se le puede considerar: primero, como nutritivo, segundo, como protector. Como nutritivo, el estigma ofrece al grano polínico un suelo húmedo y aereado, donde se verifica su germinacion: este suelo es ácido y viscoso, y por esta razon es impropio al desarrollo de los infusorios y de los hongos, sirviendo á la vez tambien como protector contra estos enemigos. Hay más, el mismo estigma obrando como un filtro, no deja pasar los granos polínicos de otras flores, previniendo así los desarrollos híbridos; la fecundacion no se puede verificar sino solo con pólen de plantas semejantes.

México, Octubre 23 de 1873.

VIAJE

A LA CAVERNA DE CACAHUAMILPA.

Datos para la Geologia y la Flora de los Estados de Morelos y Guerrero,

POR EL SEÑOR DON MARIANO BARCENA,

SOCIO DE NÚMERO.

En el viaje que acabo de hacer á la *Gruta de Cacahuamilpa*, he recogido algunos datos sobre la Geologia y la Flora del camino recorrido desde esta capital hasta aquella localidad, cuyos datos voy á exponer en esta Memoria, con el fin de contribuir, aunque en pequeño, á los adelantos de la historia natural de nuestro país.

Al salir de México y hasta las inmediaciones de Tlalpam, el camino está ocupado por la formacion cuaternaria de aluvion que caracteriza al Valle de México: en esta formacion, como es sabido, dominan las margas, las tobas y las arcillas que alternan con bancos de arena y con capas de trípoli, cuya masa está constituida en su mayor parte, por los despojos silizosos de séres microscópicos. Al llegar á Tlalpam y hácia la region O. del camino, asoman algunas masas basálticas de color negro azulado, que están relacionadas á las corrientes volcánicas del pedregal de San Angel. Siguiendo el camino hácia el rumbo de San Mateo Shalpa, se encuentran algunos arenales modernos muy abundantes en hierro titánico, que provienen de las rocas igneas de los cerros inmediatos. Estos arenales están colocados sobre las tobas blanquizcas que vuelven á aparecer en la falda de la ceja montañosa que, viniendo del Ajusco separa el Valle de México del de Cuernavaca. Al subir las vertientes septentrionales de esas montañas, comienzan á levantarse algunos grupos de rocas basálticas, hasta que apareciendo completamente libres de las tobas, se reunen y forman la masa general del cerro por donde pasa el camino que conduce á la capital del Estado de Morelos. Los basaltos se presentan en bancos compactos, ó en corrientes escoriosas como las lavas comunes, á las cuales se asocian en algunos puntos, como en las cercanías de Topilejo. La mayor parte de esas masas volcánicas contienen numerosas oquedades, producidas sin duda, por los gases que las acompañaron en la época de su aparicion.

La elevacion del terreno va aumentando hasta las inmediaciones de *El Guarda,* donde obtuve la mayor altura (2508,^{m}4) por medio de un aneroide que consultaba con bastante frecuencia. Despues de *El Guarda* desciende ligeramente el terreno, y forma, con pocas variaciones, una especie de meseta de más de dos leguas de longitud, en la cual se han depositado grandes masas de tierra vegetal y de tobas blanquecinas que forman un terreno muy fértil y á propósito para el desarrollo de las numerosas gramíneas que lo ocupan en su totalidad.

Al pasar el pueblo de Huitzilac comienza un descenso rápido, en el cual vuelven á aparecer las masas basálticas que se habian ocultado bajo las capas terrosas de la meseta referida. La formacion volcánica se pierde al concluir el descenso de la montaña, y á dos leguas de distancia de Cuernavaca se muestra de nuevo la formacion cuaternaria en su más completo desarrollo como en el Valle de México. Siguiendo el camino carretero que conduce de Cuernavaca al pueblo de Tetecala, se observan las mismas rocas cuaternarias por espacio de cuatro leguas, y al llegar á la barranca de Colotepec aparecen algunos bancos dislocados de *vàcia* gris y de pizarras arcillosas que recubren á las masas calcáreas que aparecen allí mismo y siguen formando todos los cerros que se ven en el camino de Cacahuamilpa. La caliza se presenta tambien en masas dislocadas de espesor variable; su color general es gris de humo; la testura concoidea y su dureza llega en algunos bancos á 5° de la escala de 12: frotada con algun cuerpo duro, despide un olor sulfuroso bastante sensible. En los valles que se hallan entre las montañas calcáreas, hay depósitos aluviales semejantes á los que he citado; pero entre los elementos que los forman se encuentran numerosos fragmentos calizos de diversos tamaños. Esta formacion calcárea constituye un sistema de montañas que se dirigen hácia diversos rumbos, y que, á juzgar por la figura de las que se perciben á lo léjos, puede creerse que dicha formacion ocupa un espacio muy dilatado.

En una de estas montañas que está situada como á una legua de Cacahuamilpa, se halla la famosa caverna que visitó el señor Presidente de la República, el dia 18 de Febrero de este año, acompañado de algunas personas entre las cuales tuve la honra de contarme.

Vista esa montaña desde el camino que llevábamos, presenta una forma irregular, dirigiendo su extremidad anterior hácia el E. y encorvándose gradualmente el resto para el N. O.

En la cañada que se halla cerca del pié oriental del cerro, y á una diferencia de nivel de 300 piés próximamente de la boca de la caverna principal, se encuentran las bocas de otras dos por donde salen los rios llamados de Zacualpam y Tenancingo. La salida del primero está dirigida al N., y la del segundo al E. Sus aguas reunidas siguen este último rumbo y forman el rio Amacusac. El carácter de la vegetacion en esa hondonada, las estratificaciones onduladas de sus paredes, la presencia de los rios, etc., la hacen verdaderamente pintoresca é indescribible.

La boca de la oquedad, que llaman *Gruta de Cacahuamilpa*, y que atendiendo á sus dimensiones y otras circunstancias, he designado con el nombre de *caverna* en algunos párrafos de esta Memoria, está situada en la region oriental de la montaña que he citado, y dirigida próximamente al E. Su figura, aunque algo irregular, puede compararse á la de un semicírculo, á cuyo arco se le ha calculado una flecha de 41 piés, y una cuerda de 130. Como la visita que hice á esta caverna fué muy breve, no pude rectificar estas medidas ni tomar otros datos para hacer su descripcion detallada y completa, por cuya circunstancia me limitaré á citar algunas observaciones que servirán para fundar las deducciones geológicas que haré más adelante.

Al entrar á la caverna se baja un plano inclinado que termina en la base de lo que llaman *Salon del Chivo*, á causa de la semejanza, aunque imperfecta, que presenta con ese rumiante una estalagmita que se encuentra hácia la izquierda de la entrada. Situado el observador en este lugar, comprende desde luego la magnificencia del espectáculo que le presenta la naturaleza en el seno de aquella montaña: en el fondo se percibe la oscuridad más completa, asegurándose que el subterráneo se prolonga extensamente en aquel sentido: á los lados, y en algunos puntos centrales, se presentan las grandes y variadas masas de caliza estilaticia, con que las aguas filtradas por las hendeduras de las rocas han decorado y decoran aún aquella vasta cavidad. A lo que llaman primer salon, le asignan una longitud de 229 piés y una latitud de 130; pero las divisiones que han establecido los guías y algunos viajeros, son muy variables, y no deben tomarse en cuenta hasta que se haga el estudio topográfico de la caverna. Algunos de los citados guías dividen el espacio que recorrí, y que terminó en el lugar llamado *Los Organos,* en diez tramos diferentes; miéntras que otros forman ó señalan un número mayor de salones, sin fijarse ningunos en la figura y direccion de las oquedades, sino en la forma más ó ménos totable de las estalagmitas que encuentran á su paso, y á las cuales les dan un nombre particular que aplican á sus tramos convencionales. Basada su nomenclatura en esa circunstancia y en otras de igual clase, señalan al viajero los salones del Chivo, el Pedregal, el Panteon, los Organos, etc.; pero no están generalmente de acuerdo los clasificadores en los límites de esos espacios.

La parte que visité de la caverna, terminó, como dije ántes, en el lugar llamado *Los Organos,* y que estará á 4 kilómetros de la entrada, pues aunque el cordon que se extendió en el camino recorrido, tenia una longitud mayor que aquella, no podemos tomarla como una medida exacta, por las muchas sinuosidades é inclinaciones á que tuvo que acomodarse; y calculando la distancia por el tiempo empleado en recorrerla, juzgo que seria de una legua próximamente.

El cañon general de la caverna, presenta diversas irregularidades en su forma, y variaciones en sus latitudes, rumbos y alturas. Las paredes están formadas por lechos inclinados diversamente de caliza compacta y metamorfoseada: en las bóvedas se puede ver mejor el desórden de los planos de estratificacion. Es de notarse que las rocas superiores no han podido sostener muchas estalactitas de grandes dimensiones, pues la mayor parte de las que se observan, no corresponden por su volúmen ni por su número á las estalagmitas que obstruyen el paso en varias direcciones. Pocas de esas masas, si se atiende al número de las últimas, se corresponden y tocan por sus extremidades.

El pavimento presenta en algunas partes una serie de rebordes ondulados de poca altura, y una infinidad de concreciones pequeñas, más ó ménos esféricas, formadas tambien por las gotas de agua que se desprenden de las bóvedas. A juzgar por la figura de los rebordes citados y por la de algunas de las estalactitas, tal vez más recientes, puede creerse que en las rocas que forman el lecho, exista una gran cantidad de resquebrajaduras, tambien onduladas, por las cuales se filtran las aguas que disuelven las masas calcáreas. En otras partes del pavimento se encuentran grandes masas acumuladas, que se han desprendido del techo, y cuyos rebordes afilados indican que su caida ha sido relativamente reciente. Algunos de esos cúmulos corresponden á una especie de cúpula muy elevada. Por haber perdido los apuntes que hice sobre los rumbos del camino que recorrí, no me será posible continuar el estudio de la forma y direccion del cañon de la caverna, y por esto, pasaré á hacer una mencion, aunque ligera, de su decoracion interior.

Desde la entrada del subterráneo sorprende al espectador el número considerable y la diversidad de formas de las masas de caliza estilaticia que encuentra en todas direcciones. Las figuras que se presentan con más frecuencia, consisten en grandes cortinajes que, revistiendo las paredes ó apoyándose sobre algunas columnas, forman pliegues y ondulaciones tan suaves, que imitan perfectamente los mantos y cortinas de terciopelo con que se adorna el interior de los templos. Estos cortinajes forman graciosas combinaciones con las masas cónicas, y constituyen grupos variados y fantásticos que imitan á los monumentos fúnebres de mejor gusto. Las masas aisladas presentan formas columnares ó de tronco de árbol, semejándose más principalmente á la estipa de las palmeras y de otras plantas endógenas. Cuando las columnas se reunen en series longitudinales, forman las figuras que llaman *Organos;* bien porque las comparan con los brazos del *Cereus*, ó con las flautas unidas del instrumento músico de aquel nombre.

Hay otras masas que por estar colocadas en graderías de diversos tamaños y por tener sus contornos muy desvanecidos, se designan con los nombres de fuentes y cascadas, y ciertamente que imitan á éstas con gran perfeccion.

Muchas de esas masas presentan láminas cristalinas ó concreciones arriñonadas en forma de coliflor, de semiesferas, etc.

Para describir minuciosamente la caverna de Cacahuamilpa, habria necesidad de permanecer en ella por algun tiempo. Como manifesté ántes, no pude observarla más que por algunas horas, y por esto no me fué posible hacer otra cosa, que admirarla y formarme una idea muy general de sus caractéres.

En este sentido solo podré manifestar, que la caverna mencionada, en la extension en que la visité, la considero como una gran concavidad de figura irregular, cuyas paredes y techo están constituidos por masas estratificadas y trastornadas de caliza compacta; que las aguas han establecido en ella su laboratorio de trasformacion y su taller de trabajo, cambiando la caliza compacta y opaca en caliza estilaticia y cristalina, agrupando las nuevas moléculas de diversas maneras, para formar las esbeltas y diversas figuras que admira el observador en todas direcciones.

La caverna de Cacahuamilpa, ese monumento de la geologia mexicana, no está perfectamente conocida, pues se habla con mucha variedad respecto de su longitud: algunos guías dicen que despues del salon de los Órganos no hay mas que pasillos angostos, y que muchos de ellos dan vuelta y conducen al salon de los Monumentos; otros, y en mayor número, aseguran que los salones continúan hácia adelante, y que aun se encuentra uno de los rios que salen al pié de la montaña. Sin poder comprobar ninguna de estas opiniones, yo presumo que la caverna principal ha tenido ó tiene aún comunicacion con las inferiores por donde pasan las corrientes de agua mencionadas, y probablemente, tambien con algunas grietas que comunican con el exterior. Esta suposicion la apoyo sobre el hecho de encontrarse en muy buenas condiciones para la respiracion y la combustion, el aire del interior, lo que prueba que tiene corrientes que expeditan su circulacion. He visto algunos perros dentro de la caverna, que respiraban con facilidad y no manifestaban ninguna molestia, cuyo hecho demuestra que no existen capas de ácido carbónico depositadas sobre el pavimento, como se observa en muchas de las grutas conocidas.

La Sociedad Mexicana de Geografía y Estadística, ha proyectado hace tiempo, hacer un estudio perfecto de la caverna de Cacahuamilpa, y tengo noticia de que muy pronto realizará tan interesante proyecto.

En mi humilde opinion, ese estudio debe comprender varias partes, que señalaré ligeramente.

Se necesita el conocimiento topográfico de la montaña donde está la caverna y de algunas otras vecinas, con el fin de determinar sus direcciones y poder relacionar los fenómenos que afecten. Con igual fin se consultarán los estudios hechos en el vecino mineral de Taxco, buscando los principales agentes del levantamiento de sus montañas, las direcciones más comunes de sus vetas, etc.

Se hará tambien un estudio topográfico de la caverna.

Se practicará un estudio geológico de ésta y de las montañas citadas.

Se harán, en fin, algunas observaciones meteorológicas para compararlas con las que se han determinado en algunas grutas que ya se han estudiado con perfeccion.

Sabemos, en efecto, que en la mayor parte de esas oquedades, la temperatura de su atmósfera es inferior á la del aire exterior, siendo generalmente la segunda, el doble de aquella. En algunos casos, las circunstancias locales favorecen aun las temperaturas glaciales en todo el curso del año.

Desgraciadamente para mí, las observaciones termométricas que hice en el interior de la caverna de Cacahuamilpa, corrieron igual suerte que las de los rumbos de que hablé ántes, y por tanto, no tuve ocasion de hacer las comparaciones citadas; pero recuerdo, que no obstante la fatiga que sentia al salir de aquel subterráneo, me molestó la temperatura, notablemente más elevada, del aire exterior.

Despues de haber mencionado el carácter mineralógico y algunas otras particularidades de las montañas que se observan en todo el camino que recorrí, voy á hacer su estudio geológico, con el fin de determinar las épocas relativas de su formacion y de los fenómenos que las han alterado.

Clasificadas por su orígen las rocas que forman las montañas citadas y los valles intermedios, pueden distribuirse en los grupos de las rocas sedimentarias, ígneas y metamórficas.

Al primero pertenecen las tobas, margas, arcillas, etc., de los terrenos de aluvion, así como la caliza estilaticia, aunque ésta se coloca mejor en el subgrupo de las rocas de orígen químico.

En otros puntos del Valle de México y en diversas y numerosas localidades, he tenido ocasion de estudiar las formaciones aluviales que cité al principio. Es muy comun encontrar en nuestro país esos depósitos lacustres formados por los detritus de las rocas volcánicas que tanto abundan en México. Esos depósitos que se formaron sin duda en el período posterciario, que precedió á la edad actual, están colocados sobre las masas metamórficas é ígneas que cierran las cuencas y limitan los valles, tanto en la mesa central como en otras regiones de la República. Su posicion relativa y los restos fósiles que contienen, determinan con bastante exactitud el periodo de su formacion, y que, como dije ántes, fué el posterciario ó último del tiempo cenozoico. Al hablar de estos valles de aluvion, es de notarse la diferencia tan notable de nivel que existe entre los de México y de Cuernavaca, que solo están separados por la cordillera del Ajusco.

Probablemente que al cerco de montañas que tiene el primero, es debido ese resultado; pues además de haber contribuido con su levantamiento para formar una base elevada, en un principio han encerrado grandes depósitos de agua en el período posterciario; depósitos que han acumulado numerosos lechos detruíticos, á los cuales aun no se les encuentra el fondo, en las perforaciones artesianas que se han hecho en las cercanías de esta capital y que se han llevado hasta la profundidad média de 200 metros. En cuanto á las estalactitas y estalagmitas, que, como dije ántes, pertenecen á las rocas de orígen químico, pueden haberse formado en épocas muy diversas, desde el periodo á que corresponde la formacion de la caverna hasta la edad actual, sin que su tamaño y espesor puedan darnos alguna idea sobre su antigüedad relativa, porque su crecimiento varia con la actividad de las filtraciones que las producen, con la ley salina de las mismas, con las circunstancias meteorológicas á que están sujetas, etc. Basta dejar de ver por algun tiempo algunas de nuestras minas, abiertas en formaciones calcáreas, para encontrarlas despues inconocibles por los adornos que han adquirido durante su abandono. En las grutas mismas se ven esos cambios de decoracion en un corto espacio de tiempo. Buffon, que visitó y estudió las grutas de Arcy, quedó admirado á los 19 años que volvió á verlas, de los cambios extraordinarios que habian sufrido. Es bastante curiosa la formacion de una estalactita: al principio, las primeras gotas de agua dejan un pequeño anillo calcáreo, al cual se sobreponen otros, hasta que se forma un tubito por donde sigue pasando el agua: cuando las paredes interiores de éste se han engrosado por la adicion de nuevas capas, la corriente se desliza por la superficie exterior, adquiere mayor velocidad, y el crecimiento de la estalactita se acelera. Al partir de ese período comienzan á formarse las ondulaciones y demas irregularidades que afectan cuando están suficientemente desarrolladas. Es muy comun encontrar en las estalactitas ese tubo primordial y las zonas ó capas cilíndricas que se le sobreponen; otras veces se encuentra algun objeto que ha servido de núcleo, y entónces el crecimiento es más rápido y comparable al que se nota en los frutos y otros cuerpos sólidos que se sumergen en las aguas calcáreas, y que en poco tiempo se revisten de capas de caliza estilaticia.

A las rocas metamórficas debemos referir las pizarras arcillosas, la vácia y las masas calcáreas que comienzan á mostrarse en la barranca de Colotepec y continúan hasta Cacahuamilpa y sus inmediaciones. Esas masas, que en un principio fueron tambien sedimentarias, se encuentran trastornadas y removidas en diversas direcciones por la accion de las rocas ígneas: el calor de éstas las hizo sufrir un principio de cristalizacion, que se hace notable en algunos bancos que han pasado al estado de caliza granuda.

Para clasificar cronológicamente esas masas calcáreas, las revisé con bastante cuidado para ver si encontraba en ellas algunos restos fósiles que determinasen la época de su formacion. No habiendo encontrado al principio, y valiéndome solamente de los caractéres litológicos, que eran idénticos á las de otras masas que habia estudiado en varias localidades, las consideré como pertenecientes al tiempo mesozoico. Esta clasificacion la confirmé á pocos momentos con la presencia de algunas conchas de *Nerinea* que encontré incrustadas en una roca que se halla en la cañada de Limontetla. A este hallazgo se sucedieron otros, pues en la cañada en que salen los dos rios de que hice mencion, encontré restos de *Grifeas* y de *Cranias*, y en las cercanías de la hacienda de Cocoyotla recogí otras conchas que parecen pertenecer á la *Nerinea geroglífica*, y algunas más de otra especie que encontré en las montañas de la Sierra Gorda. En la caliza de Cocoyotla se hayan tambien algunos restos de *Vermetus* y de *Hippurites*. La presencia de la *Nerinea geroglífica* determina en Europa las formaciones jurásicas; pero los hippurites pertenecen al período cretáceo. El valor cronológico de este género, es tal vez más importante que el de la especie anterior. Ultimamente he visto otros hippurites traidos por mi amigo D. Juan Cuatáparo, quien los recogió en una formacion caliza de Yautepec, que pertenece tambien al Estado de Morelos y está relacionada y es idéntica á la de Cocoyotla. Esa mezcla de fósiles, que son tan abundantes en las formaciones jurásicas como las grifeas, cranias y nerineas, con los hippurites y algunos escafites y ancicloceras que he encontrado en iguales circunstancias en la Sierra Gorda, me hacen considerar la caliza en cuestion, como perteneciente al fin del período jurásico y principio del cretáceo, pues participa, á mi juicio, de los caractéres paleontológicos de ambos.

Siempre que he tenido que mencionar en mis estudios sobre las rocas del país, la formacion calcárea de que me ocupo, he llamado la atencion sobre las vastas extensiones que ocupa, y á lo dicho anteriormente sobre el particular, debo añadir las observaciones que hice en mi viaje á Cacahuamilpa. Las rocas mesozóicas de México, se encuentran, segun lo reconocido hasta hoy, en los Estados de Veracruz, Hidalgo, México, Morelos, Guerrero, Querétaro, San Luis Potosí, Zacatecas, Aguascalientes y Chihuahua. Las numerosas huellas que dejaron los mares mesozóicos en el lugar que hoy ocupa el territorio mexicano, nos manifiestan que el aspecto físico de éste, fué muy diferente en aquel tiempo geológico, del que nos presenta en la edad actual.

La mayor parte de las grutas conocidas en el antiguo continente, se encuentran en terrenos mesozóicos; en México puede asegurarse que éstos tienen la misma particularidad, pues no es la caverna de Cacahuamilpa el único caso que podemos mencionar. En un estudio que publiqué sobre la geología de Querétaro, en cuyo Estado encontré formaciones jurásicas y cretáceas como manifesté ántes, cité la gruta de los Tecolotes, las bóvedas de Santa Inés y los rezumaderos del Valle de Chavarría, que se hallan sobre la formacion referida. Estos rezumaderos deben estar unidos entre sí por grandes galerías subterráneas, pues las corrientes que forman las aguas pluviales, desaparecen en ellos con mucha rapidez. Me han dado tambien noticia de las grutas siguientes que se encuentran en terrenos jurásicos y cretáceos, segun la opinion de las personas que me las han mencionado.

Gruta de Zinacaltipan, en terreno calcáreo, distrito de Chicontepec, Estado de Veracruz. El Sr. D. Jesus Manzano me ha asegurado, que á inmediaciones de la gruta hay algunos pozos naturales, por donde dicen que salen corrientes de aire.

Gruta de Puente de Dios, en el Estado de Hidalgo.

Gruta de Nejamay, en el propio Estado y en el distrito de Actopam. Los fósiles que se hallan en sus rocas, son los que he citado ántes, y de los cuales conservo algunos ejemplares. Segun el mismo Sr. Manzano, esta gruta tendrá 100 metros de longitud, 100 de latitud y 30 de altura. Está adornada únicamente con estalagmitas.

Caverna de los Ortiz, en el Estado de Colima; una de las más notables en el país, por sus dimensiones. Hay en su interior numerosas estalagmitas unidas á las estalactitas, principalmente en el salon que llaman de los Portales.

El carácter más general que presenta esta caliza mesozóica en nuestro país, es el desórden de sus lechos: en cualquiera parte que se la examine, se observan las huellas de los grandes movimientos y perturbaciones geológicas que sufrió despues de su formacion sedimentaria. Al buscar las causas que originaron esos trastornos, se encuentra desde luego la accion del fuego central de la tierra; pues los lechos calcáreos están bastante metamorfoseados, y los restos orgánicos que contienen, se hallan en tal estado de alteracion, que hace casi imposible su determinacion específica.

Las masas eruptivas que produjeron esos efectos, pertenecen principalmente á los grupos traquítico y basáltico. En la Sierra Gorda y en otros lugares aparecen los diques y bancos de los pórfidos traquíticos, levantando las montañas calizas y coronando su cúspide, con elegantes acantilados columnares. Los innumerables filones metalíferos que contienen esas montañas, prueban tambien los grandes y variados trastornos que han sufrido.

La consideracion de estos hechos nos puede servir de base para establecer algunas hipótesis sobre el orígen de la caverna de Cacahuamilpa y sobre la época geológica de su formacion. En efecto, cuando los lechos horizontales de caliza que habian depositado los mares, fueron invadidos por las masas eruptivas, perdieron su colocacion primitiva, y al plegarse y removerse en todos sentidos, se fracturaron y ampollaron en diversas direcciones. Más tarde las eyecciones de materias metálicas rellenaron algunas de aquellas oquedades y se formaron las vetas; pero otras de aquellas, que tal vez estaban aisladas y no comunicaban con las grietas de eyeccion, pudieron quedar vacías y conservarse así hasta la actualidad. Las dimensiones y forma de esas oquedades han variado despues por la filtracion de las aguas, que lavando y disolviendo las superficies de las rocas, han formado corrientes subterráneas que pueden ejercer acciones erosivas y sedimentarias.

Esta explicacion general de las oquedades que se hallan en nuestras formaciones mesozóicas, puede aplicarse á la caverna que nos ocupa. No léjos de Cacahuamilpa he visto algunos crestones y otros accidentes que demuestran la formacion de oquedades y su ocupacion posterior por otras materias minerales. El hecho de existir en Taxco y en otros lugares vecinos, numerosos filones metalíferos, no deja duda respecto de la generalidad de los fenómenos dinámicos y eyectantes en aquellos lugares, y por consiguiente, bien puede admitirse, que en la montaña en que está la caverna se produjeron esas grietas, que no fueron todas ocupadas por las materias que vinieron más tarde á formar los crestones referidos. Esta hipótesis, para el orígen de la caverna de Cacahuamilpa, creo que nada tiene de arbitraria, si atendemos á la igualdad de caractéres de las rocas de la montaña en que se encuentra, con otras de la misma época, en que se ven claramente los fenómenos que afectan, y á los cuales puede referirse la formacion de la grieta que dió orígen á la citada caverna.

Como dije ántes, los principales agentes del levantamiento de nuestras montañas mesozóicas, fueron los pórfidos traquíticos. Estas rocas hicieron su primera aparicion en el tiempo cenozóico, tanto en América como en el antiguo continente; en nuestro país se encuentran generalmente aplicadas sobre los terrenos cretáceos, y cubiertas por los aluviones posterciarios, por cuya circunstancia debemos referirlas al terciario ó primer período del tiempo cenozóico. Admitida esta cronología, y tomando á esas mismas rocas como los agentes del levantamiento de la caliza mesozóica, debemos suponer, con bastante fundamento, que la caverna se formó en el período terciario.

Si bien en el camino que recorrimos no encontramos otras masas eruptivas que los basaltos de las cordilleras del Ajusco, no por eso debemos negar la existencia de los pórfidos traquíticos en las cercanías de Cacahuamilpa, porque en los aluviones vecinos observé grandes *blocs* de esa roca, que por su figura, puede creerse que no han rodado por largas distancias, y que su orígen no está muy lejano del lugar en que hoy se encuentran. Aunque no habia necesidad de buscar esas masas eruptivas aplicadas inmediatamente en el lugar mismo donde se encuentran sus efectos, porque éstos se reconocen tambien á grandes distancias del lugar en que se presentan aquellos, he hecho esas explicaciones para alejar las dudas que pudieran ocurrir á algunos observadores sobre el mismo asunto. Debo advertir, por otra parte, que algunas personas que conocen perfectamente el mineral de Taxco, me han asegurado haber visto allí grandes masas de pórfido, principalmente en el cerro del Huitzteco.

Por el hecho de pasar dos rios por la masa de la montaña en que se encuentra la caverna, han creido algunas personas que el orígen de ésta era debido al paso de una corriente de agua. Esta hipótesis, poco satisfactoria, se destruye, si se atiende á la naturaleza de las rocas que forman la montaña, pues no se podria explicar de qué manera habia obrado el agua para producir aquella oquedad en una masa tan dura y en la direccion en que se encuentra. En rocas sueltas, y aun en otras de alguna consistencia, se producen excavaciones, pero no del carácter del subterráneo que nos ocupa, y para formarse aquellas, se han necesitado circunstancias especiales que no podriamos encontrar en Cacahuamilpa.

Si la caverna ha estado ocupada despues de su formacion por grandes depósitos de agua, se averiguará cuando se examinen cuidadosamente sus paredes, y las capas que forman su lecho, haciendo las excavaciones necesarias en estas últimas.

En una observacion rápida como la que yo hice, solo pueden notarse los efectos erosivos é incrustantes de las aguas filtradas.

En resúmen; mi opinion sobre el orígen de aquella caverna, se reduce á suponer que en el período terciario y por efecto de los pórfidos traquíticos, se produjeron una ó varias oquedades, que por la accion de las aguas perdieron su forma y dimensiones primitivas, para formar el subterráneo que hoy se llama Gruta de Cacahuamilpa. Las observaciones detalladas que se hagan posteriormente, resolverán con más fundamento el problema indicado.[1]

En cuanto á los basaltos que vimos en nuestro viaje, creo que pertenecen á dos épocas diferentes de erupcion. Los más compactos, que forman la masa principal de la cordillera del Ajusco, los he visto colocados debajo de las tobas posterciarias, sin que las capas de éstas estén removidas, cuya circunstancia indica la prioridad de aquellos en el órden de formacion; pero las lavas basálticas del pedregal de San Angel, que están relacionadas á las que asoman en las cercanías de Tlalpam, las he visto en el rio de Tizapan extendidas sobre las mismas tobas, probando así, que son más modernas que estas últimas. En la misma cordillera del Ajusco he observado esos basaltos escoriosos y algunas lavas rojizas de la época actual. No es extraño en los terrenos volcánicos, y sí muy comun, el encontrar las huellas de erupciones sucesivas y de diversas épocas.

---

[1] Despues de escrito lo anterior, hablé con el señor ingeniero D. Teodoro Laguerenne, que ha dirigido algunas negociaciones mineras en Taxco, y me ha dado la siguiente noticia, que apoya mis citadas opiniones: "La formacion calcárea en que está la Gruta de Cacahuamilpa, es de bastante extension y presenta muchas abras y resquebrajaduras de varias dimensiones. Muchas de ellas están comunicadas y facilitan el paso á las corrientes que forman las aguas pluviales. Es de citarse la desaparicion del agua que utilizaban en las haciendas de beneficio, que se hallan en la cañada de Atlistac, cuya desaparicion tuvo lugar la noche del 18 de Febrero de 1802, y dos dias despues, apareció un nuevo manantial al S. del pueblo del Platanillo, cuyo hecho prueba la existencia de las comunicaciones subterráneas ántes citadas. El levantamiento de aquellas montañas calcáreas puede atribuirse á las rocas porfídicas, cuyo centro de erupcion fué probablemente el cerro de Huitzteco, que está á 20 kil. de Cacahuamilpa."

La cronología de las rocas que he citado, puede establecerse de la manera siguiente:

Primer grupo.—Vácia gris, pizarras arcillosas y caliza compacta, que corresponden al tiempo mesozóico.

Segundo idem.—Depósitos aluviales del tiempo cenozóico.

Tercero idem.—Masas ígneas, correspondientes algunas de ellas á ese mismo tiempo y otras á la edad actual.

Con el fin de señalar el órden de superposicion de esas rocas, he construido un corte geológico, en el cual he hecho abstraccion de algunos terrenos de aluvion superficiales, para dejar descubiertas las rocas que constituyen la masa principal de las formaciones citadas.

Despues de haber hecho esta reseña geológica, paso á ocuparme de los datos que recogí sobre la Flora de las localidades referidas.

El movimiento casi continuo de la aguja del aneroide que observaba, me hizo llamar la atencion sobre los diferentes y bruscos cambios de altura del terreno por donde pasábamos, y esta circunstancia me indicó la idea de observar el carácter de la vegetacion de tan variadas altitudes.

Al comenzar á subir la falda de la cordillera basáltica que he citado, y en los lugares en que se habia aglomerado la tierra arcillosa, procedente de la alteracion de las rocas de la parte superior de la montaña, se encuentran como tipos característicos, algunas plantas de la familia de las Compuestas y del género *Senecio*, que desaparecen cuando las pendientes se hacen más rápidas. Al llegar á una altura de 8,900 piés sobre el nivel del mar, aparecen las coníferas, anunciándose por algunos *cupressus* aislados que son sustituidos por los *abies* que pueblan el resto de la montaña, hasta la mitad de la pendiente que toca el valle de Cuernavaca. En las vertientes australes de la cordillera, se mezclan á las coníferas los *quercus*, algunas Sapindáceas del género *Dodonæa* y los *arbutus* de las Ericaceas, en cuyos ramos se mecen los capullos blanquísimos y sedosos de la *Eucheira socialis*.

Al llegar al valle de Cuernavaca, desaparecen completamente los abies, y se presentan las familias y géneros que caracterizan los climas calientes.

Entre las primeras recuerdo las Mirtáceas, Leguminosas, Anonáceas, Terebintáceas, Bignoniáceas, Bombáceas y Convolvuláceas.

Como tipo de las Mirtáceas debemos citar el guayabo (Psidium pommiferum) que se encuentra en las cañadas cercanas á Cuernavaca. Las Leguminosas tienen numerosos representantes de las tribus de las *Mimóseas* y *Cesalpíneas.* Una de las más bellas especies que vi de esa familia, es la *Poinciana pulcherrima* ó árbol de *tabachin,* que abunda en la hondonada en que salen los rios de Zacualpam y Tenancingo. Sobre el tronco espinoso y ceniciento del tabachin, se ostentan sus ramos adornados de magníficas hojas bipinadas, y sus racimos de flores veteadas de rojo y amarillo. Se encuentra tambien con frecuencia, la *Mimosa unguis cati,* ó *huamuchil,* la *acacia fœtida,* y otras especies espinosas. Las Anonáceas están representadas por la *Anona indica,* y las Terebintáceas, por varios individuos del género *Amyris.*

En la cascada de San Anton, á inmediaciones de Cuernavaca, hay unos árboles, desprovistos actualmente de hojas, pero adornados de bellísimas flores rojas ó blancas, que les dan un aspecto raro y elegante. Esas flores, que se llaman *Cabellos de Angel,* ó *Clavellinas,* tienen una longitud de cuatro ó cinco pulgadas. Su cáliz es carnoso y cupuliforme; la corola, de cinco pétalos alargados y flexibles; los estambres, que constituyen su mayor belleza, son muy numerosos y alargados, y forman una especie de mota elegantísima. Por esta circunstancia llamaban los indígenas *Xilotlxochitl* á las clavellinas, comparando sin duda sus estambres á los estilos alargados del *jilote.* Al hacer la clasificacion de esa planta, pude reconocer desde luego que pertenecia á la familia de las Bombáceas; pero al determinar el género, vi que habia necesidad de examinar los frutos, que yo no poseia, pues de la existencia ó falta de pelos lanosos en su interior, depende la diferencia entre los géneros *Bombax* y *Pachira;* pero atendiendo á otros caractéres secundarios, creo que la clavellina roja es la *Pachira fastuosa,* y la blanca la *Pachira insignis* de Swartz.

Al lado de estas plantas se presenta el *Bombax ceiba,* extendiéndose, como aquellas, hasta los cerros de Cacahuamilpa.

El conjunto de géneros y especies que acabo de citar, me recordó la vegetacion caracteristica de Ameca de Jalisco, mi pueblo natal, y solo me faltaba la presencia de la *Bignonia biminalis* para completar el cuadro que buscaba. Esta preciosa planta no se hizo esperar por mucho tiempo, pues en el rio de Colotepec y en las inmediaciones de Miacatlan, encontré diversos ejemplares tan bien desarrollados como los que he visto en Jalisco. La bignonia biminalis es un hermoso árbol, de hojas verticiladas, alargadas y de color verde claro; sus ramos están terminados por bellísimas panojas de flores amarillas. Estas bignonias las he citado otra vez como características de los climas calientes y de los terrenos modernos de aluvion que se hallan cercanos á las corrientes de agua. En el Estado de Morelos he confirmado este hecho, que habia observado en Jalisco.

Creo de alguna importancia para nuestra Flora y nuestra Climatología, hacer notar la identidad completa de vegetacion entre dos localidades tan lejanas.

Los tipos más constantes y característicos desde Cuernavaca hasta Cacahuamilpa, son dos plantas de la familia de las Convolvuláceas. Una de ellas, que se conoce con el nombre de *Casahuate*, es la *Ipomœa murocoides* de Rœm. Esta especie, es un árbol que adquiere hasta cinco metros de altura, sus ramos están terminados por elegantes panojas de flores blancas, de forma campanulada, y de dos á tres pulgadas de longitud.

La otra convolvulácea de que hice mencion, es un arbusto trepador que por no estar aún especificado, como lo demostraré más adelante, voy á hacer su descripcion completa.

Tallo verrugoso, destrovoluble, leñoso, lechoso, pubescente, de color gris, ligeramente rosado y listado de verde en las extremidades. Hojas alternas, peciolos alargados, la figura más general del limbo es cordiforme y acuminada. Inflorescencia en racimos axilares. Pedúnculos angulosos de color verde claro más ó ménos rosado, flexibles, largos; el mayor que he medido tenia 0,^{m}130 de longitud, son multifloros; en algunos he contado hasta cuarenta y ocho flores. Pedunculillos articulados, la primera parte de 0,^{m}005 á,0^{m}007; de la articulacion á la base del cáliz, 0,^{m}005 de longitud. En cada articulacion hay tres brácteas desiguales; dos muy pequeñas de 0,^{m}0015 de longitud, herbáceas y acuminadas. Una de estas recubre un pequeño boton que rarísima vez se desarrolla, pues muere generalmente del tamaño de la bráctea. La tercera es arriñonada, ligeramente mucronada, algunas veces parece cordiforme. Su color es verde rosado en un principio, y va cambiando despues, pasando por varios rojos hasta quedar amoratada; al fin es coriácea, y sus nervaduras aparecen muy pronunciadas, principalmente si se ve dicha bráctea por trasparencia. Sus dimensiones médias, cuando se abre la flor, llegan á 0,^{m}043 de anchura y 0,^{m}023 de longitud. Cáliz, 5-sépalo de 0,^{m}007 de longitud, de prefoliacion quinconcial; sépalos desiguales, aovado-agudos y herbáceos. Corola hipoginea de color rojo purpurino, tubulosa, 5-dentada, de prefoliacion torcida; su longitud média es de 0,^{m}045. Estambres en número de cinco, desiguales y exertos; filamentos aplanados y pelosos en su base: anteras sagitadas; basifijas y biloculares. Ovario libre, cónico bilocular y 4-ovulado; está rodeado de cinco masas glandulosas de color blanco amarillento; estilo apicilar, cilindrico, alargado y terminado por un estigma bilobulado. Fruto capsular, y en todos los ejemplares que he visto hasta ahora, solo tienen un grano desarrollado y otro atrofiado en cada lóculo. Cotiledones foliáceos y plegados.

Como se ve, esta planta pertenece á la familia de las Convolvuláceas, por ser monopétala hipogínea, de corola regular, con cinco estambres, ovario bilocular y cotiledones foliáceos y plegados. De las cuatro tribus en que está dividida esta familia, debemos colocarla en la segunda, por tener los carpelos unidos en un solo ovario y el pericarpio capsular; y á la segunda division de ésta, por ser su ovario bilocular, y al género *Exogonium* por la figura de su corola y por estar exertos sus estambres. De las siete especies que describe De Candolle, solamente el *Exogonium racemosum* y el *Exogonium spicatum* se parecen por algunos caractéres á la especie que describo; pero las diferencias que se encuentran respecto de éstas son bastante sensibles para tomarse en consideracion. Difiere de la primera por el número de flores que tienen los pedúnculos, pues el *E. racemosum* solo tiene de 3 á 4, y en la que me ocupa he contado hasta 48 como lo indiqué ántes. Las brácteas de ésta son cordiformes ó reniformes y mucronadas y no ovado-elípticas como las de aquella, ni se encuentran algunas veces aproximadas á la flor como sucede en la misma, sino siempre colocadas en la articulacion de los pedúnculos secundarios. Difieren tambien ambas especies por la forma de los sépalos, pues en el *E. racemosum* son ovado-elípticas como las brácteas, y no ovado-agudos como en la otra.

Con el *E. spicatum* tiene de comun la especie á que me refiero la forma de las hojas y de las brácteas; pero se distinguen fácilmente por la forma de la inflorescencia y por ser unifloreos los pedunculillos en aquella. No puede confundirse con las cinco especies restantes por los caractéres del tallo, de las hojas y de la inflorescencia. En consecuencia, el *Exogonium* que encontré en el Estado de Morelos, es, á mi juicio, una especie nueva, ó no descrita, que propongo se designe en tal caso con el nombre de *Exogonium Olivæ* en recuerdo del sabio naturalista jalisciense D. Leonardo Oliva, que falleció en Guadalajara el año de 1872.

El *Exogonium Olivæ* se encuentra con frecuencia desde las cercanias de Cuernavaca, á una altura de 1997 mts. sobre el nivel del mar hasta la montaña de Cacahuamilpa al S. de aquella ciudad; sus preciosos racimos, adornados de brácteas rojas, contrastan graciosamente con el follaje de las vigorosas plantas de aquel clima cálido que le sirven de apoyo.

He consultado el establecimiento de esta nueva especie á los distinguidos botánicos mexicanos D. José Barragan y D. Manuel Villada, quienes me han ayudado muy eficazmente en mi estudio, y ambos opinaron por la afirmativa

Me complazco, pues, en añadir un nombre más en la riquísima Flora de nuestra República.

Para fijar mejor las ideas respecto de la distribucion geográfica de las plantas que he citado, así como de algunas de las causas que mas influyen en su estacion, inserto el siguiente cuadro que contiene el resúmen de las observaciones que hice sobre el particular.

CUADRO

DEL RESUMEN DE OBSERVACIONES.

ESTACIONES.	PLANTAS CARACTERISTICAS.	Alturas sobre el nivel del mar.	Temperatura en grados centígrados.	Horas de las observaciones.	Fechas de las mismas.
Tlalpam	Compuestas gen. senecio	2276 m.	23. 7	8 de la mañan.	15 Feb. 1874.
San Mateo	Idem, idem	2283 m.	27. 5	9½ de idem.	,, ,, ,,

Las alturas fueron calculadas, como advertí ántes, por medio de un aneroide pequeño y compensado. La altura que me dió en México el dia de la partida, (15 de Febrero) y á las seis de la mañana, fué de 2269 metros, número que no difiere mucho de los que se han determinado por medios más exactos. La observacion la hice en la esquina E. de la calle de Cadena en esta capital.

He llegado al fin de mi trabajo, que adolecerá sin duda de muchas imperfecciones, tanto por mi falta de conocimientos como por la brevedad del tiempo en que hice mis observaciones, las que, me he resuelto á escribir, como anuncié al principio, con el fin de cooperar al adelanto de la Historia Natural de México.

Marzo 10 de 1874.

DESCRIPCION

DEL

MINERAL BISMUTIFERO DE SAN LUIS POTOSI,

DESCUBIERTO POR EL SR. D. FLORENCIO CABRERA,
QUE RESULTA SER UN HYDROCARBONATO DE OXIDO DE BISMUTO
O LA BISMUTITA DE LOS MINERALOGISTAS,
SEGUN NUESTRA CLASIFICACION A LA VISTA DE LOS EJEMPLARES REMITIDOS POR EL
MISMO SEÑOR AL MUSEO NACIONAL Y MINERIA,
POR EL SR. D. ANTONIO DEL CASTILLO, SOCIO DE NUMERO.

Se presenta en las combinaciones de las formas siguientes, que pertenecen al sistema orthorómbico:

1.ª Pirámides rombales, con las caras de la base, ó truncados los vértices:

2.ª Pirámides rectangulares, que resultan de la combinacion de los domas macro y braquidiagonales:

3.ª Las mismas pirámides con la cara de la base, ó tablas rectangulares biseladas las aristas de la base.

Estas formas cristalinas son de caras ásperas, formando agrupamientos por las bases, ú otros indeterminados. Las tablas forman celdillas. Los cristales están sueltos ó embutidos en la masa del pórfido cuarcífero del criadero. Tambien se encuentra en concreciones globosas, arriñonadas, en granos, en costras y pulverulento.

Los cristales son pequeños y medianos, hasta de 8 milímetros del lado de la base. No se prestan á la medicion de ángulos, por lo áspero de las caras; pero su textura es hojosa perfecta, siendo el crucero paralelo á la base de la pirámide: por este carácter me parecen no ser formas pseudo-mórficas. (Para el Sr. Frenzel las formas son aparentemente pseudo-mórfosis del Espato pesado). Hasta ahora no se habia encontrado cristalizado. Tienen lustre de nácar en la textura hojosa; y el de las figuras concrecionadas es de cera á vidrio; y mate el terroso. Su color es blanco amarillento que pasa á amarillo de cera, y pajizo; á veces teñidas de rojo, por la arcilla del pórfido rojo que las acompaña.

Los cristales de textura hojosa tienen una dureza de 4 á 5, y dan raspadura blanca. Es quebradizo: su peso específico es de 7,52. Segun el Sr. Rammelsberg tiene el de la Carolina del Sur 7,67: y 6,86-6.909, el de Europa, segun Breithaupt.

Hace efervescencia con los ácidos.

La solucion clorhydrica toma luego un hermoso color amarillo subido.

Da agua en el matracito calentado á la lámpara de alcohol.

Al soplete tiene una fusibilidad de 1.

Se funde en escoria amarillenta con pegadura amarilla parduzca; y continuando el soplo á la llama de reduccion, se obtienen globulitos metálicos y quebradizos.

En el "Neues Jahrbuch der Mineralogie von Leonhard und Geinitz," de 1874, entrega 8.ª, pág. 801, el Sr. Frenzel de Freiberg publicó un análisis, dando la composicion siguiente en 100 partes:

Oxido de bismuto.	90,10
Acido carbónico. . . :	7,00
Acido sulfúrico	0,27
Agua	1,80
Resíduos . . . . :	0,30
	99,47

Los análisis que trae el Sr. Dana en la última edicion de su *System of Mineralogy*, en la descripcion de esta especie, pág. 716, practicados por los Sres. Rammelsberg y Genth, con ejemplares de la Carolina del Sur, son los siguientes:

	$\ddot{C}$	$\dddot{Bi}$	$\dot{H}$	
1.º Distrito de Chesterfield	6.56.	90.00.	3.44=100	Ramm.
2.º ,, ,, ,,	7.04.	89.05.	3.91=100	Genth.
3.º ,, ,, ,,	7.30.	87.67.	5.03=100	Genth.

Como se ve, estos últimos análisis solo difieren del primero en la cantidad de agua y un cuarto por ciento de ácido sulfúrico, que da el del Sr. Frenzel; de manera que en la fórmula $3(\dddot{Bi}\ddot{C}+\dot{H})+\dddot{Bi}\dot{H}=\dddot{Bi}{}^4\ddot{C}{}^3\dot{H}^4$ del Sr. Rammelsberg, solo habria una variacion en la proporcion de átomos de agua que no hace una variacion esencial en la fórmula. El Sr. Cabrera en tres análisis diferentes sacó: 4,43; 4,06; y 4,76 de agua; lo que da un término medio de 4,42, y una proporcion atómica de H^5.

Observaciones.—El hydrocarbonato de óxido de bismuto de San Luis, se cria, como el óxido de estaño arriñonado, en pórfidos, y se encuentra mezclado en pequeñas cantidades con él. Por esta circunstancia las muestras de bismuto metálico obtenidas de este mineral por el Sr. Cabrera contienen una pequeña cantidad de estaño que le quita el tinte rojizo del color propio del bismuto metálico. Además, el Sr. Frenzel observó que los fragmentos del mineral procedentes de México, que examinó, iban mezclados de hojillas blancas, y muy dúctiles, las que, tratadas al soplete, resultaron ser de estaño puro.

El hallazgo ó descubrimiento en México de esta especie mineral, se debe á nuestro socio de San Luis, el Sr. D. Florencio Cabrera, aun cuando sus investigaciones y análisis lo hayan conducido á otros resultados diferentes de los expuestos aquí; por constar que él fué el primero que reconoció el bismuto metálico extraido de esta especie mineral.

Por este trabajo, publicado en Agosto del año pasado, y por los ejemplares que nos remitió, sabemos que se encuentra á pelo de tierra envuelto en la tierra vegetal (seguramente por acarreo); en bolsas, en las excavaciones de las minas, acompañado de arcillas, de bol, litomargas kaolin y ocres, mezclados con cristalitos de cuarzo, de topacio y riñoncitos de óxido de estaño: y en las abras de un pórfido rojo en el que se halla tambien embutido y diseminado en masas y cristales.

El mismo pórfido contiene en sus rajas costras ó concreciones concéntricas amarillentas de óxido de estaño ó casiterita.

Las minas están situadas tres leguas al Oeste de San Luis, en unos cerros de 100 metros de altura sobre el nivel de la ciudad, en las cercanías del Santuario del Desierto; y sobre las Mesas de Buenavista y la Cruz. La sierra de que forman parte dichos cerros, contienen muchas catas que se han abierto por los pepenadores de estaño arriñonado.

Desgraciadamente la produccion de estos criaderos superficiales ha sido escasa, y segun nuestros informes, la casa de los Sres. Gutheil y C.ª de esta ciudad, mandó á Alemania 5000 libras. La libra de metal, puesta allá, sale á 50 centavos; y el metal puro se paga á 2 pesos 50 centavos la libra.

Parece que las minas están ya agotadas, y no se trabajan.

El mineral que analizó el Sr. Frenzel lo tomó, segun me comunica el Sr. Burkart, á quien debo la noticia del análisis ántes citado, de unas 54 libras procedentes de México, que una casa de Hamburgo compró.

México, Julio 16 de 1874.

LA PEGA-ROPA AMARILLA

POR EL SEÑOR DON MANUEL F. DE JAUREGUI.

Esta planta pertenece á la familia de las *Loasaceas*, familia de plantas fanerógamas indígenas: al género *Mentzelia* de Lineo, y es la *Meutzelia hispida* de Will. Tiene los caractéres siguientes:

Planta herbácea; tallo cilíndrico de color verde amarilloso, con un corto número de ramos, rudos al tacto: crece á un metro de altura: hojas alternas, ovado-lanceoladas y dentadas, las inferiores más grandes que las superiores, y éstas casi sentadas, de color verde oscuro, más claro en la parte inferior: las nervaduras de color blanquizco. Las flores se hallan en las extremidades de los ramos y son regulares: cáliz de cinco sépalos, agudos, lisos por su cara interna: corola de cinco pétalos obtusos, lisos y acuminados, de color amarillo de oro é insertos en un disco anular, alternos con los sépalos del cáliz: cuarenta y dos estambres, diez esternos más desarrollados que treinta y dos internos, insertos en el disco de la corola: anteras biloculares: ovario ínfero, carnoso, pluriovulado: estilo filiforme: estigma de tres divisiones lineares: el fruto es una caja triangular, coronada por el cáliz persistente: granos dispuestos de tres en tres y adheridos á tres placentas, ásperos á consecuencia de muchas estrias que tienen en su superficie. Los tallos, las hojas y el cáliz por su parte externa, están cubiertos de un sin número de pelos largos vueltos hácia abajo: los ovarios y frutos tienen tambien pelos rígidos, pero de una forma particular; examinados con una lente son unos cónos con algunos puntos brillantes. Al microscopio, se advierte que los puntos brillantes son otros tantos cónos cuyo vértice está volteado hácia uno de los lados. Por la disposicion de estos pelos, la planta, y principalmente los ovarios, se adhieren á los géneros, y tal vez por este carácter ha recibido el nombre de *Pega-ropa*.

Las raíces afectan muchas formas; la que parece predominar es la cónica alargada, ramificándose por su base ó lateralmente. Su color es amarillo sucio al exterior, con algunas cicatrices, debidas á otras tantas raicesillas que han desaparecido: es muy carnosa; haciendo un corte trasversal se presentan dos zonas muy bien marcadas, una que está inmediata á la corteza es de color más subido relativamente; la otra, que forma el resto de la raiz, es blanca, compuesta de un tejido celular muy compacto: su olor cuando está fresca es nulo, lo que no sucede cuando está seca y en polvo: la zona que está inmediata á la corteza es amarga, miéntras que la central casi no tiene sabor. Esta planta se halla en los alrededores de México. Los indígenas la usan como purgante, y su nombre en mexicano es *Zazale.*

He analizado esta raíz, cuyos resultados son:

Resina, Materia grasa, Goma, Azúcar, Almidon, Sales, Extracto acuoso.

La resina es ácida, de color moreno oscuro, olor apénas sensible, de sabor amargo, soluble en los álcalis cáusticos ó subcarbonatados; neutralizando el álcali que tiene en solucion la resina, ésta se precipita con un color blanco: si se deja secar poco á poco, toma su color primitivo. La he obtenido dejando macerar el polvo de la raíz en alcohol á 40°, concentrando el vehículo y precipitándolo por el agua. Contiene 11 por 100.

El agua que sirvió para la extraccion de la resina, fué concentrada y abandonada á sí misma; poco despues abandonó unos cristales cúbicos muy brillantes. Me pareció ser un principio inmediato: fué necesario hacer la experiencia en mayor escala; y sometida la sustancia cristalina y el agua madre á la accion de los reactivos, éstos me dieron á conocer en los cristalitos cloruro de potasio. El agua madre tiene un sabor dulzacho: contiene azúcar incristalizable. La fécula la he extraido por los procedimientos ordinarios: es muy blanca; puesta al microscopio, se ven los gránulos redondos, ligeramente ovoides: contiene la raíz bastante. La goma la extraje por maceracion de la raíz en el agua, á la temperatura ordinaria y precipitándola por el alcohol concentrado. Por el éter he obtenido una materia grasa, de color amarillo, del olor de la raíz, insoluble en el agua y en el alcohol.

Creo que el principio activo es la resina: á un perro de pequeña talla, que se habia alimentado con pan y leche el dia anterior, se le dieron 0,30 de resina envuelta en un pedazo de carne: á las pocas horas tuvo una excrecion morena de consistencia sólida: poco despues vinieron otras dos excreciones líquidas. En este intermedio, el animal estuvo muy inquieto, ladraba, y se revolcó repetidas veces.

Ninguna otra experiencia fisiológica se ha hecho con las raíces de la *Pegaropa*, y no puedo dar mi opinion sobre su empleo terapéutico; pero á juzgar por los datos de los indígenas, si producen dolores intestinales, son soportables.

ANALISIS DE LA CENIZA

DE LOS

ORGANOS LUMINOSOS DE LOS CUCUYOS

POR EL SEÑOR DOCTOR CARLOS HEINEMANN,

SOCIO CORRESPONSAL EN VERACRUZ.

La imperfeccion de nuestros conocimientos sobre la composicion química de los órganos luminosos de los *Lampirideos*, y sobre la facultad que poseen, ha consistido principalmente en la pequeñez de los objetos que estuvieron al alcance de los investigadores europeos. Dan más probabilidad de averiguar algo sobre estas cuestiones interesantes, los cucuyos americanos, en atencion al notable tamaño de algunos de ellos.

Siento no poder ofrecer por ahora más que un principio para nuevos trabajos, es decir, una análisis de la ceniza de los órganos luminosos, que ya he descrito en un artículo poco ha reproducido en este periódico.

Por falta de aparatos, he tenido que limitarme solo á una análisis cualitativa.

Los órganos luminosos ventrales de ciento ochenta y seis cucuyos, cuidadosamente preparados, y colocados despues en un crisol de porcelana, fueron reducidos á carbon por medio del fuego lento de una lámpara de Berzelius.

El carbon fué tratado con agua hirviendo y su resíduo insoluble, convertido posteriormente en ceniza, lo cual se logró muy bien, exceptuando una insignificante porcion de él.

El extracto acuoso tenia una reaccion ligeramente alcalina, y desprendió con el ácido clorohídrico unas cuantas burbujas de un gas cuya naturaleza (probablemente ácido carbónico), no pudo averiguarse, por su pequeña cantidad.

La continuacion del exámen químico demostró la existencia de rastros de cloro y de cantidades relativamente grandes de potasa y de ácido fosfórico.

La parte de ceniza insoluble en el agua se disolvió en el ácido clorohídrico, desprendiéndose bastante ácido carbónico y no quedando más que rastros insignificantes sin disolverse. En la solucion ácida se podia demostrar con exactitud la existencia de la cal.

Para discutir ahora la reparticion de las sustancias encontradas, es preciso recordar la estructura de los órganos luminosos.

Como lo expuse en el artículo arriba citado, hay que distinguir en ellos dos capas, una luciente, compuesta de células y traqueas, y otra que no luce, en la cual yo, en oposicion á las observaciones hechas por el Sr. Kölliker, que hizo sus estudios en el *Lampiris splendidula*, no he podido encontrar células.

En nuestro cucuyo se compone esta capa de ramificaciones gruesas de las traqueas y de masas compactas, en parte esféricas, mezcladas unas con otras.

Solo el exámen microscópico hace ya probable en estas masas la existencia de dos diferentes combinaciones químicas, porque una parte de ellas está compuesta de pequeños gránulos perfectamente contorneados, miéntras que otras presentan una estructura radiado-cristalina, que con mayor precision se presenta bajo la accion de la potasa cáustica.

El Sr. Kölliker ha hecho en los *Lampirideos* el interesante descubrimiento de que la capa no luciente, añadiéndole algun ácido, da orígen á la cristalizacion de cantidades considerables de ácido úrico, observacion que yo pude confirmar en los cucuyos; pero no estoy conforme con la suposicion del Sr. Kölliker, de que sea amoniaco la base combinada con aquel ácido, porque los órganos luminosos frescos, tratados convenientemente, no lo desarrollan. La análisis que acabo de explicar, da á mi juicio, la resolucion de este asunto.

En mi concepto, se encuentra el ácido úrico en dos combinaciones, una al estado de urato de cal que forma las masas compuestas de gránulos, y otra al de urato de potasa, formando las masas cristalinas.

El ácido carbónico, que se desprende de la ceniza insoluble en el agua, debe considerarse como producto de la combustion del ácido úrico, porque no está preformado en la capa luminosa.

El ácido fosfórico se debe referir á las células lucientes, porque si se encontrase en la capa que no luce, solo podia estar en la forma de fosfato de cal (hay que recordar que esta capa es insoluble en el agua), y entónces debia probarse su presencia en aquella parte de la ceniza, que solamente se disuelve en ácido clorohídrico.

Otra cuestion, y muy importante es, si está preformado el ácido fosfórico y combinado con la potasa, ó si es el resultado de la combustion de cuerpos fosfóricos. Esto no puede decidirlo una simple análisis de la ceniza. Sin em-

EXOGONIUM OLIVÆ. (Bárcena.)

21. Selasphorus Floresii. 22. Trochilus Alexandri

LIT DE H. IRIARTE MEXICO

bargo, llama mucho la atencion el hecho averiguado, y me dará motivo para nuevos estudios, que tal vez aclararán más la causa de la produccion de luz en los coleópteros luminosos.

Veracruz, 24 de Mayo de 1874.

ENSAYO ORNITOLÓGICO

DE LA FAMILIA TROCHILIDÆ

O SEA DE LOS COLIBRIES O CHUPAMIRTOS DE MEXICO,

POR EL Sr. D. RAFAEL MONTES DE OCA, SOCIO DE NUMERO.

(CONTINUA.)

Num. 19.—*Chupamirto de pecho dorado.*

Selasphorus rufus, Gould; *Trochilus rufus*, Swains.; *Mellisuga rubra*, Gray y Mitch.; *Selasphorus ruber*, Bonap.; *Le Sasin*, Aud. y Vieill.

Esta preciosa especie de colibries, es otra de las que como el *colubris*, recorre una vasta extension de la América Setentrional durante su peregrinacion anual, pues el Sr. Gould, dice, que ha obtenido ejemplares de esta familia, de Guatemala; se encuentra en abundancia en el Valle de México, durante el otoño, adonde efectúa su nidificacion, segun manifiesta el Dr. Villada en su interesante Memoria de los "Colibríes del Valle de México," que públicó la Sociedad Mexicana de Historia Natural, en el 2.º tomo de su periódico *La Naturaleza;* y por consiguiente, debe decirse, que esta es su localidad, á pesar de que el número de nidos que se encuentran allí, es insignificante en proporcion á la gran cantidad de individuos de ella que se ven en esta region, siendo muy probable, que tales avecitas hagan su primera incubacion durante la primavera, en algun lugar más meridional, puesto que está probado que algunas de ellas hacen dos posturas al año. Tambien se encuentran individuos de esta especie en California, y segun algunos viajeros, recorre toda la cordillera hasta llegar á la isla de Sitka, á unos 56 grados de latitud setentrional.

La apariencia del macho adulto, es así: la parte superior de la cabeza, de un tinte pardo verdusco; la parte de encima del cuerpo y la cubierta de la cola, color de canela; la cola tambien de este color, pero un poco más subido, teniendo en las puntas de cada pluma, una mancha pardo-oscura; alas pardo purpúreas, y sus cubiertas verde-bronceadas; la garganta y cuello lo tiene cubierto con unas plumas de apariencia escamosa, de un color de oro naranjado brillantísimo; cubiertas de debajo de la cola, flancos y vientre, del mismo color castaño-canelo de la parte superior del cuerpo, un poco más claro en el centro del abdómen; parte inferior del pecho, blanca, que toma gradualmente el tinte canelo del abdómen, con el cual se confunde; region anal cubierta de plumon blanco; patas pardo-oscuras, y uñas y pico negros.

Su largo total, es de 3⅜ de pulgada; alas 1¾ idem; cola 1¼, y pico casi recto, ¾ idem.

La hembra es casi del mismo tamaño que el macho, diferenciándose de éste, en que toda la parte superior de la cabeza, cuello y cuerpo, es de un color verde-bronceado pardusco, con las cubiertas y bases de las plumas de la cola, del mismo color canelo del macho, con lo restante de ellas pardo-oscuro, teniendo las tres de cada lado, las puntas blancas, arredondadas y no lanceoladas como las del macho; toda la parte inferior, blanca, tintada de color canelo en los flancos y cubiertas de debajo de la cola, teniendo por último, una mancha en la garganta, formada por las extremidades de algunas plumas tintadas del hermoso color metálico del macho.

El macho jóven participa tanto de la apariencia de la hembra, como del macho adulto, pudiendo desde luego decirse, que es el intermediario entre ambos.

Num. 20.—*Chupamirto real de pecho azul celeste.*

Delattria Clemenciæ, Gould; *Ornismya Clemenciæ*, Less.; *Mellisuga Clemenciæ*, Gray y Mitch.; *Lampornis Clemencia.* Bonap.

Este hermoso colibrí, es muy parecido al *Campylopterus Delattrii;* tiene el nombre de *Clemencia* que le dió Lesson al dedicarlo á su esposa.

El Sr. Gould, le ha dado tambien el nombre de *Cazique de garganta azul,* y se encuentra en las inmediaciones de Jalapa, Coatepec y Córdoba; pero con más abundancia en el Valle de México, de donde parece ser peculiar, pues mora allí desde la primavera hasta la conclusion del otoño.

La apariencia del macho adulto de esta especie, en cuanto á su plumaje, es como sigue: la parte de encima de la cabeza, del cuello, del cuerpo y cubiertas de las alas y de la cola, de un tinte verde bronceado, y un poco más pardusco y oscuro en la parte de la corona y cubiertas de la cola; alas pardo-purpúreas; cola negro-purpúrea, con las extremidades de las tres plumas de cada lado, como media pulgada blancas; siendo un poco ménos en las dos interiores; cubiertas de debajo de ésta, pardo claro verduscas, marginadas de blanco; parte inferior del pecho y abdómen, gris pardusco con visos bronceados en los flancos y lados del pecho; region anal cubierta de plumon blanco; garganta y parte superior del pecho, de un color brillante azul de cobalto; en la parte posterior del ojo, le nace una linea blanca que se dirige hácia atrás en una extension como de tres octavos de pulgada; sus patas son negro-parduscas, su pico recto y uñas negras.

El tamaño del macho adulto es, 5¾ de pulgada; alas 3¼ idem; cola 2 idem, y pico recto de una pulgada.

La hembra es un poco más pequeña que el macho y muy semejante en el colorido de su plumaje, pues solo se diferencia de él, en que carece del tinte azul metálico que tiene en la garganta, hallándose esta parte cubierta de un color gris claro uniforme, que se une con el resto del color de toda la parte inferior del cuerpo.

NUM. 21.—*Chupamirto de corona y pecho escarlata.*

Selasphorus Floresii, Gould; *Floresi's Flame-bearer.*

De esta singular especie de colibries, solo existe un ejemplar en Inglaterra, en la coleccion particular del finado G. Loddiges, á quien se lo presentó el Sr. Floresi, y éste lo obtuvo durante su estancia en este país, cerca del mineral de Bolaños, en el Estado de Jalisco.

La Srita. Loddiges, segun dice el Sr. Gould, le permitió tomar un dibujo de dicho ejemplar, y además le proporcionó copiar la siguiente nota escrita por su padre con respecto á esta especie, cuya traduccion es como sigue:

«Agosto 11 de 1845.—El Sr. Floresi me envió un hermoso colibrí nuevo, que he apellidado *Floresii*. Fué cogido en Bolaños; es muy parecido al *Anna*, pero sus colores son mas brillantes; visto de frente es escarlata; los lados del cuello los tiene color de rubí ó carmesí; la cabeza es tambien color de rubí, y su cola es parecida á la del *platycercus;* pero tiene parda la parte interior de sus plumas. El Sr. Floresi dice que es el único ejemplar que ha llegado á ver.»

La apariencia de dicho ejemplar es así: la parte superior de la cabeza, garganta y parte superior del pecho, color de granate vistosísimo; parte superior del cuerpo y cubiertas de las alas y de la cola, verde bronceadas; alas pardo-purpúreas; cola, de un color castaño rojizo, con la punta y parte exterior de cada pluma pardo-purpúreo, ménos las dos de enmedio que tienen el centro verde bronceado; parte inferior del pecho y abdómen, gris casi blanco, con los flancos tintados de verde bronceado; patas pardo-oscuras; y su pico recto, y uñas negras.

La hembra, como debe suponerse, es desconocida.

La figura de la ilustracion anexa, tiene el tamaño natural, y la planta, es el *Exogonium Olivæ* descrito por el distinguido mineralogista y botánico D. Mariano Bárcena.

Num. 22.—*Chupamirto de pecho morado.*

Trochilus Alexandri, Bourc. y Muls.; *Mellisuga Alexandri;* Gray y Mitch.; *Trochilus Alexandri*, Bonap.

El Dr. Alexandre que visitó nuestro país, fué quien descubrió esta preciosa especie de colibríes, y los Sres. Bourcier y Mulsant, en honor del descubridor, le dieron el nombre de Alexandri; es muy parecida, por su configuracion y tamaño al *T. colubris*, y habita en la altiplanicie del Valle de México y otros lugares del N. E. de este país, pues el Dr. Heerman ha encontrado individuos de ella en Guaymas. Tambien se encuentra en Tejas y California, por cuyo motivo los americanos la consideran como perteneciente á su fauna.

El *Alexandri* visita el Valle de México durante el principio del otoño; pero no en abundancia, pudiendo desde luego decirse que es raro en esta region.

El color del macho adulto, en la parte superior de la cabeza, del cuello, del cuerpo y cubiertas de las alas y de la cola, es verde bronceado, algo pardusco en lo que corresponde á la cabeza; alas pardo-purpúreas; cola con las dos plumas del centro, verde bronceadas, y las laterales que son lanceoladas, de un tinte negro-pardusco con ligeros visos bronceados; cuello color de púrpura metálico, que se confunde en la parte de arriba con el negro aterciopelado de la garganta; abdómen pardusco, un poco más claro en su centro y desvanecido en su parte anterior con el tinte casi blanco que tiene en el pecho; las cubiertas de sus piernas son blancas; sus patas pardo-oscuras, y uñas y pico que es recto, negros.

El tamaño del macho, desde la punta del pico hasta la extremidad de la cola, es 3½ pulgadas; alas 1¾ idem; cola 1 idem, y pico 8 líneas.

La hembra es muy semejante al macho; pero se diferencia de él, en que está desprovista de los tintes de la garganta y cuello, teniendo en lugar de éstos, un color pardo gris muy claro uniforme hasta el abdómen, y además las plumas de la cola, que no son lanceoladas sino arredondadas; tres de cada lado tienen las puntas blancas, y la generalidad de ellas sus bases grises.

El macho jóven se parece más á la hembra que al macho, y solo se diferencia de aquella, en que en el lugar en que éste tiene el color purpúreo, se le ven una multitud de manchitas pardas, las cuales con la edad se convierten en el hermoso tinte metálico ya descrito.

Num. 23.—*Chupamirto de cola de tijera y garganta azul.*

Ornismya Dupontti, Less. y Jardin; *Triphœna Duponti,* Gould; *Mellisuga Duponti,* Gray y Mitch; *Ornismya Zémès,* Less. Rev. Zool.; *Taumastura Duponti,* Bonaparte.

Esta elegante especie de colibríes, se encuentra durante el verano, en las inmediaciones de Jalapa y Coatepec, así como tambien en el Valle de México; mas sin embargo de hallarse bastante esparcida, es otra de las que como el *Elizæ,* se considera entre las muy raras de dichos lugares. El Sr. Gould dice, que ha obtenido tambien ejemplares de ella, de Guatemala, donde parece que es más abundante, y hace notar, que tiene el modesto nombre Zémès, derivado del que daban á sus idolos los antiguos mexicanos y haitienses.

La apariencia del macho adulto es como sigue: la parte superior de la cabeza, cuello, cuerpo y cubiertas de las alas y de la cola, de un color verde bronceado, un poco más oscuro en lo que corresponde á la cabeza; alas pardo-purpureas; cola extremadamente horquillada, con las dos plumas del centro muy cortas, verde-bronceadas; las dos siguientes de este mismo color un poco más oscuro, con una pequeña mancha blanca en la punta, las tres restantes de cada lado de ella, que gradualmente aumentan en tamaño, tienen las bases y hasta como la mitad de su largo, pardo-oscuras, en seguida una pequeña porcion blanca, y por último, otra parte pardo-oscura con las puntas blancas; su garganta y cuello, cuyas plumas tienen una apariencia escamosa muy marcada, son de un color de índigo brillante; en el pecho tiene una banda blanca; la parte inferior del cuerpo, es de un color verde-bronceado pardusco; las cubiertas de debajo de la cola, de un tinte pardo-claro verdusco; la parte que cubre los cuadriles hasta muy arriba, tambien es blanca; patas pardas, y el pico, que es casi recto y uñas, negras.

Su largo total, desde la punta del pico hasta la extremidad de la cola, es de 4 pulgadas; alas 1 ½ idem; cola 2 idem ménos una línea, y pico ½ pulgada.

La hembra, en cuanto á lo que pertenece al cuerpo, es del mismo tamaño que el macho; toda la parte superior la tiene verde-bronceada pardusca; la inferior castaño rojiza, inclusa la cubierta de debajo de la cola, con excepcion de las plumas que cubren la region anal, que son blancas sedosas; alas pardo-purpúreas; cola de este mismo color, con visos bronceados, más marcados en las dos plumas del centro, teniendo todas las demas, ménos éstas, en las puntas, una manchita blanca tintada de castaño en sus extremidades.

NUM. 24.—*Chupamirto morado grande.*

Calothorax cyanopogon, Gould; *Cynanthus Lucifer*, Swainson;
Ornismya cyanopogon, Less.; *Calothorax Lucifer*, Gray y Mitch.

Esta preciosa especie de colibríes, á la cual el Sr. Gould le da tambien el nombre de *Mexican Star*, Estrella mexicana, es otra de las peculiares del Valle de México, y acaso la más comun de todas las que se encuentran en esta region, pues vive en ella desde el principio de la primavera hasta concluir el otoño; durante cuyo periodo los cazadores cogen un sinnúmero de individuos de ella, tanto para disecarlos, como para venderlos vivos en jaulas á aquellas personas que gustan ver, aunque sea por poco tiempo, tan hermosas joyas animadas; puesto que raras veces se pueden conservar más de dos semanas aprisionadas, y siempre se mueren, ya sea por la falta de ejercicio, ó porque el alimento de azúcar que se les da, no les nutre suficientemente. Visita tambien algunos lugares del Noroeste de México, adonde probablemente va á invernar; pero nunca se le ve en las inmediaciones de Jalapa como ha dicho el Sr. Bulock en su Memoria de «Seis meses en México.»

La apariencia del macho adulto, es como sigue: la parte superior de la cabeza, del cuello, del cuerpo y cubiertas de las alas y de la cola, de un color verde-bronceado parduzco, un poco más oscuro en la parte frontal de la cabeza; alas algo cortas, pardo-purpúreas; cola bastante horquillada, con las dos plumas del centro, como de la mitad del largo de las laterales, verde-bronceadas; las dos siguientes, un poco más largas, del mismo color ménos marcado, las demas negro-purpúreas, siendo las dos exteriores muy angostas en su extremidad y algo más cortas que las siguientes, las cuales son lanceoladas y tienen algunas veces un filete casi imperceptible, blanco en sus extremidades; su garganta, cuyas plumas son de apariencia escamosa, así como las de los lados del cuello que tienen hasta média pulgada de largo, es de un color de púrpura metálico hermosísimo en algunas posiciones de la luz, pues en otras tiene unos reflejos violados indescribibles con la pluma, é inimitables por el pincel; el pecho y las cubiertas de debajo de la cola, las tiene de un color blanco sucio, así como tambien la parte del centro del abdómen, con los flancos pardo verduscos y un tinte castaño cerca de las cubiertas de las piernas que tambien son de este mismo color; sus patas, pico que es algo curvo, y uñas negras.

Su largo total es de 4 pulgadas, desde la punta del pico hasta la extremidad de la cola; alas 1¾ idem; cola 1⅓, y pico 11 líneas.

La hembra, en cuanto á tamaño y color de toda su parte superior, es exactamente igual al macho; toda la parte inferior la tiene de un tinte blanco sucio, algo más claro en el centro del abdómen, con ligeros visos bronceados á los lados del cuello; sus flancos son de un tinte castaño bastante pronunciado; su cola, que no es horquillada, sino arredondada, tiene las dos plumas del centro, verde-bronceadas; las demas son de un color negro-purpúreo, con las bases de un tinte castaño, que al unirse con el color oscuro tiene visos verduscos, y por último, las tres plumas de cada lado de ella, tienen las extremidades blancas.

Segun el Dr. Villada, esta especie nidifica al principio del verano, y como tambien dice que á la hembra se le ve ocupada en esa misma tarea á mediados de otoño, queda confirmada la idea de que algunas especies de esta familia hacen dos posturas al año, y que ésta es una de ellas.

NUM. 25.—*Chupamirto morado pequeño.*

Calothorax Pulchra, Gould.

Esta otra preciosa especie de colibríes, á la cual el Sr. Gould ha dado tambien el nombre de *Beautiful wood Star*, Hermosa estrella del bosque, es tan semejante á la anterior, que á primera vista puede confundirse con ella, pues que toda la diferencia que se encuentra entre ambas, es ser ésta, como cinco octavos de pulgada mas pequeña en su largo total, y tener el pico algo más curvo, más delgado, y por consiguiente más pequeño que el de aquella.

El Sr. Gould dice que los ejemplares que ha obtenido de esta especie, fueron cogidos en Oaxaca, y que es al Sr. Sallé, de Paris, á quien se debe el conocimiento de ella; pudiendo agregar el que esto escribe, que ha conseguido en el Valle de México unos cuantos individuos, que le parecen ser iguales á los descritos con el nombre de *C. pulchra*, cuya apariencia es como sigue:

Macho adulto; la parte superior de la cabeza, del cuerpo y cubiertas de las alas y de la cola, de un color verde-bronceado pardusco, algo más oscuro en lo que corresponde á la cabeza; alas pardo-purpúreas; cola tan horquillada como la del *cyanopogon*, con las dos plumas del centro muy cortas, verde-bronceadas, las dos siguientes un poco más largas, de ese mismo color algo más oscuro; las demas negro-purpúreas, siendo las dos exteriores muy angostas, particularmente en sus extremidades, y tambien un poco más cortas; su garganta y cuello, cuyas plumas tienen una apariencia escamosa, son de un color de púrpura metálico hermosísimo; pecho y centro del abdómen de un tinte blanquizco, con los laterales pardo-verduscos; cubiertas de los cuadriles blancas; idem de debajo de la cola, de este mismo color, y patas, pico y uñas, negras.

Su largo total es de 3⅜ de pulgada; alas 1 idem, y cinco líneas; cola 1¼ y pico ¾ idem.

La hembra de esta especie es tan parecida á la del *cyanopogon*, que muy bien pudiera tomarse por la de aquel, si al compararse no se notara que es un poco más pequeña, así como lo es el macho.

(Continuará.)

DESCRIPCION
DEL VOLCAN DE TUXTLA

POR

D. JOSEPH MARIANO MOZIÑO SUAREZ DE FIGUEROA,

BOTANICO NATURALISTA
DE LA Real expedicion de Nueva España y de la de limites
al Norte de California. *

AÑO DE 1793.

Me parece que debo suponer, como una cosa que no admite controversia, el que la formacion primitiva de esta Serranía de Tuxtla, ha sido enteramente volcánica. La irregularidad de los cerros, tanto por sus ángulos entrantes y salientes, como por la confusion de los materiales de que se componen, acredita esta verdad. No se ve por todas partes mas que vestigios de las grandes erupciones que hubo en los siglos más remotos. La misma villa de Tuxtla, los pueblos de San Andrés y Catemaco fueron tal vez cráteres de otros volcanes antiguos, ó á lo ménos su suelo no está cubierto más que de lavas.

---

* La Sociedad juzgó de interés la insercion en su periódico de este antiguo manuscrito del Sr. Moziño, que le facilitó su socio el Sr. D. José Mª Melgar, de Veracruz, por las importantes noticias que contiene, y que servirán para el conocimiento de la Geología de México.—*C. de P.*

Los lechos por donde corren los arroyos, á más de estar llenos de frecuentes cataratas, se componen, en la mayor parte, de una extension enorme de peñascos requemados, y cuya magnitud y firmeza en el encaje hacen increible que hayan sido arrastrados por las avenidas por copiosas que éstas fuesen. Los pozos indican en las tierras bajas el mismo desórden que se advierte en las montañas. Un agregado confuso de tierra, arcilla-arena y escorias he sacado hasta la profundidad de veinte varas; todo el resto del circuito es un mal país.

Los enlaces de esta Sierra con las de Orizaba, Cofre de Perote y Jalapa, son bien conocidos; y no lo son ménos los que tiene con la de Acayucam, Tabasco y que están al N. y N. E. de Oajaca, de donde pueden originarse los continuos terremotos á que está expuesta aquella ciudad. A cada uno de los muchos y recios que sufrió sobremanera á fines de Marzo y principios de Abril de 1787, precedia siempre un ruido subterráneo que las gentes atribuian á un golpe extraordinario de las olas del mar contra la costa, como si esto pudiera oirse á más de 30 leguas de distancia, aun cuando no hubiera de por medio montañas elevadas circunvalando el contorno. El estrépito se oia del E. al N. E., circunstancia que no debe olvidarse por la conexion que tiene en nuestro asunto.

En el siglo pasado, segun informes que he recibido de algunos ancianos de esta vecindad, arrojó llamas y arenas el monte de San Martin, que se haya situado al N. del pueblo de San Andrés á poco más de 2 leguas de distancia: aseguran haberse esto verificado un dia 15 de Octubre, sin que haya quedado memoria del año, ni otro testimonio que el recuerdo que hace el comandante de estas tropas, vecino antiguo y de mucha veracidad, de haber leido una escritura jurídica sobre tierras, en que por incidencia habla de una fiesta jurada con motivo de aquel suceso á Santa Teresa de Jesus. He solicitado en el archivo de la parroquia algun documento sobre este particular y ninguno ha podido encontrarse. Todo lo que sé por una tradicion impresa es que la erupcion duró muy poco, que las materias arrojadas no pasaron de tres leguas en contorno, ni quedó otro vestigio sino un poco de humo que veian no solo con descuido, sino con desprecio todos los habitantes de la comarca, y aun éste lleva más de cincuenta años de haberse disipado enteramente.

El dia 2 de Marzo del presente año (1793), á las cuatro de la tarde, se oyeron en estos pueblos, hácia el referido punto, unos grandes truenos, que sin embargo de ser subterráneos, el vecindario creyó fuese el efecto de una recia tempestad; cosa á que estaba muy expuesta la mencionada serranía.

Una espesa nublazon cubria la cima de los montes, de modo que parecia aproximarse uno de los más fuertes aguaceros. A las seis se dejó ver en Tuxtla por el Nordeste y aquí por el Noroeste de la montaña una gran columna de fuego, de cuyo centro se disparaban con muchísimas centellas que culebreaban en diversas direcciones, y atemorizaron de tal modo á los vivientes, que éstos acudian en tropel á los templos, creyendo inevitable la ruina total de este territorio.

Dos dias de seguida duró esta melancólica escena, sin más novedad que un estremecimiento de tierra la segunda noche por espacio de seis horas y una lluvia de arena de muy poca consideracion, porque el viento favorable que soplaba del Sur, arrastró la mayor parte á los montes de Tecolapan, camino del Marqués y mar inmediato.

La noche del 3 al 4 del propio mes el Gobernador interino, el Pagador del Real Fuerte de San Cárlos de Perote y cuantas personas habia dentro de aquel castillo creyeron que se habia estado disparando sin cesar toda la artillería de Veracruz, y en la misma fecha participaron al Excmo. Sr. Virey de este Reino tan inesperada novedad. El mismo estruendo de artillería se percibió en Tezuitlan y Xalacingo, distantes el uno seis y el otro ocho leguas al Norte de Perote. Los habitantes de Papantla y Misantla en la costa de Tampico, se alarmaron á la misma hora, creyendo que los enemigos con quienes tenemos actualmente guerra estaban bloqueando la plaza de Veracruz.

Mas de 400 cañonazos habian oido en aquella noche, causando suma sensacion, y se sospechó una invasion en las costas de Tabasco que distan unas 100 leguas al S. de este volcan, del que están retirados más de 40 los pueblos que he citado en la de Tampico.

En San Andrés Chalchicomula que está más de 35 leguas al O., creyeron en consecuencia de igual ruido subterráneo, que iba á reventar el volcan de Orizaba y temian quedar sepultados en sus escombros.

El propio mar no estuvo libre de este estruendo, que á bordo del bergantin Volador percibió su capitan D. Ignacio de Olaueta, como consta de oficio, que dió parte á S. E. Se ve claramente que los diversos socavones que ministran los materiales con que hace sus erupciones este volcan, se extienden á muchos centenares de leguas.

Pasados los dos primeros dias todo quedó en serenidad. Los horizontes despejados, solo dejaban ver una pequeña humareda en el cerro de San Martin, que se formaban muy alto algunas nubes acompañadas de truenos sin que siguiera ninguna lluvia. Al cabo de 15 todo se habia disipado perfectamente.

El 22 de Mayo á las siete de la mañana, soplando el viento por el N., fué la segunda erupcion. La elevacion del fuego fué mucho mayor que la primera, mas frecuente el relampagueo, más espesa la nublazon y mas copiosa la lluvia de arena. El sol se oscureció tanto, más de 15 leguas en contorno, que á las 12 del dia fué preciso valerse de las luces artificiales. Las aves quedaron tan aturdidas con tan inesperada noche en el sitio que las sorprendió, que caían á las manos los faisanes en algunas rancherías. Los vecinos me aseguraron que jamás han experimentado noche más tenebrosa que aquel medio dia.

Se renovó la erupcion como la primera vez. A no haber limpiado oportunamente los tejados y azoteas, se hubieran hundido seguramente los edificios por el enorme peso de la arena que cayó sobre ellos, y si no hubiese estado al concluirse la cosecha de algodon por este tiempo, el vecindario hubiera experimentado pérdidas sumamente fuertes, porque el viento contrario trajo los materiales del volcan y arruinó todos los vegetales.

El dia 23 llegaron hasta Oajaca las nubes que la arena habia formado, y el 24 yo mismo vi la lluvia que parecia de ceniza, y pude consolar a algunas personas que habia consternado un caso tan extraordinario, asegurándoles que no podia ser otra cosa mas que una de las erupciones de este volcan de que ya tenia noticia. Casi al mismo tiempo hubo igual lluvia en un lugar de la provincia de Tabasco, por no constar ahora la de Tehuacan, Orizaba, Córdoba, etc., etc.; de modo que calculando la extension por mar y tierra sobre que se desgajó la lluvia, puede asegurarse que las arenas del volcan de Tuxtla han cubierto una superficie de mas de once mil leguas cuadradas.

Otros dos dias duró esta furia á que sucedió la serenidad como en el principio, arrojando diariamente el volcan humo, y de cuando en cuando algunas llamas.

El 28 de Junio fué mayor la erupcion á las seis de la mañana. El viento del Sur arrebató por la mar, montes de Tecolapam y camino del Marqués, la copiosa lluvia que estaba vomitando la montaña. Se obstruyó tanto el camino, que el correo semanario tuvo que volver con la balija á Tuxtla. La arboleda pereció, la cual se componia de grandes y deliciosos bosques que daban sombra en un circuito de 10 leguas. Troncos quemados son las tristes reliquias que dejó el fuego en los tres dias que duró la tormenta, á la que sucedió en los mismos términos que ántes la deseada calma.

No se disfrutó de ésta mas que hasta el 26 de Agosto, en cuya noche, precediendo grandes aguaceros y frecuentes rayos, se encendió de nuevo y continuó arrojando sus materiales impetuosamente hasta no sé qué dia del mes de Octubre, porque las continuas nublazones, lluvias y materias del Norte, nos quitaron de la vista por más de 30 dias los montes vecinos.

Desde principios de Setiembre que venia navegando por la costa, sentí la lluvia de arena que no dejé de experimentar en los dias que continué mi navegacion por los rios que desaguan en la Barra de Alvarado, y de entónces acá, apénas ha habido dia que no haya caido mayor ó menor cantidad.

El rio de Tuxtla tenia varias hundidas en que solia haber algun pescado. Sus aguas eran cristalinas, ahora son turbias, y todo el lecho quedó llenó de bancos de arena. La que se halla desleida y se toma en la bebida, puede haber ocasionado las muchas disenterias que observé con síntomas de malignidad en esta villa, y las porfiadas toses no reconocen, segun mi dictámen, otro orígen que la infeccion de la atmósfera con algunas materias que no extraño traigan algun principio arsenical. Por otra parte, los tuxtlecos han sacado utilidad de tanta lluvia de arena. Su piso barrancoso se componia ó de fango ó de arcilla resbalosa, mezclado lo cual con los materiales resecos, permite andar sin las caidas que anteriormente eran inevitables. El 23 de Setiembre me aproximé al volcan en obediencia á la suprema órden de S. E., que con fecha 18 del mismo mes me comunicó el director del real jardin y expedicion botánica, D. Martin de Sesé, y en sus inmediaciones advertí que la arena habia subido más de tres varas castellanas en una circunferencia de tres leguas de diámetro, cuya capacidad, aun calculada por lo más bajo, pues en algunas partes la elevacion era de cinco varas á seis, produce 57.000,875 piés cúbicos.

Era espantoso el ruido de truenos que sin cesar percibiamos al pié de la montaña; muchos rayos parecia que se estaban disparando en la cumbre, y todo el terreno se estremecia tan frecuentemente que ni en Oajaca ni en México he experimentado iguales temblores de tierra. La misma arena nos habia nublado el sol, y el viento que se habia mantenido toda la mañana por el Sur, nos acabó de proporcionar las circunstancias más favorables para emprender la subida.

En efecto, perdiendo frecuentemente terreno por deleznarse la arena, hubimos de conseguirlo despues de dos horas de afanes que me pusieron á punto de sofocarme, como acaso hubiera sucedido á no estar prevenido un criado de la expedicion con un frasco de alcali volátil para socorrerme.

La columna de fuego que salia del cráter este dia, tenia un diámetro de más de cuarenta varas, y contando con el humo de más de ciento. El que se figure un chorro de fuego perfectamente semejante al de los cohetes y del tamaño que llevo referido, se formará la más perfecta idea del que se presentó á mis ojos. Entre él se elevaban muchísimas piedras de diversa magnitud, tan encendidas todas como el hierro en la fragua. Las mayores caian casi perpendicularmente sobre la misma boca que las vomitaba, y las menores en la circunferencia, con particularidad hácia el Norte. El estruendo con que se hacian tan contínuas explosiones ya no me pareció allí semejante al de los rayos; heria el oído del mismo modo que el que produce las olas del mar, que agitadas por un fuerte vendaval, van á azotarse contra las rocas.

Un olor de azufre muy intenso comenzaba á sentirse casi desde la mitad del cerro. El piso estaba bastante caliente, y por muchas partes se veían salir muchos vapores, todos ellos perfectamente blancos.

En el humo de la grande hoguera habia tal variedad de colores, que no soy capaz de expresarlos, por no hallar nombres adecuados con que darlos á conocer. Esto daba el espectáculo más horrible, y algunos de los que me acompañaron se precipitaron ciegamente por los arenales diciendo haber visto el infierno.

Al borde extremo de la meseta, inmediato al cráter, el termómetro de Reaumur, suspendido en el aire, estaba á los 16°, y otro de igual graduacion tocando el suelo, marcaba 68°. Hácia la parte interior, á dos varas de distancia del fuego, pasaba de los 70°, suspendido en el aire, y llegaba á los 74° puesto en el suelo. En este sitio, que es perfectamente al E. de la chimenea, dejé enterrada una botella con una inscripcion latina en que expreso el dia y hora en que estuve ahí, y los sugetos y nombres del alcalde mayor D. Manuel de Escobar y mi compañero D. Julian de Villar, que habian ido conmigo.

Se recogieron varias piedras, en las que casi encuentro una suma uniformidad.

En la crestonería superior hubo probablemente una minería de cobre con matriz silicosa. Las piedras que han rodado conservan todavía la pinta, de lo cual, y de no haber encontrado vitrificacion alguna en todo el distrito, infiero que no han sufrido la accion del fuego estas sustancias, y tengo por seguro que no formaban más que un manto muy superficial.

En las que dispara el volcan, el hierro es el metal que más se distingue. Todos los manchones blancos á que apliqué repetidas veces la lengua, me parecieron el producto de una sal marina. No falta algun ocre ni deja de abundar el azufre. El gas azótico creo que es comun en todos los volcanes.

Los minerales no pueden conocerse bien sin un análisis químico; y aquí, más que en otra parte, son insuficientes los sistemas de varios mineralogistas que caracterizan los géneros y especies de este reino por la diversidad de sus figuras. Las recias frotaciones despuntan necesariamente los ángulos y salta á los ojos que ese es el orígen del polvo negro que se ha esparcido por tantas leguas, cuya naturaleza es idéntica á la de las piedras que yo mismo he remolido. Me faltaban unos barómetros para conocer la elevacion de la montaña sobre el nivel del mar; mas el celo y actividad con que S. E. quiere llevar hasta el fin las observaciones útiles al bien público, y los progresos de las ciencias y artes, me proveyó de dos con que poder hacer un segundo viaje. Más de un mes tuve que diferirle, obligado por los perpétuos temporales que ha habido en Octubre pasado y más de la mitad de éste. Traté de construir en este tiempo una máquina eléctrica, que no salió de lo peor, y de que contando con los grandes auxilios que me proporcionaba el alcalde mayor, se remediasen las sumas incomodidades del camino con una estacada, tanto por padecer ménos en aquellas molestas subidas y penosos arenales, como por defender los instrumentos de un golpe. En 21 del corriente, que fué el primer dia sereno que se presentó, resolví concluir mi encargo, y con un numeroso acompañamiento llegué á la cumbre del volcan á la una de la tarde, llevando conmigo para que lo dibujase, al dibujante de la expedicion, D. Antonio Echeverría, que no habia podido acompañarme en el primer viaje por estar enfermo.

Habia dejado al pié de la montaña uno de los barómetros con su termómetro anexo, que no obstante haber sido el que llegó casi inservible de Veracruz, pudo aquí componerse medianamente. El otro que era muy bueno se entregó al gobernador indio, para que bajo su custodia lo condujese hasta arriba uno de los naturales en la misma situacion que yo lo habia dado. Pero fuese porque variasen ésta improvisamente, ó porque en la áspera pendiente, que con motivo de las grandes lluvias se habia puesto más barrancosa que ántes, tropezase el que lo llevaba, lo cierto es que al momento de hacer uso de él, tuve el desconsuelo de ver quebrado el tubo por su parte superior. Hice sobre la marcha subir el que habia quedado en la falda, y por su medio, aunque imperfectisimamente, averigué que la mayor altura del cerro de San Martin es de 500 varas escasas sobre el nivel del mar. No fué más afortunada que el barómetro la maquina eléctrica, llegó despegado el vaso que tenia puesto en lugar de la botella de Leyden. Todo lo encontré muy cambiado respecto á lo que habia visto la otra vez. Al pié de la montaña no se percibia ruido alguno, y en su cumbre no habia otro que el semejante á un rio caudaloso que se precipita á quince ó veinte varas de profundidad.

En el sitio en que quedó la inscripcion, habia subido más de 8 piés la arena, y el fuego habia disminuido mas de dos terceras partes, tanto respecto del diámetro de la columna como su elevacion. Con esto tuve la felicidad de ver una gran parte del fondo de aquella horrible chimenea, que no tiene 30 varas de profundidad. Por entre innumerables grietas sale un vapor parecido á la neblina que se eleva muy poco de la tierra y la conserva llena de humedad. Por la banda del Norte sale con mayor abundancia y subsisten allí, las piedras ardiendo, tan convertidas en ascuas, como las que se disparan en las erupciones impetuosas de la fragua que está al NE.

La peñasquería que se ve por el N. amenaza el hundimiento por estar ya desplomada, ser en ella más recios los temblores y tener á su pié un incendio que, aunque no es tan voraz como al principio, no deja de ir haciendo excavaciones.

Conjeturo que la boca que arde actualmente con fuerza, presente dentro de pocos dias ó meses una vista semejante á la de la otra que parece estar próxima á apagarse, de donde infiero, que sin embargo de todos los indicios que acreditan la desmesurada extension que por conductos subterráneos tiene la mina volcánica hasta por debajo del fondo del mar, esto no hace, como vulgarmente se imagina, unas excavaciones de mucha capacidad, sino por el contrario, de pequeño calibre, y más propias por consiguiente, para comprimir los vapores enrarecidos, cuya violencia es bien conocida de los físicos, por superar incomparablemente á la de la pólvora, y cuya suma total produce la fuerza con que se lleva consigo las masas enormes que he visto dispararse.

En el borde interior de la hornilla que está al NE., á ménos de una vara del mismo fuego, dejé enterrada otra botella con una inscripcion poco diversa de la anterior. Apénas podiamos mantenernos Villar, el criado Calderon y yo en este arriesgado sitio: el humo nos envolvia algunas veces y nos robaba de la vista de nuestros espectadores; lo peor era que se nos quemaban los piés, no obstante que al asentar el uno levantábamos el otro con suma velocidad; tostados sacamos los zapatos, y al descender del pequeño cerrito, que por todas partes estaba humeando, sentiamos hasta los muslos un vapor poco ménos que de agua hirviendo, que no dejó de escaldarnos completamente. La sal de tártaro, ántes de media hora habia sufrido su delicuescencia.

Léjos de las hornillas y cerca del borde extremo de la serranía en que quedó la mayor parte de los que me acompañaban, era tan intenso el frio, que todos tiritaban, aun los que pudieron cubrirse sobre sus vestidos con unas especies de camisas de balleta muy usadas en estos paises. El viento soplaba por el E., y el mercurio en el termómetro de Reaumur, bajó á los 14 grados.

Estaban despejados los horizontes y se veían con claridad, no solo la ruptura del mar, sino tambien los innumerables bajos que la arena ha producido en su fondo. Calculo que el cráter del volcan no dista en línea recta, tres cuartos de legua de la playa. Tres horas y média empléé en mis observaciones, y bajé de la montaña á poco más de las cuatro de la tarde.

Como la gente vulgar ve siempre como efecto sobrenatural de la indignacion divina todos los fenómenos extraordinarios de la naturaleza, no es extraño que estos habitantes estuvieran sobrecogidos de un terror pánico que los impelia á abandonar su antigua patria y aun sus posiciones. Algunos, de hecho lo ejecutaron así, bien que fueron despues restituidos á ellas por el celoso magistrado que los gobierna.

San Andrés Tuxtla, Noviembre 27 de 1793.

EL ÁRBOL DE MANITAS,

POR EL SEÑOR DON MARIANO BARCENA,

SOCIO DE NÚMERO.

Con el fin de obsequiar los deseos de mi respetable amigo el Sr. D. Ramon Terreros, que me pidió algunas noticias acerca del *árbol de manitas*, voy á anotar algunos datos que he reunido sobre la historia y caractéres de este interesante vegetal.

Hácia el año de 1787, que se hallaba en México la expedicion botánica venida de España, y presidida por el Sr. D. Martin Sessé, trajeron los indígenas de Toluca, algunas flores del árbol de manitas que llamaron la atencion de los miembros de la referida expedicion, quienes se dirigieron á aquella ciudad con el fin de observar el árbol de donde provenian aquellas, y tuvieron la fortuna de encontrarlo provisto de todos los órganos necesarios para estudiarlo con perfeccion.

No pareció desacertada á los observadores cientificos la denominacion de *Macpalxochitlcuahuitl*, dada por los indigenas á la planta en cuestion, y adoptada tambien como sinónimo por el Dr. Hernandez, puesto que la sustituyeron por la de *Cheiranthodendron*, equivalente á aquella, y compuesta de las voces *Mano—Flor—Arbol*, con que significaron que las flores de ese vegetal tenian la forma de una mano. Más tarde el ilustre Bompland cambió ese nombre genérico por el de *Cheirostemun*, formado á su vez de las palabras *Mano, Estambre*, que expresa más exactamente el caracter que se quiso hacer notar, puesto que los estambres solamente y no toda la flor, presentan la figura de una mano.

Los caractéres que asignan algunos botánicos al árbol de manitas, son los siguientes:

Arbol de 12 á 15 metros de altura; tallo erguido, cilíndrico, cuyo diámetro en el tronco, es generalmente de 0^m4; ramos alternos, horizontales y de color pardo-rojizo. Hojas alternas, con estípulas peciolares; peciolo de la longitud del limbo; la forma de éste es palmatilobada. Flores subopositifolias, solitarias, pedunculadas; pedúnculos rojizos y provistos de tres bracteas ovado-oblongas y acuminadas; cáliz sub-campanulado, carnoso, 5-partido; las divisiones son oblongo-acuminadas y presentan un reborde longitudinal ó carena en su parte exterior.

No tiene corola.

Estambres cinco, monadelfos en la base, separados hácia la parte superior: son desiguales y están terminados por anteras oblongas. Ovario pentágono, oblongo; estilo alargado y terminado por un estigma agudo.

Fruto capsular, 5-locular, conteniendo de diez á doce semillas en cada lóculo.

Estos caractéres colocan al árbol de manitas en la familia de las Bombaceas, constituyendo un género, cuyo nombre admitido en la actualidad es el de *Cheirostemun* dado por Bompland, así como el nombre específico de *platanoides* dado por el mismo sabio, y que recuerda la semejanza de las hojas de nuestro árbol con las del *platanus*, quedando por fin designada dicha planta, con el nombre específico de *Cheirostemun platanoides*.

Por el hecho de no haber encontrado en el principio más que un solo *Cheirostemun*, que era el que se hallaba en las inmediaciones de Toluca, creyeron los individuos de la expedicion botánica, así como otras personas de las que se han ocupado de ese árbol, que aquel ejemplar habria sido plantado allí por los reyes aztecas, y no sabian, por tanto, á qué patria debian referirlo. Más tarde un discípulo del distinguido botánico mexicano D. Vicente Cervantes, encontró el *Cheirostemun* al estado silvestre en las inmediaciones de Guatemala, y se creyó que era propio solamente de aquella localidad; pero en el año de 1871 lo encontró tambien al estado silvestre en el Estado de Oaxaca, mi apreciable amigo D. Antonio Peñafiel, segun consta en las «Observaciones de viaje» que leyó en la Sociedad Mexicana de Historia Natural, quedando así demostrado, que el árbol de manitas pertenece tambien á la flora mexicana.

Las dificultades que se encontraron para reproducir ese árbol en los tiempos pasados, hicieron creer a los indígenas que por disposicion divina no se podria lograr otro ejemplar mas que el que existia en Toluca, y este fué el informe que dieron aquellos á los botánicos españoles que deseaban obtener algunas plantas de la misma especie para remitirlas á Europa. Sin hacer caso de esa superstición, dejaron acodados algunos ramos al cuidado inmediato del corregidor de Toluca y de un indígena que vivia en un lugar inmediato al terreno en que se hallaba el árbol citado.

Por descuido de ambos encargados no se lograron los acodos ni las semillas correspondientes á aquel año; mas los botánicos de la expedicion habian traido á México algunas estacas que llegaron aún vivas y las plantaron en macetas pequeñas, cuidándolas con el mayor esmero el director de la expedicion D. Martin Sessé y Lacasta.

De esas estacas, que eran en número de veinticuatro, solo tres comenzaban á desarrollar sus yemas y fueron trasportadas en ese estado al jardin del palacio vireinal, donde al fin se logró una que siguió su desarrollo y formó un árbol elegante que vivió muchos años y del cual se tomaron algunas estacas y semillas en diversas épocas.

En el año de 1794, el señor profesor D. Vicente Cervantes mandó hacer unos acodos en ese árbol con el fin de mandar algunas plantas al jardin botánico de Madrid; y segun noticia que dió en aquella época el jardinero mayor de palacio, se habia logrado uno de los acodos en el año de 1795 y se proponian remitirlo á Europa tan pronto como acabara de desarrollar sus yemas.

En la actualidad hay en el jardin de Palacio un árbol de *Cheirostemun*, que tendrá cerca de 12 metros de altura. Segun me informó uno de los jardineros, no existia ya el árbol plantado por Sessé, y el que ahora se encuentra en ese lugar procedia de una semilla del anterior, y que habia sido plantado en el lugar que hoy se encuentra, hácia el año de 1848. El tronco de este ejemplar se halla dividido á la altura de $0^{m}75$ en tres brazos robustos; la seccion de su tronco es elíptica, siendo el eje mayor de 73 centímetros de longitud. En su pié está provisto de varios renuevos que presentan algunas hojas notablemente desarrolladas, cuyos caractéres y dimensiones son los siguientes: peciolo rollizo, cilíndrico, verde-claro, sembrado de hacecillos de pelos estrellados de color pardo-cetrino claro; su longitud es de $0^{m}227$; limbo palmatilobado, con siete lóbulos ondulados; la longitud de aquel es de

$0^{m}335$, y su anchura de $0^{m}373$; sus nervaduras son palmeadas, en número de 9, siendo siete de ellas muy prominentes, y dos pequeñas y poco abultadas. El ciclo de las hojas es de ⅓.

El árbol de Palacio florece desde el mes de Julio y continua hasta Diciembre. En las flores que encontré caidas á su pié he notado algunos detalles que no he visto citados por los autores que se han ocupado de esa planta.

Las flores tienen su pedúnculo articulado, comprimido, de color verde-amarillento, mas ó ménos rojizo por la presencia de los pelos estrellados de que hablé anteriormente; es 3—bracteolado, las bracteas aovado-agudas y de prefoliacion revoluta. Cáliz 5—lobulado, divisiones desiguales y carenadas; dos de ellas, que están opuestas, *tienen los bordes por la cara posterior petaloides y de un color rojo de sangre; otras dos carecen de este carácter y tienen el aspecto y color de la carena, y la quinta solo presenta un borde petaloide y es inequilátera.* En cuanto al ovario, creo que más bien que como pentágono y oblongo debe considerarse como piriforme y 5—lobulado, á lo ménos en los ejemplares que he examinado.

Al observar la lozanía que afectaba ese árbol y el desarrollo tan notable de sus renuevos, me vino la idea de examinar la naturaleza del terreno en que se encuentra, así como la de las sustancias minerales de sus cenizas, para buscar aquellos elementos mas favorables á su desarrollo. El terreno está formado por tierras arcillo-arenosas y humíferas, bastante húmedas y provistas de restos vegetales en diversos grados de descomposicion.

Incinerada la madera de los ramos jóvenes, dejó un resíduo de cenizas que corresponde, en proporcion, á un 2,5 por 100. Dichas cenizas contenian las sustancias siguientes:

Cal, potasa, hierro, ácido carbónico, sílisa y ácido fosfórico.

De estos componentes la cal se mostraba con mayor claridad en las reacciones, y debe tener una influencia muy notable en la nutricion y buen desarrollo de aquel árbol.

En la actualidad hay ya varios ejemplares de *Cheirostemun platanoides* en esta capital y sus inmediaciones; existe un individuo, tambien antiguo, en el jardin de plantas de San Francisco, donde he visto algunas plantas pequeñas obtenidas por semilla; sé que en la hacienda de los Morales, en Tlalpam ó en un lugar vecino, hay varios arboles de donde provienen algunas de las flores que venden anualmente los indígenas en esta capital.

En cuanto á las propiedades terapéuticas del árbol de manitas, creo que deben ser las mismas que las que poseen la mayor parte de las Malvaceas, con las que tiene mucha afinidad y contiene como ellas una cantidad notable de mucilago.

México, Setiembre 2 de 1874.

DE LA TOBA FITOLITARIA DEL VALLE DE TOLUCA,

POR EL SEÑOR EHRENBERG.

TRADUCCION
COMUNICADA POR EL SEÑOR DOCTOR BURKART A DON ANTONIO DEL CASTILLO, CON ENCARGO DE CORREGIRLA PARA SU PUBLICACION EN MEXICO.

En sesion del 17 de Marzo de 1866, de la Clase físico-matemática de la Academia Real de Ciencias de Berlin, el Sr. Dr. Ehrenberg leyó una comunicacion preliminar sobre una toba fitolitaria, que se halla en el valle de Toluca, en México. Esta comunicacion se imprimió en los informes mensuales del corriente año de dicha Academia, y literalmente traducida dice lo que sigue:

«Varias veces he presentado á la Academia, rocas muy importantes en geología, que daban á conocer la presencia, no sospechada hasta entónces, de séres orgánicos extremadamente pequeños, sobre vastas extensiones de terrenos, y su influjo en la composicion de las rocas. A estas rocas pertenecen las tobas de las llanuras desiertas de la Patagonia observadas en una inmensa extension por el Sr. Darwin, de las que he recibido muestras y he descrito su naturaleza en los informes mensuales de la Academia, del año 1845, y despues en mi Microgeologia, pág. 293. Pertenecen tambien á ellas las rocas de los grandes depósitos del Maipú, volcan del Chile, designadas en parte como traquita descompuesta y toba traquítica, y en parte como piedra pómez por Meyen, cuyas muestras he examinado publicando los resultados de mi investigacion en las obras ya citadas. Los depósitos de trípoli de la costa de Atacama, sobre los cuales he informado á la Academia desde el año de 1856, despues de haber examinado sus muestras remitidas por el Sr. Philippi, no ofrecen indicios volcánicos; pero el lodo de las erupciones del volcan de Quito que el Sr. A. de Humboldt examinó detenidamente y de las cuales he informado á la Academia durantes los años de 1839, 1841 y 1846, tienen una íntima relacion con la vida orgánica, así como los productos de las erupciones de Imbaburu, que describí en 1846.

«Tambien tuve oportunidad de examinar el lodo de las erupciones del volcan de Guadalupe en «Cabo es terre,» erupciones que en el año de 1843 causaron terribles devastaciones en dicha isla, y las he descrito en la Microgeologia, pág. 361. He observado igualmente, segun consta en los informes mensuales de 1856, pag 429, que la toba traquitica de Honduras en Centro-América, contiene restos orgánicos; y que la tierra blanca de las inmediaciones de México, designada en la Microgeologia con el nombre de Tiza, se compone enteramente de ellos. La más notable de estas formaciones es la de «Fall River» del Oregon, en Norte América, que es un depósito de 500 piés de ancho, cubierto por una masa de basalto compacto de 100 piés de espesor, que Fremont descubrió y designó como kaolin blanco, y de cuyos pormenores di cuenta en los informes mensuales á la Academia, en las sesiones de 1849, y en la Microgeologia.

«Todos estos depósitos son acumulaciones ó mezclas de formas de agua dulce, contrarias á la suposicion de que la accion volcánica tenga por lo general una relacion íntima con las condiciones marinas, y estén realmente en relacion con las aguas del mar; opinion dimanada de la posicion de los volcanes, generalmente próxima á las costas.

El Sr. Burkart, director que ha sido de minas en México, durante los años de 1825 á 1834, tambien presentó para su exámen una muestra aparentemente de toba, pomeza, que cubre una extension considerable de la mesa de la cordillera de México, y que parece acaso guardar la misma relacion con las acciones volcanicas que la llamada *moya* de Quito, observada por el Sr. de Humboldt.

El mismo Sr. Burkart me remitió por conducto del Sr. Rammelsberg una muestra de toba gris que acababa de recibir del Sr. Castillo, de México, quien la recomenbaba para su exámen al microscopio, porque en su concepto, podria ofrecer grande interes para la geologia [1]. La muestra traia esta etiqueta: TIZA DEL VALLE DE TOLUCA ¿DE PIEDRA PÓMEZ Ó DE INFUSORIOS? Hallando yo á primera vista con el microscopio, que la toba se componia principalmente de partículas vegetales silizosas que he nombrado litolitharias, mezcladas con pocas Bacilarias y partículas espumosas muy visibles, me puse desde luego en correspondencia con el Sr. Burkart sobre el asunto, y recibí en contestacion la carta siguiente:

---

[1] NOTA DE CASTILLO.—En el impreso del Sr. Ehrenberg, no se hace mencion de esto; mas en esta traduccion del Sr. Burkart que me remite con el objeto expresado en el encabezamiento de este artículo, y con el cual cumplo hasta ahora, por circunstancias, repito, ajenas á mi voluntad, me hace la justicia de expresar que eran tambien mias las instancias para que el Sr. Ehrenberg examinase la tiza que yo le remitia.

Bonn, Febrero de 1866.

«Con mucho gusto me he impuesto por su grata, fecha 29 del mes pasado, de que vd. ha reconocido en la muestra de la roca problemática del valle de Toluca ó Lerma, un conglomerado orgánico, de naturaleza silizosa predominante, cuya sustancia consiste casi enteramente de formas fitolitharias con mezcla de formas basilarias. Deseando vd. alguna informacion más sobre la extension y la anchura de los depósitos de que se tomó la muestra examinada, así como sobre su yacimiento y localidad, me apresuro á darle las noticias siguientes, suplicándole me permita pedir informes más circunstanciados al Sr. D. Antonio del Castillo, de México, porque no podria dar los informes detallados que la importancia de la materia requiere, y un plano más exacto de su situacion, que el que contiene mi obra sobre México (Reisen und Aufenthalt in México Stuttgart 1836), ó el que presenta el mapa del Estado de México, por el Sr. de Gerolt y Berghes, ó el mapa de México del instituto geográfico de Weimar. El Sr. Castillo me dice solamente, que la dicha roca se encuentra en el valle de Toluca ó de Lerma, entre Ixtlahuaca y Almoloya, distantes de 6 á 7 leguas, y lo que conozco de ella se limita á mis observaciones hechas de paso, caminando de México á Lerma, á Toluca, á Ixtlahuaca y á Tlalpujahua, hace ya 40 años; pero de las cuales, sin embargo, voy á comunicar á vd. el siguiente resúmen.

«El valle de Toluca ó de Lerma se halla en la falda occidental de la cordillera de México, en posicion análoga á la del Valle de México, en la falda oriental, á una altura considerable sobre el nivel del mar, y en él tiene su orígen el rio que desemboca cerca del puerto de San Blas, en el mar del Sur. Este valle está formado del lado derecho de la alta serranía que forma el vértice de las aguas entre el rio de Moctezuma y el rio de Santiago, ó entre el golfo de México y el mar del Sur, y tiene una elevacion sobre el nivel del mar en el cerro de Ajusco, de 12.054 piés de Paris, y en las Cruces, (entre Cuajimalpa y Lerma,) de 9.959 piés. Del lado izquierdo hay una sierra elevada que está dominada por el Nevado de Toluca, (cono traquítico de 14.271 piés de elevacion,) la que separa las aguas del rio de Santiago de las del rio de las Balsas, que desemboca cerca de Zacatula, en el mar del Sur.

Entre el cerro de Ajusco y el Nevado, el valle de Toluca en su parte superior se dirige por lo general de Sur á Norte, y sus aguas corren con cortas interrupciones, de Oriente á Poniente, bajando de las sierras elevadas para juntarse en la cabeza del valle, al Sur de Lerma, formando las varias lagunas bajas que dan orígen al rio de Lerma ó de Santiago. Estas lagunas se extendian ántes más hácia el Norte; pero poco á poco se han ido azolvando con los detritus de rocas acarreados por las aguas de las serranías vecinas que se han depositado en ellas. El suelo del llano que forma el valle de Toluca, que en esta parte se extiende entre Toluca á 8.334 piés de elevacion, Lerma á 8.084 piés, Almoloya á 8.014 piés, Ixtlahuaca á 7.943 piés, los ojos termales de Ocotitlan á 7.833 piés, el puente de la Jordana á 7.804 piés, y más al Noroeste, hasta una anchura de más de 5 á 6 leguas, ofrece en su superficie, por lo general, los caractéres de la mesa de la cordillera de México, que parece pertenecer en su mayor parte, á la misma formacion de acarreo. Este valle es escaso de Monte, pero no carece de vegetacion, y ofrece en muchos puntos un terreno favorable á la agricultura, como lo prueba el gran número de pueblos, de haciendas y de ranchos situados en él, y en que se cultivan granos y el maguey de que se saca el pulque.

Las sierras que rodean el valle de Toluca en su parte superior, constan de pórfidos, en la mayor parte traquíticos, y de rocas volcánicas basálticas más modernas, cuyos destrozos cubren la llanura, formando diversos depósitos anchos y estratificados alrededor de las rocas macizas que de ellos sobresalen en varios puntos. En el camino de Lerma á Ixtlahuaca, hácia la mitad del cual se junta el de Toluca, en las inmediaciones de los Cajones, se observan como á 3 leguas al Sureste de Ixtlahuaca, cerca del puente de San Bernabé á 8.068 piés de elevacion, depósitos anchos, estratificados, de una roca terrosa, desmoronadiza, de color blanco agrisado, que al principio habia tomado por ceniza volcánica ó piedra pómez desmoronada, los que se extienden un buen trecho en el camino entre Lerma y el dicho puente. En otras partes del valle se notan depósitos igualmente estratificados en capas de rocas poco duras, con pasta de grano fino y de color gris, conteniendo granos finos de sanidin y destrozos de las traquitas vecinas; estos últimos son á veces de gran tamaño, formando un conglomerado traquítico.

La posicion horizontal de los depósitos de estas rocas, la escasez de lugares espaciosos del suelo descubiertos y la falta de tiempo para buscar su continuacion en el cauce del rio de Lerma, me impidieron averiguar la relacion de yacimiento que guardan estos depósitos entre sí; pero me pareció que los primeros están enclavados ó subordinados á los conglomerados traquíticos. La supuesta ceniza volcánica parece extenderse más allá del Puente de San Bernabé, al Sur, porque se observa tambien en otros varios puntos de los caminos que conducen para Lerma ó para Toluca, hasta que predominan en las inmediaciones del Rancho de Palmillas, á dos leguas de Toluca, las rocas basálticas que sobresalen del valle. Pero la roca terrosa blanca agrisada, se halla tambien mas allá de este Rancho, en el camino para el pié Norte del Nevado, donde parece hallarse en capas gruesas; y como el Sr. Castillo asegura, que se encuentra además entre Almoloya (á 4 leguas al N. O. de Toluca) é Ixtlahuaca, ha de tener una extension mucho mayor en esta parte del valle de Toluca, si, como es de suponer, la roca que he observado y calificado por ceniza volcánica (piedra pómez remolida,) sea la misma que la que se halla entre Almoloya é Ixtlahuaca.

Se deben de mencionar tambien aquí, los ojos termales de Ocotitlan que brotan á 4 ó 5 leguas al N. O. de Ixtlahuaca, y á 2 leguas del pueblo de Ocotitlan, al pié de la falda Sur del cerro de este nombre. Al pié de este cerro revientan las mismas rocas ampollosas basálticas que en las inmediaciones de los ranchos Palmillas y Amealco, cerca de Toluca; miéntras que más al Sur, se hallan conglomerados traquíticos estratificados en gruesas capas. Este conglomerado se compone de granos redondos, finos y gruesos de un pórfido felsítico blanquizco, con hornblenda y mica contenidas en una pasta hialítica que muchas veces los envuelve á modo de cascaron. Este conglomerado encierra además restos vegetales que consisten en fragmentitos de ramas, de tallos, y de raíces silicificadas, que aunque han conservado todavía la estructura de la madera, no permiten determinar la especie de plantas á que han podido pertenecer. Pasa este conglomerado por una transicion de arenisca de grano fino á formar una roca compacta que presenta además de algunas partículas finas de hornblenda y de mica, pequeñas masas de ópalo y jilópalo, en union con los restos de vegetales. Por una grieta en un peñasco de esta roca, que apénas se levanta unas 3 ó 4 varas sobre el suelo, brotan varios ojos de agua caliente, con una temperatura de 42. C.°, cuando la del ambiente era de 14° centígrados, y cuyo olor se asemeja al de las aguas termales de Ex la Chapelle.

No sabré decir más sobre la constitucion geológica del terreno; pero en atencion á la importancia que la roca ha adquirido para la ciencia, por las partes vegetales que la componen, segun las observaciones microscópicas de vd., será de sumo interes averiguar, por un exámen prolijo la parte del valle de Toluca donde se encuentra, así como, cuál sea su extension y su yacimiento, con relacion á las demas rocas que la acompañan; y aun es de suponerse que rocas semejantes se extiendan más al Poniente del valle de Toluca, hácia Valladolid, en la vasta llanura de la mesa que el rio de Santiago atraviesa por aquella parte. Con tal motivo, procuraré lograr que el Sr. Castillo se interese en esta investigacion y me comunique los resultados. Sera preciso tambien, que recojan muestras de las varias localidades donde se halla la roca citada, para cerciorarse de su semejanza de composicion, y de si pertenecen todas al conglomerado de sustancias orgánicas determinadas por vd.

Quedo su muy atento, etc., etc.—*Burkart.*»

Consta por esta carta del Sr. D. José Burkart, que el depósito de la roca traquitica tobosa, con una elevacion média de 8.000 piés, puede tener, segun las observaciones de un minero tan experimentado, una vasta extension, y que está, del mismo modo que la pizarra de pulir de Bilin, en relacion con semiópalos, conteniendo tambien restos orgánicos, de los cuales se habian de desarrollar más tarde formas organicas contemporaneas de mayor variedad y tamaño. Bastará por ahora llamar la atencion sobre sus importantes y extensas relaciones geológicas y de enumerar los elementos principales de la sustancia de la presente muestra.

La sustancia de la muestra que se me mandó, es una toba áspera que se desmorona con facilidad, de color gris de perla, que no hace efervescencia con los ácidos, y que al fuego se pone al principio más oscura, pero no negra, blanqueándose algo despues y tomando un color pardo claro. La sustancia, por consiguiente, no tiene carbonato de cal, sino un ligero vestigio de fierro. El analisis al microscopio, dió á conocer que toda la masa está compuesta de fitolitarias, generalmente muy pequeñas; aunque muy á menudo algo más grandes, y que en su mayor parte pertenecen probablemente á las gramas, entre las que se ven esparcidas, por lo general, una que otra Basilaria Poligástrica. El número de las diversas formas observadas hasta ahora en la masa, se compone de 47 cuerpecillos orgánicos silizosos, y entre ellos se hallan como rellenando los huecos, un gran número de pequeñas partículas espumosas silizosas con células y paredes rasgadas. Hasta ahora no se ha podido averiguar si estos últimos se han de considerar como partículas silizosas celulares de plantas, ó como partículas espumosas vidriosas. Sometidos á la luz polarizada todos estos elementos, tienen refraccion simple como el vidrio, y solamente en los lugares donde se juntan en haces, aparecen reflejos de luz abigarrada, que no son, sin embargo, de luz transmitida; por consiguiente no puede contener la sustancia fragmentos de cristales inorgánicos como la arena cuarzosa de la *moya* de Quito.»

Se dividen estas formas orgánicas en veintinueve fitolitarias y diez y ocho poligástricas. Es muy digno de observarse que todas las formas que componen los depósitos de toba, muestran únicamente los caractéres de formas terrestres ó de agua dulce. Son, en su mayor parte, fitolitarias y poligástricas muy difundidas, mas tambien se encuentran entre ellas formas que hasta ahora no se han hallado en ninguna otra parte, y se han designado con un nombre particular; quedan otras indeterminables y por tanto en cuestion. Muy extraña es la presencia del *Himantidium ¿Arcus?* que forma la toba siliza (Kieselghur) de la isla volcánica «Isle de France» en las islas Mauricias: pues todas estas formas de las fitolitarias, entre las cuales no se ha encontrado ninguna Espongiolita (Spongolith), no pueden considerarse como formas marinas, porque nunca se han hallado en la superficie de la tierra como partes de plantas marinas, sino que generalmente se presentan como partes de gramas y tambien de maderas. Con respecto á las poligástricas, se ha de notar que aun cuando algunas formas de agua dulce se depositan por los rios en el mar, no se halla ninguna entre ellas, que deba considerarse como exclusivamente forma marina, aunque las hay sin número en otras partes».

Con relacion á las poligástricas tambien es digno de notar, que el número de sus individuos es mucho menor que el de las fitolitarias y que en gran masa predominan mucho. Esta toba del valle de Toluca, que parece ocupar tanta extension en dicha localidad, trae á la memoria la masa de lodo que el Sr. Humboldt ha mencionado por primera vez y que cubrió y arruinó muchas leguas de tierra habitadas por millares de hombres; así como recuerda tambien la erupcion de lodo del volcan de Imbaburu. La moya de Quito se distingue sin embargo esencialmente de la toba del valle de Toluca, por su contenido de carbon, que al microscopio aparece no como grafita, sino como porciones de gramas reducidas á carbon, y en tan gran cantidad, que esta tierra la usaban para hacer lumbre como si fuera turba. Estas partículas de carbon faltan en la toba del valle de Toluca, lo que indica por lo poco que se ennegrece al rusentarla, que el carbon orgánico ha desaparecido casi completamente de esta roca.»

«Si se entra á examinar ¿de qué modo ha desaparecido el carbon que contenia esta enorme masa de gramas? ¿si se hizo á favor de una lixiviacion gradual dentro del agua? ¿ó por sublimacion del carbon por la accion del calor volcánico? la sustancia no deja de presentar caractéres que permiten formar juicio sobre la cuestion. Si se hubiera rusentado tanto la sustancia por el calor volcánico, que se hubiera sublimado enteramente el carbon contenido en las plantas, no hubiera podido verificarse esto sin quemarse y destruirse las sutiles fitolitarias y poligástricas, de modo que hubieran quedado solamente masas deformes como las que ví en Eifel en 1844 y 1845 y he imitado artificialmente. Pudiera tomarse por un indicio de que esta masa estuvo expuesta á un calor volcánico, el hecho de que contiene pocas poligástricas enteras y el de que la pequeñez de las más sencillas fitolitarias pudo resultar de haberse reventado al enfriarse, despues de rusentadas. Pero faltan tan completamente los indicios de haberse quemado, que esta suposicion no puede tener lugar, y no queda más que admitir que la separacion del carbon se verificó por la lixiviacion de aguas meteóricas; tiene en su apoyo el que las partes silizosas de la toba son muy limpias en la superficie y en la nieve que cubre las sierras vecinas, resultando un influjo no interrumpido de la humedad atmosférica. Resulta del exámen de esta roca, que se le debe considerar como el producto de una erupcion de lodo de algun volcan vecino, semejante á la moya de Peliléo de Quito, pero que su depósito es muy antiguo y no se ha de comparar directamente á la moya, que es producto de una erupcion muy moderna. Se necesita averiguar por nuevas investigaciones, si el cráter del Nevado de Toluca que Burkart visitó en 1826, y cuya elevacion resulta ser por sus observaciones barométricas de más de 14.000 piés de Paris, produjo en tiempos remotos y poco á poco por sí solo, ó en union de otros volcanes, [1] el depósito de toba en forma de materias eruptivas, extendidas en gruesos bancos á muchas leguas en contorno, y se hallan cubiertos ahora por destrozos y cascajo de pórfidos y de traquíticas; ó si al tiempo de su formacion existieron otras condiciones y relaciones en la superficie de la tierra. No se intenta con el presente informe el agotar y concluir el asunto, sino indicar solamente que las muchas tobas de los volcanes de Centro América, que muchas veces se han tenido por erupciones de cenizas volcánicas y traquitas descompuestas, son efectivamente algunas veces sustancias parecidas á la moya, y participan de su orígen orgánico; pero son tambien otras muchas veces enigmáticas bajo otro respecto, segun lo ha confirmado últimamente en Costa Rica, el señor profesor Seebach (Peterman'ns geographische Mittheilungen 1865). Las sustancias orgánicas forman en la moya de Peliléo la mitad de la masa, miéntras que en la toba del valle de Toluca, la forman casi en su totalidad; proporcion que ha podido resultar por el deslame en el agua de las partículas homogéneas más finas.

El importante punto de vista que me ha inducido principalmente á presentar desde ahora mis investigaciones á la Academia, es el que la roca parece pertenecer, segun se ha podido averiguar con perspicacia, al tiempo primitivo y no al tiempo moderno de la formacion de la costra de la tierra, y por consiguiente, seria el primer caso en que la edad de la formacion se pudiera comprobar con hechos; porque los destrozos y el cascajo de pórfido y traquítica, pudieran servir de escala para esta conclusion. Tambien dieron á conocer las muestras de la isla volcánica de Ascension, que trajo el Sr. Darwin, examinadas al microscopio, tobas fitolitarias; pero guardan más relacion por su carácter, con una moya superficial que con una formacion geológica antigua.

---

[1] Nota del Sr. Burkart.—Añadiré que en mi opinion, el cráter de Toluca, que se compone enteramente de rocas traquíticas dioríticas, nunca ha arrojado materias en forma de lava ó de lodo, y que si la toba fitolitaria ha debido resultar de tal formacion, seguramente habrá provenido de otro volcan vecino al del Nevado de Toluca.

Conforme á mi deseo, el Sr. Burkart se ha puesto ya en correspondencia sobre el asunto, con el Sr. Castillo, de México, y espera que el celo científico de este distinguido sabio y el de otros geólogos mexicanos, les excitará á examinar las relaciones de esta toba, con respecto á su extension y á su yacimiento; mas se ha de pasar algun tiempo ántes de que se puedan obtener sus aclaraciones.

LISTA de las formas orgánicas de la toba fitolitaria del valle de Toluca, comparadas con las de la Moya de Guadalupe (Cabo es terre) 1843, las de la Moya de Quito, las de la ceniza del Imbaburu, las de la toba de Esquipalos y las de la toba volcánica de Ascension.

Los números de la primera columna se refieren á la lámina, y el signo + indica la presencia de las especies en las diversas tobas marcadas en la tabla.

EXPLICACION DE LA LAMINA.

Los números de la 1.ª columna del estado, corresponden á los números de la lámina. La figura 1, representa el conjunto y aproximadamente la proporcion numérica de las formas, aumentadas 300 veces de su tamaño natural; así como el de las más pequeñas partículas espumosas inorgánicas y su proporcion.

La lámina representa solamente las formas de la toba de Toluca, aumentadas linealmente 300 veces, y las principales formas de las otras localidades, están representadas en la lámina XXXVIII de la Microgeología.

En la lámina hay dos escalas para el aumento á 300 veces. La escala superior de 2 pulgadas de Paris de largo, contiene los aumentos indicados en medida normal. La inferior contiene las medidas que el observador vió en realidad. Son las mismas y bajo el mismo modo empleadas con escrupulosidad en la Microgeología; así como en los dibujos semejantes, de los informes presentados ántes á la Academia, cuando no se ha dicho expresamente lo contrario.

Nota del Sr. Burkart.—No dejo de notar aquí que el Sr. Ehrenberg funda su opinion acerca de la antigüedad de la toba fitolitaria del valle de Toluca, en mi observacion de que una roca semejante, descrita como ceniza volcánica, está cubierta cerca del puente de San Bernabé y en algunos otros puntos, por depósitos de destrozos y cascajo de traquita. Pero ya he asentado en mi carta ántes inserta, que en localidades diferentes la toba varía de caractéres, y que no he podido averiguar con certeza su yacimiento y su continuacion hácia diferentes puntos, ni aun de un punto á otro cualquiera.

Tampoco estoy seguro si la roca examinada al microscopio por el Sr. Ehrenberg, es de los mismos puntos que yo he reconocido. Por consiguiente, se necesita observar las relaciones que tiene la toba en las varias localidades del valle de Toluca, y entre Iztlahuaca y Almoloya; y estudiar los cortes naturales de los depósitos que formen su suelo, tomando muestras de las rocas de esos cortes y principalmente de los parajes en que la toba está cubierta con los depósitos de destrozos de pórfido y traquita; examinando además su yacimiento para confirmar si esta toba es la misma que la de las localidades de que son las muestras examinadas.

Nota de Castillo.—Al revisar esta traduccion, por encargo de su autor, y en lo que he tenido suma satisfaccion, confirmo que no es la toba que yo mandé y examinó el Sr. Eherenberg, de los mismos puntos que recorrió el Sr. Burkart: no se habla aquí de que contenga infusorios la que menciona el mismo señor, y por consiguiente no pueden identificarse en su carácter y relaciones geológicas. Es, pues, esencial, como lo reconoce dicho Sr. Burkart, hacer un nuevo estudio del terreno, para buscar en los lugares que él recorrió, la toba fitolitaria aquí descrita, para poder generalizar las hipótesis

Tobas de Phytolitharias del Valle de Toluca cerca de Mexico

del Sr. Ehrenberg á todas las tobas del valle de Toluca en el caso de que se encontraran iguales á aquella.

Para obsequiar la excitativa de tan eminentes sabios, los Sres. Ehrenberg y Burkart, que se interesan en aclarar este punto científico, he estado dispuesto á emprender el reconocimiento que se desea; pero las circunstancias no han sido hasta ahora favorables para verificarlo.

Por esto me limitaré al presente, á asentar, sin que por esto se crea que prejuzgo en la materia, que las conjeturas del Sr. Ehrenberg, con respecto á la separacion ó escape del carbon de las gramas por lixiviacion en el agua, se confirman en la localidad é inmediaciones donde está la tiza que le remití; porque en efecto, debajo de las capas superficiales de tiza, de las que recogí el ejemplar citado, cerca de la hacienda del Salitre de Urendiz, á cosa de 20 leguas al O. N. O. de Toluca, y 2 leguas al N. O. del pueblo de San José Malacatepec, se encuentra á cosa de 2 metros de profundidad y 230 más al Sur de donde se recogió el ejemplar de la toba, una capa de lignite de 30 centímetros de gruesa, de la cual conservo ejemplares.

Con estas rectificaciones respecto á la ubicacion topográfica de la capa de toba fitolitaria del Salitre de Urendiz, se comprenderá que la posicion que le da el Sr. Burkart, acaso por falta de precision en mis noticias, es algo diferente; no quedando entre Almoloya é Ixtlahuaca, sino á cosa de 6 leguas al Oeste de la mitad de la distancia entre ambas poblaciones. Así, son diferentes las tobas ó supuestas cenizas volcánicas que llenan la cuenca del gran valle de Toluca, de las del Salitre de Urendiz. La que observó en el puente de San Bernabé, queda muy cerca de Iztlahuaca, junto á cuya poblacion al Sur, está la Hacienda de Maró, donde se beneficia el *tizate* deslavándolo y formando bolas con él para venderlo, y acaso sea igual á los infusorios de la tiza de esta última localidad.

Pero las capas de tiza de este gran valle de Toluca, son interrumpidas y de poca extension local, abundan en muchos lugares y parecen formar capas distintas y á diversas alturas, en la toba volcánica lacustre comun de dicho valle, formada de fragmentos de pómez de todos tamaños, argamasados por más ó ménos barro, con bancos de cascajos y conglomerados de pórfidos traquíticos volcánicos, y con una fauna post-terciaria.

Pero si bien se confirma por la capa de *lignite* ó carbon pardo, inferior á la toba fitolitaria, su origen por lixiviacion en agua, y en consecuencia, de formacion lacustre, segun nuestro modo de ver; no por eso podemos negar, que pudiera haber otras capas aun no observadas, provenidas de erupciones volcánicas de lodo, y que los restos orgánicos hubieran sido deslamados de él, y concentrados por las aguas, como asienta el Sr. Ehrenberg.

Citaré un hecho de que tengo noticia para que sirva á una investigacion futura, y es: «que entre las producciones volcánicas (dice el Sr. Moral, hablando del valle de Toluca), se encuentran bancos de barro de color gris y «negro que envuelven esqueletos de Elefantes, ó sea de Mamú, en las inme«diaciones de Almoloya.[1]» Ahora, esas producciones deben ser el resultado de erupciones del volcan del *Molcajete,* á cosa de dos y media leguas al Sur. Hay que examinar ese barro y si existen depósitos de fitolitarias provenidas de sus deslaves en las cercanías.

En cuanto á la antigüedad de la capa de toba fitolitaria, de que nos ocupamos, y de las tizas de Ixtlahuaca y otros lugares del gran valle de Toluca, supuesta nuestra opinion, de provenir de formaciones lacustres, y aun admitiendo tambien, las que pudieran provenir de erupciones volcánicas de lodo; no cabe duda, por ser superficial la toba fitolitaria, y estar las tizas contenidas, ó alternando con bancos de las tobas *post-terciarias* del valle de Toluca, que esos depósitos fósiles de la vida orgánica, son contemporáneos con los bancos que los contienen, ó con las cuales alternan; y son, por tanto, de la época *post-terciaria* de la edad ó era del hombre; es decir, muy modernos.

Antes de concluir, me veo precisado á hacer observar, que esta traduccion con sus notas, estaba preparada para su publicacion desde el año de 1867, sin que se hubiera podido verificar hasta ahora, por circunstancias ajenas de mi voluntad.

México, Octubre 1.° de 1874.

NOTAS

SOBRE

LOS HELECHOS Y SU DISTRIBUCION EN YUCATAN,

POR EL DOCTOR ARTURO SCHOTT.

La parte Noroeste de Yucatan puede apénas llamarse «país de Helechos,» porque durante los diez y ocho meses que permanecí en la península, solo pudieron colectarse quince especies, representando siete géneros de este órden de criptógamas. Un clima notablemente seco y un suelo árido y pedregoso, no surcado en ninguna parte por aguas corrientes, explican suficientemente el motivo de la escasez de variedades en este órden de plantas, que se desarrollan principalmente en las regiones humedas de los trópicos de ambos hemisferios, que es la zona especial para su propagacion.

---

[1] Tomás R. del Moral. Informe sobre la estadística de México, publicado en la Memoria del Gobernador del Estado—1834—pág. 8. Toluca.

Aunque de poca importancia conocida para el hombre, presenta la familia de los Helechos algun interes bajo el punto de vista fitogeográfico; por lo cual el corto número de especies que ahora presentamos, merece alguna consideracion. La siguiente lista da á conocer, además de las especies, las localidades en donde han sido colectadas.

1 *Adiantum chilense,* Kaulf. Quinta Encalada, cerca de Mérida.
2 ,, *tenerum,* Swartz. Cenote de Kikel, cerca de Tizimin.*
3 ,, *tricholeptis,* Fée. En Mérida, Nohcacab y Uxmal.
4 *Aneimia adiantifolia,* Swartz. Ruinas de Uxmal, Kabah, Nohpat y Mérida.
5 *Aneimia cicutaria,* Kunze. En cenote Yáutzil, hacienda de Mucuyche.
6 *Aspidium fimbriatum,* W. Pozo de Uayma.*
7 ,, *reptans, var. radicans,* Metten. Cenote de Uayma.*
8 ,, *trifoliatum,* Swartz. En cenote de Santa Ana y Valladolid.
9 *Asplenium dentatum,* L. En cenote de Telchaguillo.*
10 *Asplenium pumilum,* Swartz. En Mérida y en todas partes.
11 *Cheilanthes mycrophylla,* Swartz. Comun en todas partes.
12 *Chrysodium* (*Acrosticum*) *aureum,* Metten. Manglares de Sisal.
13 *Phegopteris tetragona,* Metten. Cenote de Sacalum.*
14 *Polyphodium lycopodioides,* L. En cenote, de Kikel cerca de Tizimin.*
15 *Polyphodium Phylitidis,* L. En cenote Maxcabicu, cerca de Calotmul.*[1]

El profesor Dr. Eaton, del colegio de Yale, en New Haven, Connecticut, que tuvo la bondad de clasificar estas 15 especies, dice que la mayor parte de ellas pertenecen igualmente á la Flora de las Indias Occidentales. Los números 4 y 9 se encuentran en la Florida. El número 3 es exclusivamente mexicano y parece ser raro en las colecciones. Los números 14 y 15 se encuentran, como se sabe, en localidades adecuadas en toda la América central y la zona tropical de la América del Sur.

---

[1] Un asterísco fijado en las localidades, significa, que las especies respectivas, no han sido encontradas en otra parte.

Tomando en consideracion la naturaleza de sus particularidades, se pueden clasificar estas especies de la manera siguiente:

a., Aquellas que ocupan lugares áridos, abiertos y expuestos durante toda la estacion seca, á los rayos abrasadores del sol tropical, sin recibir casi ninguna humedad, ya sea de la atmósfera ó del suelo. A ésta seccion pertenece el número 11, el cual, así como un gran número del mismo género, tiene una graciosa fronda de tres penachos y tambien un alto grado de vitalidad latente, por lo cual puede soportar los efectos de una sequedad muy prolongada. Esta hermosa planta crece sobre las paredes de piedra y sobre las peñas quemadas por el sol. Las que se encuentran cerca del agua se desarrollan tan vigorosamente, que se hallaria uno expuesto á considerarla como una especie diferente. En Norte-América el género *Cheilantes,* está representado del lado del Atlántico por una sola especie; miéntras que en las regiones más secas del lejano Occidente y hácia el Océano pacífico se encuentran de 4 á 6 especies.

b., Esta division incluye especies que requieren más humedad y alguna proteccion contra los efectos extremos de la luz directa del sol, y son los números 1, 2, 3 y 4. Por consiguiente, su morada propia, es la sombra de los arbustos, rocas y ruinas de mampostería, en donde se desarrollan mejor, pues reciben ocasionalmente el beneficio de la humedad atmosférica ó terrestre; á la vez que por su propiedad de congregarse, forman manchones de grande extension, como se ven alrededor de los manantiales de los cenotes y de los brocales de los pozos, como tambien en la entrada de las cuevas y entre las ruinas de los edificios antiguos.

c., La humedad constante y más ó ménos sombra, parecen indispensables á los números 5, 6, 7, 8, 9, 10, 13, 14 y 15; algunas de ellas aun gozan de mejor vida troglodítica cuando reciben una luz muy escasa ó ninguna, como sucede con los números 9, 10 y 13. El número 5 es una forma verdaderamente pigmea, y una de las más elegantes de su clase, lo que se podrá inferir de su nombre específico *cicutaria,* en razon á que su fronda pequeña y muy entrecortada, presenta alguna semejanza superficial con aquella yerba venenosa bien conocida bajo el nombre de cicuta. El número 10 es otro pigmeo que se halla en todas partes del lado húmedo de las paredes, acueductos, pozos y otras obras hidráulicas. Los Mayas llaman á esta graciosa plantita «Sisalchen,» lo que quiere decir: «frescura de pozo.» Este nombre nativo bien apropiado, es uno de los raros casos en que el idioma castellano no haya sucumbido enteramente á la influencia del idioma maya, porque los mestizos del país llaman esta planta, aunque impropiamente, «culantrillo.»

d., La última division ó el término opuesto, por decirlo así, de nuestra escala, está representada por una especie verdaderamente acuática que es el número 12 de la lista anterior. Crece en los lugares despejados, en medio de los Manglares tupidos, asociada con Palmeros enanos, *Sabal* ó *Thrinax* y una espadaña gigantesca, *Rhyncospora*, juntamente con otras plantas marítimas. Este helecho necesita para su existencia, el contínuo baño de agua salobre, ó aun salada como la de las lagunas y los pantanos, á lo largo de la costa en los puertos de Sisal y del Progreso. Cosmopolita esta especie, aparece con hojillas ligeramente variadas, en toda la extension de las playas del Atlántico y del Pacífico de la América tropical. Los nativos de los alrededores de la ciudad de Cartajena, en Nueva Granada, llaman esta planta «Matatigre» por alguna razon no explicada. La mencionada criptógama, desempeña en la economía de la naturaleza un papel importante, ayudando á sus asociadas ántes mencionadas, á proteger la tierra recientemente formada, contra las incursiones del mar, como evidentemente se nota en los lugares de su crecimiento.

Lo dicho demuestra, que la mayor parte de nuestras especies se desarrollan principalmente en las cercanías de la humedad y en la sombra; y que la peculiar condicion hidrográfica de este país eminentemente apotámico, ó más bien criptopotámico, es la causa de que su distribucion sea verdaderamente accidental, por limitarse exclusivamente á estas capas húmedas, que constituyen el término del desagüe perpendicular de la costra superior, sólidamente constituida de terreno pedregoso, como sucede especialmente en toda la parte Nordoeste de Yucatan. Hácia el Este se modifica esta circunstancia visiblemente, ya por el aumento de los *Cenotes*, tanto en número como en tamaño, ya tambien por la mayor acumulacion de tierra fertilizante, y de consiguiente mayor riqueza en su cubierta vegetal. Esta última condensa particularmente los vapores que se levantan de las aguas calentadas que corren por el golfo de Honduras, pasando por el estrecho de Yucatan y Cuba.

En Yucatan es bien sabido que el tiempo de aguas comienza cada año por los meses de Octubre y Noviembre, despues de los primeros Nortes en esta latitud. Hasta despues de que dos ó tres de estas tormentas han refrescado palpablemente la seccion oriental de la Península, es cuando se extienden las lluvias hácia la parte más árida del Poniente.

Por estos motivos la Flora oriental aparece mucho más variada y cuenta por consiguiente un número mucho mayor de especies, y relativamente mayor grado de desarrollo individual. Segun todo esto, es muy probable que en los límites de las secciones del Este y Sur de Yucatan, cuyas condiciones físicas se acercan más á las regiones protegidas por la sombra y humedad de la América central y tropical del Sur, se podria triplicar y aun cuadruplicar la lista de las especies indígenas de los Helechos, si se buscasen con la debida inteligencia.

Georgetown D. C., Julio de 1872.

MINERALOGÍA.

EL WAD OOLITICO.

POR EL SEÑOR DON MARIANO BARCENA,

SOCIO DE NÚMERO.

La Sociedad tiene conocimiento del viaje que hice al distrito de Jacala, del Estado de Hidalgo, con el fin de estudiar los terrenos en que se habian encontrado algunas tierras platiníferas. Durante mi permanencia en aquella localidad, tuve lugar de observar algunas de las diversas y curiosas producciones naturales que allí se encuentran y que me propongo describir ante esta Sociedad, con el fin de prestarle constantemente mi insignificante cooperacion.

En el informe que presenté al Ministerio de Fomento, sobre los terrenos platiníferos, mencioné algunas concreciones esféricas de peróxido de manganeso que encontré en varias localidades del distrito citado y que me propongo describir ahora con más detenimiento, por considerarlas como una curiosidad mineralógica de formacion reciente.

Caracteres físicos.—El diámetro de esas concreciones varia desde 0,^{m}001 á 0,^{m}01 ó poco más, siendo más comunes las intermedias entre los límites citados: su figura general es la esférica más ó ménos regular. Lustre centellante. Superficie desigual; textura terrosa gruesa. Color pardo de hígado que pasa á negro azulado y negro pardusco. Dureza de 1,5 á 2: dócil, raspadura lustrosa; el polvo es negro pardusco. Peso específico de 3,5.

Caracteres químicos.—Calentadas en un tubo abierto dan vapores acuosos. Fundidas con carbonato de sosa dan una masa verde. Con bórax, producen una perla de color violado ametista.

Por la via húmeda dan las reacciones correspondientes al manganeso, al hierro, á la cal y á la barita.

Clasificacion.—Por todos esos caractéres debemos clasificar las concreciones citadas como wad oolítico ó *Groroilita*, adoptando el nombre dado al wad concrecionado que se halla en Groroi cerca de Mayena en Francia.

Observaciones.—El wad que acabo de describir se encuentra en las arcillas ferruginosas del distrito de Jacala, y con más especialidad en los cerros vecinos á la villa de ese nombre.

Las oolitas manganesíferas forman verdaderos conglomerados en las arcillas citadas, y son más abundantes en las capas superficiales. Su abundancia es verdaderamente notable en los terrenos bajos, al grado de que en algunas partes pueden formar hasta las dos terceras partes de la masa que llena las desigualdades del terreno.

Al buscar el orígen de ese óxido de manganeso, solo pude encontrarlo con más claridad en las cercanías de la mina del Cármen de Jacala, donde hay grandes masas de carbonato de plomo y galenas argentíferas asociadas á los óxidos de hierro y manganeso, hallándose este último al estado de psilomelan, y de cuya descomposicion deben provenir las moléculas que forman las oolitas. Algunas de éstas contienen trazas de plata y carbonato de plomo.

En otras localidades donde no se ven las vetas metalíferas que contengan los óxidos de manganeso, no puede atribuirse á las concreciones de wad, el mismo origen que á las que se hallan en las inmediaciones de la mina del Cármen. Parece que en los otros yacimientos se encontraron reunidos desde un principio los óxidos de hierro y manganeso, y que separados despues por las corrientes de agua, se han puesto en contacto las partículas semejantes para asociarse bajo la forma de cascos concéntricos. Para explicar esta curiosa asociacion y la separacion de los dos óxidos, no podemos recurrir á la consideracion de la diferencia entre sus pesos específicos, porque el del peróxido hidratado de hierro, oscila entre tres y cuatro como el del wad, y creo que la asociacion se verifica en virtud de la fuerza ó tendencia cristalogénica que se nota en esos óxidos pulverulentos cuando son arrastrados por las aguas, y que forman las figuras dendríticas que podemos considerar como una tendencia bien marcada á la cristalizacion. Faltando á esas partículas alguna otra influencia desconocida para nosotros, no podrán formar, en el momento de su asociacion, las caras planas de los poliedros y quedan formando esferas solamente.

En las arcillas ferruginosas de Jacala se encuentran las esferas de wad en diversos grados de desarrollo, desde las más completas y perfectas, hasta otras rudimentarias y que están actualmente en vía de formacion.

El wad oolítico de Jacala, no solo es notable por las figuras que afecta, sino tambien por su abundancia, y bajo este respecto debemos considerarlo como una de las especies minerales que caracterizan á aquel distrito minero. Por esta circunstancia me resolví á presentar estos apuntes á nuestra Sociedad, así como por la de no haber visto citada ninguna localidad americana para ese curioso mineral.

México, Octubre 8 de 1874.

EL ÁRBOL DEL MAMEY.

POR EL SEÑOR DON FERNANDO ALTAMIRANO, SOCIO DE NUMERO.

Voy á ocupar la atencion de esta respetable Sociedad, para cumplir con el turno de lectura que me ha sido señalado, refiriéndole mis observaciones sobre la planta que encabeza este artículo. La excelencia de sus frutos, tan agradables á la vista como gratos al paladar, y que en México se consumen con mucho aprecio; el notable aspecto de sus semillas, llevadas á Europa como objetos de curiosidad, y la utilidad, sobre todo, que de ellas podemos obtener, fueron los motivos que me impulsaron á estudiar este vegetal, para llamar la atencion de las personas á quienes mis indicaciones pudieran ser de algun provecho. Anticiparé tambien, que respecto de la grasa que se extrae de las semillas, existe una creencia popular muy extendida, de que produce efectos maravillosos haciendo brotar el pelo donde ha desaparecido. Esta aplicacion tiene probablemente su origen de los aztecas, que usaban una preparacion de la almendra, que si bien es cierto no era para hacerlo crecer, sí para que conservase su suavidad é impedir que se dividiese por el hongo que suele en él desarrollarse: frotándolas en una piedra áspera y untándose el cabello con la masa que resulta, es como se usa hoy más comunmente. La verdad de esta propiedad me es desconocida, pues no tengo aún terminada ninguna de las experiencias que con este fin he emprendido.

Me propongo, por tanto, el fijar la atencion especialmente sobre la composicion química de las almendras, para deducir en seguida sus aplicaciones, y que la experiencia se encargará más tarde de rectificar.

La historia de este hermoso arbol propio de las regiones calientes de México, la refiere Hernandez en su Tratado de plantas de Nueva-España, bajo el titulo: «Del *Tezonzapotl* ó de la fruta que presenta el aspecto y color del *tezontli*. Su descripcion, como era de esperarse, se reciente de la época en que fué hecha, y da una idea muy imperfecta y aun inexacta en algunos puntos, del árbol mencionado. Afirma el apreciable historiador, que sus almendras las empleaban los aztecas en los usos que actualmente se les dan y hemos ya señalado; que las mezclaban á la bebida del chocolate y les servian tambien para dar color a las *jícaras*. Las propiedades medicinales que les asignaban los mexicanos no se fijan con precision, no siendo, por lo mismo, de algun interes el referirlas.

Se ve por lo anterior, cuál es el verdadero nombre indígena del Mamey: la terminacion *Tzapotl*, segun Clavijero, significa que es fruto de forma redonda ó que se aproxima á ella, y de pepita dura.

Segun los estudios que se han hecho sobre esta planta en otros países, resulta que pertenece á la familia de las Sapoteas, género *Lucuma*. Me inclino á pensar que nuestra especie debe referirse más bien á la *Bonplandii* y no á la *mamosa*, segun dice Guibourt, y se cree generalmente, porque los caractéres que he observado en unos ramos que recibí de Cuernavaca, distan bastante de la *mamosa*, y mucho se acercan á la *Bonplandii*, debiéndose tal vez el que no coincidan exactamente á las variaciones que imprime el clima. Indicaré, pues, los caractéres de nuestra planta y las diferencias que existen entre ella y las que le son afines.

No hablaré del tallo, por no haberlo examinado; los ramos que he tenido á la vista son pubescentes, siendo el vello leonado y tanto más abundante, cuanto más jóvenes son estos ramos; están cubiertos de cicatrices cordiformes, correspondientes á las hojas, notándose en ellas tres puntitos salientes, dispuestos con mucha regularidad. Las hojas son alternas, sin estípulas, agrupadas hácia los extremos de los ramos, oblongo-lanceoladas y acuminadas, siendo algunas sub-espatuladas, coriáceas, apezonadas, de color verde oscuro, más subido en la cara superior que en la inferior; el limbo es entero, cuneiforme hácia la base, de 0. 31^{m}de largo por 0. 08 id. de ancho; el pezon muy pubescente de 0. 035^{m}de largo. Flores hermafroditas, completas, regulares, esparcidas en grupos de tres á cuatro, de las que solamente una dá fruto, axilares y sentadas; cáliz persistente, formado por sépalos en número de 11 á 15, dispuestos en cuatro series imbricadas y libres al parecer de adherencia; blanquecinos, marginados, pubescentes en la cara externa y lampiños en la interna, cóncavos y orbiculares, siendo los exteriores más cortos. Corola gamopétala, hipogínea, blanco-amarillenta, campanulado-ventricosa, con 6 divisiones oblongas, que se cubren ligeramente en el márgen unas con otras. Estambres más cortos que los pétalos y flexuosos algunos: son 12, 6 fértiles opuestos á los pétalos y adheridos á ellos y 6 estériles y alternos; anteras basifijas, cordiformes, unas extrorsas y otras introrsas, con su dehiscencia longitudinal. Ovario pubescente, quinquelocular, con un solo óvulo en cada lóculo, anátropo, oblongo y pendiente, y de los que comunmente se llega á desarrollar uno por aborto de los demas. Estilo más corto que la corola, flexuoso, rollizo; estigma capitado y subquinque lobulado. El fruto es una baya oblonga, por lo regular de 9 á 10 centímetros de largo por 7 á 8 id. de diámetro en su parte média; el epicarpo es de un color pardo claro rojizo, en algo parecido al salvado, aunque más oscuro, muy áspero y duro; el sarcocarpo es rojo, amarillento ó moreno, de consistencia de pasta muy blanda, de un sabor *sui generis* muy agradable y poco aromático. El grano es obovado-elíptico, sub-comprimido en los lados, anguloso en el dorso y casi plano en el vientre, de 0, 08^{m} de largo y 0,12^{m} de circunferencia: su texta es leñosa, lateral y posteriormente lisa, lustrosa, de color castaño oscuro, notándose en el vértice la micrópila en un punto próximo á la hila; esta parte de la texta forma los dos tercios de la envoltura exterior de la semilla, está limitada por un reborde blanco-amarillento que circunscribe el ombligo, el cual ocupa toda la cara anterior ó ventral del grano. La figura del ombligo es exactamente la de la hoja del mamey; su largo es el del hueso, y su mayor ancho es de 0,035^{m}, de superficie desigual, opaco, amarillento al principio, y más tarde, con el contacto del aire, blanquizco; en el extremo opuesto á la micrópila existe una cicatriz muy aparente (onfalodio), por donde penetran los vasos nutritivos destinados al embrion; el funículo es grueso, carnoso, y cubre completamente el ombligo; en el fruto se ve que párte del sarcocarpo, que está en contacto con el ápice de la semilla y asciende hasta llegar casi á la parte más elevada de la misma. Embrion sin endosperma, cotiledones muy desarrollados, constituyendo toda la almendra y oleaginosos; la radícula inferior y muy corta.

OBSERVACIONES.—De las cuatro secciones en que De Candolle ha dividido el género *Lucuma*, indudablemente nuestra especie corresponde á la tercera, *Eulucuma*, que es la única que tiene numerosos sépalos y las semillas tal como la hemos descrito. Dos son las únicas especies adscritas á esta seccion, la *mamosa* y la *Bonplandii*. En la primera los lóbulos del cáliz son 10, pétalos 5, hojas oblongas con la base atenuada y enteramente lampiñas. En la segunda los lóbulos del cáliz son de 9—12, ovados, 3 exteriores más grandes, pétalos 5, hojas obovado-oblongas, obtusas, acuñadas en la base, con las nervaduras y el pezon pubescente-tomentoso. En la nuestra el número de sépalos es de 11—15, los exteriores más cortos, como en la *mamosa*, y pubescentes como en la *Bonplandii;* corola de 6 divisiones y estambres 12, mas numerosos que en las anteriores; hojas oblongo-lanceoladas, acuminadas, diferente tambien en esto á las referidas, con la base acuñada y pubescentes como la *Bonplandii;* no teniendo los demas órganos caractéres que separen á unas de otras. ¿Serán suficientes las diferencias que hemos señalado, para considerar nuestra especie como distinta de la *mamosa* y de la *Bonplandii*, ó simplemente como una variedad de ésta? Solo el exámen de mayor número de ejemplares, que nos indiquen la fijeza de los caractéres señalados ó su mutabilidad, nos pondria en el caso de resolver esta cuestion.

Lo expuesto demuestra que nuestro *tezonzapoll* no es aún perfectamente conocido por los naturalistas europeos; esta opinion la he corroborado con lo que se asienta en el Diccionario enciclopédico; en esta obra se presenta el mamey de México, como perteneciendo á las Gutíferas, lo que es debido quizá á que se le confunde con el mamey de América, *Mamosa americana*, que corresponde á esta familia.

Analisis química.—La análisis que he practicado se reduce á demostrar tansolo los principios más notables que contienen las almendras.

Desde luego diré, que desgarrando un fragmento pequeño de la superficie de la almendra, se notan al separarlo unos como filamentos que se alargan, formados por una sustancia blanca y glutinosa; tan presto como se rompen, lo que se efectúa á una distancia como de dos centímetros, se retraen como un hilo elástico, sin que se note con claridad su punto de orígen. Al microscopio se observa un tejido celular compacto, con unos puntos brillantes en la superficie, que corresponden á aquella sustancia.

Triturada una almendra en un mortero y agregando agua, forma una emulsion muy persistente y espesa, de un olor prúsico marcado; hirviéndola, se coagula una sustancia que es albumina, que reteniéndola en un filtro deja pasar un liquido lechoso que no se coagula con el ácido acético; pero evaporándola hasta la sequedad, casi al fin se separan algunos grumitos, y queda la cápsula cubierta como de un barniz brillante, soluble en el agua y de un olor como de cebada germinada y tostada (Malte).

Cuando no se hierve la emulsion y se le agrega ácido acético, precipita una sustancia en forma de grumos, que he tomado por caseina, aunque me llama la atencion que despues de hervirla no la precipite dicho ácido.

Al evaporar la referida emulsion á fuego desnudo, se forma espuma, que á medida que se quita, se ve aparecer una película como la de la leche cuando comienza á enfriarse despues de cocida, nuevo carácter que indica la caseina. Al fin de la evaporacion queda una sustancia espesa, morena, de sabor amargo, pegajosa, que aun pasando mucho tiempo no se endurece; insoluble en el sulfuro de carbono, cloroformo, éter y alcohol á 85 y 90°, pero el agua inmediatamente la emulsiona poniéndose lechosa. Si se hierve con ácido clorohídrico se disuelve dando un color rojo subido, lo mismo que con los ácidos sulfúrico y nítrico, aunque no se disuelve del todo ni es tan intensa la coloracion. Podria citar aún otras reacciones, pero no han sido ni constantes ni claras, y tansolo citaré, que malaxándola repetidas veces en sulfuro de carbono, y abandonando este líquido á la evaporacion espontánea, deja como resíduo aceite, y un cuerpo cristalizado en agujas planas, insoluble en los ácidos, álcalis y éter sulfúrico, soluble en el cloroformo: este cuerpo queda en cantidades pequeñísimas y no siempre, por lo que no he averiguado su naturaleza.

Tratando por agua el resíduo de la evaporacion al fuego, y filtrando despues de hervir, se consigue que pase un líquido claro; hirviéndolo con unas gotas de potasa y acetato de cobre, se pone turbio y de un color amarillento, por la precipitacion del óxido de cobre, lo que demuestra la presencia de la glucosa.

El aceite que se extrae por el sulfuro del carbono, es amarillento, con muchos cuerpecitos blancos que al microscopio se ven formados por grupos de cristalitos que aumentan á medida que pasa el tiempo, hasta solidificarse todo el aceite. Por el contrario, cuando despues de esprimir las almendras, se les trata por éter sulfúrico en aparato de desalojamiento, se extrae un aceite amarillento que no se solidifica; así como, cuando por expresion se saca una gran cantidad, muchas veces no se solidifica todo, sino que en la superficie queda una capa líquida no muy gruesa.

Esta sustancia grasa se saponifica por la potasa, dando un jabon blando, que descompuesto por el ácido sulfúrico, deja libre una materia grasa que viene á solidificarse en la superficie del líquido, y exprimiéndola entre papeles de estraza, deja un cuerpo blanco, duro, quebradizo, que se funde á 65° centígrados, y cristaliza por el enfriamiento, y por solucion en el éter sulfúrico.

Cuando se extrae por expresion el aceite de las almendras recientes, sale mezclado con agua y con un cuerpo que donde se adhiere, forma al secarse como un barniz que solamente el agua disuelve poniéndose blanca.

Tratando la almendra pulverizada y comprimida entre papeles, dos veces por el alcohol á 90°, exprimiendo el resíduo y filtrando, deja cristalizar en agujas, por evaporacion, un cuerpo blanco que es amigdalina, puesto que desarrolla ácido prúsico en una emulsion de almendras dulces.

Poniendo un fragmento pequeño de almendra de mamey con una gota de ácido sulfúrico concentrado, despues de algunos minutos adquiere un color rojo morado, que aunque parecido al que toma en las mismas circunstancias la amigdalina y creí que á ésta era debido, no es así, pues que con la almendra dulce hay la misma coloracion y con otras varias almendras, como el yoyote, *Thevetia iccotli*, el ricino, habilla de San Ignacio, etc., etc.

Notaré tambien que cuando se opera por el método de lixiviacion, el éter sulfúrico disuelve aceite y no se solidifica como ya dije; el alcohol á 85° deja por evaporacion una sustancia extractiva que sabe á almendras amargas, produciendo además ésta una sensacion amarga muy intensa y desagradable; llamándome la atencion, sobre todo, que no cristalizase la amigdalina que debió haber disuelto, lo que tal vez haya sido por las impurezas que contiene, en fin, el agua sale algo trasparente, con un color blanquizco y que no precipita por el ácido acético, lo que me indicó que no habia caseina: ésta quedó retenida en el aparato, puesto que exprimiendo el resíduo agotado con agua, da un líquido lechoso, espeso, donde forma un precipitado abundante el ácido acético. Evaporada esta agua blanquizca al baño de María, deja una sustancia al parecer extractiva, de color rojo oscuro, muy amarga, que reproduce con el mismo vehículo el líquido de donde provino; insoluble en el alcohol y tomando un color rojo intenso con los ácidos clorohídrico y sulfúrico, caliente el primero y frío el segundo.

De lo dicho, se deduce en resúmen, que la almendra de mamey contiene los principios siguientes:

1.° Aceite que llamaré manteca por ser sólido a la temperatura de 20°, y que está formado por un cuerpo sólido y otro líquido en menor cantidad: el primero es parecido á la estearina y á la palmitina, el segundo es oleina. La cantidad de manteca que he obtenido, es de 45 p$\frac{0}{0}$.

2.° Amigdalina que obtuve por el método que indica Soubeiran.

3.° Sinaptasa que se demuestra por la formacion del ácido prúsico.

4.° Tanino que se comprueba por el color negro que toman los instrumentos de fierro al dividir la almendra, y sobre todo, porque hirviendo unas rebanadas de ésta en agua y agregando proto-sulfato de fierro, adquieren un color negro azulado.

5.º Glucosa que tal vez provenga de las reacciones de la amigdalina, pero que existe, puesto que hay reduccion de las sales de cobre en las condiciones necesarias para esta reaccion.

6.º Albumina que la revela la ebullicion por los coágulos que se forman.

7.º Caseina en grande porcion, á juzgar por la abundancia del precipitado del ácido acético y la película que se forma durante la evaporacion.

8.º Una sustancia que me pareció gomo-resina, provenida de la evaporacion hasta la sequedad del líquido lechoso, que resulta esprimiendo con agua las almendras, pero que probablemente es más bien, una mezcla de caseina y materia extractiva. Notaré solamente, que dicha caseina, despues de precipitada por alcohol y lavada con varios vehículos, no produce las reacciones generales que asignan los libros á los cuerpos albuminosos; lo que podria depender quizá de su alteracion al evaporarla, ó porque realmente los elementos que la forman ó su agrupamiento molecular, no corresponda exactamente ni al de la caseina animal ni á la de los demas vegetales. [1]

Respecto de las aplicaciones de la grasa del mamey, buscada hasta ahora únicamente como objeto de tocador, pero que más tarde tendrá sin duda usos más importantes, diré tansolo, que siendo muy abundante en las almendras, un 45 p% como lo he indicado (aunque el Sr. D. Maximino Rio de la Loza ha obtenido nada más que un 25 p% , lo que me ha llamado la atencion), y por otra parte, siendo indudable que se conseguirán éstas á un precio muy bajo, tan luego como se solicite su venta, la extraccion debe ser más económica que la del aceite de las almendras amargas del durazno y chabacano.

Más tarde presentaré á esta respetable Sociedad el resultado de la análisis cuantitativa de las almendras del mamey que en la actualidad estoy emprendiendo, así como el ensayo de sus diversos productos, con objeto de investigar algunas de sus aplicaciones útiles: espero entretanto, que este primer trabajo será recibido con indulgencia.

México, Octubre 15 de 1874.

---

[1] El Sr. D. Cándido Gaytan encontró en las almendras del *Lucuma mamosa*, amigdalina y un aceite graso fusible á 15°, compuesto de oleina y de estearina, puesto que el ácido sólido que se obtiene por la saponificacion no es fusible sino á 70°. Histoire des Droges simp., Guibourt, vol. II.

APUNTES QUE PUEDEN SERVIR DE BASE

PARA LA FORMACION

DE LA FLÓRULA DE LA CIUDAD DE MONTEREY

Y SUS INMEDIACIONES,

POR EL Sr. D. ELEUTERIO GONZALEZ, SOCIO CORRESPONSAL.

Monterey, Diciembre 15 de 1873.

EL ANACAHUITE,[1]

POR LOS SEÑORES DON GUMESINDO MENDOZA Y DON ALFONSO HERRERA,

MIEMBROS DE ESTA SOCIEDAD.

HISTORIA.—La palabra *Anacahuite* es evidentemente una corrupcion de *amacuahuitl*, como *copalhuate* lo es de *copalcuahuitl*, *chalahuite* de *xalcuahuitl*, etc. Con ella designaban nuestros antepasados, un árbol de suma importancia para ellos. En su sintético y elegante idioma, *amacuahuitl*, significa *árbol del papel*.

De su etimologia podemos inferir esta consecuencia: los antiguos mexicanos daban nombre á las cosas, indicando con él alguna ó algunas de sus propiedades ó usos; pero como esto no se hace, sino observando ó experimentando los objetos, podemos asegurar que nuestros antecesores se dedicaban al estudio de la naturaleza; tenemos multitud de pruebas con que corroborar nuestro aserto, que no exponemos ahora por ser ajenas al asunto de que tratamos.

Hernandez, el sabio médico de Felipe II, vino á fines del siglo XVI, á explorar estas vastas y ricas regiones; por espacio de siete años anduvo con una constancia admirable, adquiriendo de boca de los médicos indígenas, lo que sabian de las propiedades y usos de las plantas, y recogió, por decirlo así, los últimos destellos de una civilizacion, que desaparecia entre la sed insaciable de oro y ante el fanatismo religioso que desmoronaba los templos y las estatuas cubiertas de geroglíficos, y arrojaba á las llamas los manuscritos que contenian la historia de un gran pueblo y los secretos de las ciencias; describió el árbol que nos ocupa, mas con tal sencillez y concision, que no es posible identificar con su descripcion el Anacahuite usado hoy; sin embargo, la semejanza de la palabra antigua con la moderna, por una parte, y por otra la estructura de la corteza que se presta muy bien á los usos que le daban los aztecas (pues habiendo nosotros preparado una corteza de Anacahuite, siguiendo en todo el procedimiento descrito por Hernandez, hemos obtenido un *papirus* muy semejante al preparado por los antiguos, lo cual pudimos confirmar, comparando el nuestro con el de un documento indígena, escrito sobre este *papyrus*, nos hace creer que el Amacuahuitl de Hernandez, es por lo ménos de la misma familia y del mismo género que el nuestro.

---

[1] Este trabajo se publicó en el año de 1864 en un periódico político: conforme al programa de la Sociedad, de reunir todos los datos científicos relativos á la Historia Natural de México, se inserta en la Naturaleza. (C. de P.)

Es digno de notarse que hácia la época en que vino Hernandez á estudiar las producciones de nuestro país, se fabricaba aún en Tepoxtlan el *papyrus* mexicano con el árbol del papel, puesto que nos da en la fabricacion de este precioso objeto, esta expresiva y elegante frase: «Tepoxtlanicis provenit montibus, ubi frequenter interpollatur ex ea papyrus, fervetque opificum turba» y hierve la multitud de trabajadores: es decir, que aun habia actividad en ese comercio del *papyrus*, que como el de los egipcios, servia para escribir en él la historia de los dioses y de los héroes, para adornar las piras funerales y para hacer vestidos y cuerdas: en una palabra, lo empleaban en los usos religiosos, políticos y económicos.

Pero es indudable que cuando Hernandez admiraba la turba de trabajadores, ya no se utilizaba nuestro árbol mas que en los usos ecónomicos, sucediendo aquí lo que dice el naturalista romano al hablar del *papyrus* egipcio: «despues pasó á usos comunes un objeto del que depende la inmortalidad de los hombres.»

Hernandez concluye dandonos el método que seguian los artesanos aztecas para preparar su *papyrus*, y encontramos en esta manipulacion, una semejanza tal con la que usaban los antiguos habitantes del Nilo, que casi no hay diferencia alguna.

Clasificacion y descripcion botanica.—El Anacahuite, conocido tambien con el nombre de Siricote y Trompillo, pertenece a la familia de las Borragináceas, tribu Cordieas, género *Cordia* de Plumb, y especie *Boissieri* de D. C.: sus caractéres son como sigue:

«C. G. Cáliz tubuloso, obovado ó campanulado, 4—5 dentado, raras veces 3, ó 6—8 id; dehiscencia regular ó irregular, nunca circumcisa. Corola infundibuliforme ó hipocraterimorfa; limbo 4—5 partido, raras veces 6—12 lobulado. Estambres en número igual á las divisiones de la corola. Estilo dos veces bifido, casi siempre exerto. Drupa ovada ó globosa, pulposa, ceñida frecuentemente por el cáliz persistente; de 1—3 lóculos, 1—espermos por aborto de uno de los lóculos del ovario. Hojas alternas, raras veces subopuestas, apezonadas, de forma variada, enterísimas ó dentadas. Flores diversamente dispuestas, alguna vez por aborto poligamas ó monoicas: corola casi siempre blanca. Arboles ó arbustos de las regiones calientes del globo, con especies de frutos pectorales.»

«C. E. En las extremidades de los ramos las hojas más jóvenes por su cara superior, y el cáliz, leonado-tomentoso; hojas ovado-elípticas, obtusas en sus dos extremidades, enteras ó sub-enteras, escabro-rugosas por encima y por debajo tomentosas; cimas paniculado-terminales, más cortas que las hojas; cáliz cilíndrico, infundibuliforme, exteriormente tomentoso-seríceo de 5 lobulos libres, ó 2—3 igualmente sub-unidos; corola cuatro veces más larga que el cáliz, en la parte média exterior pubescente, infundibuliforme, en el interior del cáliz cilíndrica; hojas de 3 á 7 pulgadas de largo, incluso el pezon que tiene de 6 á 24 líneas y de ancho de 1 ½ á 4 pulgadas. Cáliz sentado de 6 líneas de largo, sub 10—estriado. Estivacion de los lóbulos de la corola quincuncial. Estambres 5, lampiños.» Prodromus, vol. IX, D. C.

Habitacion.—Las regiones calientes y húmedas de la vertiente oriental de la gran cordillera mexicana.

Analisis química.—En el *Journal de Pharmacie et Chimie*, T. XXIX, se ha publicado la análisis que Buchner hizo del leño de este árbol, la que copiamos á continuacion:

«La madera de Anacahuite recomendada para el tratamiento de la tísis, no tiene sabor, el agua fria solo disuelve una pequeña cantidad de tánino, que da un precipitado verde con las sales férricas; lo mismo sucede con el agua hirviendo, no obstante que se encuentran algunos granos de almidon entre los rayos medulares. Por el alcohol se extrae algo de tanino y una corta cantidad de una sustancia resinosa. El éter casi nada disuelve.

No contiene ningun principio inmediato particular, y solo se encuentra en ella los ácidos tánico y gálico, una poca de goma y de resina, y oxalato de cal en abundancia, contenido de preferencia en el liber y la medula.

1.000 gramos de madera han dado por la calcinacion 18,05 de ceniza, compuesta de cloruros y sulfatos alcalinos, siliza, carbonatos de cal y de magnesia, sexquióxido de fierro y vestigios de ácido fosfórico.

El liber seco produjo 20 % de cenizas, formadas casi enteramente de carbonato de cal.

La madera bien seca y desprovista del líber, solo produjo 2.93 % de cenizas.

Buchner hace la observacion de que en el liquen de Islandia, usado tambien como pectoral, existe en abundancia el oxalato de cal, de donde infiere que las propiedades medicinales del Anacahuite deben atribuirse en gran parte á esta sal, que como se ha dicho existe en él en gran cantidad.

Creemos conveniente añadir, que el método práctico y sencillo que hemos encontrado para reconocer el leño del Anacahuite, consiste en el exámen de la corteza, la que esta formada de láminas fibrosas que se desprenden con facilidad, y entre las cuales se encuentra en abundancia un polvo blanco, (oxalato de cal,) pero principalmente en la coloracion verde que toma la madera cuando se vierte en un corte reciente, una solucion alcalina cualquiera que sea.

Para concluir ponemos á continuacion las diferentes especies de *Cordia* que sabemos existen en México.

C. tinifolia, Wilden. Acapulco. *C. diversifolia,* Pav.

C. elaeagnoides, D. C. Entre Tehuantepec y Boca del Monte. *C. nodosa,* Lam.

C. dodecandra, D. C. Alvarado. (Llamada vulgarmente Copito.) *C. rotata,* Mociño.

C. ferruginea, Rœm. et Schult., Jalapa. *C. crenulata,* D. C.

C. Peruviana, var. *Mexicana,* Rœm. et Schult., Cerca de Campeche. *¿C. linearis?* D. C.

C. Hermanniæfolia, Cham., Hacienda de la Laguna. *C. integrifolia,* Rœm. et Schult.

C. serratifolia, H. B. K. Cerca de Campeche. *C. Oaxacana,* D. C. Totolapa.

C. ambigua, Cham. Cerca de Jalapa. *¿C. parvifolia?* D. C.

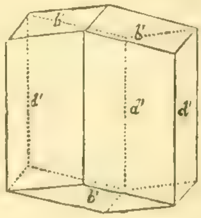
NOTA

SOBRE LA

PLATA SULFÚREA PSEUDOMÓRFOSIS DE ROSICLER OSCURO

POR EL SEÑOR DON SEVERO NAVIA, SOCIO CORRESPONSAL.

Hace algunos meses que estudiando la coleccion particular de minerales de plata de las minas de Guanajuato, perteneciente al señor ingeniero de minas, D. Ignacio G. Rocha, me encontré dos ejemplares cristalizados de la mina de Sirena, cuyos caractéres corresponden á los de la plata sulfúrea, excepto la forma que es la del rosicler oscuro. En efecto, los cristales presentan desde luego el aspecto de los de esta especie, como lo manifiesta el dibujo: son prismas exágonos regulares, termina-



dos por el romboedro equiáxeo de ángulo de 137° 30', medido con el goniómetro de aplicacion. A este carácter, que no deja duda de que la forma es la del rosicler oscuro, supuesto que el ángulo del romboedro es, con diferencia de 10', el mismo que el Sr. Dufrénoy le asigna al equiáxeo de dicha especie, se añade el que las caras laterales de los prismas poseen aún, la textura hojosa encubierta de los cristales de la misma forma de rosicler no alterado.

En cuanto á los demas caractéres, son estos: los cristales por fuera son poco lustrosos, casi mates, en parte cubiertos de polvorilla de plata y de color negro de hierro; adquieren lustre en la raspadura, que es lustrosa y de color gris de plomo negruzco; blandos; dureza de 2,5 en la escala de Breithaup; semidúctiles; al golpe de la mano del mortero se rompen, y los fragmentos que saltan se aplastan en laminitas brillantes del mismo color gris de plomo; poco pesados; peso específico de 4,12, notablemente inferior á los de la plata sulfúrea y del rosicler, lo que se explica fácilmente por la porosidad que presentan y que manifiesta haber sido atravesados por corrientes gaseosas.

Una pequeña porcion que desprendí, tratada al soplete, sobre el carbon, sin reactivo ninguno, fundió inmediatamente, dando olor sulfuroso, un boton de plata pura y una pegadura débil de color amarillo de ocre en la cavidad del carbon, junto á la prueba, y otra pardo-rojiza oscura hácia fuera, ambas debidas á la plata. [1] Estos caractéres pirognósticos manifiestan que los únicos elementos que contienen, son la plata y el azufre. La falta de ejemplares que puedan proporcionarme material para ejecutar un análisis cuantitativa, me ha impedido asegurarme de si los referidos elementos se encuentran en las mismas proporciones que en la plata sulfúrea.

El otro ejemplar de los dos que he citado al principio, presenta estos caractéres: los cristales son tambien prismas exágonos regulares; pero el romboedro que forma el apuntamiento, parece más bien el primitivo del rosicler, que el equiáxeo; no he podido asegurarme de ello midiendo el ángulo, por estar los prismas incrustados en cristales cúbicos de plata sulfúrea. Exteriormente poseen un tinte rojizo, análogo al del rosicler, en tanto que en la raspadura su color es gris de plomo y son perfectamente dúctiles. Este ejemplar, juntamente con otros de bromuro de plata cristalizado en cubos sencillos, de la mina de la Luz, han sido regalados por el Sr. Rocha á la coleccion Mineralógica del Colegio del Estado, de que es digno profesor.

---

[1] Como pudiera causar sorpresa á algunas personas oir que la plata da pegaduras, cuando la mayor parte de los autores en uso colocan este metal entre los que no producen ninguna, debo advertir, que al clasificar la coleccion de minerales de plata en el colegio de este Estado, observé que las diferentes especies de ese género, tradas al soplete sobre el carbon, dan las mismas pegaduras arriba citadas; con la particularidad, de que cuando la sustancia que se prueba, contiene antimonio, como la plata agria y los rosicleres oscuro y semiprismático, la parte pardo-rojiza oscuro, mezclándose con la de este metal adquiere un tinte rojo, unas veces carmin flor de albérchigo ó rosa, y otras violado-purpúreo ó rojo pardusco; cuyas coloraciones comienzan á notarse en caliente, al desprenderse los últimos humos blancos de ácido antimonioso, y por el enfriamiento vienen á ser muy marcadas, presentándose bajo dos formas, en zonas circulares y flameadas. Estas coloraciones algunas veces no se obtienen. Por experiencias directas sobre la plata pura y ligada con antimonio, verifiqué que las pegaduras que acabo de citar, son debidas á la plata y á la mezcla de la de este metal con la del antimonio. En el otro artículo que á la vez tengo la honra de presentar á esa ilustrada Sociedad, doy detalles sobre este particular, así como sobre las pegaduras que dan algunas ligas binarias de plata.

Tratando de explicar la causa que haya producido la presente pseudomórfosis, efectué dos pruebas: 1.ª Expuse en las pinzas de platina á la llama de una vela, un fragmento de rosicler perfectamente puro; á la primera impresion del calor se resquebrajó; pero con la porcion que quedó adherida á las pinzas, despues de haberse desprendido el antimonio, parte al estado de óxido, y la otra en el estado de sulfuro, obtuve un resíduo de color gris de plomo y dúctil, aunque en menor grado que la plata sulfúrea. 2.ª Sometí á la reverberacion, en un tubo abierto por los dos extremos y encorvado, otro fragmento de rosicler igualmente puro; desde luego se resquebrajó y fundió; despues se desprendió óxido de antimonio, y quedaron por residuo unos fragmentos dúctiles de color gris de plomo. Estas experiencias, aunque no explican definitivamente la pseudomórfosis, al ménos manifiestan la posibilidad de que sea el calor el agente que trasformó el rosicler en sulfuro de plata dúctil.

He creido que la presente noticia sobre la referida pseudomórfosis, que no he visto descrita en ninguno de los autores de Mineralogía que yo conozco, será de alguna importancia, aunque meramente científica, y por lo mismo, aceptable á los ojos de esa respetable Sociedad.

Colegio del Estado de Guanajuato, Abril de 1874.

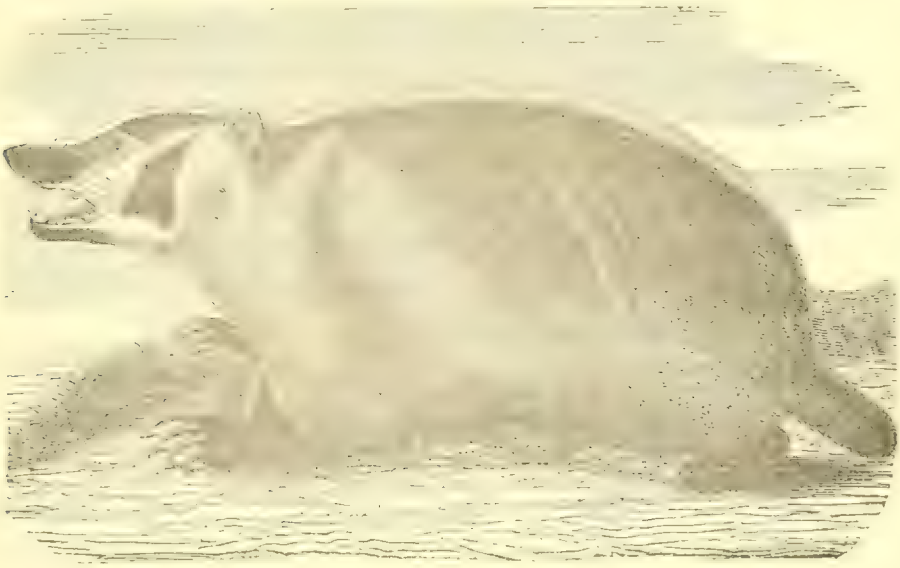
EL TLALCOYOTL,

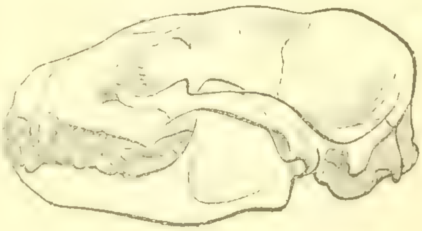
POR EL SEÑOR DON ALFREDO DUGES,

SOCIO CORRESPONSAL EN GUANAJUATO.

El mamífero carnicero, designado por Hernandez con este nombre, es evidentemente la *Taxidea Berlandierii*, de Baird, conocido con el nombre de Puerco Juin, y tambien con el de Tejon.

Su descripcion, en vista de una hembra jóven, la única que he examinado, es como sigue:





Dimensiones: cabeza 0,^{m} 15; cuerpo 0,^{m} 32; cola 0,^{m} 13; ancho del dorso 0,^{m} 20. Fórmula dentaria i. $\frac{3}{3}$, c $\frac{1}{1}$, m $\frac{4}{5}$

Pelo muy largo sobre el cuerpo, menor en la cola y corto en el hocico; partes superiores de un gris leonado; laterales leonado claro con rayas negrzucas. Detras de la nariz nace una línea blanca que sube á la frente y llega hasta la nuca; en los dos tercios posteriores de la parte média del dorso existe la misma. Nariz y lados del hocico pardos, así como una faja entre la línea blanca de la frente y el carrillo; éste es blanco, y sobre los lados de la quijada hay una extensa mancha triangular negra; orejas negras, ribeteadas de blanco en su borde libre. Iris negruzco. Cola rojiza con la punta casi negra. Patas de este color con las uñas pardas.

Este animal, que es la primera vez que lo veo, en 17 años que llevo de permanencia en Guanajuato, me dicen que se encuentra por el rumbo de Silao, y que de noche sale de sus madrigueras, a asolar los plantíos de maiz; mas por lo que he observado prefiere la carne á los demas alimentos.

Setiembre de 1870.

El género *Meles*, de Linneo, designado despues por Cuvier con el de *Taxus*, pertenece á la sub-familia de los Carnívoros plantigrados de este autor y á la division sub-ursianos de Blainville. Está caraterizado por tener 36 dientes, 6 incisivos y 2 caninos en ambas mandíbulas, 8 molares en la superior y 12 en la inferior. Son animales de cuerpo rollizo y bajo por la cortedad de sus piernas, que los hace andar casi arrastrándose; su hocico es recogido y las orejas cortas, arredondadas y casi ocultas por el pelo; ojos pequeños; lengua lisa, piernas terminadas por 5 dedos armados de uñas largas y robustas, sobre todo las anteriores, las que son propias para escarbar la tierra; cola corta y velluda, y junto al ano se encuentra una bolsa provista de un orificio trasversal, siendo el producto de la secrecion de un olor repugnante; mamas en número de seis, 2 pectorales y 4 ventrales; pelo largo, grasoso, rudo al tacto, y de tres colores y nada escaso.

El género de que nos ocupamos ha sido dividido por los metodistas modernos: 1.°, en *Taxus* propiamente, que comprende el Tejon de Europa, Blaireau de los franceses, *T. vulgaris*, Lin.; 2.°, *Taxidea*, á la que corresponde el *T. Labradorica*, y nuestra especie; *Ursitaxus*, reservada al *U. Napaulensis*, de las Indias Orientales.

Estas secciones fundadas en las distintas regiones que habitan las especies y en algunas diferencias en la denticion, son consideradas por Chenu como simples sub-géneros y no géneros como así las admiten algunos.

Como el Tejon de Europa, el Tlalcoyote es un animal perezoso; la forma de su cuerpo, la cortedad de sus patas y fuerza de sus uñas, le permiten escarbar con facilidad la tierra é internarse en ella á traves de una madriguera tortuosa y oblicua; no sale sino durante la noche para alimentarse, siendo muy duro de matar y valeroso cuando se ve atacado.

Esta especie habita, segun noticias, exclusivamente en la mesa central de México, en los terrenos pedregosos de la falda de las montañas que están inmediatos á los plantíos de maíz, pues se alimentan siempre que pueden, con las raíces de esta planta, devorando tambien el *elote* cuando está tierno. En el Valle de México se les encuentra raras veces.

El único ejemplar de la *T. Berlandierii* que existe en las colecciones del Museo Nacional, es una hembra bastante jóven; mide de largo 65 centímetros y de ancho en el dorso 25; su cola, en lo general, es tal como la describe el Sr. Dugés, notándose sin embargo, que la línea blanca que nace de la extremidad del hocico, se extiende hasta el nacimiento de la cola, con una ligera interrupcion en la mitad del dorso; las manchas negruzcas, más bien que rayas, de la parte superior y lateral del cuerpo, son muy extensas; la parte inferior es blanco-amarillenta; el pelo del dorso y flancos examinado aisladamente, es de este color en su primera mitad, en seguida negro, y blanco cerca de la punta. Los dientes anteriores que son los únicos que se pueden estudiar en el ejemplar citado, presentan los caractéres que F. Cuvier describe en los animales del género *Taxus*; incisivos, dispuestos trasversalmente, con los externos superiores mas gruesos que los demas y en forma de caninos, los inferiores correspondientes algo ensanchados en paleta y desigualmente bilobulados; caninos robustos, poco largos, cónicos, bastante arqueados, sobre todo los inferiores que son más ganchudos y ménos carenados que los superiores. (C. de P.)

Nota.—El pelo no está representado en el grabado tal como debe ser, pues es mucho más largo y lacio.

ENSAYO ORNITOLÓGICO

DE LA FAMILIA TROCHILIDÆ

O SEA DE LOS COLIBRIES O CHUPAMIRTOS DE MEXICO,

POR EL Sr. D. RAFAEL MONTES DE OCA, SOCIO DE NUMERO.

(CONTINUA.)

Num. 26.—*Chupamirto comun de pecho blanco.*

Cyanomyia cyanocephala, Gould; *Ornismya cyanocephala*, Less.; *Cyanomyia cyanocephala*, Bonap.

Este chupamirto, conocido vulgarmente con el nombre primero arriba citado, vive durante todo el año en las inmediaciones de Jalapa, Coatepec, Orizava y Córdoba, y en algunos otros lugares que se hallan poco más ó ménos á esta latitud. Es sumamente familiar con el hombre, pues se le acerca mucho sin aparentar miedo á gustar la miel de los calices de las flores, particularmente las del mazapan, si hay algunas en el campo cerca de él. Además visita casi constantemente y en todas las estaciones, los jardines de las casas de las ciudades; pudiendo desde luego decirse, que Jalapa y la parte de la República que se halla á la misma latitud y altura, es su localidad; puesto que el que esto escribe ha encontrado, en los meses de Abril y Mayo, nidos de esta especie de avecitas, los cuales están fabricados por dentro con los filamentos sedosos de la semilla del tule, como lo están la mayor parte de los de esta familia que pertenecen á aquella region, y por fuera cubiertos con el musgo de las peñas, de una manera tan ingeniosa y perfecta, que seria difícil al hombre imitar tan curioso trabajo.

Dichos nidos los hace la hembra, con ayuda del macho, en tres ó cuatro dias, y pone por lo general dos huevecitos, y alguna que otra vez, tres; que son blancos, ovalados y al parecer grandes en proporcion al tamaño de ella.

La apariencia de estos colibríes es como sigue: las plumas de encima de la cabeza, de un color azul marino metálico hermosísimo; las cubiertas de las alas, las de la cola y la parte posterior del cuerpo, son de un color pardo verdusco bronceado; la cola del mismo color, pero con ménos brillo; sus alas son largas igualando el tamaño de la cola y de color de tierra purpúrea; su garganta blanca que parece de raso, con los lados tintados de un color entre azul y verde mar muy delicado y brillante; las plumas del centro del vientre y las cubiertas de las piernas, de color blanco sucio; la parte de debajo de las alas pardo bronceado; las cubiertas inferiores de la cola, del mismo color un poco más claro; sus patas, uñas y mandíbula superior negras; la mandíbula inferior con las tres cuartas partes de ella, cerca de la cabeza, color de carne.

Su tamaño desde la punta del pico hasta la extremidad de la cola es 4½ pulgadas; alas 2¼; cola 1¼, y pico ¾ id.

La hembra, es del mismo tamaño que el macho y solo se diferencia de éste, en que tanto el azul de la cabeza como el blanco del pecho, no son tan marcados y su cabeza es más pequeña, teniendo ambos el pico recto.

NUM. 27.—*Chupamirto verde de cola de pescado.*

Chlorostilbon auriceps, Gould.

Este vistoso colibrí, cuyo descubrimiento se debe á las infatigables tareas del Sr. Floresi d' Areais, es muy probable que se encuentre en el rumbo de las minas de Real del Monte, adonde dicho señor tuvo el gusto de encontrar la mayor parte de las especies que envió á Europa. Tambien se halla en el Valle de México, mas en esta region se considera como muy raro; puesto que solo se pueden conseguir anualmente uno que otro ejemplar.

El Sr. Gould ha colocado esta especie en el género *Chlorostilbon*, que significa verde resplandeciente, y le ha dado además, el nombre de «*Long-tai-*

led Emerald,» esmeralda de cola larga á causa de esos dos caractéres tan marcados que tiene.

La apariencia del macho adulto, es como sigue: la parte superior de la cabeza, de un color verde metálico con reflejos de oro, que en algunas posiciones de la luz, mas bien parece que sus plumas son escamas de ese precioso metal perfectamente bruñido; toda la parte superior del cuerpo y cubiertas de las alas y de la cola, tienen un tinte verde bronceado lustroso; alas pardo-purpúreas; cola extremadamente ahorquillada, de un color negro azuloso con las extremidades de cada pluma tintadas de gris ferruginoso claro, excepto la exterior de cada lado que es de un solo color; toda su parte inferior, comenzando desde la garganta hasta llegar á la region anal, es de un color verde esmeralda metálico hermosísimo, con reflejos dorados; flancos de este mismo color; region anal y cubiertas de las piernas, blancas; cubiertas de debajo de la cola, pardas con visos verde bronceados; su pico, que es recto, negro, con la base rojiza; patas pardo-oscuras y uñas negras.

Su largo total es de 4 ¼ de pulgada; alas 1 pulgada 10 líneas; cola 2 pulgadas, y pico recto, 7 lineas.

La hembra, que es un poco mas pequeña que el macho, tiene la parte superior de la cabeza, del cuerpo, cubiertas de las alas y de la cola, así como los flancos, verde bronceados; alas pardo-purpúreas; cola, tan ahorquillada como la del macho, con las dos plumas del centro verde bronceadas, las demas, con excepcion de la exterior de cada lado, de este mismo color en su base, con el resto negro, ligeramente tintadas de gris en la extremidad de cada una; la exterior es tambien del color de las demas en su base, en seguida tiene una porcion gris ferruginosa, despues negro y termina con un tinte gris claro; toda su parte inferior, inclusa la cubierta de debajo de la cola, tiene un tinte gris ferruginoso, un poco más claro en la parte que corresponde á la garganta, y por último, su pico, patas y uñas, son iguales á las del macho.

Num. 28.—*Chupamirto de pico de coral y vientre castaño.*

Heliopædica Xantusi, Lawr.; *Xantus's humming-bird,* Gould; *Amazilia Xantussi,* Lawr.; *Heliopædica castaneocauda,* Lawr.

Este precioso colibrí, que el Sr. Lawrence ha apellidado así en honor del Sr. J. Xantus, á quien la ciencia debe mucho por sus investigaciones ornitológicas en la parte occidental de la América del Norte, se encuentra en la Baja California, cerca del cabo San Lúcas, de cuya localidad fueron enviados ejemplares al Smithsonian Instituto de Washington.

El Sr. Lawrence, en los Anales del Liceo de Historia natural de New-York, de principios de Abril de 1860, describió primero una hembra de esta especie, con el nombre de *Amazilia Xantusii*, y pocos dias despues, un macho con el de *Heliopaedica castaneocauda*, siendo la apariencia exterior de éste, como sigue: la parte frontal de la cabeza, garganta y una línea que le corre por la parte inferior del ojo y se prolonga hasta como média pulgada hácia atrás de éste, de un color negro azulado, teniendo además otra línea blanca que se extiende hácia el lado superior de la negra, comenzando en la parte posterior del ojo; toda la region superior del cuerpo y cubiertas de las alas y de la cola, verde-bronceadas; alas pardo-purpúreas; cola de un color castaño rojizo oscuro, con las dos plumas del centro marginadas de verde bronceado en casi todo su derredor; las restantes tienen tambien un sombrío oscuro cerca de sus orillas; cuello y pecho, con plumas de apariencia escamosa, de un color verde metálico hermosísimo; abdómen y cubiertas de debajo de la cola, de color castaño; flancos con reflejos bronceados; cubiertas de las piernas, blancas, tintadas de color castaño; pico color de carne, con la punta negra; patas negro-parduscas, con las uñas negras.

Su largo total es de 4 pulgadas; cola 1 ⅜ idem; alas 2 ¼ id, y pico ¾ idem.

La hembra es casi del mismo tamaño que el macho, con la parte superior de la cabeza, del cuerpo y cubiertas de las alas y de la cola, verde-bronceadas, con un tinte más latonado en la cubierta de la cola y algo pardusco en la parte frontal de la cabeza; las dos plumas del centro de la cola tambien son verde-bronceadas, las demas castaño rojizas, con una mancha oscura en la mitad exterior de cada pluma, cuya mancha disminuye en longitud, gradualmente en las que están más hácia los lados; alas pardo-purpúreas; toda su parte inferior, de un tinte castaño uniforme con visos verde-bronceados en los lados del cuello, y en los flancos adonde son más marcados; en la parte superior del ojo tiene una línea de color castaño, la cual, prolongándose hácia atrás de éste, toma un tinte casi blanco; la mandíbula inferior es color de carne con la extremidad pardo-oscura, siendo tambien de este color la superior; patas y uñas iguales á las del macho.

NUM. 29.—*Chupamirto de cabeza y cuello escarlata.*

Calipte Annae, Gould; *Ornismya Anna*, Less.; *Trochilus Anna*, Jard.; *Mellisuga Anna*, Gray y Mitch.

Esta bellísima especie de colibríes, parece ser peculiar de California, pues allí la descubrió el Dr. Botta; mas parece ser equívoca la idea de que visita la altiplanicie del Valle de México, puesto que el que esto escribe aun no ha podido encontrarla en esta region.

En 1829 fué introducida en las colecciones parisienses, y el Sr. Lesson, encontrando que era una especie nueva, la dió el nombre de Anna, en honor de la Duquesa Anna de Rivolí, á la cual, así como á su marido, consideraba como entusiastas naturalistas.

El Sr. Gould dice, que se debe al Dr. Gambel, de Philadelphia, el crédito de las observaciones que hizo en sus *Notes of the birds of California*, Notas de los pájaros de California, entre las cuales se halla la correspondiente á esta notable especie, que dice así: «Frecuenta las viñas y los jardines de los pueblos, formando sus delicados nidos en los pequeños matorrales florecientes ó escondidos en los cercados de los huertos, durante los meses de Abril y Mayo. Dichos nidos se encuentran en casi todos los jardines.» Por lo expuesto se ve, que su localidad está perfectamente bien determinada.

La apariencia del macho adulto es como sigue: la parte superior de la cabeza, las cubiertas de las orejas, garganta y lados del cuello, de un color carmesí metálico brillantísimo; toda la parte superior del cuerpo y cubiertas de las alas y de la cola, verde-bronceadas; alas pardo-purpúreas; cola casi cuadrada, con las dos plumas del centro verde-bronceadas, las demas pardo-oscuras, con los lados interiores de un tinte un poco más claro; pecho y centro del abdómen, gris; flancos verde-bronceados; region anal y cubiertas de las piernas, blancas; cubiertas de debajo de la cola, verduscas marginadas de gris; patas negro-parduscas; pico que es recto y uñas, negras.

Su largo total es de 4 pulgadas; alas 2⅛ idem; cola 1⅛, y pico ¾ idem.

La hembra tiene la parte superior de la cabeza, parduscas; toda la parte de arriba del cuerpo y cubiertas de las alas y de la cola, verde-bronceadas, con las dos plumas del centro de ésta, de ese mismo color; las restantes tienen las bases grises, en seguida una porcion verde-bronceada, despues otra negra, con una manchita blanca en las extremidades de las dos laterales de cada lado de ella; alas pardo-purpúreas; toda la parte inferior, de un tinte gris con visos verduscos en los flancos y lados del cuello, teniendo además unas cuantas plumas carmesí brillantes en el centro de la garganta; patas, pico y uñas iguales á las del macho.

Num. 30.—*Chupamirto real de pecho verde y cabeza azul.*

Eugenes fulgens, Gould; *Trochilus fulgens,* Swains.;
Ornismya Rivolí, Less.; *Mellisuga fulgens,* Gray y Mitch.;
Cœligena fulgens, Bonap.

Esta preciosa especie de colibríes, es otra de las que llaman la atencion en el territorio mexicano, tanto por su tamaño, como por el vistoso contraste de los colores metálico de su cabeza y garganta. Se halla bastante esparcida en este país, encontrándose en las inmediaciones de Jalapa y Coatepec durante la primavera y verano; pero con más abundancia en el otoño, en lo general gustando la miel de las flores del Cardo Santo *(Centaurea benedicta),* en cuya estacion se halla en el más abundante estado de florescencia. Tambien se encuentra en el Valle de México durante ese mismo periodo del año; mas es extraño que en ninguna de esas localidades se haya podido encontrar algun nido de los que fabrica dicha especie, puesto que debe nidificar durante alguna época de ese período. El Sr. Gould dice que habita tambien en Guatemala; y aunque no especifica el tiempo de su estancia allí, es muy probable que ésta sea durante el invierno, y le da tambien el nombre de *Rivolí* que le asignó Lesson, cuando creia que era una especie nueva, en honor de Massena, Príncipe de Essling y Duque de Rivolí, aunque algun tiempo ántes Swainson la habia apellidado *fulgens.*

La apariencia del macho adulto es como sigue: la parte superior de la cabeza, de un color azul turquí metálico hermosísimo; la parte tambien superior del cuello, del cuerpo y cubiertas de las alas y de la cola y abdómen, con excepcion de la parte posterior de éste, que es algo pardo-ferruginosa, son de un color verde-bronceado, siendo de notar, que tanto la parte superior del cuello como la anterior del abdómen é inferior del pecho, vistas de frente, á pesar de ser del color indicado, tienen la apariencia de un negro mate muy intenso; su garganta y parte inferior del cuello, son de un color verde tan brillante y hermoso, como el de la esmeralda; alas pardo-purpúreas; cola con las dos plumas del centro, verde-bronceadas, las demas negro-parduscas con reflejos bronceados en sus bases y extremidades; cubiertas de debajo de la cola pardo-ferruginosas, marginadas de un tinte un poco más claro; patas pardas; pico casi recto y uñas, negras; teniendo, por conclusion, una pequeña mancha blanca en la parte posterior del ojo.

La hembra, es con poca diferencia, del tamaño del macho adulto; tiene la parte superior de la cabeza, del cuerpo y cubiertas de las alas y de la cola, de un color verde-bronceado, algo pardusco en lo que corresponde á la cabeza; alas pardo-purpureas; cola con las dos plumas del centro verde-bronceadas, y las laterales negro-parduscas, con un sombrío más oscuro hácia sus extremidades, donde tienen las tres exteriores de cada lado, una mancha casi blanca, más pequeña en las que están más hácia el centro; toda su parte inferior es pardo-gris ferruginosa, con visos bronceados en sus flancos; teniendo unas manchitas parduscas, no muy marcadas en la garganta; y por último, tiene el pico, patas, uñas y la mancha blanca en la parte posterior del ojo, iguales á las del macho.

El macho jóven se parece más á la hembra que al macho, pues solo se diferencia de aquella, en que tiene algunas plumas azules en la cabeza y verdes en el cuello, en mayor ó menor número, á medida que tiene más ó ménos edad, y que las extremidades claras de las plumas de los lados de la cola, son ménos marcadas miéntras tanto no le desaparecen con la edad.

Num. 31.—*Chupamirto de pecho color de amatista.*

Calliphlox Mitchelli, Gould; *Mellisuga Mitchelli*, Gray y Mitch.;
Calothorax Mitchelli, Reichem.; *Tryphæna Mitchelli*, Bonap.

De esta rara especie de colibríes, hasta hace pocos años, solo dos ejemplares existian en Inglaterra, uno en la coleccion del Sr. Loddiges de Hackney y otro en la del Sr. Gould; de los cuales, el primero tenia asignada por localidad Zimapan, en el Estado de Hidalgo, segun dice el mismo Sr. Gould en su interesante monografía de los colibríes; y el otro en las cercanías de Popayan, siendo machos ambos ejemplares.

El Sr. Bourcier fué quien le dió el nombre de *Mitchelli*, en honor de Mitchell, célebre naturalista inglés, que tanto celo ha desplegado en la propagacion de la historia natural en su país.

Los individuos de dicha especie se parecen mucho al *Calothorax cyanopogon*, tanto por su tamaño, como por el color de su garganta y forma ahorquillada de su cola.

El macho adulto, en su apariencia exterior es como sigue: la parte superior de la cabeza, del cuerpo y cubiertas de las alas y de la cola, de un color verde-oliva con ligeros visos bronceados; alas, pardo-purpúreas; cola, bastante ahorquillada, de ese mismo color, pero mucho más oscuro; garganta y cuello, de un tinte purpúreo violado metálico hermosísimo; parte superior del pecho, gris blanquecino; abdómen y flancos, del mismo color de la parte superior del cuerpo; cubiertas de debajo de la cola, pardo-verduscas; region anal cubierta de un plumon blanco, teniendo además una mancha oblonga, de un tinte castaño, en la parte superior que cubre los cuadriles; sus patas son pardo-oscuras; sus uñas y pico casi recto, negros.

Su largo total, es de 4 pulgadas desde la punta del pico hasta la extremidad de la cola; alas 1 ¾ idem; cola 1 ½ idem, y pico 8 líneas.

La hembra, como debe suponerse, es desconocida.

NUM. 32.—*Chupamirto de gola y cabeza violada.*

Calypte Costae, Gould; *Ornismya Costae,* Bourc.; *Mellisuga Costae,* Gray y Mitch.; *Selasphorus Costae,* Bonap.

Esta notable especie de colibríes, tan conspícua, como dice el Sr. Gould, por el raro y hermoso tinte de su cabeza y cuello, imposible de describirse con exactitud, así como por su diminuto tamaño, es otra de las muchas que colectó el Sr. Floresi y que se encuentran en la parte occidental de la República mexicana, así como tambien en California.

El Sr. Bourcier fué el que la describió primero con el nombre de *Costae,* en honor del marques de Costa, de Chambery, posesor de una magnífica coleccion de pájaros de distintos países.

La apariencia del macho adulto es como sigue: la parte superior de la cabeza, cubiertas de las orejas, garganta y cuello, adonde sus plumas de aspecto escamosa son mucho más largas que las demás, de un color de lila ó violeta metálico hermosísimo; la parte superior del cuerpo y cubiertas de las alas y de la cola, verde-bronceadas; alas pardo-purpúreas; cola cuadrada, con seis de sus plumas centrales, de un tinte verde bronceado un poco más oscuro que el de la parte superior del cuerpo, con las dos restantes de cada lado, pardo-oscuras, teniendo todas las demas las extremidades tintadas de ese mismo color; toda su parte inferior es gris blanquizca, con un tinte verde-bronceado en los flancos; patas, pico casi recto y uñas, negro-parduscas.

La hembra presenta la misma diferencia que se observa con respecto al macho, en cuanto al color, que la que existe entre los dos sexos del *Calypte Annae* con cuya especie tiene mucha analogía tanto la una como el otro, excepto en el tamaño.

(CONTINUARA.)

APUNTES

SOBRE

EL MINERAL DE SAN NICOLÁS DEL ORO,

SITUADO EN EL DISTRITO DE MINAS DEL ESTADO DE GUERRERO:

POR EL SEÑOR DON TEODORO LAGUERENNE, SOCIO DE NUMERO.

Octubre 1º de 1874.

Este mineral se encuentra á sesenta leguas al S. O. de la capital de la República; esta distancia la aprecio en línea recta, pues por el camino que se toma para llegar á aquel lugar, se tiene què caminar próximamente el doble, atravesando el Rio Mexcala á cosa de once leguas ántes de llegar á San Nicolás del Oro.

Respecto á la descripcion de su formacion geológica, no podré extenderme tanto como deseara, pues como dicho mineral se encuentra situado en la falda de la Sierra Madre, casi todo el terreno, que es muy quebrado, está cubierto de una vegetacion rica y abundante, lo cual como es de suponer, dificulta las observaciones. En estos terrenos abundan los encinos y ocotes, contándose entre la primera clase el encino blanco y el encino prieto; de suerte que no escasean las maderas para la fortificacion en las minas y para las obras exteriores.

Durante mi permanencia en este mineral, que tuvo por objeto, el dar un informe de sus minas á la Compañía Restauradora, he podido observar que estas montañas están formadas en su mayor parte, de calizas metamorficas, teniendo en lo general, un color blanco amarillento, y algunas con un tinte azulado; las considero como calizas de los terrenos secundarios, pertenecientes á la época jurásica. Esta formacion es muy semejante, á las que he observado en el Mineral de Mazapil, en el Estado de Zacatecas, y en el Mineral de Zimapan, en la Sierra de Jacala, etc., etc.; puedo decir que es la formacion más dominante de todo el país; he vacilado por mucho tiempo, no sabiendo si deberia yo clasificar esta formacion, como cretácea ó como jurásica, ó como una formacion intermedia entre ambas, pues como todas estas calizas se hallan en estado metamorfico por el contacto y levantamiento de los pórfidos, sienitas, dioritas, etc., etc., no se encuentran por consiguiente, ningunos restos fósiles que lo puedan guiar á uno en la clasificacion; sin embargo, en las inmediaciones del Mineral de Tasco, existen calizas semejantes; y como se puede considerar que las serranías en estos dos distritos mineros son contemporaneas, y perteneciendo las calizas del Mineral de Tasco á la época de la formacion jurasica, segun se puede juzgar por las pocas petrificaciones características de esa época que se encuentran en ellas, no vacilo por lo tanto en clasificar las calizas del Mineral de San Nicolas del Oro, como calizas pertenecientes á la época de la formacion jurásica, como indico más arriba.

Esta formacion de calizas metamórficas, está recubierta por capas de arcillas coloridas, algunas veces de amarillo, otras de azul bajo, y generalmente de rojo más ó ménos intenso, cuyos colores son debidos á los óxidos de fierro, los cuales se hallan en tal abundancia, que propiamente podemos llamar a estas tierras *arcillas ferruginosas*, siendo de una resistencia variable, tenaces cuando se humedecen, ásperas al tacto, y quebradizas cuando se resecan.

Todas estas formaciones parecen haber sido levantadas por los pórfidos metalíferos, presentandose únicamente estas rocas eruptivas bajo la forma de diques ó montecillos aislados; se puede considerar mas bien que han penetrado o atravesado las calizas, metamorfizando el conjunto y accidentándolo en parte, que haberlas levantado en masa por una de esas grandes revoluciones que imprimen la unidad de constitucion física que se nota en todas las grandes cadenas de montañas: tansolo en los numerosos vallecillos y angosturas que presenta esta localidad bastante accidentada, es en donde se pueden ver los contactos de las capas de caliza con las rocas igneas; los pórfidos que han ocasionado estos levantamientos, son los pórfidos feldespáticos y dioriticos. Me inclino á creer, sin embargo, que la roca ígnea más antigua que ha ocasionado el levantamiento de esta parte de la Sierra, aun cuando en este mineral no aparece al exterior, es el granito, el cual he tenido ocasion de observar en la Cañada del Zopilote, situada á cosa de 20 leguas en linea recta al SE. de este lugar; en dicha cañada, en algunos puntos he podido ver el granito, y sobre él las capas de caliza, presentándose en extratificacion discordante.

El levantamiento de las rocas ígneas, es lo que en mi concepto ha dado orígen á la formacion de las diversas vetas, que en este distrito minero cruzan á sus montañas en todas direcciones. En este mineral considero varios sistemas de vetas, que dividiré en grupos para mayor claridad de mi relato.

El primer grupo comprende las vetas cuya direccion ó rumbo, es generalmente NO. 45° SE., las cuales tienen en lo general, de un metro á un metro veinticinco centímetros de ancho, y son casi verticales.

El segundo grupo lo forman las vetas cuyo rumbo es generalmente NO. 60° SE., con una inclinacion por lo comun, de 60° SO., y teniendo de ancho por término medio, un metro.

El tercer grupo lo forman vetas cuyo rumbo es NO. 65° SE., con un ancho de cincuenta á setenta y cinco centímetros, y casi verticales.

El cuarto grupo está formado por vetas que corren con rumbo NE. 75° á 80° SO., con su inclinacion al SE.; estas vetas parecen ser de bastante espesor: no puedo indicar ni su anchura ni echado medio, por no haberlas podido examinar en la profundidad.

Es evidente que hay un órden de sucesion entre esas cuatro direcciones que han formado estos cuatro grupos de vetas, pero en un terreno tan trastornado por diversas causas de fractura, deben de haberse producido tambien rajas en direcciones cruzadas, lo cual ha dado orígen á un sinnúmero de hilos ó vetillas que partiendo de estos cuatro grupos principales, se cruzan en todas direcciones.

Las vetas del primer grupo arman comunmente en pórfido, y en algunos casos atraviesan las calizas; sus matrices son espato calizo ó una mezcla de carbonato de cal con cuarzo, encontrandose a veces algunas arcillas que los prácticos designan con el nombre de *jabones* o *jaboncillos*, sus *pintas* son: sulfuro de plata, algunas veces sulfuros multiples, mezclados con algun oro en estado nativo.

Las vetas del segundo grupo arman por lo general en las calizas, y se encuentran descompuestas en algunas partes y formadas de arcillas ferruginosas; se necesita en estos casos un ojo practico para poder distinguir en dónde comienza el cuerpo de la veta y en dónde termina, pues es muy fácil confundirlas con el terreno en que arman; en estas vetas se encuentran algunas cintas ó hilos de tierras arcillosas que podemos llamar arcillas ferruginosas, por las grandes cantidades de óxidos de fierro que contienen, cuyos óxidos provienen indudablemente de la descomposicion de las piritas de hierro; las cintas son más blandas que el resto del cuerpo de la veta; el oro en el estado nativo, está contenido en ellas, y es perceptible á veces á la simple vista, pero en otras se halla tan diseminado en la masa arcillosa, que es necesario hacer tentaduras para saber si las arcillas contienen ó no este metal precioso. Estas vetas no están descompuestas en otros puntos, y entónces la matriz en que se presenta es cuarzo, y la *pinta* metálica, sulfuro de plata; dicha pinta metalica es muy fina, y por consiguiente, está muy diseminada en la matriz; ensayan por lo comun dos marcos de plata, por carga de 300 libras, teniendo ley de oro; cuando la pinta es muy visible á la simple vista, es decir, cuando es bastante *poblada*, ensayan hasta siete y nueve marcos de plata por carga; creo que estas vetas llegando á cierta profundidad han de amacizar, y la pinta que presenten entónces, será de plata con ley de oro, cuya ley irá tal vez disminuyendo con la profundidad, segun he observado que acontece en otros minerales.

Las vetas del tercer grupo, arman por lo general en las calizas, pero en algunos casos pueden considerarse tambien como criaderos de contacto: las vetas de este grupo las podemos considerar como divididas en dos zonas distintas. La primera está comprendida desde la superficie hasta la profundidad de 40 ó 50 metros, y está compuesta de arcillas teñidas por óxidos de hierro, mezcladas con cuarzo arcilloso, con rocas del alto y del bajo de la veta y con piritas de hierro; en esta zona, que podemos llamar de *los colorados*, se encuentra el oro en el estado nativo, y generalmente sigue en una cinta que á veces va del lado del bajo y otras veces del lado del alto de la veta; suelen encontrarse entre estas arcillas ferruginosas, masas más ó ménos grandes de cuarzo, teñidas por el óxido de hierro; con oro nativo, como se ve en el ejemplar marcado con el núm. 1, el cual tengo el honor de ceder á la Sociedad para su coleccion mineralógica, puede ceñirse tambien la cinta, en cuyo caso desaparece el metal, pero tan pronto como aquella se vuelve á ensanchar, se presenta otra vez el oro; de manera que podemos decir, que en estas vetas se presentan clavos ó tramos con oro, separados por tramos en *borra*, siendo éstos generalmente bastante cortos, segun he podido observar en algunos cañones que he seguido á hilo de veta. La segunda zona, que comienza desde la profundidad de 40 á á 50 metros, está formada por el carbonato de cal, el cuarzo, ó una mezcla de ambas sustancias, en las cuales existe el oro en el estado nativo y en el estado de *oro verde:* aun cuando no me fué posible bajar á la mina de San Nicolás, por estar inundado su laborío, pude encontrar en el terreno de dicha mina, despues de haber buscado por mucho tiempo, algunas piedras, ó más bien dicho, algunos ejemplares de espato calizo con oro nativo y otros con oro verde; me alegré sobremanera haber hallado esta última pinta, porque el oro verde es una pinta nueva, digámoslo así, y conocida solamente por muy pocas personas, lo que haria dudar tal vez de su existencia; por lo mismo tengo la mayor satisfaccion en poder ceder a esta Sociedad dos de estos ejemplares. En la muestra marcada con el núm. 2 se ve distintamente el oro verde, y en el ejemplar marcado con el núm. 3, que ha sido quemado en la fragua, se ve cómo ha brochado el oro, lo cual prueba evidentemente la existencia de aquella pinta, pues en el ejemplar que se quemó en la fragua no era visible el oro nativo. Esta pinta la considero como una mezcla íntima de oro nativo con cloro-bromuro de plata.

Las vetas que forman el cuarto grupo, realmente no han sido trabajadas, pues solo se han picado sus crestones en uno que otro punto, y por lo mismo, me he limitado únicamente ha indicar el rumbo que siguen.

Las vetas que constituyen estos cuatro grupos, forman un gran número de reuniones ó cruzamientos, y por los datos que he podido obtener, parece que los mejores clavos de oro se han encontrado en estas intersecciones.

Debo de hacer notar tambien, que en ciertos puntos de la superficie del terreno, la dispersion del oro es tal, que de cualesquiera tierra que se recoja y se haga tentadura, se encuentra una ceja de oro, á veces muy poco perceptible, y otras algo abundante; en fin, hay puntos en donde se encuentra concentrado el oro, formando verdaderos placeres, los que desgraciadamente son bastante reducidos.

Es digno de notarse que en este mineral, los metales de plata tienen buenas leyes de oro; miéntras que en el mineral de Tepantitlan de las Platas, que está á dos leguas escasas en línea recta al NO. de este mineral, y en el de Coronilla, que dista poco más ó ménos una legua al SE. de San Nicolás del Oro, las platas no tienen ninguna ley de oro.

Me parece conveniente el indicar, ántes de concluir, que en otras partes del globo hay formaciones muy semejantes á la que acabo de describir, habiéndose encontrado en ellas buenos criaderos de minerales de plata y oro. Es bien sabido que las calizas jurasicas ó cretaceas levantadas por rocas dioríticas, contienen los mejores criaderos de mineral de plata, y sabemos que en todas las vetas en que dominan las piritas de hierro, mezcladas con hidróxidos de hierro, que provienen indudablemente de la descomposicion de estas mismas piritas, mezclado todo con guija silizosa, etc., se encuentran verdaderos criaderos de minerales de oro, en los que este último metal está aislado de la plata. Recuérdense las sustancias que se encuentran en las vetas descompuestas á que he llamado *colorados*, y se verá que son precisamente los acompañantes del oro; recuérdese tambien la formacion geológica de este «Mineral de San Nicolás del Oro,» y se verá que corresponde, como indico más arriba, á las formaciones en donde se han encontrado buenos y ricos criaderos de minerales de oro y plata.

ESTUDIO QUÍMICO DEL LIVINGSTONITE:

POR EL SEÑOR DON MARIANO BARCENA,

SOCIO DE NÚMERO.

A mi maestro D. Jose Maria César.

En la sesion que celebró esta Sociedad el dia 4 de Mayo de este año, le presenté la descripcion de una nueva especie mineral que designé con el nombre de *Livingstonite*, en honor del viajero inglés David Livingstone.

Al señalar los caractéres químicos de la nueva especie, manifesté que habia encontrado las reacciones características del azufre, del antimonio y del mercurio, y ofrecí hacer una analisis cuantitativa para determinar las proporciones atómicas de esos componentes. Despues de algunas dificultades para obtener cristales limpios y bien determinados en que practicar mis investigaciones químicas, logré reunir algunos fragmentos que consideré como exentos de matriz, y con parte de ellos repetí algunas pruebas para confirmar la existencia de los componentes citados, cuyo objeto logré satisfactoriamente, y determiné además la presencia del hierro en el mismo compuesto.

Las reacciones que presenta el livingstonite cuando se calienta en un tubo abierto, son bastante notables; á la primera impresion del fuego emite humos blancos que se condensan en las paredes del tubo; en el segundo tiempo de la reaccion se forma un anillo negro agrisado de brillo metálico, y en su base se depositan nuevas partículas blancas, semejantes a las anteriores y provistas á veces de manchas rojizas. Todos esos sublimados pueden desalojarse por la accion del calor. Entretanto, la masa del mineral que está en el fondo del tubo, se funde y toma un color gris de acero en el centro, y sus bordes se tiñen de rojo carmin. Esta circunstancia, así como la presencia de las manchas rojizas, me hicieron sospechar la presencia del selenio, pero no se nota el olor característico que produce ese metaloide cuando se calienta, ni he podido descubrirlo por medio del ácido sulfuroso y otros reactivos propios para precipitarlo de sus disoluciones. Para alejar las dudas que me habian ocurrido sobre el particular, formé una mezcla de cuatro partes de sulfuro de antimonio natural y una de cinabrio, procurando imitar la composicion que he encontrado para el livingstonite; esta mezcla la calenté en las mismas circunstancias que aquel, y se produjo tambien la mancha roja, en la que encontré óxido de antimonio y cinabrio que se habia volatilizado ántes de descomponerse.

Examinadas las pegaduras que se depositaron en el tubo al calentar el livingstonite, reconocí que los sublimados blanco y negro, eran de óxido y sulfuro de antimonio, y que la parte gris mas brillante estaba formada de glóbulos de mercurio. Durante la reverberacion se produjo un olor bastante sensible de ácido sulfuroso.

Para efectuar la analisis cuantitativa, disolví en agua régia un decigramo del mineral en cuestion, y traté el licor por el ácido sulfohídrico; se formó un precipitado abundante en el que dominaba el color anaranjado propio del sulfuro de antimonio. Ese precipitado se disolvió en gran parte en sulfohidrato de amoniaco y quedó sobre el filtro un depósito negro que reconocí como sulfuro de mercurio.

El compuesto que se habia disuelto en el sulfuro alcalino lo precipité de nuevo añadiendo ácido clorohídrico á la disolucion; y habiéndolo calentado en presencia del hidrógeno, dejó un residuo de antimonio metálico, que correspondia á un 53,12 por ciento respecto del peso tomado del mineral. El sulfuro negro que quedó sobre el filtro, lo disolví en agua régia, y despues de evaporar varias veces la disolucion para desalojar el ácido azótico y sustituirlo por el clorohídrico, precipité el mercurio al estado de protocloruro por medio del cloruro de estaño; pero deseché este medio docimástico, porque el cloruro se reducia en parte espontáneamente y me daba resultados variables; emprendí la reduccion total de ese compuesto, pero se dividió tanto el mercurio, que no me resolví á pesarlo en ese estado, y adopté por fin el método de destilacion, obteniendo, por término medio, un 14 por ciento de mercurio, operando sobre un gramo de polvo del mineral.

El licor, de que habia separado los sulfuros de antimonio y mercurio, lo traté por el sulfohidrato de amoniaco que produjo un precipitado de sulfuro de hierro. Este fué redisuelto en ácido clorohídrico, y tratada la solucion por el amoniaco, se precipitó el hierro al estado de sesquióxido hidratado, y por la calcinacion lo trasformé en peróxido anhidro, cuyo peso acusó una cantidad de hierro correspondiente á 3,5 por ciento.

Separados todos esos cuerpos, solo me quedaba por pesar el azufre, y á este fin disolví un decigramo de mineral en agua régia, cuya disolucion se verificó con mucha lentitud, pues desde un principio se separó una masa de azufre que flotaba en la superficie del líquido, y para disolverla tuve necesidad de añadirle una buena porcion de clorato de potasa. Este método lo deseché, porque al poner el mineral en el agua régia, se producia una ligera efervescencia debida al gas sulfohídrico que se desprendia; y para evitar esta pérdida de azufre, ataqué el mineral por el ácido azótico solamente, que bajo la influencia del calor lo disolvió en su mayor parte, quedando un resíduo blanco de ácido antimónico.

En la disolucion separé los otros óxidos por medio del amoniaco, y en el licor filtrado precipité el ácido sulfúrico que contenia, al estado de sulfato de barita, acusando éste una cantidad de azufre que correspondia á 29,08 respecto del peso del mineral analizado. En la primera análisis que hice y que se publicó en el *Minero Mexicano*, encontré para el azufre la proporcion de 28,88; pero al repetir las operaciones, subió un poco esta cantidad, quedando por término medio, la que señalé ántes. En la matriz del livingstonite hay bastante azufre nativo, y tal vez á la presencia de éste, en los cristales que sometí al análisis, se deba este aumento, aunque he procurado servirme de los cristales más limpios en todas las experiencias que he practicado.

En vista de los resultados referidos, establezco la siguiente composicion centesimal para el livingstonite:

Azufre.	29,08
Antimonio.	53,12
Mercurio	14,00
Hierro.	3,50

Para determinar las combinaciones que pudiera formar el azufre con los otros cuerpos que lo acompañan, busqué por el cálculo las cantidades que se necesitan de ese metaloide para formar sulfuros de antimonio, mercurio y fierro, con las cantidades que de estos cuerpos determiné en la análisis cuantitativa. La composicion centesimal del sulfuro natural de antimonio que tiene por fórmula $Sb^2 S^3$, es de 27,12 de azufre y 72,88 de antimonio, y por consiguiente, para formar ese compuesto con 53,12 de este metal, se necesitan 19,77 de azufre. Por un método semejante he determinado las proporciones que de este metaloide corresponden á 14 de mercurio y á 3,50 de hierro para formar los sulfuros naturales cuyas fórmulas son HgS y FeS^2, y de este modo ha quedado perfectamente repartido el azufre encontrado en la análisis. Sumando las cantidades de este metaloide con sus correspondientes de los otros metales, y dividiendo las sumas por los equivalentes de los sulfuros $Sb^2 S^3$, HgS y FeS^2, se obtiene, despues de simplificar los cocientes, la relacion 4:1:1: que conduce á la fórmula $4Sb^2 S^3 + HgS + FeS^2$.*

---

* En este cálculo tomé por equivalente del antimonio el número 60,55 que se encuentra en la obra de Payen, tomando para el ácido antimónico la fórmula $Sb^2 O^5$.

Se llega al mismo resultado si se dividen las cantidades de azufre, antimonio, mercurio y fierro, obtenidas en la análisis, por sus equivalentes respectivos, pues por este método se obtienen los cocientes 18,17: 8,7: 1,4 y 1,2, que divididos por el menor, dan la relacion $S,^{15} Sb,^{7} Hg, Fe$, que puede escribirse $4Sb^{2} S^{3} + Hg, S + FeS^{2}$ como la anterior, y en la cual quedan bien repartidos los 15 equivalentes de azufre.

El livingstonite se encuentra en Huitzuco, en el Estado de Guerrero; las matrices de los ejemplares que he examinado están formadas de carbonato y sulfato de cal, y lo acompañan el azufre nativo, el cinabrio, la valentinita y el sulfuro de antimonio.

Al observar la naturaleza de las matrices, así como la de los cuerpos que acompañan al livingstonite, pudiera sospecharse que el primer compuesto que existió en los terrenos de Huitzuco fué el stibnite ó sulfuro de antimonio, que despues fué descompuesto por la accion de aguas termales sulfurosas y provistas de sulfuros de hierro y de mercurio. Bajo la accion de estos agentes, pudo verificarse la trasformacion del carbonato de cal y del stibnite en sulfato de cal y en livingstonite. Las masas cristalinas de este compuesto tienen el mismo aspecto que las del sulfuro de antimonio, pero algunos cristales aislados del primero tienen muy obtuso el ángulo de inclinacion de las caras del prisma, asemejándose por esto á los cristales de la valentinita ú ocre de antimonio. Esta cuestion cristalográfica la resolveré más tarde, pues ahora me ha sido imposible efectuarlo por falta de un buen goniómetro. Admitiendo la presencia de la valentinita al lado del sulfuro de antimonio, como se observa generalmente, podemos explicarnos su trasformacion en livingstonite por medio de los agentes ántes citados.

Por otras causas geológicas posteriores, pudo descomponerse el livingstonite en los cuerpos que lo acompañan, ó faltando á éstos algunas circunstancias propicias, quedaron aislados sin poder combinarse más que en parte para formar el compuesto múltiplo de que me ocupo. En algunos ejemplares he visto el cinabrio afectando los prismas del livingstonite presentando así un caso muy raro de pseudo-morfismo.

Desconfiando de mis propios esfuerzos, he mandado á Alemania, á mi ilustrado amigo el Sr. Dr. Burkart, algunas muestras de livingstonite para que repita su análisis el señor profesor J. Rammelsberg. Muy complacido quedaré, si los números que he determinado en mi análisis se aproximan siquiera á los que señale el sabio químico de Berlin.

México, Noviembre 7 de 1874.

ANALISIS

DE LA CORTEZA DE LA QUINA CALISAYA,

Cultivada en Cordoba.

Los que suscribimos, comisionados por esta ilustrada Sociedad, para hacer la análisis de la corteza de quina calisaya recogida del vegetal que lleva este nombre, y remitida por nuestro malogrado consocio el Sr. D. José Apolinario Nieto, el cual la cultivó y aclimató en Córdoba con tanto empeño y tan buen éxito; y deseando que la análisis que se nos encomendaba, fuera lo más exacta posible, tanto por la importancia que tiene el alcaloide principal contenido en ella, la quinina, cuya aplicacion terapéutica es tan conocida, siendo considerado hasta hoy como el principal agente para dominar las intermitentes, cuanto para corresponder, del mejor modo posible, á la honrosa confianza que en nosotros ha depositado la Sociedad, solicitamos del señor Director de la Escuela Nacional de Medicina, nos permitiera practicar la análisis en el laboratorio de química de dicha escuela.

Inútil es decir, que el señor Director de la mencionada Escuela, que lo era entónces el Sr. Dr. D. Leopoldo Rio de la Loza, tan amante de todo lo que sea adelanto en el país, se prestó gustoso á la solicitud que le hicimos, y puso á nuestra disposicion todos los aparatos y utensilios necesarios al objeto y que se encuentran en el referido laboratorio.

Antes de exponer el resultado de la análisis, creemos conveniente dar una ligera descripcion de la corteza que tuvimos á la vista, y es la siguiente: enrollada, su peridérmis tiene cisuras anulares algo profundas y á distancias casi iguales; se notan además resquebrajaduras trasversales y longitudinales; dérmis algo liso, de color leonado, la cara interna está finamente fibrosa y es de color amarillo-leonado; la quebradura trasversal es algo resinosa en la parte externa.

Por la descripcion que acabamos de hacer, creemos, que la quina en cuestion, pertenece á la segunda variedad de la calisaya.

Despues de haber deliberado sobre el medio más á propósito para practicar la análisis, y que diera mejores resultados, nos decidimos á hacer varios ensayes por tres métodos distintos, con el objeto de compararlos, y por el resultado, saber cuál era el más ventajoso de los que últimamente se han propuesto y por cuál se obtendria mayor cantidad de quinina.

Comparando los resultados de los distintos métodos que seguimos, y tomando el promedio, se obtuvo 1 gramo 883 miligramos por 100 de la corteza empleada, y por proporcion, 1 gramo 554 miligramos de los otros alcaloides.

M. F. Vigier obtuvo de las cortezas que el citado Sr. Nieto remitió á Paris, 1 gramo 15 centigramos por 100 de quinina, y 0 gramos 95 centigramos por 100, de los otros alcaloides. (Esta análisis fué hecha en 1871.)

Como se ve, nosotros hemos obtenido 0 gramos 733 milígramos de más de quinina, y 0 gramos 604 milígramos, tambien de más de los otros alcaloides: creemos que la diferencia consiste, tanto en la clase de corteza con que se ha hecho la análisis, cuanto en la edad y cultivo del vegetal. Es bien sabido que las cortezas delgadas producen ménos cantidad de alcaloides que las gruesas, y si se admite la teoría de M. Carles, de que los alcaloides residen principalmente y se encuentran en mayor proporcion en las capas superficiales que en las del liber, y siendo necesariamente las primeras mucho más delgadas en las cortezas á que nos referimos, que en las gruesas, de consiguiente tendrán aquellas ménos alcaloides.

Con el objeto de estudiar este punto, así como el de rectificar nuestros anteriores ensayes, hicimos una análisis de las cortezas gruesas y otro de las delgadas, dándonos por resultado, que en las mismas proporciones, las gruesas contenian 0 gramos 139 milígramos de más de alcaloides que las delgadas, y confirmamos con hechos prácticos lo que indica la teoría anterior.

No satisfechos con esto, y para comparar, aplicamos el método industrial y obtuvimos 1 gramo 776 milígramos de quinina por 100 partes de corteza; cantidad que solo se diferencia del primer resultado en 0 gramos 107 milígramos de ménos; cantidad insignificante, si se atiende á que por este método más bien se busca la economía en el procedimiento que la exactitud en la análisis.

La diferencia observada entre la análisis hecha aquí y la practicada en Francia, nos hace comprender, que con el tiempo puede mejorar en mucho la cantidad de quinina contenida en las quinas cultivadas en Córdoba, por lo que se hace indispensable que esta Sociedad fije el tiempo en que se hagan análisis anuales, para saber por este medio, el aumento de alcaloides contenido en dicho vegetal.

México, Diciembre 14 de 1874.

J. M Laso de la Vega.

Manuel Rio de la Loza.

SECRETARIA DE LA SOCIEDAD MEXICANA DE HISTORIA NATURAL.

Por acuerdo de esta Sociedad se publica lo siguiente:

«Necrologia.—Por el último paquete inglés se ha recibido la noticia del fallecimiento del sabio mineralogista aleman D. Juan Burkart, acaecido en Bonn, la noche del 4 de Noviembre próximo pasado.

El nombre del Sr. Burkart es tan querido para nosotros, como el de su ilustre compatriota el baron de Humboldt, pues á ambos sabios debemos algunos de los principales estudios científicos que se han hecho en nuestra República.

El Sr. Burkart vino á México hácia el año de 1825; dirigió algunas de las empresas mineras del país; recorrió éste en varias direcciones, reuniendo una infinidad de datos preciosos que publicó con el nombre de «*Reisen in México, in den Jahren 1825 bis 1834.*» El conocimiento de esta obra importantísima, basta para apreciar el mérito científico del Sr. Burkart y los grandes servicios que prestó á las ciencias en México.

De este excelente libro se han extraido y publicado numerosas memorias sobre diversos puntos científicos. En los «Anales de la Minería Mexicana» hemos visto un interesante estudio que tradujo del aleman el Sr. D. Miguel Velazquez de Leon, y se refiere á la explotacion de las minas de Pachuca y Real del Monte. La estadística, la historia, y otras materias muy importantes de esas negociaciones mineras, están consignadas admirablemente en ese estudio del Sr. Burkart.

Las observaciones verificadas por este sabio durante su permanencia en México, las enriqueció despues con datos más recientes, pues siempre tenia un vivísimo interes en saber los adelantos científicos y los progresos industriales de nuestra República. En sus cartas nos pedia constantemente algunas noticias sobre diversas materias, que se apresuraba á darlas á conocer en las academias de Alemania.

Otro de los estudios importantes del Sr. Burkart, que se ha publicado posteriormente, es un cuadro de alturas barométricas determinadas en varias localidades de México, como son las del camino de San Blas á Tampico y otras muchas, tomadas en varias direcciones, partiendo de Tlalpujahua, Zacatecas, Guanajuato, Zimapan y otros puntos donde permaneció por algun tiempo. El número de observaciones es de 1,800 próximamente.

El Sr. Burkart publicó últimamente el extracto de uno de los estudios del que suscribe, sobre los ópalos mexicanos, haciendo referencia á varias localidades en que habia observado rocas análogas á las que citamos como matrices opalíferas, y presagiando, por esa circunstancia, la existencia de los ópalos en aquellos puntos. Esta sábia prevision se ha cumplido con rigurosa exactitud en Amealco y en otros puntos citados por aquel ilustre mineralogista.

Los meteoritos mexicanos llamaron siempre su atencion de una manera muy especial: cuando regresó á Europa llevó consigo algunos fragmentos de los aerólitos de la Mixteca, Zacatecas y otras localidades, los cuales estudió en union del profesor Bergemann. En sus cartas nos pedia informes sobre todas las masas meteóricas descubiertas en México, pues se proponia escribir un catálogo general que las diera á conocer, y últimamente publicó un extracto de los estudios que sobre el meteorito de la Descubridora publicaron las sociedades mexicanas de Geografía y estadística é Historia natural.

El Sr. Burkart fué socio de muchas academias científicas de América y Europa; las sociedades mexicanas que acabamos de citar, lo contaban tambien entre sus miembros. Desempeñó muchos encargos importantes, como el de consejero privado de minas del rey y de la administracion superior de minas de Prusia.

La Sociedad Mexicana de Historia Natural toma parte en el sentimiento unánime de los cuerpos científicos, por la muerte del Sr. Burkart; y entretanto recoge los datos necesarios para publicar su biografía, reciba su apreciable familia el más sentido pésame, que tenemos la honra de dirigirle, por la irreparable pérdida que acaba de sufrir.

Enero 4 de 1875.

Mariano Barcena,
Primer Secretario.

NOTAS

SOBRE

LAS HORMIGAS MEXICANAS,

POR EDUARDO NORTON,

PUBLICADAS EN EL «AMERICAN NATURALIST» DE FILADELFIA.

TRADUCIDAS POR EL SEÑOR DON ANICETO MORENO.

SOCIO CORRESPONSAL EN ORIZABA.

Los insectos mencionados en este escrito, fueron enviados de México á la Institucion Smithsoniana por el profesor Sumichrast, con algunas notas sobre las costumbres de varias especies. Es interesante notar, que entre cerca de 20 especies, casi la mitad está aún sin describir, y que ninguna de ellas es conocida en los Estados-Unidos, miéntras que varias se encuentran en Panamá y el Brasil, y sin embargo, muchas de ellas viven en las regiones templadas de México.

He añadido a los datos del profesor Sumichrast algunas notas de varias de las especies descritas ya, para mostrar cuán poco se conocen realmente estos curiosos insectos, y tambien con la esperanza de que algunos de los lectores observen los hábitos, ocupaciones y trabajos de las especies que habiten los lugares en que ellos residan.

La propiedad quizá, más notable en el carácter de las hormigas, es su sociabilidad, reunidas en compañía de innumerables individuos y trabajando de consuno para objetos determinados, pues miéntras no han reconocido cabeza ó guia parecen todas consagrar sus esfuerzos sistemáticos para conservar el bien público, dedicando á ello toda su energía y aun estando prontas á sacrificar su vida.

La familia de las hormigas, además de los machos y de las hembras que son alados y generalmente de corta vida, presenta ademas individuos neutros que no tienen alas, viven todo el año y hacen los trabajos de la comunidad. Los machos y las hembras aparecen solo en el verano. Despues de cierto tiempo, cuando les es permitido dejar el nido, toda la sociedad entra en alboroto, y solo recobra su acostumbrada tranquilidad, cuando el número supérfluo vuela en enjambre en busca de nueva habitacion. De las que quedan, los machos mueren miéntras que las hembras pierden sus alas ó les son arrancadas por las trabajadoras. La hembra pone sus huevos que son pequeños y que crecen ántes de que la larva haya salido. Estas son pequeñas, sin patas, y están cuidadosamente atendidas y alimentadas por las trabajadoras, con un fluido elaborado préviamente en su estómago. Cuando han llegado á su mayor crecimiento las larvas, pasan al estado de ninfas; algunos géneros forman capullo, y otros no, y pronto sufren su transformacion en insectos perfectos. Estas larvas y ninfas son vigiladas con mucho celo por las trabajadoras, trasportadas a diferentes partes del nido y más ó ménos expuestas al aire segun la temperatura. Antes de que el hombre pueda prever la tempestad, las hormigas cierran cuidadosamente sus nidos, y tan pronto como aclara el cielo, vuelven á seguir sus trabajos. Los cuerpos de otros animales, los jugos de las plantas y aun las secreciones cerosas de otros insectos, por ejemplo, los *Aphides* ó pulgones son tomados por ellas para alimentar á sus delicadas educandas.

Las trabajadoras presentan dos formas distintas, conocidas con los nombres de *obreras mayores* y *menores:* á éstas debe agregarse una tercera que se encuentra con frecuencia en el nido y es de otra especie, pero que ha sido capturada en estado de larva por la especie más fuerte, y criada y esclavizada para el trabajo. Acerca de este punto poco se ha observado en este país, pero tenemos bastantes testimonios de las personas que han observado las especies europeas.

Las obreras mayores son de gran tamaño y tienen la cabeza muy desarrollada; pero relativamente pocas en número. Sus deberes en la sociedad no están claramente determinados; se supone, sin embargo, que tienen una especie de superintendencia sobre las demas.

En las siguientes descripciones he creido conveniente mencionar únicamente uno ó más de los caractéres externos prominentes, por los que puede conocerse el género de las especies mencionadas en ellas.

SUBFAMILIA FORMICIDÆ.

En el género *formica,* el artejo ó segmento semejante á un nudo, que está entre el tórax y el abdómen, forma una masa oval ó globular, aplanado y sin espina.

Formica esuriens. Smith.—Es muy comun en Orizaba y Córdoba. Vive en gran número en los árboles secos, en los que hace sus galerías en forma de embudo, ó debajo de las piedras. Por su aspecto puede comprenderse en el grupo de la grande hormiga negra pensilvánica, que vive en los árboles muertos. No es cierto que las especies que habitan en la madera muerta perforen la que está con vida; parece más probable que ocupen los canales formados ya por las larvas de varios coleópteros fitófagos y solo terminen la obra hecha en parte por éstos. En esta region las obreras permanecen en un estado de torpeza dentro de los arboles secos durante el invierno. El Dr. Fitch ha descrito una especie menor, *Formica caryae,* que habita en una clase de nogal, [1] taladrando sus galerías, segun cree, en el árbol vivo. La madera de estas galerías está muy descolorida y reblandecida, probablemente por un fluido acre (ácido fórmico) secretado con ese objeto por los insectos.

Formica fulvacea.—Cogida en Córdoba en los bosques, donde hace ordinariamente sus nidos en medio de las ramas de las parásitas bromeliáceas.

Formica nitida.—Habita las montañas de Orizaba y vive en pequeñas compañías debajo de las cortezas de los pinos.

Formica nacerda.—Orizaba y Córdoba. Se ha encontrado en las hojas de los árboles.

Tapinoma.—En este género el nudo está embutido en una depresion de la base del abdómen, de suerte que á primera vista parece que falta enteramente.

Tapinoma piceata.—Potrero (cerca de Córdoba). En los bosques de encinos.

Tapinoma tomentosa.—Orizaba. En pequeñas sociedades debajo de las piedras.

Polyrhachis.—Este género tiene el nudo del pedúnculo adelgazado y generalmente espinoso (de aquí el nombre genérico que en griego significa *muchas espinas*), con dos, tres ó cuatro espinas. El tórax está más ó ménos armado con espinas ó ganchos.

Polyrhachis arboricola.—Indígena en la region caliente, donde es muy comun. Su nido se encuentra ordinariamente en las hendiduras ó aberturas de los grandes árboles. Con frecuencia escoge los nidos abandonados de las hormigas blancas (*Comejen*) ó Termitas. En los mismos, que generalmente son muy grandes, vive una pequeña especie de perico, el *Conurus aztec,* (Swain). Es completamente vagabunda en sus hábitos y se le ve correr en los troncos de toda clase de árboles y hojas de arbustos, lo que prueba que es esencialmente habitante de los árboles. No hace daño en los plantíos.

---

[1] Véase la nota núm. 1 al fin.

SUBFAMILIA PONERIDÆ.

Ponera.—Este género, que es cercano al de la hormiga arriera (driver) de la costa oeste de Africa, se conoce porque tiene el artejo del pedúnculo adelgazado, nodiforme, con el primer segmento del abdómen más ó ménos estrecho. En las alas anteriores hay una célula marginal, dos completas submarginales y una discoidal; las espinas de la tibia son pectinadas.

Ponera strigata.—En las regiones templadas de México, debajo de las piedras.

Ponera pedunculata.—Smith. Se ha recibido una obrera de México. Esta especie se ha encontrado ántes en Panamá y en Rio.

Ectatomma.—Este género se conoce por el nudo del pedúnculo adelgazado y un poco ancho entre el primero y segundo segmento del abdómen. Las antenas están insertadas bajo la base del *clypeus*; los ojos están colocados en medio del rostro, y solo son pectinadas las espinas de la tibia anterior.

Ectatomma ferruginea.—México. Esta especie solo se ha encontrado en los encinales de la region templada y caliente, en donde vive en pequeñas sociedades debajo de los troncos de los árboles secos. Los machos difieren mucho en las antenas, y en la forma del tórax de las obreras. A esta especie parece peculiar la division del metatórax.

SUBFAMILIA MYRMICIDÆ.

En el género *Eciton*, el pedúnculo está formado de dos nudos. Son desconocidos los machos y las hembras. Las dos clases de obreras tienen ojos muy pequeños, los cuales faltan en varias especies. En algunas de ellas las obreras mayores tienen las mandíbulas muy largas, encorvadas en su extremidad, pero no dentadas.

Eciton hammata. Fabr.—Rio Atoyac, cerca de Córdoba. Tambien se encuentra en el Brasil y Cayena. Las dos clases de obreras de ésta y de las siguientes especies, han sido ya descritas.

Eciton mexicana.—Córdoba y Orizaba.

Eciton brunnea.—Córdoba y Orizaba.

Eciton Sumichrasti.—Córdoba y Orizaba. Todas las indagaciones que he hecho para descubrir el *formicarium* del género Eciton han sido sin éxito, y no he podido obtener informe alguno de los nativos, acerca del lugar en que son comunes estos insectos. Una sola vez encontré debajo de un tronco caido un numero prodigioso de obreras del *Eciton mexicana*. Estaban amontonadas unas sobre otras, como las abejas en un enjambre. Atacándolas con una vara, las obligué á dispersarse, pero no encontré entrada ó agujero alguno, ni huevos, ni machos, ni hembras.

Especialmente despues de una tempestad ó de una lluvia, se encuentran viajando bandadas de Ecitones. Su marcha se hace en un órden excelente, y en hileras de uno ó dos individuos de frente. A veces se ensancha, sin embargo, la columna, ataca y muerde al pasante que por descuido ó de intento las molesta. La *Eciton mexicana* parece especialmente muy irascible, y el entomologista que desée enriquecer su coleccion con ejemplares de esta especie, debe tener mucho cuidado y proteger sus piernas contra un ataque. Solo he encontrado individuos de mandíbulas grandes, á los que Smith llama obreras mayores, entre la *E. hammata* y la *E. mexicana*. Es difícil explicarse el papel que desempeñan en la comunidad. He vigilado con atencion el paso de las columnas de Ecitones, pero nada he podido ver que indique algun oficio ú ocupacion peculiar á estos individuos.

La *Eciton* no daña á la agricultura, despojando de sus hojas á los árboles como la *Œcodoma*. Al contrario, destruye probablemente multitud de insectos dañosos, y así se recomienda en las plantaciones, miéntras que merece la atencion de los entomologistas, por la singularidad de sus hábitos y la oscuridad que aun reina en su historia.

Acerca de los trabajos de las obreras mayores de grandes mandíbulas, Mr. Bates se expresa (British Museum Catalogue of Himenoptera) sobre una especie de la América del Sur, en los siguientes términos:

«Estoy casi convencido, de que los individuos de cabeza parda, son de un órden diverso en una colonia de Ecitones, y desempeñan funciones distintas y peculiares. Una vez ví en una playa una espesa columna de estas hormigas bajando de las rocas por un lado del puerto, atravesando la playa y subiendo por el opuesto. La longitud de la columna era de 60 á 70 yardas, y no se veia todavía ni la vanguardia ni la retaguardia del ejército. Probablemente era una emigracion, pues los individuos de cabeza pequeña, llevaban en las mandíbulas una multitud de gusanos blancos, que sin duda eran larvas de su especie. Los de cabeza grande estaban en la proporcion de 5% con los de pequeña, pero ninguno de ellos llevaba carga en las mandíbulas, y caminaban á los lados de la columna distribuidos en proporcion regular en toda la línea, haciéndose notar entre las demas, por su cabeza blanca y globular, que movian hacia arriba y abajo á uno y otro lado, cuando atravesaban las desigualdades del terreno.»

Parece que todos los Ecitones subsisten de objetos vivos. Es probable que el alimento animal sirva de nutricion á sus larvas, despues de pulverizado como sucede en otras especies con las materias vegetales. Mr. Bates hace notar, que la observacion es muy difícil en la mayor parte de las especies, porque ninguna paciencia humana puede soportar sus terribles ataques, el cruel aguijon y las mordidas de esos formidables insectos. Generalmente marchan en columnas. De las especies de la América del Sur, la *E. praedator* caza en compañía. Al atravesar la falange entera por un terreno descubierto, ocupa un espacio de 6 á 10 yardas cuadradas. Ya que ha pasado toda la legion se ponen los insectos en alarma y conmocion; corren por el suelo y suben á la copa de los árboles bajos, escudriñando sus hojas. Se les ve con frecuencia con las larvas, huevos y restos de otras hormigas, que son sin duda el resultado de sus ataques. Los suyos nunca han sido descubiertos.

En estos términos cuenta el resultado de una de sus observaciones sobre la *E. legionis:* «Una tarde descubrí una columna de ellas en el trabajo. Al dia siguiente las encontré cerca del mismo lugar; estaban excavando un banco de tierra ligera y extrayendo una especie grande de hormigas, con sus larvas y huevos. Era curioso verlas amontonadas en el orificio de la mina ayudando á sus compañeras á cargar los cuerpos de las desgraciadas hormigas, y como éstas eran muy voluminosas, las despedazaban, y los merodeadores corrian cargados con su botin. A cierta distancia habia varias hileras caminando por el declive del banco, y las que más adelante se unieron á las otras. Entónces se dirigieron á un grande y antiguo termitario, y para subir á él las *Ecitones*, formaron una columna compacta como una cinta de metal líquido. Algunas tiraban hácia arriba el cuerpo de las hormigas, y todas desaparecieron en una de las cavidades tubulares que atraviesan los termitarios antiguos, de la cúspide á la base.»

Pachycondyla.—En este género el nudo del pedúnculo es aplastado, cúbico ó casi cúbico, levantado al mismo nivel del primer segmento, y regularmente de la misma anchura. Los ojos pequeños é insertados en la parte inferior de la cabeza. Los ganchos de las dos tibias anteriores son comunmente pectinados.

Pachycondyla orizabana.—Vive en Orizaba debajo de las piedras y de los troncos de los árboles.

Pseudomyrma.—En este género el primer nudo es alargado, pedunculado; el segmento ancho y globuloso. Las antenas están insertadas cerca de la boca y entre sí; los ojos son alargados, ovados y ocupan una gran porcion de la cabeza. Las alas anteriores con una celdilla marginal y tres sub-marginales.

Pseudomyrma bicolor.—Guerin. México. Se encuentra tambien en Colombia y Panamá.

Pseudomyrma flavidula.—Smith. México. Tambien es especie de Sur América. No estoy completamente seguro de que sea la *P flavidula.* Entre las numerosas especies de este género que se encuentran en México, una parece ser solitaria, al ménos siempre se encuentra sola, miéntras que otras, como en la *P. bicolor* y *P. flavidula,* viven en mayor ó menor número en las espinas de que están armados los tallos de algunas especies de mimosas. Estas espinas, fijadas por pares en las ramas, están horadadas en su extremidad por un agujero que sirve de entrada y salida á las hormigas. El interior está hueco y contiene algunos neutros, las larvas, y en su estacion los machos y las hembras. La picadura de estos insectos es muy dolorosa, pues se fijan con las mandibulas muy tenazmente a la parte que agarran. Sin embargo, á pesar de que una de sus especies difiere un poco en tamaño de la *P. flavidula,* Smith dice que debe ser considerada como la misma.

Mr. Smith ha descrito una especie de Panamá, *P. modesta,* que vive en las espinas huecas de una especie de Acacia. Estas espinas tienen tres pulgadas de longitud, terminando en punta, con una base ancha. Las hormigas hacen un pequeño agujero en la punta, formando en la base su domicilio, admirable por la pequeñez. No tiene celdas ni divisiones para recibir los huevos y larvas. El número de ninfas encontradas en un nido es de 29, de las cuales 20 estaban ya formadas; todas eran obreras. Las ninfas no estaban encerradas en capullos.

Pseudomyrma thoracica.—Córdoba. Vive en los troncos y debajo de la corteza de los arboles, en sociedades que á veces son muy numerosas. Otras dos especies de *Pseudomyrma* de la América del Sur, han sido observadas por M. Bates, la *P. oculata* y *P. termitaria,* que construyen sus nidos en cámaras, dentro de las paredes exteriores de los túneles de diferentes especies de termitas. Otra especie que vive en pequeñas colonias, forma su *formicarium* en el tubo medular de los tallos secos. Por esta variedad de hábitos se ve que no hay una regla para el género, como en las *Formicae* y en las *Myrmicae.* Toda especie ó grupo de especie, debe estudiarse separadamente, aunque se encuentren propiedades comunes á todo el género, como la manera de procurarse alimento y transformarse.

El género *Atta* tiene dos nudos en el pedúnculo, las alas son más grandes que el cuerpo, con una celdilla marginal y tres sub-marginales, la tercera es á veces incompleta, y la segunda en forma de campana. Las obreras grandes tienen la cabeza muy desarrollada y el coselete ó tórax sin espinas. Este género pertenece á la subfamilia *Attidæ* de Mr. Smith.

Atta clypeata.—Smith. Mr. Smith describe solamente el macho y la hembra. La obrera menor de Orizaba (México) conviene bastante á la descripcion.

Otro género de este grupo es la *Œcodoma*. Difiere del *Atta* exteriormente, en que tiene el coselete armado de espinas, y en las alas anteriores dos celdillas sub-marginales; la segunda incompleta.

Œcodoma mexicana. Smith. Esta especie desgraciadamente es muy abundante en México en los departamentos templados de la costa del Golfo, tales como Orizaba, Córdoba, etc. Los neutros se conocen en México con el nombre de *arrieras* ú *hormigas arrieras*, por la semejanza que presentan en su marcha en columna con una caravana de muleteros. El macho y la hembra llevan el nombre de *chicatanas*. En varios lugares los nativos se comen el abdómen de las hembras desprendido del tórax.

En las comarcas arcillosas construye la *Œcodoma* su enormes formicarios, de suerte que se ven desde léjos por la proyeccion que forman sobre el nivel del suelo y por la ausencia completa de vegetacion en su derredor. Ocupan estos nidos una superficie de muchos metros cuadrados, y su profundidad varia de uno á dos. Se ven al exterior muchas aberturas de una á tres pulgadas y conducen á las cavidades interiores que sirven de almacenes para los huevos y las larvas. La parte central del nido tiene una especie de embudo destinado para el desagüe, pues en un pais en que las lluvias periódicas son muy abundantes, difícilmente escaparian de ser sumergidas completamente, si no tomaran algunas providencias para evitarlo.

El órden que reina en el interior de estos formicarios es admirable. La coleccion de vegetales llevada por las obreras es a veces considerable; pero los depositan de tal modo, que no causa incomodidad alguna a los habitantes, ni impide su circulacion. Las hojas forman especialmente ese depósito, y por esto la *Œcodoma* es un verdadero azote de la agricultura. A cada paso y en todas partes, en los bosques elevados y en las llanuras, en los desiertos y en las cercanías de las habitaciones se encuentran columnas numerosas de estos insectos, ocupados con celo admirable en trasportar sus hojas. Y aun parece que la gran ley de la division del trabajo no es ignorada por estos pequeños séres, á juzgar por las siguientes observaciones que he tenido ocasion de hacer.

La tierra al pié del árbol donde se han reunido las *arrieras* para despojarlo de sus hojas, ordinariamente está regado de fragmentos cortados con la mayor precision. Si el árbol no es muy alto, puede uno mismo cerciorarse de que una parte de las forragistas que han subido á él, se ocupan en cortarlas, miéntras que en el pié hay conductoras que hacen viajes del árbol al nido. Este manejo que indica en estos insectos un grado raro de inteligencia, tal vez no sea de práctica constante é invariable, pero es un hecho incontestable, que puede probarse fácilmente. Las habitantes que han sido llamadas trabajadoras, carecen de alas y son de tamaño variable. Las más grandes (obreras mayores, Smith) se distinguen de las otras á primera vista por el gran desarrollo de la cabeza y la presencia de pequeñas ocelas en la faz. Algunos viajeros han atribuido á estos cabezones un grado superior de inteligencia y los representan como ejerciendo una especie de sobrevigilancia sobre los otros miembros de la comunidad. Confieso que no puedo conformarme con estas conclusiones, porque siempre las he visto entregadas á los mismos trabajos de cortar y trasportar hojas, y esto sin indicar de ninguna manera mayor desarrollo de instinto. Probablemente su especial papel, si alguno desempeñan, se limita á la excavacion del nido y á hacer el túnel de las galerías, trabajos que requieren mayor fuerza y mejores útiles.

El nido de la *Œcodoma* sirve de habitacion á varios parásitos, algunas serpientes y particularmente ciertos insectos que sufren allí sus metamórfosis. Escarbando los nidos en la primavera, se encuentran algunas especies de escarabeos; tambien un gran número de machos de un himenóptero [2] (*Elis costalis*, Lyp.) vuelan sobre los nidos y se paran en las ramas secas que están inmediatas, y estoy seguro de que esperan á las hembras de su especie que han entrado en el hormiguero.

Al principio de la estacion de aguas, despues de los primeros aguaceros, comienza la *Œcodoma* el trabajo de la reproduccion. La union de los sexos probablemente tiene lugar durante la noche, pues por las mañanas se encuentran las cercanías del hormiguero regadas de cuerpos muertos de machos y hembras ya fecundadas, á las que los neutros han cortado las alas.

Los destrozos cometidos por la *Œcodoma* [3] en los lugares habitados, tanto por la superficie que remueven para el nido y que impide el cultivo, cuanto por el número de árboles que despojan de hojas, son considerables y exigen mucho cuidado de los cultivadores. Han ensayado muchos medios para ahuyentarlas; pero el único que produce buen resultado, es el de extraer todo el nido. Para conseguirlo, hacen una excavacion á su derredor, de una profundidad suficiente, sacan la boveda y las paredes del nido, y al encontrar las celdillas destruyen las larvas y los huevos. Los insectos perfectos que escapan en la ruina de la colonia desaparecen para no volver más.

Los plantíos de café que exigen un suelo limpio, son preferidos por las hormigas arrieras para hacer sus nidos, y es fácil comprender las pérdidas que ocasionarian á las propietarios, si no tuvieran una vigilancia diaria y continuada para evitarlas. Parece conveniente copiar el testimonio de Mr. Bates acerca de la *Œc. cephalotes*, especie comun en la América del Sur. Este insecto, por su ubicuidad, inmenso numero, industria, y constante propension al pillaje, es uno de los más importantes animales del Brasil. Sus numerosos individuos están ocupados sin cesar en deshojar árboles, y los más atacados son las especies mas útiles y cultivadas. Hacen una division regular del trabajo, pues parte suben á los árboles, parte cortan las hojas en pequeños pedazos irregulares del tamaño de un *shiling,* al punto que caen, y otras las cargan. Para trasportarlas se reunen todas en columna, y las que hacen una carga muy pesada, la depositan en un monton inmediato al agujero, en cuyo derredor hay un gran número de obreras pequeñas. Las de cabeza grande no están ocupadas en cortar hojas, ni se ven en la caravana, sino únicamente en remover el nido.

Mr. Bates dice: «He encontrado despues de remover en un pequeño espacio tres minas de cerca de una puĺgada de diámetro y medio pié de profundidad, las tres unidas por otras tubulares de cerca de 4 pulgadas de diámetro. No pude encontrar su fondo con una vara de 4 á 5 piés. El tubo era liso y cubierto de un gran número de obreras de un tamaño mucho menor que el de las que se ocupaban en llevar hojas y no se mezclaban con ninguna. Despues, profundizando más la mina, subieron de uno en uno varios individuos gigantescos, más grandes que los del mayor tamaño que andaban afuera, y los que supongo que deben pertenecer á otra especie. Además del volúmen más considerable de la cabeza, tiene una ocela en medio de la frente. Este último carácter les da un horrible aspecto en las profundidades del nido.»

Hablando de otras especies, la *Œ. sexdentata,* Mr. Smith cita al Rev. Hamlet Clark, que dice, que en Constancia (Brasil) el propietario de una plantacion empleó toda clase de medios para exterminarlas y ninguno produjo resultado. Algunas veces en una sola noche despojan un naranjo ó un limon de sus hojas; una zanja con agua al derredor del huerto que lo libra de las demas hormigas, no produce ningun efecto para impedir su invasion, pues esta especie hace una mina por debajo sin dificultad. Personas fidedignas me han asegurado, que en sus avances en la comarca estas hormigas han minado debajo del gran rio Pariaba. De cualquier modo que sea, y sin ninguna especie de puente natural ó artificial, aparecen del otro lado y continúan su camino. Este testimonio está confirmado por Mr. Lincecum (Proceedings of Academy of Natural Sciences of Philadelphia, 1867, pág. 24) en una interesante Memoria sobre la *Œc. texana* que ha observado por 18 años; asienta que con frecuencia, por algunos centenares de yardas llevan sus caminos subterráneos en los desiertos cubiertos de yerbas, donde ésta opondria algun embarazo á su marcha. Una vez, para llegar al jardin, donde estaban despedazando las plantas, hicieron un túnel debajo de un estanque que tenia 15 ó 20 piés de profundidad y cerca de 30 de diámetro. Tambien observó que las obreras menores que permanecen cerca del nido, no se ocupan ni en cortar ni en acarrear las hojas, sino que están ocupadas en sacar la arena, y generalmente trabajan con pereza, de un modo muy diferente al de las activas y listas cortadoras de hojas. Tambien observó que los pedazos de hojas regularmente se secan afuera ántes de ser acarreados, y que si son humedecidos por un aguacero repentino, los dejan podrirse allí. Asimismo cree, que necesitan agua para vivir y que siempre escogen los lugares en que la puedan encontrar cavando pozos. Una vez M. Pearson excavó uno para su uso y encontró el agua á 30 piés de profundidad.

El género *Cryptocerus* pertenece á la subfamilia *Cryptoceridae* fundada en la forma de la cabeza, y que es más ó ménos aplastado en la parte superior, con los costados dilatados en placas marginales, lisas, que ocultan ó cubren en parte los ojos. El pedúnculo está formado de dos nudos; el coselete es espinoso y el rostro está acanalado en la frente para recibir las antenas.

Cryptocerus laminatus.—Smith. Brasil. Esta especie vive en Córdoba, en los mismos lugares que la siguiente, pero es más rara y más solitaria.

Cryptocerus multispinosus.—Es la especie más comun en los alrededores de Córdoba, donde vive en el tronco de ciertos árboles, especialmente en los de *Croton sanguiferum*, *Cedrela odorata*, *Spondias chilias*. Las hormigas muestran poca viveza; permanecen estacionarias una gran parte del dia á la entrada de los agujeros que conducen al nido. Al medio dia se les ve correr sobre los troncos caidos, sin órden ni objeto aparente. Cuando intenta uno cogerlas, elevan el abdómen al correr a la manera del *Cumatogaster Moctezumae*.

NOTAS DEL TRADUCTOR.

Habiendo pasado la mayor parte de mi vida en Orizaba, donde es muy comun la *Œcodoma Mexicana*, he tenido ocasion de observar algunas de sus costumbres, y de convencerme de los perjuicios que ocasiona esta especie, no solo en los plantios, sino tambien en las trojes y en las poblaciones mismas, en cuyas calles y casas hacen sus habitaciones. En las tiendas en que se venden semillas, cuando llegan a entrar, hacen sufrir á los propietarios pérdidas de consideracion, pues en una sola noche pueden trasportar á su hormiguero, sin exageracion, media carga de maiz, que es la semilla que prefieren. Ademas, no solo atacan las hojas de los árboles, sino tambien las cáscaras de ciertos frutos, como naranjas, plátanos, etc., y aun animales vivos, pues yo las he visto varias veces cargadas con un coleóptero lamelicornio (*Anomala cupricollis*), que se movia aunque le faltaban casi todos los tarsos, pero nunca con otra especie; y aun me parece que no buscan el insecto, sino que lo toman cuando lo encuentran en su camino. En su nido, segun la creencia comun, habitan algunas serpientes; yo nunca he encontrado más que algunas especies de *Elaps* y el *Coriphodon constictar*. Dicen que parecen vivir en buena compañía con dichos insectos, en cuyos nidos depositan tambien sus huevos.

(1) El original, inglés al mencionar este arbol, usa de la palabra *Hickory tree*, cuyo nombre se da á varias especies del género *Carya*, de Nutard, ó *Hicorius*, de Rafinesque, de la familia de las Yuglandéas, y por lo mismo no he encontrado el nombre de la especie á que se refiere el texto.

(2) Tal vez, y es punto interesante que no he tenido oportunidad de verificar, las hembras de la *Elis* depositan sus huevos en el cuerpo de las larvas de los *Scarabæus*. En Tehuacan (Departamento de Puebla), en donde es muy comun la *Scolia Azteca*, Sauss., abunda especialmente en las tenerias, por lo que me inclino á creer que las hembras de esta especie depositan tambien sus huevos debajo de la epidérmis de las larvas que pululan en la corteza del encino.

(3) A lo ménos por la *Œ. mexicana*, pues la *Œ. hystrix*, que tambien se encuentra aislada en los bosques de la parte caliente, es muy rara para ser peligrosa. Es conveniente añadir, que Orizaba está en la zona templada, Córdoba entre la templada y la caliente, y Tehuacan en las zonas frías de México. Mr. Bates nota, sobre la *hystrix*, que una vez encontró un gran número en un prado bajo, llevando fragmentos de los frutos caidos, pero que no vió ninguna de cabeza parda. Esto sucedió en el Brasil.

MINERALOGIA.

NOTAS SOBRE LAS ESFEROLITAS DE MÉXICO:

POR EL SR. D. MARIANO BARCENA, SOCIO DE NUMERO.

Hay en las formaciones volcánicas de México algunos compuestos minerales que, aunque conocidos en general, no lo son sin embargo en las numerosas variedades que presentan, y las que están caracterizadas por sus figuras particulares, colores, yacimiento, etc. Hace algun tiempo que hice notar esas circunstancias respecto de las obsidianas mexicanas, y en un estudio que hice de ellas, y que se sirvió aceptar la Sociedad Mexicana de Geografía y Estadística, mencioné los tipos ó variedades que me eran conocidas de ese feldespato volcánico, á fin de contribuir á la formacion de su historia y caractéres detallados.

Siguiendo mis observaciones sobre los minerales propios de nuestros terrenos de origen ígneo, voy á hacer algunas anotaciones sobre las variedades que he observado en las *esferolitas*, refiriéndome únicamente á los tipos que he visto personalmente hasta ahora, dejando para más tarde la continuacion de este estudio.

Se distinguen en general con el nombre de *esferolitas*, ciertas concreciones feldespáticas que se hallan en las formaciones volcánicas, y ese nombre colectivo se aplica á todas ellas sin hacer notar ninguna de las diferencias que presentan entre sí.

Las esferolitas mexicanas que yo he observado pueden referirse á los grupos siguientes:

1. *Esferolitas sueltas ó libres.*—Las concreciones de este grupo se encuentran en los terrenos de acarreo inmediatos á las montañas volcánicas, principalmente a las que están formadas de pórfidos traquíticos. La figura de estas concreciones es más ó ménos esférica ó arriñonada, pero rara vez se presentan en formas simples, sino más bien en grupos de esferas de diversos radios y sobrepuestas en varias direcciones. Su lustre, en la superficie exterior es centellante; en la interior ó de fractura, pasa á resinoso. Colores agrisados pasando por varios tonos de amarillo y rojo, principalmente del amarillo pajizo al rojo pardusco. Textura general concoidea pequeña; la interior es comunmente estriada y divergente. Peso específico de 2,5. Dureza de 6 en la escala de 12º.

Estas concreciones se desprenden generalmente de las masas en que estaban embutidas, principalmente cuando las rocas presentan acantilados ó planos verticales; pero muchas de estas esferolitas parece que quedaron libres desde su formacion, pues los accidentes de su superficie demuestran que se formaron con libertad y sin ninguna presion lateral. Las concreciones de este género son muy comunes en el Estado de Hidalgo, donde las toman equivocadamente algunas personas, por óxido de estaño, sin atender mas que á la figura concrecionada, sin fijarse en la gran diferencia de densidades que existe entre ambos minerales.

2. *Esferolitas embutidas.*—En las masas de pórfido, de obsidiana, piedra pez y piedra aperlada, se encuentran diseminadas ó en grupos las esfe-

rolitas; generalmente las de ese modo de yacimiento tienden á trasformarse en arcilla, pues parece que son ménos ricas en siliza. Su figura es esférica ó poliédrica, segun que estan aisladas ó comprimiéndose reciprocamente. Colores análogos á los de la variedad anterior ó idénticos á los de la roca que los contiene. Los otros caractéres físicos son, con pocas excepciones, como los ántes citados, pues en éstos solo el yacimiento y la figura son diferentes, aunque hay tambien esferolitas embutidas de formas arriñonadas.

En el distrito de Cadereyta, del Estado de Querétaro, he observado estas concreciones en dos yacimientos distintos. Se presentan formando grandes masas por sí solas en el cerro de la Silleta inmediato á la Villa de Cadereyta, cabecera del Distrito de su nombre. Las masas de esferolitas alternan con las de pórfido traquítico que constituyen el cerro, y forman con ellas transiciones insensibles, pues en las últimas hay esferolitas diseminadas ó cavidades esféricas ocupadas por calcedonia y cristales pequeños de cuarzo. Si se hace una seccion en la roca esferolítica, se obtienen figuras poligonales, pues las concreciones están comprimiéndose reciprocamente, y el efecto de esos dibujos se hace más agradable con las líneas divergentes que presenta la textura de las esferolitas. En la region oriental del valle de Cadereyta hay algunos bancos de pórfido que alternan con otros de piedra pez, de color negro agrisado. En la masa de ésta he observado las esferolitas de figura más regular; se presentan, en efecto, bajo la forma de esferas aisladas de diversos diámetros, y se separan con la mayor facilidad al romper la roca que las contiene. El color de estas esferolitas es blanco agrisado y rojizo, por cuya circunstancia contrastan perfectamente con el color negro de la piedra pez en que arman.

En las cercanías del pueblo de Tequixquiapan, en el distrito de San Juan del Rio, del propio Estado de Querétaro, hay una vasta formacion de piedra aperlada, en cuya masa se encuentran numerosas esferolitas formadas tambien de la misma piedra ó de cascos concéntricos de siliza blanca agrisada: en algunos puntos de la masa solo se ven las cavidades esféricas que ocupaban los cascos silizosos, y aun se perciben sus restos más ó ménos completos, ó solamente bajo la forma de un polvo silizoso muy fino.

3. *Esferolitas que se hallan en las cavidades de la obsidiana.*—El Sr. del Rio, en sus «Elementos de Oritocnosia,» al hablar en general de la esferolita, menciona la que se encuentra en las oquedades de la obsidiana afectando figuras de cuadros ó pequeñas eras, así como de figuras hemiesféricas imitando á los *equinos*, por cuya circunstancia la llamó *equinolita.* Advierte tambien el Sr. del Rio, que la equinolita se cambia al fin en una

arcilla ferruginosa de color pardo cetrino que deja los huecos vacíos. Esta circunstancia me hace creer que unas concreciones que he examinado últimamente y se encontraron en los huecos de la obsidiana de Zinapécuaro, son distintas de las observadas por el Sr. del Rio. La sustancia á que me refiero presenta los caractéres siguientes:

Figura elipsoidal, presentando hácia el medio un reborde estriado, lo que le da al conjunto la forma de una flor. Lustre entre centellante y de vidrio en la parte que estaba embutida en la obsidiana, y de vidrio en la parte libre. Color blanco agrisado. Textura estriada divergente. Dureza de 7. Densidad de 2,48. La parte superior ó libre de estas figuras está cubierta de una multitud de pequeñas concreciones de lustre de vidrio que parecen de siliza pura. Al soplete sobre el carbon no se altera; con carbonato de sosa se funde difícilmente, y la escoria humedecida con azotato de cobalto y despues calcinada, toma el color azul característico de la alúmina.

Estas concreciones parecen ser de piedra aperlada impregnadas de un exceso de siliza libre, lo que se deduce de su mayor dureza y de las esferitas vitrias que cubren su superficie. Fueron encontradas por el Sr. D. Eufemio Amador, quien me las cedió para que las estudiase. En la cavidad en que estaban alojadas en la obsidiana, hay algunas masas pequeñas de la misma naturaleza que las concreciones, y en la forma cuadrangular que cita el Sr. del Rio, pero no he observado la arcilla ferruginosa á que el mismo autor se refiere.

En resúmen, las variedades ó tipos de esferolita que he visto hasta ahora, son los siguientes: masas sueltas amarillentas ó rojizas, de figura arriñonada ó de esferas agrupadas; esferas arcillosas embutidas en las masas de pórfido y de piedra pez; esferas de piedra aperlada embutidas en masas de esta misma roca, y figuras cuadrangulares y en forma de flor, de color blanco agrisado, é impregnadas de siliza y ocupando las cavidades de la obsidiana.

La formacion de la esferolita es debida sin duda, á la concentracion en diversos lugares y en la masa en que se presentan, de un exceso de siliza libre y sobrante despues de la formacion de los feldespatos, y que arrastrando las partículas de éstos, se concreciona formando figuras esféricas de diversos tamaños y de composicion variable. Igual orígen debe atribuirse á las masas sueltas, con la diferencia de que éstas se separarian bajo la forma de gotas que se unian al solidificarse. La tendencia que tiene la siliza á concrecionarse nos es familiar en un gran número de casos.

El Sr. del Rio, en su obra mencionada, cita el siguiente analisis de una esferolita, hecho por Ficino.

Siliza	79.12
Alumina	12.00
Potasa y sosa	3.58
Oxido de hierro	2.45
Magnesia	1.10
Pérdida por rusentacion	1.75
	100.00

Si se compara esta análisis á las numerosas que del feldespato ortoclasia se encuentran en la obra de Mineralogía del profesor Dana, se ve que efectivamente hay más siliza en la esferolita, pues ese ácido en la ortoclasia varía de 65 á 67 por ciento.

En la análisis de Ficino hay ménos alúmina que en los feldespatos, pues en éstos varía de 17 á 20, miéntras que en la esferolita citada es 12 solamente. Creo que en todas las análisis que se hagan de las esferolitas se encontrarán resultados variables, pues deben considerarse como una mezcla de siliza libre y de materias feldespáticas diversas.

México, Enero 21 de 1875.

OBSERVACIONES

SOBRE LOS CARACTERES QUE PRESENTAN TRATADOS AL SOPLETE LOS MINERALES DE PLATA Y SOBRE LAS PEGADURAS QUE PRODUCEN ALGUNAS LIGAS BINARIAS DE ESTE METAL, SOMETIENDOLAS AL MISMO TRATAMIENTO:

POR EL SEÑOR DON SEVERO NAVIA,

SOCIO CORRESPONSAL EN GUANAJUATO.

En el artículo anterior que tuve el honor de dirigir á esa respetable Sociedad, «sobre la pseudomórfosis de la plata sulfúrea,» ofrecí describir detalladamente los caractéres que presentan al soplete, sobre el carbon, las principales especies minerales de plata, así como tambien las pegaduras que dan algunas ligas binarias de este metal, sujetándolas á igual tratamiento. Cumplo ahora con ese ofrecimiento.

Cuando clasifiqué la coleccion de minerales de plata, perteneciente al Colegio de este Estado, en la cual figuran gran número de ejemplares de *polybasita* y *de plata agria*, algunos de ellos amorfos, y por lo mismo difíciles de ser distinguidos solamente por sus caractéres exteriores, tuve necesidad de efectuar algunas pruebas al soplete, sobre el carbon, con los referidos ejemplares, para determinarlos con toda exactitud; y entónces observé que producian una pegadura débil de color amarillo en la cavidad del carbon, y hácia fuera, cerca de los bordes de ésta, otra pardo-rojiza oscura, la cual, mezclándose algunas veces con la del antimonio en el caso de ser plata agria la sustancia que probaba (pues esta especie es la que lo contiene esencialmente), adquiria un tinte ordinariamente rojo claro. Al principio creí que estas pegaduras, que me llamaron fuertemente la atencion, serian producidas por el bismuto ó cadmio, con las que tienen alguna analogía, contenidos tal vez en corta cantidad en las citadas especies; pero buscándolos por via húmeda en union de mi apreciable amigo é inteligente químico el Sr. D. V. Fernandez, no los encontramos, ni tampoco ningun otro elemento distinto de los que constituyen las mencionadas especies. Repitiendo las pruebas con fragmentos cristalizados y puros de esas mismas especies, y ademas extendiéndolas a la *plata sulfúrea, y á los rosicleres claro, oscuro y semiprismático*, igualmente puros, siempre obtuve los mismos resultados. Presentando ya seis especies distintas las mismas pegaduras, supuse que éstas serian debidas á la plata y a la mezcla de la de este metal con la del antimonio, fundado en que, segun las fórmulas de dichas especies, solamente entran en su composicion *azufre, antimonio, arsénico, plata* y *cobre*. Ahora, de estos elementos, el primero no da ninguna pegadura; y aun cuando los dos siguientes las producen, son blancas y bien conocidas; así es que solo quedaban la plata y el cobre á que atribuirlas; pero como por una parte, el último metal solamente lo contiene la *polybasita*, y por otra, habia probado tambien al soplete varias especies minerales de cobre perfectamente puras, y no habia obtenido en este caso pegadura ninguna, era claro que la plata las producia en los minerales de su género. Sin embargo, para asegurarme más de este hecho, ejecuté pruebas directas de la misma naturaleza que las practicadas con los minerales de plata; primero sobre fragmentos de este metal puro, y despues sobre ligas binarias de plata y de antimonio, uno y otro en proporciones distintas; y como en ambos casos obtuve pegaduras iguales a las de los minerales de plata, no habia ya duda de que este metal las producia en aquellos, quedando, por consiguiente, verificado así mi supuesto.

No limité mis experiencias á esto, sino que guiado por las observaciones anteriores, las extendí á otras ligas binarias formadas de plata, como elemento constante, y de cantidades variables de otros metales (plomo, bismuto, zinc, etc.), con el objeto de investigar si la pegadura del primer metal modificaba á las de los otros de la misma manera que á la del antimonio. Con este fin traté sucesivamente al soplete, sobre carbones diferentes, cada una de las ligas mencionadas, y encontré que efectivamente, la pegadura pardo-rojiza oscura de la plata, mezclandose con la de los otros metales, les comunica en parte de su extension, un color de tintes diferentes, de tal manera marcados, que por solo la inspeccion pueden reconocerse, en muchos casos, los dos metales ligados.[1] En vista de estos resultados, hice tambien pruebas, tanto sobre algunas especies naturales, en cuya composicion entraran los dos metales de cada una de las ligas enumeradas, como sobre mezclas de dos especies minerales, siendo una de ellas del género plata y la otra conteniendo el segundo metal, que formaba parte de la liga sobre que operaba; y en uno y en otro caso siempre pude reconocer la presencia de la plata, aun ántes de obtener el boton metálico. Es de advertir, que más de una vez, probé ejemplares de blenda, que contenian plata en diversos estados, y que no obstante ser imperceptible a la simple vista, me la indicó el tinte rojizo que su pegadura le comunicaba á la del zinc.

Tanto por lo que acabo de exponer, como porque, hasta ahora están la mayor parte de las personas que se dedican al estudio de los minerales, en la inteligencia de que la plata no da pegadura, y podrian por lo mismo incurrir en errores, ó por lo ménos, no saber á qué atribuir las que producen las especies de este metal, y en general, todos los minerales que lo contengan, aun solamente como acompañante, pero en cantidad apreciable, me ha parecido no solo conveniente sino necesario, comunicar á esa ilustrada Sociedad los resultados de mi estudio sobre este particular.

El presente trabajo, segun he indicado ya, comprende la descripcion de los caractéres que presentan al soplete los minerales de plata, y la de las pegaduras que producen algunas ligas binarias de este metal, sometiéndolas al mismo tratamiento.

Caractéres que presentan tratados al soplete, sobre el carbon, los minerales de plata.

De las especies de este género he estudiado de preferencia las que se encuentran con más ó ménos abundancia en las vetas madre y de la Luz, que son: *plata sulfúrea*, *plata nativa*, *plata verde*, *plata córnea*, *plata*

---

[1] El cadmio produce modificaciones análogas, de las que hablaré adelante.

agria, polybasita, rosicler claro, oscuro y semiprismático. He ejecutado repetidas pruebas con fragmentos de ejemplares distintos y puros de cada una de estas especies, sin adicion de reactivo alguno, excepto el cloruro y el bromuro, á las que les añadí carbonato de sosa. Algunas veces tambien agregué este reactivo á la plata sulfúrea y á la polybasita para violentar su reduccion; rara vez lo hice con los rosicleres, porque en este caso las pegaduras no se obtienen, como sin él.

Los caractéres que manifiestan dichas especies tratándolas al fuego de oxidacion, son los siguientes:

Plata sulfurea (AgS).—Funde á la primera impresion de la llama, desprende olor sulfuroso, da un boton de plata pura y una pegadura (fig. 1), en la cual se distinguen tres coloraciones: *pardo-rojiza oscura en la parte média, cuando se ha enfriado; casi negra en caliente; amarilla de ocre en la cavidad del carbon, y verde azulada en la periferia.* Esta última zona aparece las más veces, solamente por un soplo prolongado, aun despues de haber obtenido el boton; en el mismo caso las tres coloraciones son muy marcadas, sobre todo en frío.

Plata nativa ($Ag.$)—Produce las mismas pegaduras arriba descritas. Esta especie es muy escasa en las minas de Guanajuato.

Plata verde ($Ag\,Br$) y plata córnea ($Ag\,Cl$).—Mezcladas con carbonato de sosa dan un boton de plata pura y pegaduras iguales á las descritas en las especies anteriores. Ambas son raras en las vetas de este mineral: la primera se encuentra en las minas de la Luz y en las del Nayal, acompañando al oro nativo, y la segunda en la de Mellado.

Plata agria ($Sb^2\,S^3 + 6\,AgS$), rosicler oscuro ($Sb^2\,S^3 + 3\,AgS$) y rosicler semiprismatico ($Sb^2\,S^3 + AgS$).—Funden facilmente, desprenden olor sulfuroso y abundantes humos blancos, quedando por resíduo un boton de plata pura. Aparece la pegadura blanca del antimonio desde el principio de la operacion; y al fin, cuando se desprenden los últimos humos, se observa que comienza á colorearse en parte de su extension de rojo carmin, flor de albérchigo ó rosa, unas veces, y otras de hermoso violado-purpúreo ó rojo-pardusco, viniendo á ser estas coloraciones muy marcadas en frío. Se presentan bajo dos formas: flameadas ó en zonas circulares, siguiendo los contornos de la cavidad, cuyo interior queda cubierto de la pegadura amarilla débil ya citada en las otras especies (figs. 2, 3, 4 y 5). Algunas veces no se obtienen todas las coloraciones que acabo de mencionar; pero en este caso se observan separadas las del antimonio y de la plata, particularmente si se ha prolongado el soplo, despues de haber obtenido el boton.

Rosicler claro ($As^2\,S + 3\,AgS$).—Funde con facilidad, desprende humos blancos, con olor sulfuroso al principio, y despues de ajo; quedando un boton de plata pura. Se obtienen las pegaduras del arsénico, que se deposita muy distante de la cavidad del carbon, y las de la plata en el interior de ésta y hácia fuera cerca de sus bordes, sin ser alteradas por la primera (fig. 6).

Polybasita $(Sb. As) S + 5 (Ag. Cu) S$.—En cuanto á esta especie, que es abundante en las minas de Guanajuato, advertiré que hay ejemplares que solo contienen arsénico, y otros, que además de este metaloide, encierran antimonio en cantidad considerable: [1] los primeros dan olor sulfuroso y de ajo, un boton de plata cuprífero, y las pegaduras del rosicler claro; los segundos desprenden tambien olor sulfuroso y poco de ajo, dan un boton de plata cuprífero y las pegaduras de la plata y del antimonio, siendo ésta poco abundante; las que, mezclándose algunas veces, manifiestan los tintes ya descritos al hablar de la plata agria.

Los detalles que preceden manifiestan cuáles son los caractéres pirognósticos de las especies minerales del género plata de que he hecho mencion. Solamente me he ocupado de esta clase de caractéres, por ser los únicos que ofrecen particularidades notables, no expresadas en los autores de Mineralogia; pero unidos estos caractéres á los exteriores y cristalográficos de esas mismas especies, que son bien conocidos, completan su historia y las determinan claramente.

Debo advertir que, para obtener las pegaduras tal como las he descrito, he procurado siempre llenar estas condiciones: 1.ª, usar de carbon vegetal de pino, muy compacto, practicar sobre él una cavidad cónica, poco profunda, de 3 á 4 milímetros, y de un diámetro de 8 mm.; 2.ª, emplear un soplete cuya abertura sea muy fina, y como combustible de preferencia, la vela, cuidando que la mecha esté siempre corta; 3.ª, dirigir la llama de oxidacion, corta y delgada, de tal manera que solo bañe al ensaye, y que forme un ángulo de 135° próximamente con el plano del carbon, y éste, uno de 85° con respecto á la vertical de la llama de la vela. Con estas precauciones, indispensables para un buen éxito, la reduccion se efectúa violentamente; la cavidad del carbon no se ensancha, ni se profundiza por su combustion, y la pegadura del antimonio se conserva intacta y cerca de los bordes, pudiendo así mezclarse con la de la plata y adquirir los tintes rojos ya dichos.

---

[1] Esta diferencia en la composicion corresponde á otra en los caractéres exteriores. He notado que los primeros se presentan en tablas exágonas regulares, muy delgadas; poséen un crucero claro, segun las bases; reflejos rojo de sangre al través de ellas, y mucho lustre: los segundos están tambien en tablas exágonas, pero gruesas; no se advierte ni los reflejos, ni el crucero, y son de poco lustrosas á mates.

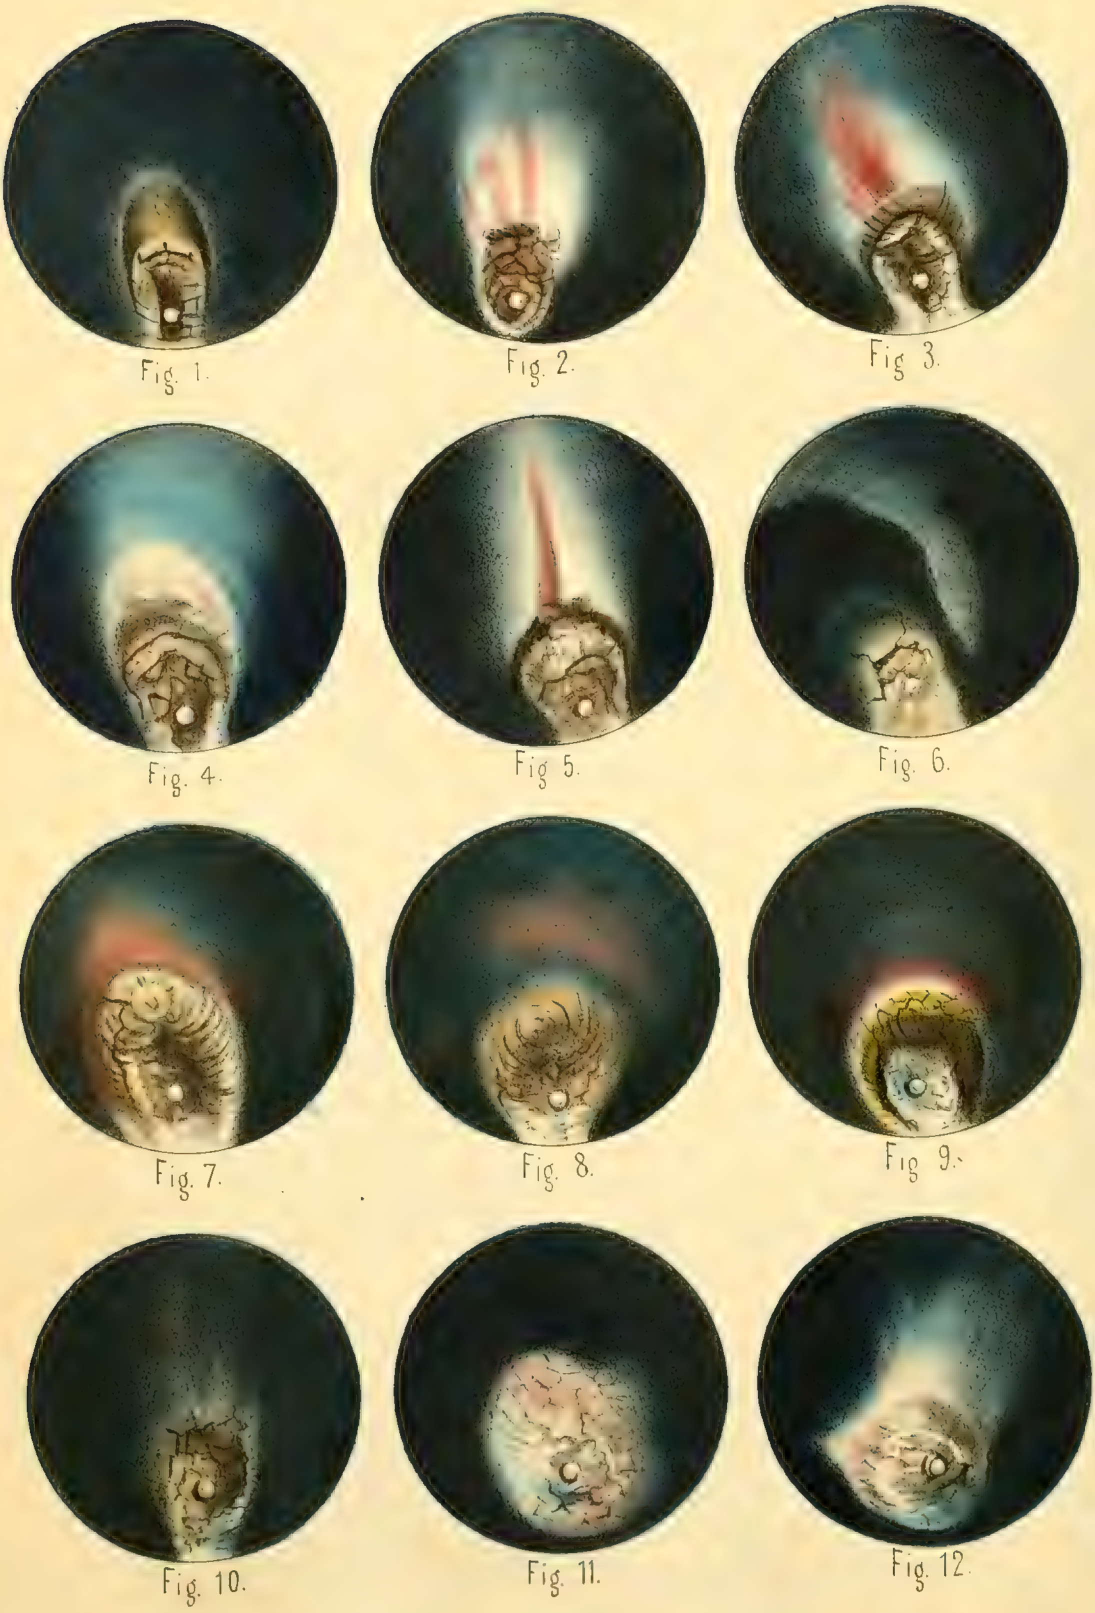


Fig. 1. Fig. 2. Fig 3.

Fig. 4. Fig 5. Fig. 6.

Fig. 7. Fig. 8. Fig 9.

Fig. 10. Fig. 11. Fig. 12.

Pegaduras que dejan sobre el carbon algunos minerales argentíferos tratados al soplete.

Pegaduras que produce la plata pura y ligada con algunos otros metales.

Plata pura. [1]—Este metal, sometido á la accion oxidante del soplete sobre el carbon, produce las mismas pegaduras que la plata sulfúrea, lo que prueba que las que da esta especie, son debidas á este metal.

Plata y antimonio.—La liga de estos metales produce las mismas pegaduras que la plata agria y los rosicleres oscuro y semiprismático. Esto confirma que las que dan las referidas especies, son debidas á la mezcla de las del antimonio y de la plata.

Plata y plomo.—Se obtienen con esta liga las pegaduras del plomo: la amarilla verdosa ó de azufre, junto á la prueba, y la blanca azulada en la periferia; pero en la línea de separacion de ambas, ó en la periferia, si no hubiere parte blanquecina, *aparece una zona mas ó ménos extensa y bien marcada, en frío, de color violado de obispo, rosa ó carmin* (figs. 7 y 8), segun las proporciones relativas en que se encuentran los dos metales. Si el plomo está en cantidad considerable, sus pegaduras son muy perceptibles; la llama se tiñe de azul débil; se observan globulitos irisados, y cuando la mayor parte de este metal se ha expulsado, comienza á notarse la zona roja que se aclara por el enfriamiento. Si al contrario, el plomo se encuentra en muy corta cantidad, su pegadura apénas se reconoce; pero la de la plata aparece casi inmediatamente coloreando á la anterior de rojo-carmin ó violado oscuro, en la mayor parte de su extension.

Estas mismas pegaduras obtuve tratando cortas porciones de una mezcla de plata sulfúrea y de galena (ésta en pequeña cantidad); lo que manifiesta que los compuestos naturales que contienen los mismos metales de la presente liga, dan idénticos resultados.

Plata y bismuto.—Con esta liga se obtienen las pegaduras de los dos metales que la constituyen. Las del bismuto aparecen desde el principio de la operacion: la blanca azulada ó verdosa en la periferia, y la amarillo-naranjada, ligeramente pardusca, en frío, junto á la prueba; la de la plata se anuncia por *la zona de color violado, rosa ó carmin oscuro, que se forma*

---

[1] El sabio profesor de química M. Fresenius, en su Tratado de análisis cualitativo, (pág. 274,) al hablar de los cuerpos que dan pegaduras, dice, refiriéndose á la de la plata: "es débil y rojo-oscura: plata. Si hubiese al mismo tiempo un poco de plomo y de antimonio, la pegadura será rojo-carmin." Esto confirma los resultados de mi estudio. Como esta propiedad de la plata nos era desconocida, hizo, que segun dije al principio, buscáramos por la vía húmeda el bismuto ó cadmio, á cuyos metales atribuíamos tal pegadura.

en la línea de separacion de las dos anteriores, ó en la periferia, si no hubiere parte blanquecina (figs. 9 y 10). Esta zona comienza á notarse cuando se ha expulsado la mayor parte del bismuto, si está en gran cantidad; en el caso contrario, aparece casi inmediatamente desde el principio de la operacion. La llama no se tiñe de azul; lo que puede servir en la mayor parte de los casos, para distinguir el plomo del bismuto, cuyas pegaduras es fácil confundir sin una larga práctica.

La nueva especie, descubierta por el ilustrado profesor de Mineralogía, el Sr. D. Antonio del Castillo, la Tapalpita ($Ag^2 S + Bi Te$) que contiene los mismos metales que la liga de que acabo de hablar, da exactamente las mismas pegaduras que ella.

Plata y zinc.—Se obtienen las pegaduras de los dos metales modificadas mutuamente. Si el zinc está en gran cantidad respecto á la plata, *la pegadura del primer metal se deposita en capas gruesas coloreadas de azul-violado ó de espliego ó gris de perla* (figs. 11 y 12); el dardo del soplete se tiñe de blanco azulado brillante, y la pegadura es fosforescente en caliente. Las coloraciones mencionadas comienzan á observarse en caliente, cuando se ha oxidado casi todo el zinc, y hasta despues de haberse enfriado la prueba, aparecen con toda claridad. Si al contrario, el zinc está en corta cantidad, su pegadura aparece casi inmediatamente coloreada de un hermoso violado de obispo ó de rojo rosado por la de la plata.

Las varias mezclas de blenda y de plata nativa ó dúctil, que sometí al mismo tratamiento, me produjeron pegaduras iguales á las de la liga artificial.

Plata y cobre.—Esta liga da las mismas pegaduras que la plata pura, con la diferencia de que las zonas pardo-rojiza, oscura y amarilla, son más extensas; la llama se tiñe de verde, y el boton se irisa unas veces y otras presenta un color uniforme amarillo de bronce ó de laton; tomando en algunos casos el aspecto de esmalte de color rojo cochinilla ó amarillo-naranjado parduzco, particularmente en frío. Estos diferentes aspectos del boton, dependen de las proporciones en que se encuentran dichos metales.

La mezcla de cobre sulfúreo y de plata dúctil, me dió los mismos resultados que esta liga.

Plata y cadmio.—La pegadura del primer metal no modifica sensiblemente á la del segundo. Debia suceder así, puesto que ambos metales producen una parte rojiza y otra amarilla, que aunque de tintes diferentes, tienen alguna semejanza; y mezclándose, no se observa modificacion marcada en los colores de la del cadmio, que por otra parte, es mucho más abundante que la de la plata, aun estando en proporciones iguales. Por esta razon, creí que la pegadura del cadmio, lo mismo que la de la plata, modificaria á las de los otros metales, plomo, bismuto y zinc. Y en efecto, las modifica; pues encontré que formando ligas binarias y tratándolas al soplete, los tintes que adquieren son parecidos á los que la plata les comunica. Sin embargo, pueden distinguirse por ser en general más débiles y aparecer solamente cuando el cadmio está en muy corta cantidad; pues en el caso contrario se reconoce perfectamente la pegadura de este metal. A la del antimonio le comunica ordinariamente un tinte amarillento.

Las blendas cadmíferas son las que producen pegaduras análogas á las de la liga de plata y zinc. Así es que en este caso deberá comprobarse la presencia de la plata por el régulo que deja, y el cadmio por la ausencia de boton.

Tales son los resultados que he obtenido, y de ellos se deduce:

1.º Que la plata pura da pegaduras tratándola al soplete sobre el carbon;

2.º Que mezclándose la parte pardo-rojiza de esas pegaduras con las del antimonio, plomo, bismuto y zinc, las modifica, coloreándolas de rojo-claro en parte de su extension, y

3.º Que en algunos casos la pegadura del cadmio les comunica á las de esos mismos metales, tintes semejantes.

De estas deducciones se obtiene esta conclusion: *la plata da una pegadura especial que sirve para reconocer su presencia; y modificando las de otros metales (antimonio, plomo, bismuto y zinc), caracteriza á éstos, sea en sus ligas, ó bien en los compuestos naturales que los contengan.*

Deseo que esa ilustrada Sociedad, encuentre exacto este trabajo, para que, como lo espero, sea útil en su aplicacion á las determinaciones mineralógicas.

Colegio del Estado de Guanajuato, Julio de 1874.

DICTÁMEN DE LA SECCION DE MINERALOGIA ACERCA DEL TRABAJO ANTERIOR.

Como miembro de la seccion de Mineralogía, y en cumplimiento del trámite dado por el señor Vice-presidente de esta Sociedad, sobre el trabajo del señor socio corresponsal D. Severo Navia, intitulado: «Observaciones sobre los caractéres que presentan al soplete los minerales de plata,» tengo el honor de presentar el informe siguiente:

El estudio que se ha dignado remitir á esta Sociedad el Sr. Navia, es sumamente interesante porque precisa los caractéres con que pueden reconocerse al soplete muchos de los compuestos argentíferos que son más comunes en nuestros distritos mineros, y que por su solo aspecto, pudieran ser confundidos con otros que presentan semejanzas con ellos. Por otra parte, la descripcion de cada uno de esos compuestos queda ya más determinada con el estudio detallado de sus caractéres pirognósticos como acaba de presentárnoslo el Sr. Navia, quien para comprobar sus observaciones, ha hecho una serie muy interesante y curiosa de experiencias, formando ligas de los metales que entran en la composicion de los minerales citados y comparando estos resultados con los obtenidos en los compuestos naturales.

El trabajo á que me refiero tiene tambien el grande interes de precisar los caractéres que presenta al soplete la plata metálica; caractéres en que se habian fijado muy poco los que han tenido ocasion de observarlos, y que por este motivo son generalmente ignorados ó desconocidos de las personas que recurren al análisis de via ignea para sus conocimientos mineralógicos.

En tal virtud, tengo el honor de presentar á la Sociedad la siguiente proposicion:

Publíquese en «La Naturaleza», órgano de la Sociedad Mexicana de Historia Natural, el interesante estudio del señor socio D. Severo Navia, á que se refiere el informe anterior.

México, Agosto 20 de 1874.—Mariano Barcena.

Num. 33.—*Chupamirto de cola de guías y garganta violada.*

Thaumastura enicura, Gould; *Trochilus enicurus*, Vieill.; *Ornismya heteropygia*, Less.; *Calothorax enicurus*, Bonap.

El Sr. Gould dice acerca de esta especie de colibries, que aunque Lesson y otros naturalistas le asignan por localidad el Brasil, no hay evidencia alguna de que se encuentre más hácia el Sur del Istmo de Panamá, y que su positiva localidad es Guatemala, así como tambien Yucatan en el territorio de la República mexicana, en cuyos lugares probablemente es estacionaria, puesto que la pequeñez de sus alas es poco adaptada para hacer grandes emigraciones.

La apariencia del macho adulto, es como sigue: la parte superior de la cabeza, del cuerpo y cubiertas de las alas y de la cola, de un color verde-bronceado, un poco más oscuro en lo que corresponde á la cabeza; alas pardo-purpúreas; cola extremadamente horquillada, con las plumas centrales muy cortas, verde-bronceadas, y las dos exteriores de cada lado de ella negro-purpúreas, marginadas longitudinalmente en su parte interior de un color castaño; garganta y cuello color de púrpura metálico hermosísimo; pecho castaño-claro, casi blanco adonde se une con el tinte purpúreo de la garganta; centro del abdómen, gris; cubiertas de debajo de la cola de este mismo color, un poco más claro, con visos bronceados; flancos verde-bronceados; cubiertas de las piernas, blancas tintadas de castaño; pico bastante largo y curvo, negro-pardusco; patas y uñas de este mismo color, y por último, tiene una pequeña mancha blanca que le nace en la parte posterior del ojo y se prolonga algo hácia atrás.

Su largo total es de 5¾ de pulgada, desde la punta del pico hasta la extremidad de la cola; alas 1⅝ idem; cola 3 idem, y pico 10 líneas.

La hembra tiene la parte superior de la cabeza, del cuerpo, cubiertas de las alas y de la cola, y cuatro de las plumas del centro de ésta, de un color verde-bronceado; las demas, negro-parduscas, con las bases tintadas de un color castaño muy pronunciado, teniendo las dos exteriores las puntas blancas; toda su parte inferior es castaño-clara, casi blanca en la garganta y cuello; patas, pico y uñas, así como el tamaño de su cuerpo, iguales al macho.

Num. 34.—*Chupamirto de pecho color de carmin.*

Selasphorus platycercus, Gould; *Trochilus platycercus*, Swains.; *Mellisuga platycerca*, Gray y Mitch.; *Selasphorus platicercus*, Bonap.

Esta preciosa especie de colibríes, es otra de las peculiares del Valle de México, y se halla en abundancia en la parte baja de esta region, durante los meses de Mayo y Junio, por lo general gustando la miel de las flores del Cardo Santo, *Centaurea mexicana*, y despues de esa época sube á las montañas del lado del Sur, segun ha dicho el Dr. Villada en su Memoria de los Colibríes del Valle de México, y allí permanece estacionada aún por dos meses, efectuando entónces su nidificacion. Cuando la cria está ya en estado de poder volar, parece que emigran á Guatemala, adonde tambien se les encuentra y probablemente van á invernar.

La apariencia del macho adulto es como sigue: la parte superior de la cabeza, del cuerpo y cubiertas de las alas y de la cola, de un color verde-bronceado uniforme; alas pardo-purpúreas; cola casi cuadrada, con plumas lanceoladas, siendo las dos del centro del mismo color que la parte superior del cuerpo, las demas negro-purpúreas, con la orilla interior de la segunda y cuarta, y la exterior de la quinta de cada lado, castaño rojiza; su garganta y cuello con plumas de apariencia escamosa de color de grana ó carmin metálico hermosísimo; pecho de un tinte blanco sucio; abdómen pardo-ferruginoso claro; flancos pardo-verdusco bronceados, con visos castaños cerca de los lados del pecho; cubiertas de las piernas y de debajo de la cola blanquizcas; patas pardas; pico casi recto, y uñas negras.

Su largo total desde la punta del pico hasta la extremidad de la cola, es de 4 pulgadas; alas 2¼ idem; cola 1⅜, y pico ¾ idem.

La hembra tiene toda la parte superior del mismo color del macho, con excepcion de la cabeza que es parduscа; sus alas tambien son iguales; su cola es arredondada, con las dos plumas centrales verde-bronceadas, las demas negro-purpúreas, con las extremidades de las tres exteriores de cada lado, blancas, teniendo éstas las bases tintadas de color castaño; garganta, cuello, abdómen y cubiertas de debajo de la cola, casi blancas, con los flancos y lados del pecho tintados tambien de dicho color castaño; patas, pico y uñas iguales á las del macho.

El macho jóven es muy parecido á la hembra, y solo se diferencia de ésta, en que tiene la garganta y pecho salpicado de pequeñas manchas pardas, que con la edad van convirtiéndose en el hermoso color carminado que tiene el adulto.

Num. 35.—*Chupamirto pequeño de garganta esmeralda.*

Myiabiellia tipica, Gould; *Trochilus Abeillei,* De Latt.; *Mellisuga Abeillei,* Gray y Mitch.; *Myiabeillia typica,* Bonap.

El Señor De Lattre dice acerca de esta especie, que es peculiar de los bosques de las cercanias de Jalapa y sumamente esquiva, no cabiendo duda que es asi, puesto que el que esto escribe, en el periodo de muchos años que lleva de observar estas notables avecitas, apénas ha podido ver raros ejemplares de ella, por lo general, buscando su alimento en las parásitas que florecen en las elevadas copas de los árboles más viejos y grandes que se encuentran en las selvas del paraíso jalapeño.

El Sr. Gould dice tambien, que ha obtenido ejemplares de ambos sexos de esta especie, de Guatemala, procurados por el Sr. G. Skinner, de un jóven naturalista de aquel país, llamado M. Rivera Paz, que promete ya mucho á la ciencia por sus conocimientos.

La apariencia del macho adulto es como sigue: la parte superior de la cabeza, del cuerpo, cubiertas de las alas y de la cola, dos plumas del centro de ésta y lados del cuello, de un color verde-bronceado oscuro; alas pardo-purpúreas; plumas laterales de la cola negro-azulosas, tintadas de gris ferruginoso en sus extremidades; en la garganta tiene una mancha de color verde-metálico algo parecido al de la esmeralda; pecho negro; abdómen gris ferruginoso oscuro, con ligeros visos bronceados en los flancos; cubiertas de debajo de la cola, verduscas, marginadas de gris; patas pardo-oscuras, y pico y uñas negras.

Su largo total desde la punta del pico hasta la extremidad de la cola, es de 3½ pulgadas; alas 1¼ idem; cola 1 pulgada y 1 línea, y pico ½ pulgada.

La hembra es muy semejante al macho y solo se diferencia de éste, en que toda su parte inferior es gris ferruginosa, un poco más clara en lo que corresponde al cuello y garganta, teniendo un tinte algo castaño en este último lugar. En cuanto á tamaño ambos son iguales.

Num. 36.—*Chupamirto de pecho blanco.*

Thaumatias candidus, Gould; *Polytmus candidus*, Gray y Mitch.;
Thaumatias candidus, Bonap.

Esta especie de colibries parece ser peculiar de la parte Sureste de la República mexicana y de Guatemala. Es una de las pocas que hay de esta familia, que no tienen alguna parte de su cuerpo cubierta de algun color metálico que llame la atencion del observador, y su modesta apariencia es como sigue: la parte superior de la cabeza, del cuello, del cuerpo y cubiertas de las alas y de cola, de un color verde-bronceado; cola con las dos plumas del centro de este mismo color, las restantes pardo-oscuras con visos bronceados, teniendo cerca de sus extremidades un sombrío aun más oscuro todavía; alas pardo-purpúreas; centro de la garganta, pecho y abdómen, de un color blanco de nieve, con los flancos y lados del cuello tintados de verde-bronceado; patas pardas y uñas negras; pico de este mismo color, con excepcion de la base de la mandíbula inferior que es color de carne.

Su tamaño, desde la punta del pico hasta la extremidad de la cola, es de 4⅛ de pulgada; alas 2 idem; cola 1¼, y pico ¾ idem.

La hembra, como sucede con las demas de las de este género, es tan semejante al macho, que solamente por medio de la investigacion anatómica, se puede saber que lo es.

Num. 37.—*Chupamirto de cola oblonga y guías blancas.*

Phaëthornis cephalus, Gould; *Trochilus cephalus*, Bourc.; *Trochilus longirostris*, De Latt.; *Phœtornis cephalus*, Bonap.

Esta singular especie de colibries se encuentra en Veragua y Guatemala, así como tambien en el Sur de la República mexicana; mas parece que en esta última localidad es sumamente rara, pues el que esto escribe, solo ha podido ver un ejemplar que se halla en el Museo Nacional de esta República, el cual tiene dimensiones un poco mas pequeñas que las de los individuos de ella descritos por el Sr. Gould, célebre troquilidista que tambien da á esta especie el nombre de (*Mexican Hermit*) Ermitaño mexicano; y dice que el primer ejemplar que conoció, fué por mucho tiempo el único que habia en Europa, el cual fué llevado á aquel país por el distinguido viajero y colector frances, el Sr. Sallé, y cogido cerca del rio de San Juan de Nicaragua, cuyo ejemplar, en seguida, formó parte de su coleccion; que despues obtuvo otros ejemplares de Guatemala, y más tarde otros de México, que le parece fueron cazados en el Estado de Veracruz, cerca de Córdoba.

La apariencia del macho adulto es como sigue: la parte superior de la cabeza, del cuerpo y cubiertas de las alas, de un color pardo con visos verde bronceados, un poco más oscuro en lo que corresponde á la cabeza; cubiertas de encima de la cola y parte posterior del cuerpo cerca de éstas, de un tinte castaño, con una banda semicircular á cierta distancia de la extremidad de cada pluma, de un color pardo-oscuro, y en conjunto toda esa parte, parece que la cubren escamas de dichos colores; alas pardo-purpúreas; cola con las bases de sus plumas verde-bronceadas, cuyo tinte se desvanece al unirse con el color negro-pardusco que les precede, teniendo las dos plumas del centro las extremidades blancas, demasiado angostas y alargadas hasta casi el doble del tamaño de las demas, que tambien tienen unas manchitas blancas de cada lado de sus extremidades, con un tinte castaño al unirse con el color oscuro de ellas; toda su parte inferior tiene un color gris ferruginoso uniforme, algo castaño en lo que corresponde al abdómen y flancos; en la parte superior del ojo le nace una mancha que se prolonga hácia atrás como unos cinco octavos de pulgada, de un color blanco-pardusco; otra mancha ó línea semejante, le nace tambien en la mandíbula inferior y se prolonga por el centro del cuello hasta desvanecerse con el tinte del pecho, y por último, otras líneas parecidas á las descritas, le nacen una de cada lado de la mandíbula inferior y corren hácia atrás por la parte inferior del ojo, confundiéndose en seguida con el tinte general del cuello; cubiertas de debajo de la cola, de un tinte gris-castaño, con manchas un poco más oscuras; su pico, que es muy largo y curvo, tiene la mandíbula superior negra que parece de ballena, la inferior lo mismo, pero con la base color de carne; patas pardas, y uñas negras.

Su largo total es de 5 pulgadas; alas 2½ idem; cola 3 idem, y pico 1 pulgada 7 líneas.

A lo que parece, segun las observaciones hechas en las dos especies de

Phaëtornis que se encuentran en México, la hembra es muy semejante al macho, y solo se puede averiguar su sexo por medio del análisis anatómico.

Num. 38.—*Chupamirto de pecho blanco y cabeza violada.*

Cyanomyia violiceps, Gould.

Esta especie de colibríes, á la cual el Sr. Gould da tambien el nombre de *Violet-Crown*, Corona violeta, es otra de las peculiares de la República mexicana, que descubrió el Sr. Sallé, distinguido naturalista frances, del cual ya se ha hecho mencion en otros artículos anteriores á éste, y que tuvo la dicha de encontrar algunos ejemplares de ella en el Estado de Oajaca, en la parte Sur de México.

La apariencia de esta especie es bastante semejante á la del *quadricolor*, pues solo se diferencia de éste, en que carece del color encarnado del pico, que el azul de la parte superior de la cabeza es más violado, y la superior del cuerpo más pardusca.

El macho adulto tiene la parte superior de la cabeza, de un color azul turquí metálico oscuro; la superior del cuerpo y cubiertas de las alas y de la cola, de un color pardo con visos de verde olivo bronceados, teniendo además las plumas de la cubierta de la cola marginadas de un tinte un poco más claro; alas pardo-purpúreas; cola de un color pardo-verdusco bronceado y ligeramente horquillada; toda su parte inferior blanca; su pico, que es casi recto, negro, con la mandíbula inferior color de carne en su base; patas pardas y uñas negras.

Su largo total, desde la punta del pico hasta la extremidad de la cola, es de 5 pulgadas; alas 2¾ idem; cola 1⅜ idem, y pico 11 líneas.

La hembra creo que no debo determinarla todavía y esperar nuevas investigaciones; aunque es muy probable que sea semejante al macho, como sucede con las de los demas de este grupo. La figura representada en la famosa obra del Sr. Gould, por hembra ó macho jóven, tal vez pueda ser el jóven, y su apariencia es como sigue: toda la parte superior del cuerpo y cubiertas de las alas y de la cola, de un color parecido al del macho adulto, con la cabeza de ese mismo color un poco más oscuro; alas pardo purpúreas; cola de un tinte bronceado cobrizo, con las extremidades de sus plumas tintadas ligeramente de un color gris; toda su parte inferior blanca, con los flancos de un tinte castaño-rojizo; patas y pico como las del macho.

NUM. 39.—*Chupamirto de pecho verde y vientre castaño.*

Amazilia cerviniventris, Gould.

Esta especie de colibríes se encuetra en las inmediaciones de Jalapa y Córdoba, y aunque bastante afine al *beryllina*, se diferencia de él lo suficiente para formar una especie distinta, segun lo ha hecho el Sr. Gould en su Monografía de los colibríes, siendo de advertir, que no es muy comun en ninguna de las regiones indicadas.

La apariencia del macho adulto es como sigue: la parte superior de la cabeza, del cuerpo y cubiertas de las alas y de la cola, de un color verde-bronceado; alas pardo-purpúreas; plumas de la cola, de un tinte castaño-rojizo oscuro, con sus orillas y extremidades bronceadas; garganta, cuello y pecho, verde-metalico, un poco más claro que el del *beryllina;* abdómen de color de canela claro-parduseo; plumas de las cubiertas de debajo de la cola, de este mismo color aun más claro, marginadas de blanco; flancos con visos verde-bronceados; cubiertas de las piernas blancas; pico ligeramente encorvado en su extremidad, con la base color de carne y la punta negra; patas pardas y uñas negras.

La hembra es enteramente igual al macho, y á mi juicio, en su apariencia exterior solo se diferencia de éste, en que tiene la cabeza un poco más angosta.

Los jóvenes de ambos sexos, desde que comienzan á emplumar ya se les ven las plumas de la garganta y del pecho tintadas en sus extremidades del color verde-metálico, que con la edad se hace uniforme en toda esa parte.

El largo total de los ejemplares de ambos sexos, desde la punta del pico hasta la extremidad de la cola, es de 4 ¼ pulgadas; alas 2 ⅛ idem, cola 1 ¼ y pico 10 líneas.

NUM. 40.—*Chupamirto de pecho blanco y cabeza azul.*

Cyanomyia quadricolor, Gould; *Trochilus quadricolor*, Vieill.; *Ornismya cyanocephala*, Less.; *Polytmus quadricolor*, Gray y Mitch.

Esta especie de colibríes es peculiar del Valle de México y otros lugares del Noroeste de la República, pudiendo á la vez decirse, que es otra de las que pueden llamarse propiamente mexicanas, puesto que, segun el Sr. Gould, es errónea la idea de Lesson, en su Suplemento á la historia de los Colibríes, el asignarle por localidad el Brasil; mas sin embargo, no es de las que se pueden llamar comunes en la localidad referida.

La apariencia de su plumaje en general, es muy agradable, pues los colores verde-bronceado, blanco y azul, contrastan perfectamente con el encarnado del pico, que forma el cuarto color y ha motivado el nombrarlo *quadricolor*.

El Sr. Gould es quien ha separado esta especie del *cyanocephala*, con el cual se hallaba ántes confundido.

El macho adulto tiene la parte de encima de la cabeza, azul-celeste metálico hermosísimo; la region superior del cuerpo y cubiertas de las alas y de la cola, de un tinte verde-bronceado pardusco, ménos lustroso que en la generalidad de los de su especie; cola pardo-verdusca, con las extremidades de cada pluma ligeramente tintadas de gris; garganta, pecho y abdómen blanco, que parece de nieve; cubiertas de debajo de la cola de este mismo color; su pico, que es recto, encarnado, bastante oscuro en su extremidad; patas pardas, y uñas negras.

La hembra es muy semejante al macho, y solo se diferencia de éste, en que el azul de la cabeza es un poco ménos marcado.

Su largo total, desde la extremidad del pico hasta la de la cola, es de 4¼ de pulgada; alas 2¼ idem; cola 1¼, y pico ⅞ idem.

Núm. 41.—*Chupamirto de pecho ferruginoso y pico encarnado.*

Phœoptila sordida, Gould; *Cyanomyia sordida,* Sclat.

Esta rara especie de colibriés, que tanto se diferencia de la generalidad de estas aves, por no tener ningun color metálico, sino un tinte general sombrío, se encuentra en el Estado de Oaxaca, donde parece que no es muy comun.

La apariencia de dos ejemplares que existen en el Museo Nacional de México, que á mi juicio son una hembra y un macho, es como se ve á continuacion.

Macho adulto.—La parte superior de la cabeza, del cuello, del cuerpo y cubiertas de las alas y de la cola, de un color pardo-verdusco bronceado; alas pardo-purpúreas; cola, con las dos plumas del centro del mismo color de la region superior del cuerpo, pero un poco más pardo-oscuras en su base; toda su parte inferior pardo-ferruginoso, con los flancos algo bronceados y la garganta algo más clara; las plumas de la cubierta de debajo de la cola tienen un tinte entre castaño y gris-claro; los cuadriles estan cubiertos de una especie de plumon blanco, que forma una mancha de cada lado, muy conspicua, de este color; su pico, casi recto, es encarnado en su base y hasta como las tres cuartas partes de su largo, con la punta negra; patas pardas y uñas negras.

La hembra es muy semejante al macho, y solo se diferencia de éste, en que su colorido es más difuso, como sucede con todos los *Cyanomyae*, con los cuales es bastante afine esta especie, y que el Sr. Gould ha separado formando un género distinto.

El largo total del macho, desde la punta del pico hasta la extremidad de la cola, es de 4 ¾ pulgadas; alas 2 ¼ idem; cola 1 ½, y pico 10 líneas.

(CONCLUIRA.)

AGRICULTURA.

RAPIDA OJEADA SOBRE ALGUNOS PARASITOS DE LA PAPA.—APARICION EN EL VALLE DE MEXICO DE LA CHRYSOMELA DECEMLINEATA EN LOS PLANTIOS DE ESTE VEGETAL; POR LOS SRES. D. JOSE C. SEGURA Y D. MANUEL D. CORDERO, SOCIOS DE NUMERO.

La introduccion de la papa, *Solanum tuberosum*, en Europa, fué no solamente una mejora importante en la economía rural, sino que tambien se creyó una planta providencial contra el hambre que en los malos años amenazaba diezmar al pueblo europeo á consecuencia de la pérdida de las cosechas de cereales. Su rusticidad y el no estar sus tubérculos expuestos á la accion directa de los cambios bruscos de temperatura, así como ser un alimento sano y nutritivo, hicieron de esta solanácea un precioso vegetal recomendado por los más ilustrados agrónomos extranjeros. Todo parecia presagiar que el tubérculo del Nuevo-Mundo, propagado con tantas dificultades en el antiguo, seria una garantía contra las escaseces que ponian en peligro la vida de millares de individuos; pero el tiempo vino a demostrar que, como todos los demas vegetales útiles al hombre, está sujeto á varias enfermedades y enemigos.

De las varias enfermedades á que está sujeta la papa, casi todas reconocen como causa, parásitos criptogámicos que viven á expensas de sus partes aéreas ó subterráneas. De las primeras, unas como el *moho* ó *chahuiztli* y el *encrispamiento* (frisolee) invaden las hojas y los tallos precisamente en la época en que la vegetacion es mas activa y necesitan llenar mejor sus funciones para favorecer el desarrollo de los tubérculos. De las segundas, la más benigna, es la *sarna* producida por un hongo del género *Protomys* que se fija debajo de la epidérmis del tubérculo, y le impide llegar al estado perfecto, disminuyendo por consiguiente la cosecha.

La *gangrena seca* es más temible, la ocasiona otro hongo, el *Fusisporium solani* muy conocida en Europa, sobre todo en las orillas del Rhin, Baviera, Meklemburgo, la Silesia y otros lugares, en donde desde 1830 aparecio como una verdadera epidemia, haciéndose más notable en 1840, época en que se perdieron en varios cantones mas de las dos terceras partes de las cosechas.

El caracter principal de las plantas atacadas, es la extraordinaria dureza que adquieren los tubérculos, los cuales resisten la accion del vapor en los aparatos destilatorios, sin reblandecerse. Como fácilmente se comprende, quedan inútiles no solo para la reproduccion sino aun para distribuirlos como racion á los animales.

El Sr. Martius cree que esta enfermedad se debe á que el *Fusisporium solani* invade totalmente la papa penetrándola hasta el centro, absorbiendo la mayor parte de su agua de vegetacion, convirtiendo la parte fibrosa en ulmina, y destruyendo por esto su facultad germinativa.

Existe, además, otra enfermedad que es comun á ambos continentes de América y Europa, ocasionada por una alteracion de los líquidos albuminosos de los tubérculos, aunque algunos autores le asignan como causa la presencia del *Botrytis infestans*, que viviendo sobre sus partes aéreas, al desarrollarse sobre los estomatos de las hojas, trasmite sus emanaciones hasta el tubérculo por los canales de la circulacion; pero las observaciones de los Sres. Leveillé, Pouchet y otros agrónomos, confirman que la afeccion citada es puramente local é independiente del desarrollo del hongo.

Hemos dado una rápida descripcion de las principales afecciones del *Solanum tuberosum;* vamos ahora á ocuparnos de una plaga que ocasiona un insecto que es acaso más temible que las que acabamos de mencionar, y el cual es conocido en los Estados-Unidos con el nombre vulgar de *mosca del Colorado.*

A principios de Mayo del presente año, observaron por primera vez los profesores de la Escuela de Agricultura de esta capital, en los campos de experimentos de la misma, un insecto de aspecto agradable que parecia ser uno de tantos coleópteros de la familia de los Cyclicos, conocidos vulgarmente entre nosotros con el nombre de *catarinitas*, que se reproducia prodigiosamente y que devoraba con rapidez la sementera de papa. A la profunda penetracion de los señores profesores no se ocultó las terribles consecuencias que la presencia de este *coleóptero* en nuestro país, traeria á los cultivadores de este *solanum*, ni tampoco les fué desconocido que era el *Chrysomela decemlineata* que tantos estragos estaba haciendo en la república norte-americana.

Nosotros, prevenidos por los diarios de los Estados-Unidos y de Europa en donde se mencionan los desastres que diariamente ocasionaba el *Chrysomela decemlineata*, así como el derrotero de sus emigraciones, tratamos de investigar si ésta ú otra especie era la que habia aparecido en los terrenos de la mencionada escuela. Hicimos el estudio del insecto, y el resultado de la clasificacion así como las pocas observaciones que pudimos hacer relativas á su género de vida, fueron suficientes para convencernos que los caractéres asignados al insecto del *colorado* le convenian en todo á nuestro nuevo huésped que tan dolorosamente se ha hecho sentir de los cultivadores de la república vecina.

Los caractéres á que nos referimos son los siguientes: cuerpo oval (el que observamos tenia 0,0095 mts. de eje mayor y el trasversal 0,0070 mts.) ligeramente alargado; coselete más ancho que largo, de color amarillo con manchas negras; cabeza inclinada; antenas negras más cortas que el cuerpo, moniliformes, en forma de clava de once artejos, el último turbinado insertado cerca de la boca y delante de los ojos: éstos son compuestos; maxilares terminados por dos artejos iguales, el último ovoide; mandíbulas truncadas; lengüeta arredondada, ligeramente escotada; élitros coriáceos, lustrosos, de la longitud del cuerpo, pintados cada uno de diez bandas longitudinales alternadas de negro y amarillo; parte posterior del abdómen y del tórax lineada trasversalmente de los mismos colores; patas medianas de un color negro rojizo con cuatro artejos en los tarsos, los tres primeros provistos de sus pinceles. Larvas de 0,01 m. de largo y 0,007 de ancho, blanco-amarillentas, con la cabeza y patas negras y una doble hilera de puntos de este color á los lados del cuerpo y en la parte média y superior del tórax.

Por todos estos caractéres decimos que el insecto que estudiamos es un coleóptero que pertenece á la seccion de los *Tetrámeros*, á la familia de los *Cyclicos*, á la tribu de los *Chrysomelinos*, al género *Chrysomela*, ó si se quiere, *Proscicela* de Chevrolat, y sub-género *Polygramma* de este autor, y á la especie *decemlineata*.

Segun observaciones hechas en otros países, la fecundidad de las hembras es verdaderamente prodigiosa, la puesta se verifica tres veces por año: la primera la hacen en Abril ó Mayo, cuando la temperatura es más propia a su desarrollo, y en la época en que los tallos y hojas de la papa están tiernos y á propósito para saciar la voracidad de las larvas; la segunda en Julio ó Agosto, y la última en Setiembre ú Octubre. Cada hembra deposita en cada puesta, de mil á mil doscientos huevos de un color anaranjado subido y en grupos de doce á trece sobre la cara inferior de las hojas.

A los cinco ó seis dias despues nacen las larvas, en ese estado viven de diez y seis á diez y siete dias, ocasionando grandes estragos; despues de este tiempo se introducen en la tierra para metamorfizarse, y al cabo de catorce dias que dura el estado de crisalida, sale el insecto perfecto; á los pocos dias las hembras son fecundadas, y asegurada su progenie sigue la nueva generacion las mismas evoluciones que hemos mencionado. Las larvas de la última puesta pasan el invierno debajo de la tierra, al estado de ninfa.

Segun Walsch, este insecto apareció en el Nebraska en 1859, ocasionando grandes destrozos en los plantios de papa; en un corto número de años ha recorrido grandes extensiones, y hoy desgraciadamente lo tenemos á las puertas de esta capital.

El camino que ha recorrido en la república del Norte está perfectamente descrito en uno de los últimos cuadernos pertenecientes á este año del «Journal d'agriculture practique» del cual tomamos textualmente el siguiente párrafo:

«El clima originario de este escarabajo se encuentra en las montañas rocallosas, adonde se nutre de una especie de papa (el *Solanum rostratum*, de Dunal, que segun E. A. Carriere es una especie anual originaria de México); pero desde que se plantó al pié de estas montañas la papa comestible, las plantas fueron atacadas por este escarabajo que desde este momento comenzó á avanzar hácia el Este.

«En 1859, estaba á 100 millas al Oeste de Omahı, en el Nebraska; dos años despues hizo su aparicion en el Yowa; en 1865 habia comenzado á devastar el Missouri, habia atravesado el Misissipi y devastaba el Illinois.

«De allí continuó su marcha con tal rapidez, que en 1870 se habia instalado en la Indiana, el Ohio, la Pensylvania, el Estado de Nueva-York, Massachusett, habiendo así completado un viaje de cerca de 1,700 millas en once años. En 1874 una gran cantidad de estos escarabajos atravesó el lago Erié sobre las hojas flotantes ó los trozos de madera, y en muy poco tiempo comenzó sus depredaciones entre las riberas de Saint-Clair y el Niágara.

Ignoramos cuál haya sido el camino que este pernicioso insecto ha recorrido en sus emigraciones para llegar á extramuros de la capital; los diarios de los Estados donde se cultiva la papa nada nos han dicho sobre el particular; la hipótesis que formulamos para explicar su presencia entre nosotros, no pasa de mera suposicion; sin embargo, nos aventuramos á suponer, que acaso el ferrocarril de México á Veracruz haya sido el vehículo por el cual el *Chrysomela* haya llegado á ejercer sus destrozos á la tabla de la Escuela de Agricultura. Bien pudiera suceder que algunos de los buques que en los Estados-Unidos han sido cargados con estos tubérculos, hubiera contenido algunos huevos ó insectos de este género y despues hubiera arribado al puerto de Veracruz con cualquiera otra mercancía, en cuyos fardos se encontraban abrigadas las larvas ó los insectos, y éstos ser conducidos hasta la capital por el vehículo que hemos mencionado; pero lo repetimos, no es más que una suposicion, muy pocas pruebas tenemos para corroborar nuestro aserto.

Por los diarios de agricultura extranjeros, sabemos que no solamente se alimenta con las hojas de la papa, sino que tambien de las hojas de la col y de otras plantas de hortaliza; nosotros hemos observado que exclusivamente sacia su voracidad en el *Solanum tuberosum*, pues en el campo donde aparecieron, á muy pocos metros se encontraban hermosas plantas de col sin que ni aun despues de haber completamente devorado la papa la hubiesen atacado.

En esto nos fundamos para explicar la presencia de este insecto en la Escuela de Agricultura, sin que se haya manifestado en las hortalizas que están más próximas á la estacion de Buenavista.

Como quiera que sea, la plaga existe cualesquiera que haya sido el modo como haya llegado á la capital; por lo tanto, la Escuela de Agricultura, celosa por todo lo que importa á la agricultura nacional, nos ha honrado comisionándonos para que á su nombre prevengamos á los hacendados del mal que les amenaza, excitándolos á que fijen su atencion sobre este insecto, cuyo exterminio es interesante, ántes de que se propague y aclimate en el interior de la República.

Los medios de destruccion conocidos hasta ahora son sumamente dudosos, los norte-americanos han ensayado infinidad de remedios; pero aun todavía el éxito no ha coronado sus esfuerzos; esto depende de varias causas que vamos á indicar:

1.º Las bandadas de *Chrysomelas* no emigran como sucede con otros insectos filófagos á medida que van devastando los plantíos, sino que una generacion avanza miéntras la otra se estaciona en el lugar atacado.

2.º Resisten perfectamente á los cambios más extremados de temperatura.

3.° Soportan la mayor parte de los remedios insecticidas, así es que no queda más recurso que hacer la recoleccion de los huevos, larvas é insectos con la mano; pero para esto es necesario algunas precauciones y hacerlo con guantes de gamuza, porque las larvas é insectos secretan un líquido corrosivo que en muchos casos produce úlceras muy dolorosas y aun la pérdida de la vista si el líquido cae en los ojos.

Los agricultores canadenses han encontrado un remedio que consiste en espolvorear las plantas atacadas con una mezcla de 15 partes de harina, ó 30 de yeso con una de arseniuro de cobre; pero los grandes inconvenientes que presenta el empleo de esta sustancia venenosa, tanto por el peligro á que estarian expuestos los peones, como por su alto precio, no puede tener aceptacion entre nosotros; por lo tanto, el único remedio que ha sido recomendado consiste en coger el insecto con las precauciones que hemos indicado, y no matarlo aplastándolo, sino echándolo en un cazo que contenga una lejía fuerte, ó una lechada, ó en ácido sulfúrico diluido para evitar que al aplastarlo los líquidos que salten de su cuerpo vayan á caer en la piel ó en los ojos del operario: además, aconsejamos á los cultivadores que cuando su campo se halle atacado por estos insectos, se abstengan de sembrar la papa por lo ménos dos años, cosa que creemos practicable, pues en nuestro país ella no es la que forma la base de la alimentacion del pueblo.

La tabla donde observamos este insecto tenia una pequeña extension dedicada al cultivo de la papa, por consecuencia, pronto concluyó con todas las plantas y no tuvimos tiempo suficiente para ensayar ciertos compuestos, en los cuales nos habiamos fijado, y no habiendo verificado su eficacia, no nos parece oportuno consignarlos aquí; si en lo sucesivo se presenta esta plaga, los ensayarémos ó los darémos á conocer para que los ensayen, dando cuenta al público con los resultados que obtuviéremos.

Ojalá y nuestros esfuerzos sean innecesarios para conjurar una plaga que justamente ha alarmado á los países del otro lado del Atlántico.

México, Agosto 24 de 1874.

APUNTES SOBRE EL CHAHUIZTLI,

POR EL SEÑOR DON MANUEL D. CORDERO,

SOCIO DE NÚMERO.

La mayor parte de los vegetales cultivados, como plantas alimenticias, forrajeras, industriales y económicas, son invadidas en diversos períodos de su vegetacion y bajo causas no perfectamente determinadas, por parasitos criptogámicos que se fijan sobre las hojas, tallos, frutos y algunas veces sobre las raices, alimentándose con sus jugos y ocasionando diversas enfermedades que diezman por lo regular el producto de las plantios, y en algunas circunstancias los destruyen completamente.

Algunas de las afecciones causadas por estos hongos microscópicos fueron designadas por los antiguos mexicanos bajo el nombre genérico de *chahuiztli,* palabra compuesta de *chahui* que significa grasa, y de la partícula *liztli* característica de los nombres abstractos.

La voz *chahuiztli* que aun no ha perdido en nuestros dias su primitiva aplicacion, equivale al *Erisibe,* de los griegos; *Scabies,* de Virgilio; *Robigo,* de los romanos; *Jerakon,* de los hebreos; *Malume* ó *Melume,* de los lombardos; *Mildew, Blight, Redrust,* de los ingleses; *Rouille,* de los franceses; *Græserrost,* de los alemanes; *Mohó, Orin, Anublo, Roya, Orujo, Tizoncillo* y *Herrumbre,* de los españoles.

Segun Teophrasto, los griegos miraban esta enfermedad como un castigo del cielo, y para la cual no habia remedio. Moisés amenazaba á su pueblo con el Jerakon, cuando se le rebelaba á los preceptos que le imponia, y los romanos que vieron en esta enfermedad el enemigo más terrible, criaron en su fanática idolatria al dios Robigo, al que levantaron suntuosos templos en donde invocaban su proteccion por medio de fiestas que anualmente le celebraban. El dia señalado para estas fiestas llamadas Rubigales, fué instituido por Numa, el 15 de Abril, en el undécimo año de su reinado.

Varron y Columela, que tan curiosas noticias nos han trasmitido de la agricultura antigua, dicen que en estos dias se inmolaba una oveja ó un perro, y que durante el sacrificio se quemaba incienso y el vino se derramaba con profusion.

Los primeros agrónomos que observaron con detenimiento esta enfermedad, la atribuyeron á los insectos; suponian que los vientos frios del Este que soplan en la estacion primaveral, arrastraban consigo los huevecillos fijándolos en diversos puntos de la planta, adonde más tarde se desarrollaban.

Aymen y Girod Chantrans, consideran que es producida por animáculos que se desarrollaban en los tejidos de las plantas, opinion fundada en ciertos movimientos que observaron al microscopio; pero los botánicos modernos la rechazan y creen que los movimientos observados por los autores citados, son comunicados por los del liquido al extenderse y evaporarse, supuesta la diferencia que hay entre el movimiento que afecta un infusorio al hendir el agua en una direccion cualquiera, y el que es debido a la atraccion molecular.

Algunas otras hipótesis se han emitido con el mismo objeto, pero ninguna de ellas prueba que los parásitos que originan el chahuiztli pertenezcan al reino animal; por el contrario, las observaciones más juiciosas y las más perfectas clasificaciones de los botánicos, confirman cada dia su orígen enteramente vegetal.

Los principales hongos microscópicos que viven sobre los cereales, han sido divididos por de Candolle en parietales é intestinales, segun que se desarrollan en la epidérmis ó en el interior de los vegetales; á la primera seccion corresponde el chahuiztli, enfermedad de que me ocupo. Las especies que lo forman son varias; pero la que regularmente aparece atacando los campos de trigo, cebada y avena, es el chahuiztli colorado de nuestros labradores, *Uredo Rubigo vera* D. C. que aparece regularmente por la cara superior de las hojas, los tallos, y algunas veces suele extenderse á las glumas y los granos. Cuando esta vegetacion extraña invade las sementeras en pequeña cantidad, sus efectos pasan desapercibidos; pero cuando es abundante, el aspecto del campo cambia completamente, las hojas se ponen amarillas, las cañas quedan delgadas, y cuando el mal se propaga á las partes florales, las espigas abortan. Al principio de la enfermedad se ve á las plantas atacadas, invadidas por una multitud de puntos salientes, unas veces aislados y otras reunidos en grupos, de una forma oval ó esférica que más tarde desgarran la epidérmis y dejan escapar un polvo amarillo-rojizo que se pega á los vestidos y al pelo de los animales.

El *Uredo linearis*, de Person, es otra variedad de chahuiztli que ataca de preferencia la parte inferior de las hojas y el tallo; su color es de un amarillo muy subido; las pústulas que lo forman, vistas al microscopio son cilíndricas, alargadas y más separadas unas de otras que las de la especie anterior.

Sucede con frecuencia que despues que las plantas atacadas por el Rubigo han diseminado sus esporas, aparecen indistintamente sobre el tallo, las espigas y las hojas de estas mismas plantas, puntos ovales, de un color pardo, que al poco tiempo se abren derramando un polvo negro: los hongos que lo producen, son: la *Puccinia graminis* y la *Solenodonta graminis.*

Además de las especies mencionadas, tenemos otras varias, tales como la *Licea maidischahuiztlea* (descrita por el inteligente naturalista D. Lauro Jimenez), el *Uredo Vilmorinea*, el *U. Fabae*, etc., etc., que viven sobre el maíz, la haba y otros muchos vegetales cultivados; pero nosotros no entrarémos en pormenores por ser objeto de una memoria especial.

Como ántes hemos dicho, aun no está perfectamente determinada la verdadera causa que favorece el desarrollo de estos hongos. Algunos creen que las lluvias pasajeras que caen á principios de la primavera se congelan sobre los tallos tiernos y los destruyen, y otros, que el chahuiztli es producido por la corrupcion de los jugos y tejidos de las plantas bajo la influencia del sol, las neblinas y el agua.

A principios de este siglo se atribuyó al agracejo, *Berberis vulgaris*, una influencia muy directa en el desarrollo de los uredos. Mors, John Sinclair, Marchall y algunos otros agrónomos ingleses, suponian que en este arbusto se alojaban los hongos, y que bajo el impulso de los vientos eran trasportados á las cereales y otros vegetales cultivados. Esta hipótesis prevaleció mucho tiempo, y durante éste, se destruía cuanto pié de agracejo se encontraba á cierta distancia de las sementeras. Más tarde se combatió esta teoría probando que la especie que origina el chahuiztli del agracejo es el *Æcidium*, enteramente diferente de las que lo producen en las cereales, de manera que suponer que el *Æcidium* se convirtiera en *Uredo* por solo la circunstancia de pasar de un vegetal á otro, era tanto como convenir en la transformacion de las especies. Se probó, además, la inocencia del agracejo con algunos hechos singulares, tales como la de producirse con frecuencia el moho en algunas localidades de la Francia (Beauce), adonde no se encontraba un solo pié de este arbusto en una extension de más de 20 leguas á la redonda, así como la de emplearse como cercado para dividir las heredades en el Departamento de Côt d'Or, Allier y otros cantones en donde raras veces son atacadas las cereales. Estas observaciones, que en el primer tercio de este siglo redujeron á un absurdo la idea primitiva, son hoy desechadas por las más recientes investigaciones: en efecto, se sabe que las criptógamas están sujetas a sufrir ciertos cambios en su organizacion, estructura y género de vida, semejante á lo que pasa en los insectos y otros animales inferiores; así es, que los diferentes uredos que antiguamente se miraban como géneros diversos, no son sino las distintas formas que toma la *Puccinia* al desarrollarse.

En la generacion alternante se observa algunas veces que las células reproductoras que se forman en la sucesion de las generaciones semejantes, como en algunas algas y hongos, dan orígen a individuos tambien semejantes á aquellos de donde provienen; pero en las Mucedineas y otras, las células difieren en la sucesion, y cada tipo forma al desarrollarse, séres dotados de estructura y propiedades diferentes, hasta que en la alternacion vuelven á aparecer células reproductrices iguales a las de la primera generacion, y entónces reaparece el tipo primitivo.

Cuando se siguen estos parasitos entófitos en todo su periodo vegetativo, se ve que en el mismo *micelio* que se desarrolla en las hojas del *Berberis*, se encuentran, ademas de las esporas, otros órganos de reproduccion, los *espermogonios* y los *æcidios;* los primeros formados por un conceptáculo en forma de botella tapizada interiormente por una infinidad de pelos cortos, á manera de pincel, que llevan en su extremidad unos cuerpos semejantes á las esporas llamados *espermacios,* y los segundos situados debajo de la epidérmis de la hoja afectando la forma de una copa, en el fondo de la cual está el *himenio,* cuyos *basidios* producen continuamente nuevas esporas, al principio poliédricas y despues arredondadas, que se desprenden de la abertura de la copa derramando un polvo rojo encerrado entre sus celdillas.

Las Coniomisitas son muy notables, tanto por su ciclo de vegetacion como por su *heteræcia,* nombre con el cual M. Bary distingue esa propiedad, por medio de la cual una generacion de un hongo parásito se desarrolla exclusivamente sobre un grupo de plantas alimenticias, y otra de la misma especie elige otro grupo ú otra planta tambien particular; de manera que los æcidios que se producen sobre las hojas del agracejo, necesitan, en virtud de su heteræcia, fijarse sobre el tallo de una graminea para desarrollar su micelio y producir una nueva forma que es el uredo: éste á su vez produce una nueva generacion que se desarrolla sobre las mismas gramineas, dando orígen á uredos diferentes, y así se suceden varias generaciones durante la primavera hasta la Puccinia. En este estado, las uredósporas cesan de producirse, y son reemplazadas por esporas alargadas y tabicadas, llamadas *teleutósporas,* ó esporas hivernantes: éstas permanecen durante el invierno, sobre el rastrojo de las gramíneas hasta la primavera del año siguiente en que desarrollan sobre alguna de sus celdillas una excrecencia que se organiza en una pequeña espora llamada *esporidio,* el cual no desarrolla su micelio, si no es que se encuentre en contacto con la superficie de una hoja de agracejo, en la cual vuelve á formarse un micelio que penetra la hoja y en él los espermogonios y los æcidios.

Por mucho tiempo se supuso que las lluvias repentinas que caen en los meses de Junio y Julio, cuando son seguidas de un sol ardiente, favorecen el desarrollo de los hongos. John Sinclair en su Código de Agricultura cita como causas principales para el desarrollo del chahuiztli, la excesiva fertilidad de un terreno para una cosecha de granos, la sucesion contínua de las siembras de trigo en los terrenos de mediana calidad, las fuertes lluvias y las variaciones bruscas de temperatura que sobrevienen ántes que las plantas lleguen á su madurez.

Unger divide las causas que originan el desarrollo de los parásitos que tratamos, en próximas y ocasionales: entre las primeras señala una abundante estercoladura; la juventud de las plantas, la predisposicion de cada especie y una exuberancia de vegetacion mal equilibrada en sus funciones:

como causas ocasionales, una atmósfera cargada de vapor de agua, la ausencia de la luz, los cambios bruscos en la temperatura, la prolongada sequedad, las siembras muy tupidas y la demasiada humedad de la tierra; aun cuando M. Gasparin cree, que más bien que á la humedad de la tierra y de la atmósfera, es debida la aparicion del chahuiztli á ciertas circunstancias atmosféricas que facilitan el trasporte de las esporas, así como una predisposicion marcada de las plantas para recibirlas.

De los innumerables remedios que hasta ahora se han propuesto para combatir esta enfermedad, ninguno ha dado un resultado satisfactorio; la naturaleza es quien se encarga de conjurar esta plaga: con frecuencia sucede, que repentinamente desaparace despues de una lluvia seguida de un buen tiempo; sin embargo, cuando el mal aparece ántes que las espigas se hayan desarrollado, suele dar buen resultado regar el campo con la esperanza de ver aparecer una nueva vegetacion.

Hay ademas varios medios que pueden emplearse como preservativos y que tienen por objeto impedir, hasta donde es posible, el desarrollo de los hongos: una buena preparacion del terreno, la eleccion de las variedades precoces, la alternacion de las siembras, el empleo de la sal marina en proporciones determinadas, la preparacion de los granos con el ácido arsenioso, arseniuro de cobre, sulfato de fierro y las lejías de sosa y cal, han dado en muchas circunstancias resultados satisfactorios. El modo como obran estas sustancias para impedir el desarrollo de los hongos se ignora completamente. Por la análisis química se sabe que las uredineas contienen una gran cantidad de aceite, y es de suponerse, como lo sospechan algunos agrónomos, que si las celdillas reproductoras de estos parásitos acompañan al grano, la accion que las sustancias citadas ejerzan sobre los esporos, sea, ó puramente vital, y en este caso obrarian produciendo un envenenamiento, ó lo que es más probable, que sea química, y que los álcalis, al combinarse con el aceite, lo saponifiquen y destruyan por lo tanto su facultad germinativa.

México, Enero 31 de 1875.

FAUNA INDÍGENA.

EL OFIBOLUS DOLIATUS.—CORONELA ANILLADA.

POR EL SR. D. ALFREDO DUGÉS, SOCIO CORRESPONSAL
EN GUANAJUATO.

Presentamos á nuestros lectores uno de los más hermosos reptiles de México: como esta especie es notable principalmente por su colorido, nos ha parecido útil publicar una figura que represente exactamente los colores del animal, y pueda servir para reconocerla mas fácilmente la vez que se le encuentre.

Todos los ofidios desprovistos de veneno (Aglyphodontes de Dum. y Bibr.) pueden clasificarse en doce sub-órdenes, de los cuales dos nos interesan particularmente por ahora: examinando los dientes posteriores de la mandibulas superior, se ve que son distintos de los demás, y aun algunas veces separados de los que les preceden, como en el sub-órden de los Diacranterios, ó bien dispuestos en una serie continua como en los Sincranterios. A estos últimos pertenece el *Ophibolus doliatus,* ó *Coronela anillada.*

Hé aquí efectivamente el cuadro sinóptico dado por Duméril y Bibron en su Erpetología general, Tom. VII, pág. 527.

Sincranterios: Ofidios aglifodontos, cuyos dientes posteriores están en serie contínua con los que les preceden, y sin intervalo entre ellos.

A. Cola mediana.

1. Escamas aquilladas ó con una línea saliente. . . . *Tropidonotus*
2. Escamas lisas, hocico arredondado, algo corto . . . . *Coronella.*
3. Escamas lisas, hocico truncado y muy corto . . : . *Simotes.*

B. Cola muy larga, formando cerca de la mitad del tronco . *Leptophis.*

Coronella. Caractéres genéricos.—Cuerpo alargado, cubierto de escamas lisas; hocico redondado, poco alargado; cabeza apenas distinta del cuerpo que es cilíndrico y algo más grueso en la parte mediana; ojos pequeños, de pupila circular; cola corta, casi tan gruesa en su base como el mismo tronco en esta region; nueve placas cefálicas; rostral volteada en punta más ó ménos obtusa sobre el hocico y descendiendo oblicuamente, de manera que la extremidad de la cabeza queda más adelante que la abertura de la boca; frontal bastante pequeña, casi tan larga como ancha; narices abiertas entre dos placas; dos supralabiales en contacto con el ojo; series de escamas del cuerpo de 19 á 29; anal entera; sub-caudales dobles.

Algunos autores han distinguido los géneros *Osceola, Ophibolus, Calopeltis, Coronella y Calonotus;* darémos los caractéres del *Ophibolus.* Series de escamas dorsales 21; temporales 5 (2+3); escamas del dorso hexagonales, anchas, cortas, apenas imbricadas y muy lustrosas; dos post-oculares, la inferior descansando entre la cuarta y la quinta labiales superiores; una preocular pequeña así como la frenal; labiales superiores 7: la primera toca á la nasal y algo á la frenal; la segunda á la frenal y uno de los ángulos á la preocular; la tercera toca á la preocular y al ojo: la cuarta, al ojo y á la post-ocular inferior; la quinta á la post-ocular inferior y á la temporal inferior de la primera fila; la sexta, á este mismo temporal y á la inferior de las de segunda serie; la sétima á la última temporal inferior. Generalmente se observan ocho labiales inferiores, de las cuales cinco tocan á las submaxilares. Tal es la folidosis típica; pero se presentan algunas veces anomalías de poca importancia.

Pasemos á la descripcion de la *Coronela anillada.*

Ophibolus (Bd &c. Grd.) *doliatus* (Lin.)

Sinon.—*Coluber doliatus,* Linnæus, Syst. Nat. 1766, I, 379; Harlan, Journ, Acad. Nat. Sc. Philad, V, 1827, 362. *Coronella coccinea,* Schleg. Ess. Physion. Serp. 1837, II, 57. *Coronella doliata,* Holbr. N. Am. Herp, 1842, III, 105, lám. 24. *Ophibolus doliatus,* Baird and Girard, Catal. N. Am. Rept. 1853, 89, núm. 8.

Caracteres específicos.—Cabeza más deprimida que en las otras especies del mismo subgénero. La post ocular inferior, más pequeña que la superior, entrando en una escotadura formada por las cuarta y quinta labiales superiores, recargandose mas sobre la última. Gastrostegas 196; anal 1; urostegas dobles 58.

Dimensiones de un *especimen* macho, proviniendo de la Noria (Michoacan): Cabeza 0,^{m}025; tronco 0,^{m}70; cola 0,^{m}14; circunferencia en medio del cuerpo 0,065; longitud total 0,^{m}865. Algunos individuos miden un metro y más.

Colores. Iris pardo negruzco; lengua rojiza y la mitad anterior teñida de negro. Cabeza amarillo anaranjado; una mancha negra cubre parte de las fronto-nasales y de las preoculares, las palpebrales, la frontal, la mayor parte de las parietales y temporales, y algo de las labiales superiores que tocan al ojo: se ven algunas líneas negras sobre las labiales superiores y anteriores, y á veces tambien en las labiales inferiores correspondientes. Detrás de la cabeza, hay un angosto collar negro; despues siguen un anillo rojo cereza ancho, uno negro angosto, otro amarillo un poco más ancho, y vuelven el negro, rojo, negro, amarillo, etc. á aparecer en círculos que rodean el cuerpo, siendo siempre los rojos los más grandes; la cola lleva solo un anillo rojo en su base, y los demás son alternativamente negros y amarillos. En los espacios colorados y amarillos, las escamas están teñidas de pardo en su extremidad. Se notan sesenta y un círculos negros, de los cuales la mayor parte son incompletos, es decir, que forman un arco de círculo cuyas extremidades no se reunen debajo del abdómen.

En la mayor parte de los individuos los círculos son completos, y algunos de los negros se anastomosan en el dorso en medio de los anillos rojos; en estos he contado 49 anillos negros, 21 encarnados, y en la cola 7 amarillos; en los jóvenes este último color tira á blanco.

El número de anillos negros varía, y de consiguiente no es un carácter específico admisible; hay coronelas que tienen 46 en el cuerpo y 7 en la cola; otras que presentan 50 en el cuerpo y 11 en la cola, etc. He tenido una hermosa variedad cuyos círculos amarillos eran todos bien separados, y aun el de la cabeza quedaba interrumpido por lo negro de la cara, que se unia sobre el occipucio con la mancha negra del cuello: todos los anillos colorados estaban interrumpidos en el dorso por los negros que se unian entre sí, de manera que este último color predominaba en el tinte general. En otros, en fin, he observado este sistema de coloracion, en la parte posterior del cuerpo, miéntras en la mitad anterior, los anillos eran perfectamente distintos.

Estas variaciones en el colorido, me conducen á adoptar la opinion de Jan (Prodr. Iconogr. gener. degli Ofidi; Coronellidæ, 1863, 31) que considera el *Ophibolus gentilis* de Baird y Girard, como una mera variedad de la que nos ocupa. El mismo profesor describe las variedades *formosa,* Schleg, y *conjuncta,* Jan, la primera con anillos negros bien completos, la segunda con los mismos círculos, unidos dos á dos debajo del vientre por medio de una faja del mismo color, etc.

Patria.—Hasta ahora no he visto más que un ejemplar del Estado de Jalisco; los más los debo á la amistad del Sr. D. Epifanio Jimenez, quien me los trajo de su hacienda de la Noria, cerca de Zamora; y aprovecho esta oportunidad para darle públicamente las gracias, por las varias adquisiciones que le debo en este ramo de Erpetología, pues varias ocasiones me ha proporcionado objetos de estudio muy interesantes.

Observaciones.—Era de presumir que por sus colores, este ofidio debia ser confundido por personas poco ejercitadas, con la coralilla vulgar, *Elaps fulvius,* D. &c. B. Efectivamente lo llaman con este nombre en la Noria, y aun he recibido dos *Elaps* entre los *Ophibolus* que venian de este punto: error fatal, que pudo haber traido las más graves consecuencias, á no ser el carácter generalmente apacible del *Elaps fulvius* cuando no se le irrita: he manejado este último reptil muchas veces, y con guardar siempre sangre fria y cautela, puedo asegurar que no hay ningun peligro en estas manipulaciones; sin embargo, no las aconsejo á nadie, pues se necesita una serenidad, que solo la costumbre puede dar.

Los ofíbolos, á pesar de su pupila redonda, son más activos de noche que de dia, á lo ménos en el estado de cautividad. Salvo excepciones, son de un carácter dócil, poco irascible, y se pueden coger sin precaucion alguna, absolutamente como los alicantes ó las culebras acuáticas.

Beben agua de tiempo en tiempo, pero no parece que se bañen con placer; así es, que miéntras los tropidonotes, los corifodones, y aun las víboras de cascabel, suelen quedarse horas enteras sumergidas en el agua que se pone en sus jaulas, las coronelas anilladas, por el contrario, permanecen en puntos secos, ó raras veces en las ramas de arbustos que están á su alcance.

Se mantienen perfectamente con ratones recien matados, lagartijas de la clase de los tropidolépidos, y aun con oxirrhinas; pero he observado que siempre que se les da lagartijas llaneras vivas, *Cnemidophorus sexlineatus*, D. y Bib., es imposible hacerles admitir ninguna otra clase de alimentos, á pesar de que estén muy hambrientos. Cuando cogen á estos saurios, enroscan inmediatamente la parte anterior de su cuerpo en derredor de la presa, haciendo, como los boas, un nudo que aprietan fuertemente hasta la muerte de su víctima; despues de inmovilizada ésta, comienza la deglucion, que es parecida á la de los demas ofidios de esta clase: se adelanta primero la mandíbula superior de un lado, y fija los dientes; despues sigue la mandíbula superior opuesta, y en fin, la mandíbula inferior, continuando de esta manera hasta que toda la presa haya desaparecido en medio de un cuello tan dilatado, que la piel se ve desnuda entre las escamas muy separadas unas de otras. Sucede no pocas veces que el ofíbolo coge la lagartija por en medio del cuerpo; en este caso se verifica una especie de progresion lateral de las mandíbulas hasta que lleguen á la cabeza y se introduzca en la boca del ofidio esta parte cónica que más facilmente puede engullirse: otras veces la cola del saurio es la primera parte tragada. En ningun caso he visto á estos reptiles empapar con su saliva al animal que quieren comer; y esta observacion la extiendo á todas las serpientes que he podido examinar de cerca, y han sido innumerables.

Lo mismo diré respecto á la pretendida fascinacion de estos animales: he tenido Crótalos, Elafos de Deppe, Masticofis, Corifodones, etc., de un tamaño más que regular, y nunca he podido observar ni el mas mínimo indicio de esta facultad, que considero como completamente imaginaria.

Terminaré con un consejo: conocemos en la República mexicana varios ofidios cuyos colores son muy parecidos, y que difieren considerablemente por sus caractéres anatómicos: unos son opistóglifos, otros proteroglifos, otros aglifodontos. Es preciso, pues, miéntras no conozca uno perfectamente la especie que se encuentra, obrar con suma prudencia, pues va de por medio la vida, ó por lo ménos los accidentes mas graves pueden ser la consecuencia de una equivocacion.

Guanajuato, Diciembre 30 de 1874.

EL DIADOPHIS PUNCTATUS. VAR. DOU GESII.

POR EL SEÑOR DON MANUEL M. VILLADA,

SOCIO DE NUMERO.

Un individuo macho y al parecer jóven de un bonito ofidio fué llevado al Museo Nacional, conservando aún algo de vida; habia sido cogido en uno de los potreros de Balbuena, al Oriente de esta ciudad (México), en el momento en que salia á calentarse.

La novedad para mí de esta especie, el ser desconocida su existencia en nuestro Valle y su agradable aspecto, me decidieron á estudiarla, y tengo hoy el gusto de presentar á esta Sociedad el resultado de mis investigaciones.

Al verlo me vino la idea de que fuese, si no una especie nueva, una variedad no descrita, y tuve luego el pensamiento de dedicarla á nuestro ilustrado y entusiasta consocio, el Sr. Dr. D. Alfredo Dugés, á quien la Sociedad estima como á uno de sus mejores miembros: si mis apreciaciones no fuesen exactas, mi buena intencion conservará siempre su valor.

DESCRIPCION.

Formas.—Cabeza corta, deprimida, un poco aguzada y algo más ancha que el cuello; el hocico arredondado y la boca bastante hendida; tronco cilíndrico con el vientre ligeramente plano, y apénas saliente en su union con el dorso; cola robusta y mediana, faltándole la extremidad en el ejemplar que he tenido á la vista, á causa, sin duda, de un traumatismo y con el muñon perfectamente cicatrizado.

Folidosis.—En la cabeza es como sigue: una rostral con el borde superior arqueado, y con la canaladura de que está provisto el inferior para el paso de la lengua medianamente marcada; un escudete frontal de regulares dimensiones y de forma triangular; dos parietales bien desarrolladas; de cada lado, dos nasales entre las cuales se abre la abertura nasal; una frenal pequeña; dos preoculares; una palpebral ó supraorbitaria apénas sobrepasando a la órbita; dos post-oculares; tres temporales (1+2), una en la primera hilera, cuadrangular, más larga que ancha y acostada, dos en la segunda hilera más pequeñas y subpentagonales; siete supralabiales, que aumentan de tamaño de adelante atrás: la 1ª en relacion con las nasales, la 2ª con la frenal y algo con la anterior de atrás, la 3ª con la preocular inferior y el ojo, la 4ª con este órgano y un poco con la post-ocular inferior, la 5ª con ésta y tocando apénas la temporal de la primera hilera, la 6ª con la última en toda su extension, la 7ª en fin, con la segunda temporal; ocho labiales inferiores, cinco en contacto con las inframaxilares. En el tronco las escamas son enteramente lisas y brillantes como las de la cabeza; las del dorso subpentagonales con el ángulo posterior embotado, medianas, algo mayores las de los lados, apénas imbricadas, dispuestas en 17 hileras longitudinales (casi nada oblicuas); gastrostegas regularmente anchas y en número de 202. En la cola las urostegas son dobles, siendo 30 los pares, sin contar, se supone, los que corresponden al fragmento que falta de este órgano en nuestro ejemplar; preanal doble.

Coloracion.—Cabeza por encima de un moreno casi negro, con tintes verdosos bastante manifiestos; el resto de la parte superior ó dorsal del cuerpo y de la cola, de un color mas bien gris de plombagina y ménos marcados los reflejos verdosos que en la region anterior; toda la porcion inferior que toca al suelo desde la extremidad del hocico á la terminacion de la cola de un hermoso rojo naranjado, más claro en la garganta y tomando en la cola un rojo-carmin muy intenso; el borde libre de cada escama está salpicado ademas de cuatro manchas negras semicirculares ó semiovalares de un milímetro de diametro; bordes de las mandibulas rojo-amarillento claro, con manchas negras en el centro de algunas escamas, siendo aquellas más grandes y numerosas en la inferior que en la superior; sobre la nuca una faja trasversal á manera de collar de tres milímetros de ancho y formada por tres series de escamas y del mismo color que el vientre: está circunscrita anterior y posteriormente por una zona negruzca que insensiblemente se confunde con el color de la cabeza. Examinadas aisladamente las escamas que cubren toda la region superior, se ve que en el fondo son casi negras con jaspes de un blanco-sucio algo verdoso, ó si se quiere de este color en el fondo con puntuaciones negras bastante ligadas; en una palabra, el aspecto de ellas recuerda el del episperma de las semillas de algunas Euforbias y Lupinus.

Dentadura.—Los dientes supramaxilares, que faltan hacia adelante, son completamente lisos, sin canalillas ni surcos de ninguna clase; están dispuestos en una sola línea y teniendo sus puntas dirigidas directamente hácia atrás; son sensiblemente iguales, exceptuando los dos posteriores, que son mucho mayores y separados de los anteriores por un espacio libre de cerca de 2 mil. de extension: carácter y muy notable que es preciso tener en cuenta. Los pterigoides y palatinos no ofrecen particularidad alguna que mencionar, lo mismo que los del maxilar inferior.

Algunos de los organos de la cabeza.—Ojos pequeños, situados lateralmente; pupila redonda, iris moreno con el borde pupilar rojizo, lengua de este color en la base y el resto negra. El Señor Dugès ha encontrado siempre en las diferentes especies de estos ofidios que ha examinado, una glándula salivar superior muy abultada en la region temporal, y durante la vida se ve que despiden con frecuencia una baba abundante, aunque inocente.

Dimensiones.—Largo total 65 cent., cabeza 1½ idem, cola 6½ idem, diámetro del tronco 1½ idem.

CLASIFICACION.

Adoptando la clasificacion de los Sres. Dumeril y Bibron, en su obra intitulada: «Erpetologia general etc.,» es evidente que de los 5 sub-órdenes en que han dividido á los ofidios, nuestro reptil corresponde al segundo ó Aglifodontos que, como lo indica la etimologia de la palabra, son ofidios cuyos dientes estan desprovistos de conductos para el paso de un líquido venenoso, el que es secretado por una glandula especial, existiendo además aquellos órganos faneicos en ambas mandíbulas. El sub-órden mencionado ha sido dividido por los autores citados en 12 familias. Por no hacer demasiado largo este escrito, omito recorrerlas una á una, comparando sus caractéres con el animal de que me ocupo; básteme decir que su dentadura tiene caractéres muy marcados para colocarlo desde luego en la familia 12, que lleva el nombre de Diacranterios, cuya diagnósis, segun la obra de Dumeril, es como sigue: «serpientes teniendo todos sus dientes ó ganchos lisos, los dos últimos supramaxilares más largos y separados de los demás por un espacio destituido de ellos enteramente.» Mas examinando con cuidado los diez géneros que abraza, á ninguno ciertamente corresponde nuestra especie. Esta ocurrencia me puso indeciso acerca de la exactitud de mi clasificacion, pues me parecia difícil que mi ofidio tuviera una forma, ó mas bien dicho, una extructura zoológica no descrita: careciendo de obras en que resolver mis dudas, me decidí á consultar sobre el particular al Sr. D. Alfredo Duges, persona muy competente para juzgar este asunto, y en contestacion me dijo lo que sigue:

«No es extraño que no haya vd. encontrado la especie, cuya descripcion y dibujo me remite, en la obra de Dum. y Bib., pues han padecido una equivocacion al clasificarlo; lo han tomado por Isodontio, miéntras es, como vd. lo ha observado, un verdadero Diacranterio; busque vd. en la Erpetologia citada, t. VIII, pág. 310, *Ablabes punctatus*, y al fin de la sinonimia encontrará, *Diadophis punctatus*, Baird y Girard; este nombre es el verdadero segun Jan, «Elenco sistematico degli Ofidii» 1863, pag. 49, quien considera además como simples variedades del *punctatus*, el *docilis*, B. y G., *pulchellus*, id., *amabilis*, id., *Arnyi*, Ken., y *laetus*, Jan. Mas como Baird y Girard en su Catálogo de reptiles de Norte América, 1853, pág. 112, dicen que *D. punctatus* tiene el ojo colocado encima de la 4.ª y 5.ª labiales superiores, miéntras está arriba de la 3.ª y 4.ª en la *D. amabilis*, *docilis*, y *pulchellus*, y como vd. me señala en su *especimen* la post-ocular inferior colocada entre la 4.ª y 5.ª labiales superiores, infiero que el ojo está encima de la 3.ª y 4.ª, cuyo carácter lo excluye de la especie típica, y lo acerca á las tres últimas variedades citadas.»

Con las indicaciones del Sr. Dugès consulté la obra citada del Prof. Jan y vi que, fundandose en otro órden de caractéres, adopta una clasificacion distinta de la del prof. Dumeril y divide á los Ofidios en diez y nueve familias ó tribus; en la sexta ó *Coronellidæ* se halla inscrito el género *Diadophis*; cuya característica es como sigue: *escama rostral no proyectada hácia adelante; dos labiales en contacto con el ojo; escamas no oblícuas; dos preoculares; dorsales en* **15-17** *hileras*, caractéres todos que convienen á la especie que nos ocupa.

Admite en este género solo tres formas específicas bien determinadas, y son el *D. baliodeirus*, Boie, de la India Oriental; *D. punctatus*, B y G., de la América del Norte; y *D. purpurans*, D. y B. de la del Sur (Cayena). El *D. regalis* descrito mas tarde por Baird y Girard y que carece de la mancha rojiza á manera de collar, formará tal vez una cuarta. Considera como simples variedades de la segunda especie, pues recuerdan perfectamente el tipo, los 3 *Diadophis* ya citados por el Sr. Dugès, y distribuye en dos grupos á los *Diadophis* americanos, segun que sus escamas dorsales estan dispuestas en 15 ó 17 hileras longitudinales: en el primero se comprenden la especie tipica *punctatus* y las variedades *amabilis, docilis* y *pulchellus;* en el segundo sus demás variedades, *lætus* y *Arnyi* y la especie *purpurans*.

Las ideas del prof. Jan son aceptadas por el Sr. Dugès, pues es de opinion, y á mi entender con fundamento, «que cuando todo el conjunto de «caractéres es idéntico y no hay discrepancia mas que en algun accidente «de folidósis, no hay motivo para establecer especies distintas, sino á lo más «simples variedades.»

Volviendo ahora á nuestro *Diadophis*, puedo asegurar que sus caractéres concuerdan en lo general con los de la especie *punctatus*, mas las diferencias que entrambas se advierten, me inducen á considerarla como una variedad de esta especie. De las ya conocidas solo debemos compararla con las variedades *laetus* y *Arnyi*, por ser las únicas que con la nuestra corresponden al grupo de 17 séries de escamas dorsales. Pero la mayor robustez de las formas y la folidósis de la cabeza algo distinta, lo separan de la primera, y diferencias mas notables aún en este último órden de caractéres, lo alejan mas todavía de la segunda. Es indispensable, sin embargo, el exámen de mayor número de ejemplares, para que la variedad *Dougesii* que ahora propongo quedase definitivamente establecida.

COSTUMBRES.

Respecto del género de vida de este animal, tansolo podré señalarlo de una manera general, con el exámen de su organizacion. Su régimen alimenticio sin duda es la carne, tomando presas vivas, como por lo comun se observa en los Ofidios; sus hábitos deben ser terrestres y no acuáticos ni arborícolos, como lo indica la redondez y mediania de su cola; es ademas inofensivo como lo revela el aspecto de sus dientes, siendo quizá como sus congéneres de un natural quieto y apacible.

México. Enero 15 de 1875.

EXPLICACION DE ALGUNAS FIGURAS PARCIALES DE LA LAMINA.

A.—Cráneo, mitad mas grande del natural para hacer mas perceptible la disposicion y forma de los dientes, de la variedad descrita.

B.—Un fragmento de piel extendida.

C.—Cabeza del tamaño natural para mostrar su folidósis.

D.—Cabeza de un *Diadophis* con la glándula temporal superior descubierta.

UNA EXCURSION A LAS FALDAS DEL PICO DE ORIZAVA.

Por el Sr. D. Hugo Finck, socio corresponsal
en Córdoba.

I.

El 30 de Noviembre de 1874 sali de Córdoba acompañado de un mozo, con direccion al Jacal, especie de paraje de arrieros, situado entre San Juan Coscomatepec y San Andrés Chalchicomula, a una altura de 11,000 piés sobre el nivel del mar, en la pendiente Oriental del Pico de Orizava.

El objeto de este viaje era: 1.º, estudiar las estratificaciones desde Coscomatepec hasta el Jacal, para la solucion de una cuestion geológica; 2.º, observar la flora del invierno en alturas qne pasan de 7,000 piés, y 3.º, la colectacion de semillas de Coníferas y de otras plantas notables, incluso la formacion de un herbario de las que estuviesen en flor.

En la misma tarde llegué a Coscomatepec, continuando en seguida hasta Alpatlahua, pueblo de indigenas, á 7,000 piés de altura y a dos leguas del punto anterior. En el tránsito no encontré nada notable mas que un *Alnus* (Glite), que se encuentra desde la altura de 6 á 9,000 piés, y que es sumamente abundante; es de advertir que de los árboles originales no existen mas que los troncos. Ambos lados del camino estaban cubiertos de magníficas milpas, y aconteció, que por la extraordinaria abundancia de aguas en Mayo y Junio, las siembras de maiz se perdieran, pero calculando que habria lugar de volver á sembrar, lo efectuaron así los habitantes, siendo esta siembra el único recurso de esta poblacion. Su esfuerzo salió coronado de buen éxito, pues las nuevas plantas presentaban un aspecto muy favorable.

El maíz se cultiva en estos lugares hasta la altura de 8,500 á 9,000 piés, debido á su excelente posicion topográfica. Como la tendencia del calor es subir á esferas mas altas, y los vapores de la tierra caliente llegan a ésta y mayores alturas, resulta, que durante el dia la temperatura sube mucho, templando considerablemente el rigor del clima, aunque las noches son frias y hiela con suma frecuencia. Un fenómeno muy curioso y poco observado, proviene de la misma elevacion de los vapores calientes: cuando el cielo está despejado en Córdoba, Orizava, Coscomatepec, Huatusco, San Andrés Chalchicomula, Cañada de Ixtapa, y en fin, en todos los puntos cardinales en rededor del Pico de Orizava, se hace sentir á la entrada de la noche una brisa fresca, que gradualmente aumenta hasta que amanece. Esto se explica, pues nadie ignora que el calor en su tendencia ascensional choca, por decirlo así, con una temperatura mas fria, en proporcion á la más ó ménos altura a que asciende; de este choque resulta sin duda una brisa que irradia á todos los puntos del compás, teniendo el Pico de Orizava como centro. Sin esta brisa la vida en la tierra caliente seria insoportable.

Si en el Golfo sopla un fuerte Sur ó Sureste, se sentirá un calor fuerte, y como en lo general tras del Sur viene el Norte, este calor se diseminará en toda la pendiente oriental del Volcan de Orizava y de la serranía de que forma parte. El Norte, viniendo desde los confines de Terranova, enfria súbitamente la temperatura, de manera que los vapores se condensan y producen esas neblinas y aguaceros que hacen la fertilidad del Estado de Veracruz. Es notable que esa condensacion principia á la altura de 1,500 piés y rara vez pasa de 10,000; en lo general el límite no excede de 9,000 piés; de allí resulta que la cantidad de nieve sobre el Pico de Orizava, con raras excepciones, es mayor en el verano que en el invierno.

Volviendo á Alpatlahua, pueblo de 2 á 300 habitantes sin incluir las rancherías, que son grandes, y que está situado en una loma, cuya gradual inclinacion acaba al pié de un gran cerro, que forma el límite occidental de la poblacion, diré tansolo que el *substratum* del terreno en que está construido es granito, y extraña que edificios descansando sobre esta roca ó pórfido, estén más expuestos á destruirse que los que tienen por base de sustentacion el *tepetate* (areniscas): la razon consiste tal vez en la más ó ménos elasticidad de estas composiciones cuarzosas. La villa de Coscomatepec por tercera ó cuarta vez ha perdido su iglesia por efecto de temblores, miéntras que Córdoba y Huatusco, construidos sobre un substratum de tepetate, poco han sufrido.

El frio, durante mi permanencia, fué intenso y bajó á + 5° del centígrado.

Prosiguiendo mi viaje, frente á Alpatlahua, hácia el Norte, queda el pueblo de Cacahualco, dividido del primero por el rio de San Juan Coscomatepec formando una barranca profunda. La loma de Cacahualco comienza en las orillas de Coscomotepec, y se extiende sin interrupcion desde allí hasta el límite de la vegetacion, teniendo por el Norte la barranca de Jamapa y por el Sur la de San Juan ó Alpatlahua. Esta loma en su mayor anchura no excede de 500 metros, y muchas veces no tiene 10. El ascenso es continuo hasta la cumbre de la cordillera, que divide el Estado de Veracruz del de Puebla. De Alpatlahua 7,000 piés sobre el nivel del mar hasta el Jacal 11,000, hay seis leguas.

Pasando el rio de San Juan por un puente de cal y canto, empieza el ascenso. Se notan luego dos ó tres Ericaceas de flores blancas muy elegantes, *Leucothoe* y *Leonia*, y el *Crataegus mexicanus*, una poligala de flores pequeñas azules, encinos de varias especies y una valeriana (Tepezouxochitl) que en la terapéutica de los indigenas juega un gran papel. Entregué mi caballo al mozo y pié á tierra proseguí mi viaje. Aunque invierno, la naturaleza no duerme. Las Zarzaparrillas y dos especies de *Rubus*, la Zarzamora y Framboesa silvestres abundan; *Ampelopsis* y *Vitis* se enredan en los árboles, y entre ellas una uva, que colectada por los indios, se vende en Coscomatepec para hacer vino; algunos *Cornus*, y entre ellos se distingue el *Cornus Coronae Moctezumae*, con su grande corona blanca de pequeñas flores. Un *Lycopodium*, nuevo para mí y en plena flor, cubria el suelo, echando sus guías por todos lados; el *Philadelphus mexicanus* no falta en todo el camino, como igualmente el *Lophospermum scandens* y unas Ipomeas magnificas. A los 8,000 piés principia la *Fuchsia microphylla*, con sus florecitas y hojas diminutas; 2 *Carduus*, uno de grandes flores tricolores, con la base color escarlata, en medio blanco y en la punta purpúreo; el otro de flor más pequeña, de color violeta, ambos haciendo un efecto admirable.

Se entra á continuacion en la zona de los encinos, que son muy variados, pocos de hoja grande, la mayor parte con hojas pequeñas, finamente aserradas, pero todos muy hermosos. Puede haber sobre 20 especies diferentes, la mayor parte desconocidas de los botánicos. Calculo que en toda la vertiente oriental del Pico de Orizava, desde 2 á 11,000 pies sobre el nivel del mar, existen de 70 á 80 especies de *Quercus*. En un radio de cinco leguas alrededor de Huatusco, colecté hace 25 años un herbario y bellotas de 26 especies diferentes.

Las Ericaceas, como *Gaultheria*, *Arbutus*, *Clethra*, *Pyrola*, *Thibaudia*, *Lyonia*, *Leucothoe*, etc., cubren todo el camino a derecha é izquierda y no desaparecen sino hasta los 9,000 piés de altura. Un *Arbutus*, con racimos de flores blancas llega a ser un arbol de 30 centimetros de grueso y diez á doce metros de alto. El *Penstemon gentianoïdes*, con sus grandes espigas de flores, mitad blancas y mitad azules, *Lupinus*, *Campanula*, *Delphinium*, *Potentilla*, *Mimulus*, *Salvia*, etc., abundan igualmente. Las tres especies de *Pinus*, que existen todavia, son todos de cinco agujas (hojas), los de tres, como el *Pinus leiophilla* han desaparecido, ó mas bien, han sido exterminados. Entre 8 y 9,000 piés, se ve de léjos en léjos un *Pi-*

nus Orizavensis ó un *Pinus Ayacahuite* de poca altura y de fecha reciente, y no se encuentran mas que campos de maiz, adonde hace 27 años vi encinos y pinos colosales.

Al llegar á 9,000 piés de altura, desaparecen gradualmente los encinos, con excepcion de dos ó tres especies de *Quercus sempervirens* (texmole) para hacer lugar á esas gigantes Coníferas, que solamente en California se ven de igual tamaño. La mayor parte miden de 30 á 80 metros de altura, haciendo una impresion inolvidable. El *Pinus Russelliana,* la *Picea religiosa* y los dos ya mencionados constituyen todas las Coníferas que aun existen y que avanzan hasta 12,500 piés, pero que pasando de 11,000 disminuyen gradualmente de tamaño hasta no tener arriba de dos ó tres metros de altura. Entre 9 y 10,000 piés y donde las heladas son frecuentes, la vegetacion menuda estaba marchita, con excepcion de unas Gramíneas, *Carduus, Cineraria* y un magnífico *Habrothamnus* en plena floracion, que no es ni el *H. insignis* ni el *H. abelii.*

Es triste el ver que en una distancia de 5 leguas, que hace 27 años ví toda cubierta de encinos y Coníferas, hoy no existen mas que los troncos de los primeros, cubiertos de unos cuantos renuevos, y de los segundos solo una especie, de mediano tamaño, esparcida de léjos en léjos. Todo ha sido destruido, y al paso que va, dentro de pocos años desaparecerá el adorno más hermoso de nuestras montañas. He visto grandes siembras de maiz en medio de troncos colosales de Coníferas derribados en el suelo con el hacha, sin dar provecho de ninguna clase, y que el siguiente año serán todos quemados, sin dar más utilidad que abonar con su ceniza una tierra de por sí extraordinariamente fértil.

Llegué al fin al Jacal, y á la mañana siguiente que me levanté para ver salir el sol, todo estaba cubierto con un tapiz blanco; una helada fuerte habia caido en la noche y daba á los alredores una vista maravillosa. A la izquierda se distinguian dos lomas paralelas, cubiertas de pinos colosales, que se perdian de vista; á la derecha, hácia el Norte, el borde de la barranca de Jamapa, revestido con rocas inmensas, que parecian desplomarse á cada instante; y enfrente, á una distancia de cerca de dos leguas, el pico de Orizava, pero que no parecia distar ni 500 metros. En esta zona de dos leguas se distinguia perfectamente la gradual diminucion en tamaño de los pinos, desde 80 á 3 metros de altura, adonde termina el límite de la vegetacion, la parte árida, y últimamente la nieve. Espectáculo que no tiene igual por su magnificencia, y tanto más hermoso cuando el sol naciente doraba con sus rayos el plateado pico.

Cuidadosamente miré en mi tránsito á todos lados si podia encontrar una

Cinchona (Quina), pero no descubrí nada, aunque el gran Humboldt suponia que podian existir en la Cordillera de Centro-América y de México.

A las 7 de la mañana emprendí mi regreso, colectando por todo el camino. A las dos de la tarde llegué á Coscomatepec, adonde pernocté y al otro dia á Córdoba.

(CONCLUIRA.)

RECTIFICACION

ACERCA DEL DESCUBRIMIENTO DE LA NUEVA ESPECIE MINERAL, LLAMADA POR EL SR. PETERSEN,

GUADALCAZARITA.

Por tratarse de especies minerales del país, ha parecido oportuno á la Comision de Mineralogía y Geología de la Sociedad Mexicana de Historia Natural, dar en este periódico la traduccion del artículo de su finado miembro corresponsal, el Sr. D. José Burkart, sobre la prioridad en el descubrimiento de la supuesta nueva especie mineral, segun el Sr. Petersen. Le ha parecido tambien conveniente añadir, por no haberse publicado todavía en México, una copia de la descripcion que el Sr. Castillo acompañó á los ejemplares del *Sulfo-seleniuro de mercurio y zinc*, que remitió al Sr. Burkart, con objeto de que suplicara al Sr. Ransmelsberg la comprobacion de la nueva especie mineral, por medio de una análisis cuantitativa.

Ahora, como dicha especie mineral se describe en varias obras de mineralogía con nombres diversos, tomados de las localidades en que se ha encontrado, ó nombre de la persona á quien se ha dedicado, y resultarian para el mineral de la composicion química arriba expresada, los nombres de *Culebrite, Onofrite, Rionite, Guadalazarite*, etc., se hace necesaria una revision de los primeros trabajos mineralógicos sobre dicha especie, para discutir, tanto la prioridad del nombre como del verdadero descubridor.

México, Marzo 31 de 1875.

COMISION DE MINERALOGIA.

ARTICULO DEL DOCTOR J. BURKART DE BONN

SOBRE LA GUADALCAZARITA.

«*Infórmes mineralógicos,* 1872, *parte IV.*»

En estos Informes del tomo de 1872, se halla en la pág. 69 de la parte II, bajo el título «II, La Guadalcazarita, mineral nuevo, por Teodoro Petersen,» la descripcion y análisis química de un mineral compuesto de azufre, seleniuro de zinc y mercurio, encontrado en Guadalcázar de México, sobre el que dí un informe desde hace seis años, en los nuevos Anales de Mineralogía, etc., por G. Leonhard y H. B. Geinitz, del año de 1866, en las páginas 411 y siguientes.

Segun dicho informe, mi amigo el Sr. D. Antonio del Castillo, profesor de Mineralogía y Geología en México, me habia remitido, junto con un pequeño pedazo de chloroseleniuro de mercurio de Guadalcázar, otro más grande de allí mismo, con la clasificacion de sulfo-seleniuro de mercurio y zinc, acompañando una descripcion y el resultado de una análisis cualitativa de este último mineral, hecha por la vía seca y la húmeda, para su rectificacion.

Al remitir yo muestras de ambos minerales al profesor Rammelsberg, de Berlin, le supliqué hiciera una análisis de ellas, y habiendo repetido más tarde mi súplica, me contestó con fecha 27 de Diciembre de 1865, que los minerales de selenio remitidos, no se prestaban á una análisis química, porque además de ser las muestras demasiado pequeñas para tan difíciles investigaciones, parecian componerse de mezclas de oxidaciones, y no prometian resultados seguros.

Esto me indujo á suplicar al profesor Castillo, me mandara muestras más grandes, y á publicar entre tanto en aquella ciudad, los resultados obtenidos en las ántes referidas determinaciones hechas por este señor, á fin de que constara la existencia del chloroseleniuro de mercurio, y del sulfoseleniuro de mercurio y zinc de Guadalcázar, en el Estado de San Luis Potosí de México.

Si por lo expuesto no puede disputarse al profesor Castillo el descubrimiento del nuevo mineral llamado sulfoseleniuro de mercurio y zinc, tambien se debe al Sr. D. Teodoro Petersen el mérito de haber practicado la primera análisis completa, y confirmado con ella la existencia de la nueva especie mineral, sin prévio conocimiento, segun parece, de la descripcion hecha por el Sr. Castillo, de la Guadalcazarita descubierta por éste.

Aunque ya he recibido nuevas muestras del mineral referido, no se ha hecho aún la análisis química de ellas. Segun se ve por estas muestras, hay dos clases de sulfoseleniuro de mercurio y zinc, ó Guadalcazarita, siendo una la que describió el Sr. Castillo, de lustre metálico, de color gris de plomo, diseminada en la matriz, ó en masas terrosas embutidas en ella; y la otra, probablemente la misma que ensayó Petersen, crypto-cristalina, de color negro de fierro, segun parece, formando cintas muy delgadas.

Segun las descripciones mineralógicas hechas por Castillo y Petersen, se distinguen los dos pedazos de mineral ensayados por ellos, en su color, lustre, y forma; pero son de igual dureza, y tienen casi el mismo peso específico, aunque segun Castillo, este varía entre 6.69 y 7,165.

En el ensaye químico del mineral por la vía seca, obtuvieron Castillo y Petersen resultados casi iguales. Haciendo uso del soplete, percibió Castillo, al principio, un olor de azufre, miéntras que Petersen observó un vapor de azogue; despues sintieron ambos un olor de selenio, notando el primero, un resíduo amarillo, y blanco amarillento el último, quien lo reconoció por óxido de zinc.

Calentándolo en el matracito obtuvo Castillo un sublimado, que frotado se cubrió de azogue, y despues, habiéndose volatilizado el azufre, selenio y azogue, quedó un depósito de óxido de zinc, que era amarillo en caliente, y blanco despues de frío.

Tanto él como Petersen obtuvieron, calentando el mineral en un tubo abierto de cristal, un sublimado que Castillo designa como formado de zonas, de selenio metálico abajo, una sustancia rojo-parduscа sobre éste, y globulitos de azogue encima; miéntras que Petersen describe el producto como un sublimado gris hasta negro, de mercurio, azufre y seleniuro de mercurio.

El estudio de ambos minerales ha dado por consiguiente, segun lo que aparece de la comparacion hecha de sus pormenores, un resultado igual en varios respectos, y no podrá ponerse en duda la identidad del que fué determinado por Castillo desde 1865, con el que hasta ahora ha sido analizado por Petersen, quien lo denominó, Guadalcazarita, aunque la prioridad del descubrimiento se debe al primero.

Copia de la descripcion del Sr. Castillo a que se refiere el Sr. Burkart.

Sulfoseleniuro de mercurio y zinc de Guadalcázar.

Lustre metálico: gris de plomo negruzco. Romboedro? y en masas diseminadas. Textura hojosa encubierta y desigual, de grano grueso.

Blando. Dureza de 3: raspadura negra agrisada.

Peso específico de 6.69 á 7,165.

ANALISIS CUALITATIVA.

Via seca.

Al soplete da al principio olor sulfuroso, y despues de selenio. Arde con llama azul sobre carbon, y á la primera impresion de la llama se pone amarillo que pasa á rojo. Da pegadura pardo-rojiza y despues amarilla, dejando un esqueleto amarillo.

En el matracito se sublima una pegadura negra agrisada, cuyo polvo frotado es negro pardusco, y sobre ésta se adhiere otra de mercurio.

Desalojados el azufre, selenio y mercurio por sublimacion, se obtiene una pegadura amarilla en caliente, y blanca despues de fria, de óxido de zinc.

Con bórax da esmalte lechoso y un esqueleto amarillo que no se disuelve. Tratado el esqueleto en la cucharilla de platina con la solucion de nitrato de cobalto, da un grano verde de óxido de zinc.

En el tubo da olor de selenio y una zona de selenio metálico; encima de ésta otra rojo-parduscа, y más arriba globulitos metálicos de mercurio.

Via húmeda.

Es insoluble en ácido nítrico y en clorhídrico; pero es soluble en agua régia.

Tratado en ésta, se obtienen glóbulos que sobrenadan, de azufre y de selenio.

Evaporado despues el líquido en que se ha disuelto el mineral, para hacer escapar el exceso de ácido, y dilatado en agua, da con potasa un precipitado amarillo, insoluble en un exceso de reactivo.

Con ioduro de potasio, lo da rojo, soluble en un exceso de reactivo.

Con cloruro de estaño, si se usa en pequeña cantidad, da precipitado blanco de subcloruro de mercurio; y usado en exceso, lo da gris, de mercurio metálico, notándose particularmente cuando se calienta.

El líquido anterior filtrado y separado el mercurio, si se trata con potasa, da precipitado blanco de óxido de zinc, soluble en un exceso de reactivo. Lo da igual con ferrocianuro de potasio, y es soluble en la potasa.

Comparando pues, ambas análisis cualitativas, resulta un mineral compuesto de azufre, de selenio, de zinc y mercurio, cuyas proporciones se fijarán por una análisis cuantitativa.

México, Febrero 20 de 1865.

EL TEQUEZQUITE.

ESTUDIO DEL SR. D. MANUEL MONTAÑO RAMIRO, PUBLICADO EN EL AÑO DE 1870, COMO TESIS PARA SU EXAMEN PROFESIONAL DE FARMACIA; DISPUESTO BAJO UN ORDEN DISTINTO Y CON ALGUNAS AMPLIACIONES, POR EL SR. D. MANUEL M. VILLADA, SOCIO DE NUMERO.

La palabra tequezquite, adulteracion del mexicano *Tequixquitl*, que significa, «cosa semejante á piedra,» designa una sustancia mineral muy conocida entre nosotros, formada de la mezcla de diferentes sales, especialmente carbonato de sosa y cloruro de sodio. Lo producen naturalmente los lagos de Texcoco, Zumpango, San Cristóbal y otros lugares del Valle de México, existiendo tambien en diversas localidades de la República como Puebla, San Andrés Chalchicomula, Huamantla, llanuras de Ixtlahuaca, Valle de Santiago, etc.

Los antiguos mexicanos hacian la explotacion de este compuesto salino, segun afirma el célebre historiador Hernandez, en su artículo intitulado: «El tequezquite, ó nitro mexicano:» en él indica la manera de obtenerlo entre los indígenas y sus aplicaciones en aquella época, tanto economicas como medicinales.

El cuerpo de que ahora nos ocupamos se presenta con caractéres físicos diversos, que se designan con nombres especiales por las personas que lo esplotan; así, llaman *espumilla*, al que se asemeja á la espuma del agua; *confitillo*, cuando su superficie está erizada de pequeñas tuberosidades; *cascarilla*, si su aspecto es el de costras ó tiestos; *polvillo*, en fin, en su estado pulverulento.

El primero se recoge por los meses de Diciembre, Enero y Febrero, haciendo en la tierra numerosos surcos paralelos, destinados á recibir el agua, la que, segun la inclinacion del terreno, llega naturalmente por medio de canales, ó bien la elevan artificialmente á las partes altas; una vez llegado el liquido á aquellos depósitos, se impide su salida por medio de diques, y se aguarda á que espontáneamente se evapore para recoger los residuos.

La cosecha del segundo se verifica en los lugares de donde se ha sacado el anterior. Tan luego como caen los primeros aguaceros, que por lo regular es en el mes de Marzo, las aguas disuelven las sales más solubles que han quedado: durante el primer tiempo de la evaporacion, bajo la accion de los rayos solares, se contrae la costra ya formada y se hiende irregularmente, originándose así esta variedad, que lleva tambien el nombre de *tepalcatillo.*

La del tercero se efectúa el mes de Mayo, del modo siguiente: se construyen unos cuadriláteros de césped, dejándoles en los lados que miran hácia las aguas del lago, algunas aberturas por donde aquellas puedan tener acceso, impulsadas por el viento: tan pronto como esto se verifica, se obstruye la comunicacion, quedando las aguas extendidas en una grande superficie: por su extension y corta profundidad, la evaporacion se hace en ocho ó diez dias, al cabo de los cuales aparece en la superficie una película, debida á la concentracion; luego que esto se observa, se agitan las aguas por medio de instrumentos especiales llamados *rastrillos,* con objeto de acelerar su evaporacion y recoger el tequezquite ántes de que se adhiera á las paredes del vaso.

El cuarto, por último, se obtiene de los lugares de donde se han retirado las aguas saladas, quedando bajo la influencia del calor del sol, las sales del todo eflorescidas.

Algunas análisis han sido practicadas hasta hoy, de las distintas variedades.

La del *espumilla,* hecha por Berthier, profesor en la Escuela Real de Minas de Paris, dió el siguiente resultado:

Carbonato de sosa anhidro.	0,516
Sulfato de sosa.	0,153
Sal marina.	0,045
Agua	0,246
Materias leñosas.	0,030
Total.	0,990

Esta variedad se cosecha en la parte N. O. del lago de Texcoco y en el de San Cristóbal.

En la análisis industrial practicada por el Sr. D. Guillermo Hay, fabricante de sosa en Texcoco, sobre los tequezquites confitillo, cascarilla y polvillo, obtuvo lo que sigue:

Para el primero, por término medio.

Carbonato de sosa.	28
Cloruro de sodio.	30
Materias terrosas.	35

Se cosecha en la parte E. y S. O. del lago de Texcoco y en Ixtapalapam.

Para el segundo, por término medio.

Carbonato de sosa	0,20
Sulfato de sosa	0,14
Cloruro de sodio	0,46
Materias terrosas	0,30

Al Norte del lago de Texcoco é Ixtapam.

Para el tercero, por término medio.

Carbonato de sosa	0,5
Sulfato de sosa	1,5
Cloruro de sodio	6,0
Materias terrosas	85,0

El Sr. Montaño Ramiro obtuvo en 100 gramos de tequezquite espumilla, que es la variedad más apreciada, las sustancias que se expresan á continuacion:

Carbonato de sosa	57,00
Sulfato de sosa	10,87
Cloruro de sodio	1,13
Sales insolubles	7,00
Materia organica	2,00
Agua	22,00

El mismo señor ha encontrado además en la parte soluble del tequezquite, huellas de nitratos, usando como reactivo el sulfato de fierro, como lo recomienda H. Rose, y en la insoluble carbonato de cal en cantidad notable, óxido de fierro y fosfato de fierro y cal, muy poco, siliza pura y silicatos, especialmente de alumina. Se advierte desde luego en todas estas analisis, que las sales que predominan en el tequezquite, son el carbonato de sosa y el cloruro de sodio, y que sus proporciones cambian en las distintas variedades. La razon de esto vendrá naturalmente una vez explicado el origen de aquel compuesto; asunto, y muy importante, que los Sres. D. Gumesindo Mendoza y D. Alfonso Herrera se propusieron resolver en un trabajo publicado el año de 1866 en la Gaceta Médica de México, y del que hacemos á continuacion un extracto.

Las teorías emitidas anteriormente para explicar la fuente de donde provienen el carbonato de sosa y el cloruro de sodio, tan abundantes en las aguas de los lagos situados entre el Norte y Oriente del Valle de México, no han sido de ninguna manera confirmadas, ni por los hechos ni por la experiencia, para que pudiesen pasar al rango de verdades demostradas.

La existencia, en efecto, de un banco de sal gema, y la doble descomposicion entre el cloruro de sodio y el carbonato de cal, para producir el carbonato de sosa; la preexistencia en los lagos de las sales en cuestion, y por último, de que son éstas suministradas por las aguas del lago de Xochimilco, en el supuesto de que ántes de salir han atravesado una capa feldespática, no son de ninguna manera admisibles. No la primera, puesto que, no se ha demostrado la presencia de un banco de tal naturaleza; y aun admitiéndolo, ¿cómo explicar que el cloruro de sodio se halla al pié de los cerros de la cordillera, por sus cuatro puntos cardinales, en pequeña cantidad y solo en la superficie de aquellos lugares donde ha estado estancada el agua que ha bajado de su vertiente, y aun por allí, por donde solo han pasado esas mismas aguas? Todavia más: en los lugares donde se encuentra el cloruro de sodio en la estacion de las aguas, se encuentra el carbonato en la estacion del invierno, y siempre superficial: á unos cuantos centímetros de profundidad, ya no acusan los reactivos la presencia de estas sales, (textual). La segunda carece de todo fundamento para refutarla seriamente; la cuestion, por otra parte, quedaria siempre la misma. La tercera, en fin, tampoco es admisible, por el hecho de que, como afirma el Sr. baron de Humboldt, «el agua más pura y limpia es la de Xochimilco;» y además, ¿cómo explicar la accion de los feldespatos para determinar la formacion del carbonato de sosa y cloruro de sodio? Era, pues, necesario dirigir por otro camino las investigaciones para resolver este problema.

La antigua teoría del Sr. Aubuisson de Voisins, de que la formacion del cloruro de sodio pudiera ser espontánea, como lo es la del nitro, por singular que fuese, parecia plausible una vez comprobada la existencia del cloro, para combinarlo con el sodio, así como la del ácido carbónico para formar el otro compuesto; en una palabra, se presentaba el último término del problema; faltaba resolver el primero. La presuncion de que el cloro existiese en las aguas pluviales al estado de ácido clorhídrico, puesto que éste se produce en algunos volcanes en actividad, no fué confirmada; pero la análisis del pórfido traquítico de Guadalupe, demostró en abundancia el cloruro de calcio y el silicato de sosa entre sus componentes: además, el ácido carbónico se desprende en gran cantidad de las fuentes conocidas, como el Pocito y el Peñon de los Baños, y en general, de otros puntos numerosos: los elementos, pues, que se buscaban, existian en las rocas y en el suelo del Valle: con la adquisicion de estos datos, la teoría enunciada fué formulada por sus autores los Sres. Mendoza y Herrera en los siguientes términos:

«En la estacion de las lluvias el agua cae sobre las rocas; y sus *detritus*, formados bajo las influencias climatéricas del aire, el calor y los hielos del invierno, disuelve las dos sales, cuya existencia hemos demostrado; las arrastra y conduce á los receptáculos naturales; allí se carga, mejor dicho, se satura de ácido carbónico, proviniendo de las fuentes ya señaladas en el Valle, y todos estos cuerpos una vez en presencia unos de otros y en un estado que favorece y despierta las afinidades, se verifican las dobles descomposiciones que pasamos á formular:

«1ª El ácido carbónico obrando sobre el silicato básico de sosa, se apodera del exceso de base, forma carbonato de sosa soluble, y el silicato neutro insoluble se precipita.

«2ª El cloruro de calcio reobrando sobre el carbonato de sosa, forma cloruro de sodio soluble y carbonato de cal insoluble, que se precipita en virtud de esta ley muy conocida: "cuando se mezclan dos sales que puedan dar por el cambio de sus bases y de sus acidos, una sal insoluble ó poco soluble, estas sales se descomponen, y el compuesto ménos soluble se precipita.»

«Ahora los dos cuerpos insolubles que resultan de estas dobles descomposiciones deben encontrarse en los sedimentos, y ciertamente, una análisis que se habia hecho de esa piedra de agua, como decian nuestros mayores, pues esto significa *tepetatl*, nos habia acusado la presencia de estas dos sales insolubles, silicato de sosa y carbonato de cal.

«Por otra parte, una teoría está de acuerdo con la naturaleza cuando las experiencias directas, procurando hacer lo que ésta hace en una escala tan vasta, la confirman: hemos ejecutado esas experiencias, ellas han puesto la verdad en toda su luz y nos dan confianza para decir, el problema está resuelto; hé aquí estas experiencias:

1.ª Tomamos una solucion concentrada del liquido provenido del tratamiento del pórfido y la dividimos en dos porciones: a la primera la ponemos en contacto de una solucion débil de carbonato de sosa, inmediatamente aparece el precipitado de carbonato de cal; filtramos, concentramos de nuevo, y el cloruro de sodio cristaliza en su forma cúbica y reconocible por su sabor que nos es tan familiar.

2.ª Hacemos pasar una corriente de ácido carbónico en la segunda porcion; concentramos hasta hacer desaparecer todo el liquido; el resíduo lo tratamos por una solucion débil de ácido sulfúrico; hay viva efervescencia que acusa la presencia del carbonato de sosa que ántes no existia.

«Las mismas experiencias son repetidas con el polvo del pórfido, y los resultados son los mismos.»

Con anterioridad á esta teoría, el Sr. D. Leopoldo Rio de la Loza, habia emitido ya otra, para explicar la presencia en las aguas del lago de Texcoco de las dos sales que forman principalmente el tequezquite. Segun este señor, las materias que contienen los derrames de la ciudad de México, y que van a depositarse á aquella cuenca, bajo la influencia de los agentes físicos, químicos, etc., reproducen el carbonato de sosa y el cloruro de sodio. Las análisis más recientes han demostrado en efecto, en los excrementos humanos, sobre 100 partes, 2.367 de sosa y 0.780 de cloro; y en los de los cuadrúpedos, 2.420 de la primera y 0.198 del segundo. Supone el autor que por la diferencia de edades, pérdidas, estado patológico, etc., etc., solo se aproveche un dos por ciento de sosa; calcula que la cantidad de excrementos que corresponden á un individuo en 24 horas, inferiormente es de 200 gramos, que contienen 4 gramos de sosa. Apoyándose en seguida en el número de habitantes, deduce que la cantidad de este álcali que se produce al dia, es de 3,726 k. 584 gms., ascendiendo anualmente á 1.360,203 k. 160 gms.; a esta cifra hay todavía algo más que agregar; pero teniendo tansolo en cuenta el jabon que se consume sin hacer caso de otros muchos desperdicios, en los que existe tanto la una como el otro, el Sr. Rio de la Loza, estima sin exageracion, en 37,265 k. 840 gms. la sosa que proviene de dicho artículo.

Esta teoría, aunque no es tan general en su aplicacion como la anterior, de ninguna manera está en oposicion con ella, sino ántes bien, explica la mayor concentracion salina de las aguas del lago de Texcoco, respecto de los demas lagos. La objecion que se le ha hecho, de que por qué en otros lugares en donde existen los mismos desperdicios ó residuos, no se forman las sales mencionadas, es fácil de desvanecer si se atiende á que las circunstancias varian en las diversas localidades, y entre otras, el desprendimiento del ácido carbónico, que no es probable se observe en todas ellas.

Por último, apuntaré tansolo, que el Sr. D. Antonio del Castillo, se inclina mas bien á creer que las aguas torrenciales cargadas de ácido carbónico, obran sobre los feldespatos volcánicos, de cuya descomposicion puede resultar entre otros productos, el carbonato de sosa; en cuanto al cloruro de sodio, es probable se halle diseminado en diversas rocas, como producto de emanaciones volcánicas, é igualmente disuelto por las aguas y concentrado en los vasos inferiores de la cuenca de México, pues le parece, por otra parte, muy dudosa la existencia del cloruro de calcio en las traquitas, siendo de necesidad mayor número de experiencias para demostrar lo contrario. Esta hipótesis da sin duda una explicacion mas lata del fenómeno y es aplicable á otras localidades de la República, en donde no se observa desprendimiento de ácido carbónico, ni es probable se encuentre el cloruro de calcio que solamente existe en determinadas rocas.

Volviendo de nuevo al trabajo del Sr. Montaño Ramiro, podemos, como él dice, explicarnos la causa de la diferencia en los resultados de las análisis. La cantidad de carbonato de sosa, debe ser, en efecto, tanto más grande, cuanto mayor es el contacto de los silicatos con el agua y el ácido carbónico: la estacion de las lluvias, como se sabe, cesa por lo regular en el Valle de México, á mediados de Octubre; el *confitillo* se comienza á recoger, desde Diciembre, continuando la recoleccion, durante Enero, Febrero y principios de Marzo; por término medio, han trascurrido, hasta entónces, tres meses de sequía, y por consiguiente, la solucion debe estar muy diluida, pudiéndose calcular, próximamente, que la cantidad del cloruro de calcio, es como la mitad del carbonato de sosa que ha comenzado á formarse: en este momento, el agua, llegando á los vasos de concentracion y evaporacion, vendrá la vez de que se verifique el cambio previsto por los Sres. Herrera y Mendoza, y se forme cloruro de sodio y carbonato de cal insoluble; teniendo que ser el resíduo, concluida la evaporacion, una mezcla de estos dos cuerpos, más carbonato de sosa: de hecho, la análisis cualitativa del tequezquite, ha demostrado una cantidad notable de carbonato de cal: no habiendo hasta aquí pérdida alguna de sales, se comprende, por qué las dos que predominan están, en la variedad de que hablamos, en partes iguales.

Despues de las primeras lluvias de Marzo, se cosecha el *cascarilla*, ya formado el tequezquite, y es natural suponer, que las sales más solubles, sean llevadas por las aguas que salen de los surcos ó reabsorbidas por la arena: esta pérdida explica, por qué en dicha variedad el cloruro de sodio esta en la relacion de veinte á cuarenta y seis, ménos que en el *confitillo*.

En el mes de Mayo, se extrae el *espumilla*; a esta fecha han pasado ya, seis meses de evaporacion, y en cuyo tiempo ha estado obrando sin cesar el ácido carbónico, que continuamente se desprende, sobre los silicatos, aumentándose en consecuencia dia á dia la cantidad de carbonato de sosa; no así el cloruro de sodio, puesto que el de calcio que le da origen, no aumenta, pues cualquiera que sea su cantidad, tiene que ser la misma que la que baja de las montañas en los *detritus* del pórfido traquítico: hé aquí la razon, por qué en la variedad actual el cloruro de sodio y el carbonato de sosa están en la relacion, análisis de Berthier, de 0,045 á 0,316. Lo que pasa en la naturaleza, el industrial puede aprovecharlo, ya para obtener las dos sales más importantes del tequezquite, como en el *confitillo*, o en mayor cantidad la última de las dos mencionadas, como en el *espumilla;* la cuestion es de tiempo.

Para terminar, hablaré rápidamente de la importancia del producto de que nos ocupamos: en la fabricacion del vidrio, el jabon, la loza, de las telas pintadas, etc., es de vital interes, pues son industrias que no pueden existir sin el carbonato de sosa. Si en nuestro país bajo este respecto no presenta mayor utilidad, no así en el extranjero, cuando se llegue á exportar con economía. En efecto, siendo el tequezquite un sexqui-carbonato de sosa casi puro, basta solo la calcinacion ó algun agente químico para purificarlo; miéntras la sosa artificial se obtiene reverberando el sulfato de sosa con carbon y carbonato de cal, exigiendo la operacion mucho tiempo y no obteniéndose sino un producto harto impuro; la competencia se podria establecer, en consecuencia, con mucha ventaja de nuestra parte.

Segun el Sr. D. Guillermo Seager, en su Memoria: «Recuerdos de México, aparte de sus metales preciosos,» publicada en el año de 1866, la cantidad de sosa que puede dar el lago de Texcoco, cuyas aguas tienen un 10 por 100 de sales en solucion, es de 216 libras por metro cúbico, cuyo precio es de cinco pesos. Mas como el lago, segun él, tiene sesenta y dos y medio millones de metros cúbicos; resulta como valor de las sales $312.500,000.

El ingeniero americano, Smith, dice que el valor de las sales del lago, cuando puedan exportarse, será mayor que el de las minas del Real del Monte, Guanajuato y Zacatecas reunidas que suministran las tres cuartas del dinero que circula en todo el mundo, porque el consumo del carbonato de sosa puede calcularse:

Para	Inglaterra	$ 10.000,000
,,	Francia	10.000,000
,,	Alemania	10.000,000
,,	Estados Unidos	5.000,000

Lo que hace $ 35.000,000 anuales, solo por estos cuatro países, en el supuesto de que México sea el que abastezca estos mercados, y llegará un dia en que esto pueda verificarse, puesto que se podria vender á un precio más bajo que en cualquiera otra parte.

Estos cálculos, suponiéndolos exagerados y que se reduzcan á la mitad, demuestran la importancia industrial y mercantil del tequezquite.

México, Marzo 15 de 1875.

NOTA DEL SEÑOR DON PABLO DE LA LLAVE,

ACERCA DE LAS COSTUMBRES DE UNA HORMIGA MEXICANA.

Juzgamos de interes la insercion de esta nota como adicion al excelente artículo del Sr. Norton, ya publicado, sobre las hormigas mexicanas. La nota del Sr. La Llave se refiere sin duda á la *Eciton mexicana ó Sumichrasti. (C. de P.)*

«Entre las muchas hormigas que he visto en Córdoba y sus contornos, una de las más notables es la hormiga soldado, que entiendo se encuentra en gran parte del Estado de Veracruz, y es regular la haya tambien en otros Estados. No sé en qué época ni en qué términos procede este insecto para propagar su especie, pues nunca las he visto salir de hormigueros ni conducir á él la presa, sino que donde mismo la cogen la devoran. En los grandes calores las he encontrado formando á la sombra columnas cerradas de una cuarta de ancho y algunas varas de largo, inmóviles y como descansando, muy arrimadas unas á otras: á veces las he encontrado tambien en los mismos términos, pasado un aguacero, abrigadas en el bosque, y situadas en los pedazos más altos y eminentes del terreno. Es de las hormigas que pican, y dos veces que lo han hecho conmigo en el monte, por no advertir que por allí andaban, sentí un piquete general, es decir, que fueron subiendo por los piés é introduciéndose sin hacer mal, hasta que todas ó casi todas me picaron á un tiempo, como si hubieran recibido una señal para hacerlo. Este animal es verdaderamente feroz, segun verémos despues, y no debo omitir aquí un hecho que tambien lo confirma. Acabado de pasar un aguacero, encontré las terribles bandas como entumidas; á este tiempo salió el sol despidiendo el fuego propio de la estacion de las lluvias; á poco volvieron en sí las hormigas y empezaron á desfilar. En esto me ocurrió dar fuego por varias partes á un gran pedazo de yesca y echárselos, y las valientes hormigas, sin arredrarse con la brasa, la atacaron en términos, que despues de retiradas contamos más de ciento entre muertas y estropeadas. En medio de estas circunstancias, ¿quién creeria que la visita de este insecto en las habitaciones es para el hombre un presente inestimable de la Providencia en las tierras calientes? En efecto, aun ántes de llegar á las casas, ya los insectos de que se alimentan presienten su exterminio, y salen á luz, mas que sea á medio dia, alacranes, toda especie de arañas, cientopiés, grillos, cucarachas y hasta ratoncillos y culebritas; todos se ponen en movimiento y corren aturdidamente; pero sus esfuerzos son inútiles: llega, en fin, el atroz enjambre en una especie de desórden, ó mejor diré, desplegados sus terribles batallones: nada hay que pueda resistir á su inexorable furor; cuanto encuentran allí mismo lo devoran, y concluida la matanza, suben ordenadamente en columnas por las paredes y techos, en busca de los insectos que se han quedado ocultos en sus escondrijos y madrigueras. En poco tiempo registran y dan vuelta á toda una casa, y cuando se retiran, es porque ya la dejan limpia. Como no tengo ahora á la vista esta hormiga, no puedo describirla, pero sí aseguro que no es la *militaris* de Fabricio. Se me pasaba decir, que estos animales se desordenan y huyen tomando entre los dedos una tabla y dándole repetidos golpes con un palo como bolillo, es decir, que el tambor que en nuestros soldados arregla y sostiene la marcha, en estos insectos produce el efecto contrario. He visto tambien en estas tribus guerreras, individuos que se distinguen del resto, por su tamaño y color, pero en poca cantidad, lo que me hace sospechar que son las hembras.

México, Julio 21 de 1832.

MINERALOGIA.

EXÁMEN Y CLASIFICACION DE ALGUNAS ESPECIES MINERALES DE MEXICO,

COMUNICADAS POR EL SEÑOR DOCTOR DON JOSE BURKART.

A principios del año de 1865, el Sr. D. Antonio del Castillo me mandó varias muestras de minerales de México para rectificar su clasificacion, dirigiendo una parte de ellas al Sr. Rammelsberg, de Berlin, para su análisis. Cumpliendo con este encargo mandé tambien á este químico distinguido algunos otros minerales mexicanos poco conocidos que tenia en mi coleccion, quien á pesar de estar muy ocupado con otros trabajos científicos, no dejó de obsequiar mi recomendacion, comunicándome el análisis de algunos de estos minerales, y publicando por su parte el de otros en el periódico de la Sociedad Geológica alemana del referido año, en Berlin. [1] Voy á reproducir en diversos artículos y en idioma español, tanto estas comunicaciones del Sr. Rammelsberg, como otras noticias sobre minerales mexicanos, para conocimiento de los amantes de la mineralogía de México, contribuyendo así, al publicar estos resultados, tanto a aumentar el estímulo por el estudio de esta ciencia, cuanto á fomentar el adelanto de este ramo de la historia natural de México.

Articulo I.

De la Castillita, nueva especie mineral de México, por el Sr. Rammelsberg.

En el periódico de la Sociedad Geológica alemana, (Berlin 1866, pág. 23), dice el Sr. Rammelsberg, con relacion á esta nueva especie mineral, haber recibido de mi parte un ejemplar con el nombre de cobre abigarrado de Guanasevi, que me habia remitido D. Antonio del Castillo, de México. En esta última suposicion hay un equívoco, porque ese mineral no me fué enviado por el Sr. Castillo, sino que existia hacia algunos años en mi coleccion mineralógica; lo que escribí tambien al Sr. Rammelsberg cuando me informó acerca de su intencion de dedicar este mineral, que habia reconocido ser una especie nueva, á aquel señor; introduciéndola con el nombre de «Castillita» en el sistema de mineralogía; advirtiéndole ademas que aun cuando dicho mineral analizado no provenia del Sr. Castillo, tenia este señor tantos méritos por el fomento de la Mineralogía y Geología de México, que bien merecia la dedicatoria propuesta; de lo que resultó que el Sr Rammelsberg introdujera la nueva especie mineral en el sistema de mineralogía, al publicar los siguientes resultados del análisis de dicho mineral, con el nombre de «Castillita.»

«La Castillita se encuentra en masa de textura hojosa y está tomada de los colores abigarrados hasta en su interior. Su peso específico resulta ser por dos experimentos de 5,186 y 5,241.

«Al soplete se funde con alguna dificultad y da una escoria refractaria, que en parte está teñida de rojo por el cobre. Se disuelve en ácido nítrico, dando un licor azul, separándose el azufre y el sulfato de óxido de plomo.

---

[1] Véase el "Zeitschrift der deutschen geologischen Gesellschaft." Berlin 1866, tomo. XVIII, págs. 19 y siguientes.

Rusentada la prueba en contacto con hidrógmo, da una pequeña cantidad de azufre y trazas de sulfohidrico, pero no da agua ninguna. En un ensaye la pérdida fué de 1,85 % y el resíduo era infusible.

«El mineral no puede ser cobre abigarrado, porque además del cobre y fierro, contiene zinc, plomo y plata. Su análisis por medio del cloro da:

Azufre	25,65
Cobre	41,11
Plata	4,64
Plomo	10,04
Zink	12,09
Fierro	6,49
	100,02

Los átomos de los metales y del azufre están en la proporcion de 4 : 3; el cobre debe por consiguiente, hallarse por una ⅓ de CuS, y por ⅔ de Cu^2S, pudiéndose representar el todo por la fórmula:

$$R^2S + 2RS. = \left.\begin{matrix} Cu \\ Ag \end{matrix}\right\}^2 S + 2 \left.\begin{matrix} Cu \\ Pb \\ Zn \\ Fe \end{matrix}\right\} S,$$

y la distribucion del azufre se reparte del modo siguiente:

Cobre	27,70	+ Azufre	7.00
Plata	4,64	,,	0,69
Cobre	13,41	,,	6,76
Plomo	10,04	,,	1,55
Zink	12,09	,,	5,95
Fierro	6,49	,,	3,71
			25,66

Para averiguar si el mineral, no obstante su aspecto homogéneo, pudiera ser una mezcla, se ensayaron pedacitos de varias partes de la muestra, se lavó el polvo y se analizó la parte más ligera y la parte más pesada, por separado, resultando solamente cortas diferencias en la ley del cobre . . . .

(42,35—42,71—43,35 %)

En la ley del fierro,

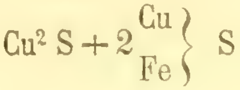
(6,30—6,55—6,92—7,06 %)

Y en la ley de plata y plomo juntos,

$$(13,76-15,18\ \%)$$

De modo que no hay duda que es una nueva especie mineral, que propongo se llame Castillita, en honor del Sr. D. Antonio del Castillo, de Mexico.

Se observa fácilmente, que el mineral es una mezcla isomórfica muy análoga al cobre abigarrado cristalizado, á saber:



$$Cu^2\,S+2\left.\begin{matrix}Cu\\Fe\end{matrix}\right\}S$$

No permite el contenido del azufre de este mineral, admitir solamente Cu^2S, pues entónces el grado más alto del sulfuro de fierro no seria $Fe^2\,S^3$ sino $Fe\,S^2$, que al ménos no se halla presente como mezcla.

Articulo II.

Del cobre abigarrado de Ramos y de su composicion comun,

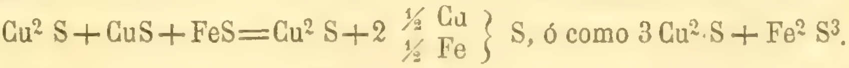
por el Sr. Dr. Rammelsberg. [1]

Una muestra de cobre abigarrado que me procuré en mi visita á este mineral, fué analizada por el Sr. Dr. Rammelsberg, y dió los resultados siguientes:

«Su peso especifico es =5,030, y perdió el mineral al calentarlo en hidrógeno =2,54 %. Su análisis dió: azufre =25,27; cobre =61,66; fierro =11,80; plomo y trazas de plata =1,90; en todo =100,63.

«Segun esta analisis, el cobre abigarrado de Ramos, tiene, con excepcion de la pequeña ley de plomo, la misma composicion que las variedades de Ross-Island, Toscana, Chile, Bristol, Westmoreland, la Mar blanca, etc., y da lugar á las consideraciones siguientes, con respecto á la composicion química de la especie, y á las de una composicion semejante en lo general.

«De los análisis de algunas variedades cristalizadas de este mineral, se deduce, que se compone de 3 átomos de azufre, 3 átomos de cobre, y 1 átomo de fierro; pero es muy dificil de determinar si estos se han de considerar como



$$Cu^2\,S+CuS+FeS=Cu^2\,S+2\left.\begin{matrix}\tfrac{1}{2}\ Cu\\\tfrac{1}{2}\ Fe\end{matrix}\right\}S,\ \text{ó como}\ 3\,Cu^2{\cdot}S+Fe^2\,S^3.$$

En todos estos minerales de cobre abigarrado, la ley de cobre es de 56 á 58 %. Pero tenemos 10 análisis de cobre abigarrado de varias localidades, que rindieron de 60 á 63 %, y además, 5 análisis que dieron casi 70 % de cobre. Todas estas variedades más ricas en cobre se hallan en masas; á lo ménos ninguna de ellas se halla en cristales bien pronunciados, y por esto se ha supuesto siempre que son mezclas de cobre abigarrado y de cobre sulfúreo.

---

[1] Véase el l. cit. p. 19.

Esta suposicion tan favorable por sí misma, está en contradiccion sin embargo con otras relaciones, y no se sostiene al examinar la cuestion atentamente. En primer lugar, seria muy raro que semejantes mezclas se hallasen en tan diversas localidades y que se redujesen á dos clases de una ley mayor de cobre. ¿Podria suponerse que los minerales de Conecticut, de Irlanda, de la Mar blanca y de México, fuesen mezclas todas de composicion igual? ¿Porque tendria el mineral de Sangerhausen, exactamente la misma composicion que el de Lauterberg?»[1] «Calculando la composicion atómica de los análisis de más confianza, se encuentra para los cobres abigarrados de:

1°. la mina	Condurra segun Plattner . . .	1 Fe	3,38 Cu	3,33 S
2°. ,, ,,	Redruth ,, Chodenew. . .	1 ,,	3,4 ,,	3,15 ,,
3°. ,, ,,	? ,, Varrentrapp . .	1 ,,	3,45 ,,	3,2 ,,
4°. ,, ,,	Martanberg ,, Plattner . . .	1 ,,	2,9 ,,	2,6 ,,
5°. ,, ,,	Ross-Island ,, Phillips . . .	1 ,,	3,8 ,,	2,97 ,,
6°. ,, ,,	Ramos en México segun Rammelsberg	1 ,,	4,6 ,,	3,7 ,,
7°. ,, ,,	Connecticut ,, Rodemann . . .	1 ,,	4,8 ,,	3,9 ,,
8°. ,, ,,	Mina de Woitzki, segun Plattner .	1 ,,	4,8 ,,	3,8 ,,
9°. ,, ,,	Eisleben ,, Plattner . . .	1 ,,	8,2 ,,	5,2 ,,
10. ,, ,,	Lauterberg ,, Rammelsberg . .	1 ,,	8,8 ,,	5,46 ,,
11. ,, ,,	Sangerhausen, segun Plattner . .	1 ,,	8,9 ,,	6,2 ,,

«Ninguno de los análisis corresponde exactamente á la composicion adoptada hasta ahora; quiero decir, á la proporcion de los átomos 1 : 3 : 3. Adoptando, sin embargo, esta proporcion para los análisis del núm. 1—4 (comprendiendo los de los minerales cristalizados del núm. 1—3) aparece que el:

		Fe	Cu	S
Núm. 6 $= 9Cu^2S + 2Fe^2S,^3$	ó en proporcion de los átomos	1 :	4,5 :	3,75
,, 7 y 8 $= 5Cu^2S + Fe^2S^3$	,, ,, ,,	1 :	5 :	4
,, 9 $= 8Cu^2S + Fe^2S^3$	,, ,, ,,	1 :	8 :	5,5
,, 10 $= 9Cu^2S + Fe^2S^3$	,, ,, ,,	1 :	9 :	6
,, 11 $= 10Cu^2S + Fe^2S^3$	,, ,, ,,	1 :	10 :	6,5

---

[1] Un análisis de este último, hecho en mi laboratorio químico, dió; azufre=23,75; cobre=68,73; y fierro=7,63; en todo =100,11. Pérdida en hidrógeno =2,77 p%.

Todos los cobres abigarrados se presentan como dos mezclas isomórficas de los dos sulfuros. Bajo los mismos principios los cobres abigarrados se pueden considerar como composiciones de

$$m\,Cu^2S + n\left.\begin{matrix}Cu\\Fe\end{matrix}\right\}S$$

y entónces el análisis de Phillips (núm. 5), suponiéndolo exacto, ofrece una diestra interpretacion, porque el cobre abigarrado de Ross Island no puede contener ningun Fe^2S^3.

Los análisis anteriores darán:

			Fe	Cu	S
Núm. 1 y 3	$= Cu^2S + 2\left.\begin{matrix}\frac{1}{2}\,Cu\\ \frac{1}{2}\,Fe\end{matrix}\right\}S$	ó en proporcion de los átomos =	1	3	3
,, 4	$= 5Cu^2S + 3\left.\begin{matrix}\frac{1}{3}\,Cu\\ \frac{2}{3}\,Fe\end{matrix}\right\}S$	,, ,, ,, =	1	3	2,75
,, 5	$= 2Cu^2S + FeS$	,, ,, ,, =	1	4	3
,, 6	$= 4Cu^2S + 3\left.\begin{matrix}\frac{1}{3}\,Cu\\ \frac{2}{3}\,Fe\end{matrix}\right\}S$	,, ,, ,, =	1	4,5	3,5
,, 7 y 8	$= Cu^2S + \left.\begin{matrix}\frac{1}{2}\,Cu\\ \frac{1}{2}\,Fe\end{matrix}\right\}S$	,, ,, ,, =	1	5	4
,, 9	$= 7Cu^2S + 4\left.\begin{matrix}\frac{1}{2}\,Cu\\ \frac{1}{2}\,Fe\end{matrix}\right\}S$	,, ,, ,, =	1	8	5,5
,, 10	$= 2Cu^2S + \left.\begin{matrix}\frac{1}{2}\,Cu\\ \frac{1}{2}\,Fe\end{matrix}\right\}S$	,, ,, ,, =	1	9	6,0
,, 11	$= 9Cu^2S + 4\left.\begin{matrix}\frac{1}{2}\,Cu\\ \frac{1}{2}\,Fe\end{matrix}\right\}S$	,, ,, ,, =	1	10	6,5

Estas fórmulas permiten tambien agregar algunas otras mezclas semejantes al cobre abigarrado, á saber:

1.° La Barnhardita de la Carolina del Norte.

2.° La Homichilina de Plauen, que dan:

			Fe	Cu	S
Núm. 1	$= Cu^2S + 4\left.\begin{matrix}\frac{1}{2}\,Cu\\ \frac{1}{2}\,Fe\end{matrix}\right\}S$	ó en proporcion de los átomos =	1	2	2,5
,, 2	$= Cu^2S + 3\left.\begin{matrix}\frac{1}{3}\,Cu\\ \frac{2}{3}\,Fe\end{matrix}\right\}S$	,, ,, ,,	1	1,5	2

En todas estas mezclas el segundo término es tambien una mezcla, á saber: ó $CuS + FeS$ = cobre amarillo, ó $CuS + 2FeS$ = Cubanite (Breithaupt); pues sin duda estas son las más sencillas fórmulas para estos minerales, no ménos probables que las fórmulas comunes, conteniendo el término Fe^2S^3, aunque como mineral no sea conocido.»

(Continuará.)

INFORME

RENDIDO

POR EL PRIMER SECRETARIO DE LA SOCIEDAD MEXICANA DE HISTORIA NATURAL,

EN LA SESION DEL DIA 28 DE ENERO DE 1875.

SEÑORES:

Cumpliendo con una prescripcion de nuestro Reglamento, tengo el honor de dirigiros la palabra para informaros de los trabajos hechos en la Sociedad, durante el bienio que acaba de trascurrir.

Ciertamente que si atendiéramos á la magnitud del edificio que tiene que levantar nuestra Sociedad en el vastísimo é inexplorado campo que la ciencia nos ofrece en nuestra patria, los trabajos que voy á mencionar nos parecerian insignificantes; pero si los consideramos como los eslabones á que deben unirse las ramificaciones de la gran cadena que tenemos que construir, y si atendemos tambien á los pocos recursos de que podemos disponer y á los innumerables tropiezos que, por consecuencia, encontramos en todas direcciones, esos trabajos nos parecerán muy estimables, porque han nacido en medio de las dificultades, y como el fruto de la constancia: ellos, por lo mismo, deben alentar nuestra fé y reanimar nuestro entusiasmo para el porvenir.

A fin de dar mayor claridad á esta noticia, ordenaré mis citas en diversos grupos, correspondiendo cada uno á las secciones siguientes en que está dividida nuestra Sociedad.

SECCION DE ZOOLOGIA.

Conforme habia anunciado mi estimable compañero el Sr. D. Joaquin Arriaga, en el informe que presentó á esta Sociedad, sobre los estudios practicados en los años de 71 y 72, nuestro consocio el Sr. D. Manuel M. Villada habia emprendido un laborioso trabajo para formar el catálogo y describir las costumbres de los troquilideos del Valle de México, y en el año de 1873 uvimos el gusto de oír la lectura de ese importante estudio que se nos habia anunciado y que con tanto interes deseábamos conocer. Nuestro consocio, para cumplir satisfactoriamente su promesa, y estimulado por ese afecto á las ciencias naturales que tanto le honra, recorrió personalmente muchos de los sitios frecuentados por esas diminutas y bellísimas aves, descubriendo muchos de sus secretos domésticos y sorprendiéndolas varias veces en la dificultosa tarea de construir el pequeño edificio en que debian alojar á su familia. En el estudio á que hago referencia, nos da á conocer el Sr. Villada las direcciones que siguen los colibris á su paso por el Valle de México, así como otras circunstancias relativas á sus costumbres.

A nuestro apreciable y modesto consocio el Sr. D. Rafael Montes de Oca, debemos un estudio análogo, aunque más extenso que el anterior y que podemos considerar como una monografía de los troquilideos mexicanos. En lo sucesivo tendrán nuestros naturalistas todo el conjunto de datos necesarios para hacer sus estudios y comparaciones, al ocuparse de esos más pequeños pero más bellos representantes de las aves.

Debido tal vez al rigor del invierno, la *Ectopistes migratoria,* la paloma viajera que recorre velozmente las montañas del Canadá y los valles septentrionales de la Confederacion Americana, dejó el año de 1873 aquellas localidades que le son propias, é invadió nuestro territorio, siguiendo una marcha no interrumpida por los Estados que se hallan en las costas del Pacífico. Cuando se tuvo noticia de tan interesante huésped, tres de nuestros consocios, los Sres. D. Antonio del Castillo, D. Jesus Sanchez y D. Manuel Villada, se apresuraron á observarlo y presentaron dos importantes Memorias, que fueron escuchadas con gran interes por esta Sociedad. En la Sierra de Zacapoaxtla, del Estado de Puebla, informaron al Sr. Castillo que hácia el mes de Diciembre habian llegado grandes parvadas de palomas á aquella region; que se posaban sobre las encinas, *Quercus,* cuyos frutos devoraban con avidez, y que al escasearse éstos, abandonaron aquellos lugares, notándose en ellas una grande agitacion la víspera de su partida.

Los Sres. Sanchez y Villada, al hablar de las emigraciones de la *Ectopistes,* hicieron notar, que varias aves, como la ganga, *Totanus Bartramius,* la *Cirtonyx Massena* y otras muchas, visitaban periódicamente el Valle de México, con cuyo motivo llamaron la atencion de la Sociedad sobre las circunstancias favorables que tiene el territorio mexicano para las inmigraciones; circunstancias que fueron estudiadas por el naturalista Saussure, y citadas en su obra intitulada, «Costumbres de algunas aves de México».

El Sr. Dr. D. Jesus Sanchez presentó á la Sociedad la primera parte de un catálogo sobre las aves mexicanas, adornado convenientemente con un gran número de notas sobre sus costumbres, así como con algunas noticias relativas al uso que hacian los aztecas de las plumas de sus aves favoritas.

A nuestro inteligente consocio el Sr. Dr. D. Francisco Cordero y Hoyos, debemos el conocimiento de una nueva especie del género *Bassaris*, cuya descripcion existe en poder de la seccion de Zoología y que verá muy pronto la luz pública. Esta adicion á la fauna mexicana sale del seno de nuestra Sociedad á la que está encomendado el estudio y conocimiento perfecto de la historia natural de México.

El Sr. Dr. Villada nos presentó un estudio del *Gallictis barbara*, mencionando sus costumbres y haciendo notar el descuido en que habian incurrido los naturalistas al ocuparse de la distribucion geográfica de ese mamífero, pues ninguno de ellos indicaba que existiera en México, despojando, por decirlo así, á nuestra fauna, de un miembro muy notable del grupo de los carniceros.

Al Sr. D. Aniceto Moreno, uno de nuestros miembros corresponsales más laboriosos, debe la Sociedad un importante estudio sobre el *Botrops atrox*, reptil que se conoce en Orizava con el nombre de *Tepotzo*. El Sr. Moreno, además de describir los caractéres de este ofidio, cita algunas circunstancias interesantes de sus costumbres, así como los experimentos que ha hecho para observar los efectos producidos por su veneno.

El Sr. Villada leyó un artículo sobre un reptil del género *Diadophis* que considera como una variedad de la especie *punctatus* y la dedicó al inteligente naturalista el Sr. Dr. D. Alfredo Dugés. Ese reptil fué encontrado en el Valle de México, donde se considera como una especie muy rara.

Nuestro consocio el Sr. D. Jesus Sanchez, cumplió su turno de lectura presentándonos una excelente copia de datos sobre los caractéres, costumbres y otras particularidades de la *Meleagrina margaritífera*, esa bellísima concha que constituye el principal ramo de riqueza en uno de los lugares más apartados de nuestro territorio, en el que contribuye á realizar esas compensaciones admirables que se observan en la naturaleza y que estimulan al hombre á establecerse en todos los climas y en todos los países por lejanos que sean, y en donde encuentra siempre algo que premie debidamente sus afanes.

Habiéndose tenido noticia de que algunos individuos de la *Ostrea edulis*, traídos de Veracruz, habian causado algunos síntomas de envenenamiento en varias personas que los habian comido en esta capital, la Sociedad tomó el mayor empeño en averiguar la causa de ese fenómeno, y en algunas sesiones tuvimos el gusto de oir discusiones muy interesantes sobre la fisiología de ese molusco; discusiones que sostuvieron más principalmente los

Sres. D. Alfonso Herrera y D. Manuel Pasalagua. Parece que la causa de los efectos producidos por la *Ostrea edulis,* son debidos á la gran cantidad de mucosidades que contienen durante la freza, y más especialmente quizá, á algun principio tóxico que se desarrollase en esa época; la idiosincracia gozando tambien en esto un gran papel: estas ideas fueron apoyadas por muchos de nuestros consocios.

El Sr. Villada nos presentó, además, el principio de una Memoria que ha comenzado á formar sobre los peces del Golfo mexicano y de los rios que en él desembocan. En esta primera parte, se ocupa de la interesante familia de los Percoides que nos proporcionan un alimento tan sustancioso como agradable; fija su atencion en las especies más notables de los géneros: *Centropomus, Mesoprion, Serranus, etc., etc.*, vulgarmente llamados Robalo, Huauchinango, Pargo, Mero y otros diversos nombres. La Sociedad espera que el autor de este trabajo prosiga infatigable la tarea científica que se ha impuesto para llenar así uno de tantos vacíos de nuestra fauna.

Al Sr. Dr. D. Manuel Pasalagua agradece la Sociedad la traduccion que le presentó del muy importante estudio que sobre los cucuyos de Veracruz, (varias especies de *Pyrophorus*), escribió nuestro consocio el Sr. D. Cárlos Heinemann.

Para enriquecer este mismo asunto, nos presentó el Sr. Herrera el extracto de una Memoria publicada en el extranjero, y que se ocupa de la materia fosforescente que se observa en diversos animales.

Al Sr. D. Aniceto Moreno debemos una traduccion de varios artículos que sobre insectos mexicanos escribió el distinguido entomologista frances, A. Sallé.

El Sr. Pasalagua leyó tambien unas notas sobre los últimos descubrimientos hechos acerca de la generacion de los infusorios.

El que suscribe tuvo la honra de presentaros algunas observaciones sobre la fauna del Estado de Querétaro, y que se hallan insertas en la Memoria que presentó á la Direccion de la Escuela de Ingenieros, al regresar de una expedicion científica que por su encargo hizo en aquel Estado.

SECCION DE BOTANICA.

En esta seccion se han hecho varios estudios interesantes que dieron á conocer nuevas especies y nuevas propiedades de las plantas mexicanas.

El Sr. Dr. D. Lauro María Jimenez nos presentó la descripcion de una especie del género *Croton,* que juzga como nueva, é hizo una reseña de las propiedades terapéuticas de ese vegetal. Tan interesante estudio está en poder de la seccion respectiva, y con su dictámen se publicará oportunamente en «La Naturaleza.»

Nuestro consocio el Sr. D. Joaquin Ibañez remitió á la Sociedad otro estudio muy importante acerca de los caractéres y propiedades químicas de la planta que se distingue en Puebla con el nombre de *Tlatlancuaya,* y en cuyo lugar la aplican como febrífuga. A juicio del Sr. Ibañez no está aún determinada la tlatlancuaya y la dedica al naturalista poblano D. Mariano Cal. La Sociedad, justa apreciadora de los méritos del Sr. Ibañez, recibió su estudio con la mayor estimacion y lo excitó á que le siguiera prestando con frecuencia su ilustrada cooperacion.

De grande importancia son para la Sociedad dos estudios que le fueron presentados por el Sr. Dr. D. Fernando Altamirano; el primero se refiere á la descripcion detallada de la planta y propiedades químicas de la almendra del fruto del *mamey;* precioso vegetal, propio de nuestros climas calientes, y que es tan estimado por la elegancia de su porte como por la riqueza de sus frutos. Siguiendo el Sr. Altamirano sus investigaciones químicas sobre las plantas que deben aprovecharse en la industria, nos presentó un cuadro que contenia los variados é interesantes productos del árbol del Perú, *Schinus molle,* como son: madera, resina y alcohol; materia tintorial y cera, producidas por las parásitas y los insectos que viven sobre aquel árbol. El cuadro á que me refiero, acompañado de una nota explicativa, figuró en la última exposicion municipal, en la que obtuvo una mencion honorífica, y hoy se encuentra adornando el salon de sesiones de nuestra Sociedad.

En las investigaciones que ha hecho el Sr. Villada para determinar las plantas de que más especialmente se alimentan los colibrís en el Valle de México, encontró un precioso vegetal en los cerros de la villa de Guadalupe Hidalgo, y del cual presentó algunos ejemplares á la Sociedad, así como su descripcion botánica. Los caractéres de esta preciosa planta corresponden, segun manifestó el Sr. Villada, á la *Fouquieria formosa* de Humboldt.

Por espacio de dos meses guardó la seccion de Botánica los ramos traidos de los cerros de Guadalupe, y no obstante que carecian de raíz y estaban expuestos al aire únicamente, permanecieron por mucho tiempo adornados de preciosos racimos de flores rojas, cuyos botones seguian abriéndose diariamente, como si los ramos se encontrasen en las mejores circunstancias para vivir. Algunos ejemplares que se pusieron en tierra húmeda, continuaron tambien viviendo, y sus yemas se desarrollaron con prontitud. Esta facilidad poco comun, que presenta la *Fouquieria* de conservar por un largo periodo sus flores frescas y elegantes, la recomienda como una bellísima planta de adorno, que debia cultivarse con aprecio.

En el año de 1873 nos presentó el Sr. Dr. D. Manuel Soriano una Memoria que le habia remitido el Sr. D. José María Morales, de Rioverde, para nuestra Sociedad, en cuyo trabajo mencionaba los caractéres botánicos y las propiedades terapéuticas de una planta que se conoce en aquella localidad con el nombre de *Revientacabras*.

Ese vegetal, segun el Sr. Morales, posée propiedades antifebrífugas muy notables, y con el fin de que se ratificase su clasificacion y propiedades citadas remitió algunos ejemplares á la Sociedad, quien los confió con el fin de que fuesen estudiados, al señor socio D. José G. Lobato.

El Sr. Soriano cubrió su turno de lectura con la traduccion que hizo de un interesante artículo del profesor Van Tieghem, intitulado: «Investigaciones fisiológicas sobre la vegetacion libre del pólen y del óvulo, y sobre la fecundacion directa de las plantas,» y que la Sociedad escuchó con sumo agrado.

Tambien ha recibido la Sociedad un artículo acerca de la planta que se conoce en Colima con el nombre de *Huaco*. Como ese estudio pasó para su revision al Sr. Dr. D. Lauro M. Jimenez, en la sesion del 4 de Abril del año pasado tuvimos el gusto de oir el luminoso dictámen que sobre el particular presentó aquel señor socio, y se mandó insertar en el periódico de nuestra Sociedad.

El que suscribe tuvo la honra de presentaros los siguientes estudios:

Distribucion geográfica de las plantas características del Estado de Querétaro, acompañada de un mapa botánico.

Descripcion de una nueva especie del género *Exogonium*, encontrada en las cercanías de la Gruta de Cacahuamilpa, y dedicada al naturalista jalisciense D. Leonardo Oliva.

Descripcion de una nueva especie del género *Hiræ*, dedicada al Sr. Dr. D. Gabino Barreda.

Observaciones y datos sobre la historia y caractéres del árbol de las Manitas, *Cheirostemum platanoides*, y algunos detalles sobre los caractéres y localidades de la *Hauya elegans*.

SECCION DE MINERALOGIA.

En la sesion celebrada el 23 de Marzo de 1873, el Sr. D. Antonio del Castillo, presidente de esta seccion, nos dió á conocer una nueva especie mineral, que clasificó como un *seleniuro de bismuto y zinc*. Esta noticia se apresuró á publicarla nuestra Sociedad, porque en aquella época se habia casi agotado el bismuto extranjero que existia en los almacenes, y el anuncio de que en la Sierra de Guanajuato se hallaba un mineral bismutífero, fué recibido con aplauso por todos los miembros de nuestra Asociacion.

Poco tiempo despues nos anunció nuestro consocio el Sr. D. Florencio Cabrera, que habia encontrado un compuesto bismutífero en el Estado de San Luis Potosí, y nos remitió una interesante coleccion de muestras y la copia del estudio que habia hecho de aquel mineral. Examinadas las muestras por el Sr. Castillo, á quien le fueron encomendadas para su estudio, las clasificó como formadas de hidro-carbonato de bismuto, y nos presentó por escrito el resultado de sus investigaciones sobre el particular, acompañándolo de una análisis que de ese mineral se habia hecho en Alemania.

El mismo Sr. Castillo, en union del que suscribe, presentó á la Sociedad una nota sobre la existencia del arsénico nativo en nuestro país, cuyo metaloide encontramos en una excelente coleccion de minerales que nos habia remitido de Zimapan y la Pechuga el Señor ingeniero D. Santiago Ramirez.

Debemos tambien al Sr. Castillo la descripcion de un mineral, al parecer alterado, que se halla en el Estado de Guerrero, y es probablemente una *epigenia* de la especie que dió á conocer el que suscribe, con el nombre de Livingstonite.

Nuestro consocio el Sr. Ingeniero D. Severo Navia, ha obsequiado á la Sociedad con dos interesantes estudios mineralógicos: uno sobre la plata sulfúrea pseudomórfosis de rosicler oscuro, y otro que se refiere á los caractéres pirognósticos de los compuestos argentíferos que se hallan en las minas de Guanajuato. Este último estudio vino acompañado de una lámina colorida, en la cual estaban perfectamente imitadas las aureolas y pegaduras que dejan sobre el carbon, cuando son tratados al soplete, los compuestos argentíferos mencionados.

Al tener noticia esta Sociedad de la gran masa de hierro meteórico que fué encontrada hace poco tiempo en el Estado de Sinaloa, se dirigió al Sr. Buelna, gobernador de aquel Estado, para que le diese un informe sobre el particular, y en contestacion recibimos una noticia pormenorizada acerca del hallazgo de aquel meteorito. El informe vino acompañado de un dibujo y de algunas notas relativas á las dimensiones de la masa en cuestion, que debe ser, á no dudarlo, la más grande de las que se han descubierto hasta ahora en nuestra República. Muy satisfactorio me es consignar aquí, el agradecimiento de la Sociedad, por la eficacia con que el Sr. Buelna le proporcionó los datos que necesitaba para dar á conocer, como lo hará próximamente, el referido meteorito.

Por mi parte tuve la honra de presentaros los estudios siguientes:

Descripcion y análisis de una especie mineral mexicana, compuesta de azufre, antimonio, mercurio y fierro, á la que dí el nombre de *Livingstonite*, en honor del viajero David Livingstone.

Descripcion y análisis de los minerales platiníferos de Jacala.

Aclaraciones sobre la piedra dibujada, remitida del Estado de Jalisco por nuestro consocio el Sr. D. Cesáreo Montenegro.

Descripcion de un sulfato de plomo cuprífero procedente del mineral del Bramador, en Jalisco.

El wad oolítico de Jacala.

Las obsidianas de México.

Las esferolitas mexicanas.

Y una noticia sobre los minerales de Querétaro, acompañada de un mapa, en que se halla marcada su distribucion geográfica.

SECCION DE GEOLOGIA Y PALEONTOLOGIA.

Varios estudios de grande interes y correspondientes á la seccion á que me refiero, fueron leidos en esta Sociedad ó remitidos por los miembros corresponsales.

Hace un año que tuvimos la satisfaccion de oir el informe que sobre el criadero de nafta, que se halla en la vecina ciudad de Guadalupe, leyó el Sr. D. Antonio del Castillo. En ese documento consta la descripcion geológica del terreno en que se han hecho las excavaciones para sacar aquel combustible mineral; su descripcion y la de los restos fósiles encontrados en las capas perforadas.

Debido al empeño de nuestro consocio el Sr. D. Juan Ignacio Matute, tiene ya esta Sociedad algunos datos más para el estudio de la geología del Estado de Jalisco. El Sr. Matute remitió hace un año el corte geológico del pozo artesiano que está abriendo en el valle de Ameca, y que tiene actualmente cerca de 300 metros de profundidad. Con anterioridad habiamos recibido varias muestras de las capas que se han cortado en la perforacion.

El Sr. D. Trinidad Barrera presentó un estudio geológico de la sierra de Querétaro, y una noticia acerca de la formacion del cerro de Escamela, en Orizava, citando los restos fósiles que allí se encuentran.

Para amplificar las teorías relativas á la formacion de las vetas metalíferas, remitió el señor socio corresponsal D. Santiago Ramirez, un estudio de los criaderos auríferos del Mineral del Oro, manifestando su parecer acerca del modo de formacion de las vetas que allí se explotan.

El mismo Sr. Ramirez, que siempre ha cumplido con una exactitud, poco comun, sus deberes de socio, remitió en la fecha que le correspondia su turno de lectura, la descripcion detallada de un criadero de azogue que se halla en las cercanías de Huetamo, en el Estado de Michoacan.

El Sr. D. Teodoro Laguerenne leyó una descripcion del terreno aurífero de San Nicolás del Oro, en el Estado de Guerrero. Este señor socio describió minuciosamente los sistemas de vetas que se hallan en aquella localidad y las rocas que constituyen la caja del yacimiento.

Interesada la Sociedad en la observacion de los fenómenos volcánicos que se han presentado últimamente en el país, se dirigió á sus socios corresponsales, suplicándoles le remitiesen los datos que fuera posible adquirir sobre el particular. El Sr. D. Cesáreo Montenegro, que reside en un lugar vecino del volcan de Colima, obsequió inmediatamente la indicacion de la Sociedad, y nos envió una noticia de las observaciones que se han hecho acerca de las erupciones antiguas y modernas de aquel volcan. La Sociedad ha sabido con satisfaccion, que el Sr. Montenegro sigue escrupulosamente un diario en que apunta todos los fenómenos que presenta aquella montaña.

Para aumentar la coleccion de datos que sobre la geología del Valle de México se ocupa en reunir la Sociedad, cuenta, además de otros varios, con un interesante estudio presentado por el Sr. D. Juan N. Cuatáparo, y en el cual están citados los caractéres geológicos de algunas localidades del mencionado valle, así como las principales particularidades de las rocas y fósiles que se hallan en los lugares á que se refiere su estudio.

El Sr. D. Antonio del Castillo leyó unos artículos muy interesantes, escritos por el sabio micrógrafo Ehremberg, referentes á las tobas del valle de Toluca, en las que se encuentran numerosos despojos de fitolitarias y otros séres microscópicos. Este estudio tan importante para la Geología y la Paleontología de México, fué ilustrado con algunas notas de los Sres. Castillo y Burkart, que han reconocido las localidades en que se encuentran las tobas mencionadas.

El que suscribe tuvo el honor de presentaros los estudios siguientes:

Noticia geológica de tres distritos del Estado de Querétaro, acompañada de un mapa geológico y varios dibujos que representan los restos fósiles y algunas de las montañas estudiadas en aquella region.

Viaje á la Caverna de Cacahuamilpa.

Carta geológica de una parte del Estado de Hidalgo.

Notas sobre los pórfidos cenozoicos de México.

Estudio de las formaciones mesozoicas de México y sus fósiles característicos, acompañado de varias figuras que representan los restos orgánicos en que está fundada la clasificacion de las rocas que en aquel estudio se mencionan.

CIENCIAS AUXILIARES.

Los miembros que forman esta seccion y que prestan tan importantes servicios á las otras que acabo de mencionar, han presentado ya algunos trabajos de gran utilidad, y se ocupan de otros cuya conclusion espera la Sociedad con el mayor interes.

Sabido es el entusiasmo que se ha despertado en México por la explotacion de los criaderos de bismuto descubiertos últimamente en el país; y como ese metal se encuentra por lo comun asociado á otros cuerpos, muy perjudiciales en sus aplicaciones terapéuticas, la seccion de que me ocupo se dedicó á estudiar los medios de purificarlo, á fin de que el metal que se preparase en México tuviera el estado de pureza que exigen las personas que lo utilizan. El señor profesor de Farmacia, D. José M. Laso de la Vega, que se dedicó empeñosamente á estudiar el asunto, encontró en un periódico extranjero un método que satisfacia perfectamente los fines indicados. El Sr. Laso de la Vega nos presentó una traduccion de dicho método, ilustrada con varias notas referentes á nuestros minerales bismutíferos.

El mismo Sr. Laso de la Vega, asociado de nuestro consocio el Sr. D. Manuel Rio de la Loza, hizo la análisis de las quinas aclimatadas en Córdoba por el Sr. D. José Apolinario Nieto. Por esa análisis ha conocido la Sociedad la notable riqueza de quinina que contiene la corteza de las mencionadas plantas. La comision citada, manifestó su propósito de repetir sus análisis todos los años, para observar la variacion que pudieran presentar las quinas de Córdoba, respecto de su riqueza en quinina.

Todos los miembros presentes tienen noticia de la polémica científica que esta Sociedad tuvo que sostener con otra Asociacion de las más respetables de México, con motivo del fraccionamiento de una masa meteórica.

Nuestra Sociedad nombró una comision para que informara sobre el particular, y ésta, presentó un dictámen, en el que por raciocinios y experimentos científicos, desaprobaba el fraccionamiento de la masa en cuestion. Felizmente, y como lo deseaba esta Asociacion, la polémica terminó, y las relaciones entre ambas Sociedades son tan cordiales hoy, como lo eran ántes de que se suscitara la cuestion referida.

La Sociedad de Historia Natural se congratula, expresando por el órgano de su Secretaría, su agradecimiento al Sr. socio D. Sebastian Camacho, presidente de la comision referida, lo mismo que á los Sres. D. Leopoldo

Rio de Loza, D. Jesus Manzano, D. Miguel Iglesias y D. Miguel Perez, que le ayudaron muy eficazmente en sus trabajos.

Nuestro consocio el Sr. Farrugia y Manly, nos remitió un informe sobre los estudios que ha hecho en Zimapan, acerca de la concentracion de los minerales argentíferos de aquel lugar.

En la comision permanente de Agricultura, que forma parte de la seccion de Ciencias auxiliares, se han hecho tambien algunos trabajos importantes, como son entre otros los relativos á la aclimatacion de plantas útiles en varios Estados del país.

Debido al empeño del Sr. D. Tomás Gardida, digno presidente de dicha comision, se han enviado á Jalisco y á otros Estados algunas semillas de la *Boehmeria nivea, Rubus idæus, Eucaliptus globulus,* así como de algunas variedades del *Nicotiana tabacum* y tubérculos de la *Oxalis crenata.*

La comision se ocupa actualmente en estudiar las causas que han podido influir en la diminucion de las lluvias, que de pocos años á esta parte se ha notado en varias localidades; y para este fin se propone reunir las observaciones meteorológicas practicadas en varias épocas en los lugares en que se ha hecho más notable aquel fenómeno.

El Sr. D. Manuel Cordero presentó dos estudios de grande importancia práctica en la Agricultura, uno sobre el cultivo del cacao, traducido del que escribió en francés el profesor Boussingault, y otro sobre el *chahuiztle* (hongos parásitos diversos), que generalmente ocasiona tantos perjuicios en las siembras de trigo. En este estudio fué auxiliado el Sr. Cordero por su laborioso compañero el Sr. D. José C. Segura, á quien agradece tambien la Sociedad un trabajo que le presentó sobre la quema del césped, y el empleo de éste en el mejoramiento y abono de los terrenos.

La misma comision de Agricultura, invitada por el Sr. Gobernador del Distrito, indicó los mejores medios para conservar el árbol histórico de Popotla, que en parte habia sido destruido por el fuego.

Para terminar esta reseña científica, diré: que en la seccion de Botánica se me pasó el referir dos trabajos presentados por los Sres. D. José M. Laso de la Vega y D. Joaquin Arriaga, para cubrir su turno de lectura: en el primero se hace mencion de algunos parásitos vegetales, y el segundo es la traduccion de una Memoria del profesor Morren, de la Universidad de Lieja, intitulada: «Energía de la vegetacion. La fisiología de las plantas y la teoría mecánica del calor.» La eleccion de estos estudios fué acertada, y la Sociedad los recibió con aprecio.

⁂

Despues de haber mencionado los trabajos ejecutados en las diversas secciones de esta Sociedad, voy á informaros, de una manera general, de las donaciones hechas por los socios, de las relaciones nuevamente adquiridas, y de otros asuntos en que ha tenido participio la Secretaría de mi cargo.

Nuestro gabinete de estudio continúa enriqueciéndose con nuevos é interesantes ejemplares pertenecientes á los diversos ramos de la historia natural.

La coleccion zoológica ha sido aumentada con las magníficas conchas exóticas que nos remitió nuestro finado consocio el Sr. D. José Apolinario Nieto, con las palomas viajeras y los grupos de colibríes hábilmente preparados por el Sr. Montes de Oca, quien los presentó á la Sociedad á fines del año pasado. Poseemos tambien algunas colecciones de insectos, mandadas por los señores socios corresponsales, entre las cuales se hallan abundantes ejemplares de la *Mosca hominívora* que colectó y estudió en Monterey el señor socio D. J. Eleuterio Gonzalez.

La seccion de Botánica ha recibido la coleccion de helechos de Nueva-Holanda, presentada por el Sr. Biagi, ministro de Italia; el herbario de plantas de la Tierra-caliente del Sur, que colectó el Sr. D. Fernando Altamirano; las plantas y productos agrícolas que coleccionó en Chiapas el Sr. D. Miguel Ponce de Leon, y los ejemplares de plantas del Estado de Hidalgo que tuve el honor de ofreceros al regresar de la expedicion que hice en los distritos de Zimapan y Jacala, pertenecientes á aquel Estado.

En las colecciones mineralógica y geológica se encuentran los ejemplares de minerales bismutíferos y cupríferos que mandó de San Luis el señor socio D. Florencio Cabrera; las rocas colectadas por nuestro consocio el Sr. D. Luis Salazar, y las muestras de minerales concentrados que mandó de Zimapan el señor socio D. Federico Farrugia y Manly. Tambien figuran dignamente en nuestro gabinete de estudio, los restos fósiles que remitió el Sr. D. Alberto Huart, y los carbones é impresiones de plantas que colectó en Tecomatlan el señor socio D. Jesus Manzano.

Á los Sres. D. Alfonso Herrera, D. Antonio Peñafiel, D. Eufemio Amador y otros de nuestros distinguidos consocios, debemos algunos ejemplares mineralógicos muy interesantes, de cuya clasificacion se ocupan los miembros que forman la seccion respectiva.

Á la biblioteca han ingresado varias obras importantes, como son las remitidas por los señores socios corresponsales en el extranjero, J. D. Dana, Jules Marcou y J. Leidy, así como las publicaciones científicas de varias Academias de los Estados-Unidos y de Europa, que recibimos por conducto del Instituto Smithsoniano de Washington. Tambien recibimos con mucha satisfaccion los Anales que van publicados de la Sociedad española de Historia Natural, residente en Madrid.

Los señores socios Hill é Iglesias y otros miembros corresponsales, han obsequiado á la Sociedad con algunas obras de grande utilidad: de todas éstas como de las anteriores se ha publicado ya un catálogo en nuestro periódico, por lo que omito especificarlas.

Las relaciones de la Sociedad con las academias de México y del extranjero siguen ampliándose, y con frecuencia recibimos invitaciones para establecer el cambio de nuestro periódico con los que publican aquellas corporaciones.

Nuestros respetables consocios los Sres. Biagi, Leidy, Marcou y Burkart nos han hecho la honra de relacionarnos últimamente con varias otras academias de Europa y de los Estados-Unidos.

A tan dignos socios, así como al Instituto Smithsoniano de Washington, les manifiesta, por mi conducto la Sociedad, su más cordial agradecimiento por su constante empeño en proporcionarle nuevas relaciones y remitirle las publicaciones de varias sociedades científicas extranjeras.

Tambien creo conveniente mencionar en este informe, que nuestra Sociedad, invitada por el Ilustre Ayuntamiento de la capital, ha presentado algunas de sus colecciones de estudio en las exposiciones municipales verificadas en los años de 1873 y 1874, las que fueron recibidas con aprecio y distinguidas con premios y recomendaciones honoríficas.

En fin, Señores, debo manifestaros que los señores tesoreros D. Manuel M. Villada y D. Manuel Gutierrez han desempeñado eficazmente su encargo; mas por abreviar consignaré tansolo en este escrito, el resúmen de sus operaciones, y es el siguiente:

INGRESOS DURANTE LOS AÑOS DE 1873 Y 1874.

Subvencion del Supremo Gobierno. .	$ 1,200 00
Cuotas y donativos de los señores socios.	459 93
Productos del periódico.	956 15
Suma.	2,616 08

EGRESO EN LA MISMA ÉPOCA.

Valor de las entregas publicadas. . . .	1,370 50
Impresiones sueltas.	229 42
Litografías, grabados é iluminaciones .	532 71¾
Gastos sueltos.	354 57¼
Suma.	2,487 21

COMPARACION.

Suma el ingreso	2,616 08
Suma el egreso.	2,487 21
Diferencia á favor de la Sociedad .	128 87

De este sobrante que ha quedado en la caja para el presente año de 75, corresponden: 15 pesos 37 centavos á la primera tesorería y 113 pesos 50 centavos á la segunda.

Antes de concluir tengo el sentimiento de expresar que la Sociedad ha sufrido la irreparable pérdida de varios de sus socios, acaecida en los años que comprende esta reseña y fué la de los señores D. José Fidel Pujol, de la Baja California; D. Albino Celis, de Tetecala; D. José Apolinario Nieto, de Córdoba; D. Miguel Quevedo, de Maravatío, y D. José Burckart, de Bonn (Alemania). La Sociedad, justa apreciadora de sus méritos, les tributa por mi conducto, en esta solemnidad, una pública manifestacion de respeto y gratitud.

México. Enero 28 de 1875.

Mariano Barcena,
Primer Secretario.

NECROLOGIA.

El 27 de Abril próximo pasado, falleció en esta capital, á la edad de 49 años, el Sr. Dr. D. Lauro María Jimenez, socio de número de la Sociedad Mexicana de Historia Natural.

Desde el principio de su carrera profesional se dedicó el Sr. Jimenez al estudio de la Zoología y de la Botánica, y fué uno de los primeros que con verdadera inteligencia usó en México del microscopio en el exámen de los animales y de las plantas. Bien pronto adquirió en el conocimiento de la Historia Natural, así como en el de las ciencias médicas, una muy justa y bien sentada reputacion.

Su indisputable mérito científico, y su constante anhelo en comunicar á todos su saber, lo condujeron al profesorado, en donde acabó de conquistar sus mejores títulos de hombre erudito y laborioso.

Fué un verdadero amigo de la juventud, especialmente de la de la clase médica, á la que profesó un entrañable afecto. Muchos tambien, de los alumnos de la Escuela Nacional de Agricultura, recordarán siempre con respeto y gratitud al sabio maestro que tanto empeño tomó en sus adelantos.

Pareciéndole aún estrechos al Sr. Jimenez los dilatados horizontes del profesorado, consagró igualmente todo su afan al progreso de las Academias científicas, cooperando con suma actividad á la fundacion de algunas de las que existen en esta capital, teniendo casi todas ellas la satisfaccion de contarlo entre sus miembros. Su vida en esta parte nos ofrece rasgos notables de abnegacion y de una inquebrantable fuerza de voluntad, siendo víctima muchas veces de su noble y entusiasta corazon.

México tendrá siempre el orgullo de mencionar como á uno de sus mejores hijos, al instruido y pundonoroso profesor, que tan solícito fué por su engrandecimiento intelectual.

Los reducidos límites de una noticia necrológica, nos impiden hacer el exámen de los no pocos trabajos que ejecutó el Sr. Jimenez durante su vida, y que con general aplauso vieron la luz pública en diversos periódicos científicos de nuestro país.

Un espíritu, en fin, verdaderamente práctico y observador, unido á una clara inteligencia; una asiduidad no interrumpida para el estudio, una constancia á toda prueba y un desprendimiento poco comun en su vida pública, fueron las dotes que más distinguieron al Sr. Dr. D. Lauro M. Jimenez y que le hicieron tan apreciable de las personas ilustradas que lo conocieron, las que sin distincion alguna lamentan hoy su temprana muerte.

La Sociedad Mexicana de Historia Natural, no solo consagra estas líneas á la memoria de tan digno miembro, sino tambien ha acordado dedicarle una sesion solemne: honra, y muy merecida, á sus relevantes cualidades.

México, Mayo 31 de 1875.

Comision de publicaciones.

FAUNA INDÍGENA.

EL TEPECHICHI DEL COFRE DE PEROTE.

POR EL Sr. D. FRANCISCO CORDERO Y HOYOS,

SOCIO DE NUMERO.

El estudio de la Mamalogía, ramo muy importante de la Historia Natural, puesto que comprende los animales más utiles al hombre, nos ofrece á cada paso motivos para convencernos de que aun faltan en esta parte de la Zoologia muchos puntos que investigar, y entre otros, el conocimiento quizá de no pocas especies que hasta hoy han escapado al exámen de los naturalistas.

El convencimiento de esta verdad es, sin duda, un aliciente para no desmayar en esta clase de trabajos, desechando, por consiguiente, la idea que tienen algunos de los que se dedican á estudios de clasificacion, de haberse llegado ya al hasta aquí de las exploraciones. Existen, en efecto, espíritus fascinados que están persuadidos de que, los que nos han precedido en estas pesquisas, no han dejado nada por conquistar; mas otros, por el contrario, suponen que todo está por hacer, y se afanan en imponer nuevos nombres a séres ya conocidos y estudiados: á esto se debe el que se hayan multiplicado sin necesidad, tanto en Zoologiá como en Botánica, no solo las especies sino aun los géneros. El que participa de la primera opinion, deja escapar ciertamente buenas oportunidades de hacer un estudio fructuoso de un animal ó de una planta, creyéndolo ya descrito; el que se inclina más bien á la segunda las aprovecha tansolo en parte, pues desecha trabajos emprendidos sobre el particular y que pudieran ilustrarlo en sus investigaciones.

Las anteriores reflexiones me han sido sugeridas al examinar un mamífero carnicero, cuya descripcion tengo hoy el gusto de presentar á esta ilustrada Sociedad; pues no obstante de tener un tamaño no muy pequeño y de vivir en regular número en uno de los distritos más visitados de la Reúpblica, como es Jalapa, parece que no es conocido científicamente, á juzgar por las obras de Historia Natural que han estado á mi alcance y he consultado.

Sinonimia.—*Bassaris monticola, nobis;* Tepechichi del Cofre de Perote, Cacomistle de monte.

DESCRIPCION:

Aparato dentario.—Incisivos $\frac{6}{6}$; los superiores tienen la particularidad de ser lisos y algo más largos y fuertes los dos exteriores, y los otros cuatro provistos cada uno de dos surcos, que nacen en un mismo punto á cosa de la mitad del diente, y de allí se separan profundizándose, hasta llegar á su borde libre, que dividen en tres porciones iguales, y que dan á este órgano, visto de frente, la forma de una flor de lis, y cuando es visto por su extremidad libre parece formado de dos partes: una vaina constituida por las dos eminencias exteriores, y un apéndice que sale de ella y forma la eminencia media; ésta se prolonga en la parte interna de la raíz del diente y forma una cuarta, lo que da á los dientes el aspecto de las muelas tuberculosas de cuatro eminencias. Los cuatro incisivos inferiores é intermedios tienen dos eminencias formadas por un surco intermediario, y los dos exteriores tienen uno profundo que los divide en dos partes desiguales, siendo la interna del doble de la externa. Caninos $\frac{1-1}{1-1}$ redondos, lisos y muy fuertes. Molares $\frac{6-6}{6-6}$, los de arriba compuestos de tres falsos molares, con el primero muy corto, un carnicero tricúspide y dos tuberculosos; abajo de cuatro falsos molares que tienen en la raíz dos eminencias formadas por dos líneas curvas, cóncavas hácia arriba, y que dan á estas muelas la forma de una lanza antigua, un carnicero con cuatro eminencias muy marcadas y un tuberculoso.

Formas.—Cabeza muy ancha atrás, terminada por un hocico desnudo y alargado, provisto de un surco profundo y longitudinal, que parece dividir la nariz en dos partes iguales, con las aberturas nasales en la extremidad; muserola bastante bombeada; bigotes largos y dirigidos hácia atrás; orejas colocadas muy posteriormente, con pabellon arrendondado de cuatro centímetros de largo y tres de ancho; ojos medianos, y, segun se me ha comunicado, pues no he podido disponer de ningun individuo vivo, la pupila es redonda. Cuerpo alargado, y bajo de piernas; éstas cortas, con los piés semipalmeados y desnudos en su cara inferior, de cinco dedos cada uno; el interno insertado más atrás, el siguiente igual al externo, y los dos intermedios iguales, más largos que los demás; uñas bastante encorvadas, agudas, semi-retráctiles, la tercera y cuarta de cada pié más fuerte.

Pelaje y coloracion.—Pelo muy tupido: el de la cabeza corto, con el entrecejo, hocico y bigotes negros; dos manchas amarillo sucio encima y debajo de cada ojo: éstos rodeados de negro, con una línea igual del mismo color, que une el borde externo de la órbita con la oreja; frente y resto de la cabeza, con el pelo amarillo sucio en el nacimiento y negro en la extremidad; pabellon amarillo en su cara interna y borde libre, y negro en la externa ó dorsal; íris amarillo oscuro; parte superior del cuerpo, flancos y cara externa de los cuatro miembros con pelo largo: la borra aplomada y la cabruda amarillo sucio, con manchas pequeñas negras; la inferior de aquel, é interna de las patas, de una coloracion uniforme amarillo claro; cola redonda con el pelo muy largo y con anillos blanquizcos y negros alternativamente, en número de ocho, y que aumentan de extension del primero al último: la extremidad negra enteramente en un espacio de 16 centímetros y copada de pelo más largo.

Dimensiones.—Cabeza 11½ centimetros; de la nariz al nacimiento de la cola 46 id.; largo de este órgano 52 id.; miembros anteriores 13½ id.; posteriores 16 id.

Hasta aquí la descripcion que podemos hacer de este animal, en vista de ejemplares disecados convenientemente, no habiendo podido conseguir hasta ahora ninguno con todas sus partes para hacer el estudio anatómico; mas entretanto puedo emprenderlo, creo que lo dicho bastará para su clasificacion científica.

CLASIFICACION.

Por los caractéres expuestos, el Tepechichi solo puede colocarse entre los Mustelianos ó entre los Viverrianos: con los primeros tendria de comun su forma, su coloracion uniforme y los instintos carniceros; pero se aleja de ellos porque los Mustelianos no tienen en su sistema dentario sino cinco muelas en la mandíbula superior y seis en la inferior; el carnicero de arriba no es trilobado en su borde externo, este lóbulo lo tiene el Tepechichi en el interno; la marcha de éste es semi-plantígrada y aquellos son digitígrados, y no tienen, por último, mas que una muela tuberculosa arriba, caracter que sirvió á Cuvier para formar este grupo. Con los Viverrianos tiene más afinidad nuestra especie por el número y disposicion de los dientes, el cuerpo ménos vermiforme que en los anteriores, la cortedad de los miembros y la marcha semi-plantígrada, el número de dedos en cada pata, que es de cinco, con las uñas arqueadas, agudas y semi-retráctiles, y la coloracion del pelo, en fin, que es más oscuro en las partes superiores que en las inferiores.

Mas recorriendo uno á uno los géneros de este grupo, no encontramos ninguno que convenga exactamente á nuestra incógnita. El *Paradoxurus*, además de la cortedad de su cola, tiene el cuerpo todo manchado y con líneas más oscuras que el fondo; sus caninos son estriados y su sistema dentario es más bien omnívoro que carnívoro, lo contrario de nuestra especie. El *Hemigalus* tiene molares $\frac{5-5}{7-7}$. El *Herpetes, Galidictis* y el *Crosarchus*, $\frac{5-5}{5-5}$. El *Galidia* dos ó tres falsos molares arriba, y abajo tres. El *Ichneumia* se le acerca por el número de dientes, pero tiene el cuarto falso molar inferior con cuatro tubérculos; las orejas con la concha muy pequeña y ancha; las palmas de las manos velludas, y bolsas en el ano.

Con el *Suricata* no lo podemos comparar bajo el punto de vista de su sistema dentario, pues aunque su fórmula seria, segun Chenu, incisivos $\frac{6-6}{6-6}$; caninos, $\frac{1-1}{1-1}$; molares, $\frac{6-6}{6-6}$; solo Gervais le asigna á estos últimos la fórmula $\frac{5-5}{5-5}$, debiéndonos atener á este autor, que acompaña su descripcion de un buen dibujo del cráneo. Haciendo abstraccion de este órden de caractéres, existen otras diferencias importantes que los separan del todo, y son: el número de dedos, que en el Suricata es de cuatro en cada pié; la presencia, además, de una bolsa anal y uñas excesivamente largas.

El *Viverra* seria el animal más semejante al nuestro, pero es manchado, tiene bolsa anal y una línea de pelos muy largos desde la cabeza hasta la cola, que le forma una especie de crin ó melena.

Por esta exposicion nos convenceremos de que no debe uno atenerse exclusivamente á los caractéres generales de las tribus; pues vemos que asignándose á la de los Viverrianos, como uno de los principales, la existencia de doce molares en cada mandíbula, tansolo lo presentan dos géneros de esta tribu.

Tenemos como una probabilidad de que nuestra especie aun no ha sido descrita, lo que asienta el profesor Chenu en su Enciclopedia metódica de Historia Natural, y es como sigue: «El número de las especies de esta tribu (habla de los Viverrianos), se halla repartida en todas las partes del mundo, excepto en América, que sin embargo tendria su representante, si se colocara en ellos el género *Bassaris*, como lo ha hecho Isidoro Geoffroy de St. Hilaire. Mas en la descripcion que de él hace el profesor Chenu, vemos las muy justas razones en que se apoya, para considerarlo como un intermedio entre las dos tribus referidas.

Ahora bien, no cabe duda que el Tepechichi tiene grandes afinidades con el género *Bassaris,* y creemos que á él debe referirse; mas si comparamos su descripcion con la del cacomistle, *B. astuta,* única especie conocida, vemos que existen entre ellas diferencias notables, y á mi entender suficientes, para considerarlas como especies distintas. Así, en el primero, las formas son más robustas, las orejas arredondadas, los dientes incisivos con su borde libre de la figura de una flor de lis, la cola enteramente redonda, con sus anillos negros completos, el color, en fin, de todo el cuerpo amarillo negruzco por encima, y amarillo claro por debajo. El segundo tiene la cabeza más aguzada, las orejas más largas y agudas, la cola deprimida, con los anillos negros incompletos, los dientes incisivos lisos é iguales; y su color, mucho ménos oscuro que el del anterior, es gris por encima y blanco por debajo, algunas veces con un tinte amarillento en ambas partes. Respecto de los hábitos de ambos, mencionaré tansolo, que miéntras el cacomistle elige para vivir los lugares habitados por el hombre, el tepechichi por el contrario, se aleja siempre de ellos, y busca su guarida en la escabrosidad de las montañas.

Por estas razones se verá si mi opinion es fundada, y si la especie *B. monticola* que ahora propongo, es realmente distinta de la *B. astuta,* descrita ya por Lichtensteim.

Observaciones del Sr. Dr. D. Alfredo Dugés al trabajo anterior,
en contestacion
a la consulta que le hizo la Seccion de Zoologia.

Es evidente que el Tepechichi es un *Bassaris,* pues no conozco absolutamente ningun otro Viverriano americano. Respecto de los caractéres diagnósticos en que se funda el Sr. Cordero, para separar su especie de la ya conocida, haré las siguientes observaciones:

1.ª He encontrado variaciones en las orejas del *B. astuta,* son más *arredondadas* en unos y en otros más agudas; 2.ª he visto uno ó dos individuos con la cola *redonda* y no deprimida; 3.ª los hay tambien con anillos *completos,* miéntras otros no tienen sino semicírculos superiores; 4.ª la forma trilobada de los incisivos no creo que pueda servir de carácter diferencial, pues la tienen igualmente los *B. astuta, jóvenes,* y les sucede lo que á los perros, que el borde libre se desgasta y se borra la flor de lis. Dos cosas sí me han llamado la atencion en el dibujo que se me remite: una es la forma del diente carnicero, pues se notará en la figura que mando un talon interno bilobado, que no se observa en el Tepechichi: otra es la singular configuracion del cráneo, que se acerca bastante á la de las *Taxideas,* y distinto de la del cacomistle: tal vez sea esto una particularidad de sexo ó de edad.

Se cree, pero sin pruebas hasta ahora, que puede haber dos especies de *Bassaris,* de las cuales científicamente no se conoce sino la *astuta:* es muy posible que el Tepechichi, á juzgar por sus otros caractéres diferenciales, sea la especie que se supone existir y que aun no ha sido descrita.

A la seccion de Zoología le parecen muy juiciosas las observaciones del Sr. Dugès; mas hace notar que los caractéres en cuestion indicados por el Sr. Cordero, son constantes en los ocho ó diez Tepechichis que han sido examinados, especialmente *la flor de lis,* que existe aun en los ejemplares de individuos que se han juzgado adultos; y además se hallan todos reunidos en el mismo individuo.

En la lámina adjunta se representan, debido al Sr. Dugès, la variedad de anillos completos del *B. astuta,* algunas figuras parciales de las otras á que hace alusion en sus observaciones, y un cráneo del tamaño natural de esta especie. Abajo está dibujado el Tepechichi y por separado el cráneo y algunos otros detalles: las diferencias entre uno y otro animal se apreciarán así con más exactitud.

México, Diciembre 1.º de 1874.

MINERALOGIA.

NOTICIAS SOBRE LOS CRIADEROS DE GRAFITA Ó PLOMBAGINA DE MÉXICO,

Y SU EXPLOTACION.

POR EL SEÑOR DON ANTONIO DEL CASTILLO,

SOCIO DE NUMERO.

Los nuevos criaderos que se han descubierto de este mineral, son de bastante interes para consignarlos en estas noticias.

Con anterioridad a estos descubrimientos, poseíamos en nuestras colecciones ejemplares de gabinete para el estudio de la mineralogía del país, sin que tuviéramos mas pormenores de sus criaderos, que la vaga indicacion del lugar de su procedencia.

1. Así, los descubrimientos más antiguos, ó bien el conocimiento de que existia la grafita en algunas de nuestras montañas, datan desde el año de 1850 en adelante, en cuyo año el que suscribe, examinando un fragmento de una roca metamórfica, compuesta de caliza y granos de hornblenda, la determinó ó clasificó; encontrandose diseminada en ella, en pequeños granos, ó masas hojosas, acompañada de pyrita, ó bisulfuro de fierro, y chalcopyrita, ó doble sulfuro de cobre y fierro. La localidad de su procedencia es vaga, pues la noticia única que se pudo obtener de ella, fué la de que la referida caliza metamórfica se encontraba en las montañas del Suroeste de Tehuacan.

2. Pocos años despues, el Sr. D. Blas Balcarcel presentó al que entónces era Colegio de Minería, un ejemplar de grafita escamosa pulverulenta é impura en caliza, de las cercanías de Santa María Itatlazco.

3. Pero es, seguramente, mas antiguo que los anteriores descubrimientos, el de la grafita de Pimas del Estado de Sonora, de la que existia un regular trozo en el antiguo Museo Nacional, cuya clase es igual á la de la grafita de que se hablará adelante, que constituye una gran capa en las inmediaciones del Real de San Marcial, del mismo Estado de Sonora, que se ha explotado últimamente.

4. Por noticias estadísticas, parece que tambien se encuentra en el Real de San Javier (?) de la Baja California.

5. Se dice igualmente que la hay en el Distrito de minas del Cardonal, pero no se precisa la localidad.

6. Por el año de 1860 se remitió á una casa de Banco de esta capital, que explotaba minas de plata cerca de Melila, un ejemplar que venia con la siguiente etiqueta: «Pierre aussi de Nopa, dont je ne me rappelle pas bien la veine.—Je lui donnerai le num. 3.» El pequeño ejemplar, que aun conservo, parece ser fragmento de una roca compuesta de pyroxena verde, de adularia y de cuarzo, con tablas exagonales de grafita embutidas, y pertenecer al grupo de las rocas graníticas.

7. Entre los minerales que figuraron en la Exposicion del Estado de Guerrero en 1870, que el Sr. D. J. Ramon Tamayo presentó despues al gabinete de Mineralogía de la Escuela Especial de Ingenieros, que clasifiqué en 1871, encontré la grafita contenida en masas, en una pizarra talcosa blanca, procedente del pueblo de Jalapa (?).

A estas vagas noticias de la existencia de la grafita en algunas de las montañas de México, se limitaba nuestro conocimiento de que la poseiamos; el cual, sin embargo, daba una guía segura de que pudieran encontrarse grandes depósitos, que formaran la base de especulaciones mineras.

Efectivamente, no se pasaron muchos años sin que llegara á nuestras noticias, que los señores arrendatarios de la Casa de Moneda de Culiacan habian tomado posesion de un gran criadero, cerca del Real de San Marcial, en el Estado de Sonora, los cuales lo explotaron, y exportaron unas 20 toneladas para Nueva York y Boston, que no les costearon los gastos, y abandonaron en seguida.

Más tarde, por el año de 1867, el Sr. Müller volvió á emprender la explotacion del mismo criadero, remitiendo á Alemania unas 400 toneladas, sin éxito favorable.

Estando yo en Guaymas en 1869, el mismo Sr. Müller me presentó una muestra de la grafita exportada para Alemania; y comparada su clase, á mi regreso á esta capital, con la del trozo de que se habló ya, núm 3, resultó ser idéntica.

No cabia ya duda entónces que el criadero de que se habia extraido el trozo de grafita de Pimas, que hacia muchos años existia en el antiguo Museo Nacional, era el mismo explotado por los señores ántes referidos.

San José de Pimas es el nombre de un pueblo antiguo de Sonora, y es el que tiene la etiqueta del ejemplar del Museo. San Marcial es un Real de minas nuevo del mismo Estado, y entre ambas localidades se encuentra el criadero últimamente explotado, que dista unas 33 leguas al N. E. del puerto de Guaymas.

Aun no se tiene una descripcion geológica de este criadero, que bajo el punto de vista industrial, es de grande interes para el desarrollo de nuestra industria minera.

Segun las noticias del Sr. D. R. Symon, ocupa una extension de 4,190 metros, ó una legua, y tiene de ancho como 10 metros. No se sabe bien si es una veta ó capa, pero su masa es homogénea, compacta y limpia. Se saca la grafita en grandes trozos, ó cantos, consistentes y puros, que son susceptibles de aserrarse, tornearse y esculpirse.

Sus caractéres son los de la variedad de grafita «escamosa,» que contiene, aunque imperceptiblemente, algun óxido rojo de hierro, y esta circunstancia la pone, industrialmente hablando, en un lugar intermedio entre la grafita de primera clase, ó de más valor en el comercio, que es la grafita hojosa de Ceilan, y la grafita escamosa de Alemania. La primera vale en Europa $160 la tonelada; y á la de Pimas se le asignó en Lóndres un valor de $60 por tonelada; miéntras que en los Estados-Unidos del Norte se pagó á $96.

En estos últimos dias, á mediados de Marzo próximo pasado, el Sr. D. F. Farrugia Manly, minero de Zimapan, y activo é inteligente corresponsal de la Sociedad Mexicana de Historia Natural, presentó á ésta una interesante coleccion de muestras de grafita, y rocas de las montañas en que se encuentra, procedentes de Huitznopala, 6 leguas al Norte de Molango, cabecera del distrito del mismo nombre.

Este nuevo descubrimiento está hecho en la misma region de la grafita núm. 6; pues la palabra «Nopa» debe ser Noapan, nombre de un pueblo situado á cosa de tres leguas al N. O. de Molango, y á doble distancia, al mismo rumbo de Melila.

Por el exámen de la coleccion, unida al informe del reconocimiento que practicó el mismo Sr. Manly, de la region de Huitznopala, publicado en el "Propagador Industrial," núm. 8, podemos juzgar de la importancia del nuevo criadero.

Las rocas de las montañas parecen pertenecer al grupo de las rocas graníticas y "gneissicas," habiéndose sustituido en parte la grafita á la mica, en estas últimas rocas, como suele suceder en otras partes.

Los terrenos inferiores formados de los despojos de descomposicion y detritus de desgaste de aquellas rocas, contienen nódulos puros de grafita hojosa; y por simple deslame, las tierras de esos terrenos dan la misma grafita en grumos, hojillas ó palletas, sueltas y limpias.

Los núdulos de grafita pertenecen á la primera variedad de la especie "grafita" de los mineralogistas, que es la hojosa y cristalizada. Forman láminas que resultan de la separacion por los cruceros de la base de los prismas, presentando una estructura cristalina. Las caras de los cruceros están además rayadas por dos sistemas de líneas paralelas formando rombos, que indican la direccion de otros cruceros.

Las láminas son resplandecientes, de lustre metálico, de color gris de acero oscuro, untuosas al tacto, tiznan los dedos, y dejan en la porcelana que se frota con ella una mancha gris, á diferencia de la molibdena sulfúrea que la deja verdosa; y presentan todos los demás caractéres de la grafita de primera clase, como la de Ceilan.

Al fin de este artículo ponemos el catálogo de nuestra clasificacion, de la coleccion del Sr. Manly.

Para concluir, recordarémos aquí la composicion y propiedades químicas de la grafita; cuáles depósitos son actualmente los que están surtiendo á la industria para la fabricacion de lápices y crisoles refractarios; y qué aplicaciones podrian darse á las clases de grafita de nuestros principales y más abundantes criaderos.

La grafita [1] se compone de carbono puro, en su mayor parte, con mezclas mecánicas de óxido de hierro y arcilla, en cortísimas cantidades.

Para formarse una idea de lo variable de estas mezclas, ponemos á continuacion algunos análisis de las grafitas mas conocidas, publicados en las "Comptes Rendus des Séances de l' Academie de Sciences, LXIV, 1091, 1867, por C. Mène.

					COMPOSICION EN 100 PARTES.				
	Peso específico.	Carbono.	Materias volátiles.	Cenizas.	$\ddot{\mathrm{Si}}$	$\dddot{\underline{\mathrm{Al}}}$	$\dot{\mathrm{Fe}}$	$\dot{\mathrm{Mg}}$, $\dot{\mathrm{Ca}}$.	Alcs. Pérdidas
De Cumberland...	2,3455	.91,55	1,10	7,35	52,5	28,3	12,0	6,0	1,2
,, ,,	2,5857	84,38	2,62	13,00	62.0	25,0	10,0	2,6	0,4
,, ,,	2,4092	78,10	6,10	15,80	58,5	30,5	7,5	3,5	—
,, Passau Baviera.	2,3108	73,65	4,20	22,15	69,5	21,1	5,5	2,0	1,9
,, Ceilan (Islas)....	2,2659	68,30	5,20	26,50	50,30	41,5	8,2	—	—

Sometida á una alta temperatura, la grafita arde sin llama ni humo, dejando por lo comun un residuo de óxido de hierro. Al soplete es infusible; pero fundida con salitre en la cucharilla de platina, deflagra, convirtiendo al reactivo en carbonato de potasa, que hace efervescencia con los ácidos, y es inalterable cuándo se ataca con ellos.

Por las condiciones que guardan frecuentemente los criaderos de grafita con las rocas en que arman, se le debe considerar como un combustible mineral privado casi completamente de gas. La más fina grafita que valia[1] $ 80 el kilógramo, (2, 17 librs.) con la que se hacian los lapices ingleses, y á la que debian su fama, se sacaba de las minas de Borrowdale, en Cumberland; pero ya estas minas se han agotado, y ha venido a reemplazarlas el depósito nuevamente descubierto en Siberia por Mr. Alibert de Montauban, cuyas muestras de calidad superior, figuraban ya en la Exposicion de Paris de 1867, al estado natural, ó cinceladas en formas de estatuas, y otras figuras de fantasia con un bello pulimento. Y la famosa fabrica de lápices de Faber, en Nuremberg, que ha ofuscado la reputacion de los de Brookman, se surte de la grafita de mejor clase de este nuevo criadero de Rusia.

---

[1] Nombre griego que le dió Werner, derivado de γραφω escribo.

La "American Graphite C.º de Cliff St. New York," se provée para su fábrica de crisoles de plombagina, tanto de las minas de Ticonderoga, del Lago Superior, como de las de Ceilan; y hace dos años ofrecia tomar de 50 á 100 toneladas, por remesas de la de Pimas, á $ 60 en oro por tonelada, puesta en Nueva York.

Con la grafita de Passau, en Baviera, mezclada a una tierra refractaria, se fabrican los famosos crisoles alemanes, que sufren bruscos cambios de temperatura sin romperse.

Los usos principales de la grafita ó plombagina, quedan ya casi indicados.

Con la de clase más fina, labrada en prismas muy delgados, embutidos en cilindros de madera, se hacen los lápices. Con el polvo de la de clase inferior, mezclada con un mucilago, se forman los lápices ordinarios.

Mezclada con tierra refractaria, en la proporcion de 1 á 4 partes, se fabrican los crisoles, cuyas propiedades de resistir á un fuego intenso y á bruscos cambios de temperatura, dependen tanto de la clase de los materiales que entran en ellos, como del punto de cocimiento que se les da en los hornos, que es lo que forma el secreto de los fabricantes.

La de textura compacta, se labra al cincel, como hemos dicho, para hacer estatuas y objetos de adorno ó fantasía.

Reducida á polvo fino y revuelta con grasa, sirve de lubrificativo para disminuir la friccion de las piezas pesadas frotantes de las máquinas; y unida á un barniz, preserva del ollin las estufas y tubos de chimeneas y piezas finas de maquinarias, cuando se pintan con ella.

La incoherente ó pluverulenta, sirve á veces para limpiar las piezas de hierro colado de maquinaria ó instrumentos.

Por las clases á que pertenecen las grafitas de Pimas y de Huitznopala, entendemos que son aplicables á todos los usos indicados; pero que se preferiria la de Huitznopala, por su calidad superior, para hacer lápices finos y crisoles refractarios.

---

[1] Mineralogie de Dufrenoy, 2.e Edition 1859.

Mas la cuestion económica es, en nuestro concepto, la de llevar ó crear estas industrias en el lugar mismo de la produccion ó sus cercanías; pues la explotacion de minerales de poco valor intrínseco, como es la grafita, estando los criaderos léjos de las costas, para su exportacion, ó de las grandes capitales, para establecer fábricas de los artefactos en que se emplea, tendria en contra los costos de los fletes de trasporte, que absorberian gran parte del valor de la materia prima, y harian la especulacion ó empresa de un éxito dudoso.

Clasificacion de la coleccion de grafitas y rocas que presentó el Sr. Farrugia Manly a la Sociedad Mexicana de Historia Natural

DE PILAPA.

1 Roca alterada, compuesta de feldespato, cuarzo y grafita, con estructura algo pizarreña.
2 Id. id.
3 Id. id., de estructura granitóidea, y con grafita en tablas exagonales.
4 Gneiss, con mica parda de tumbaga.
5 Tierras arcillosas, con grafita en hojillas sueltas.
6 Adularia, cuarzo y mica: fragmento de roca de granito.—Piedra rodada.
7 Conglomerado cuarzoso: piedra rodada, en la falda de la montaña.
8 Pegmalita (granito sin mica). Id. id.

DE HUITZNOPALA.

9 Nódulo de grafita hojosa. (Conjunto de láminas ú hojas con cruceros rómbeos, envueltos en arcilla ferruginosa.)
10 Láminas de grafita de los nódulos desbaratados y lavados.
11 Grafita en láminas, hojillas, palletas y grumos, sacados por lavaje de las tierras arcillosas.
12 Cuarzo blanco con grafita, fragmento encontrado en la arcilla, á dos piés de profundidad.

13 Feldespato alterado con grafita. (Roca alterada de la loma de Molhuasco.)
14 Basalto, caracterizado por el olivino que contiene: piedra rodada de id. id.
15 Protogyna (con talco verde y blanco), del cauce del rio.
16 Feldespato (adularia) de cerca del rio.

México, Junio 20 de 1875.

AGRICULTURA.

TEORÍA Y PRÁCTICA DE LA "QUEMA,"

POR EL SEÑOR DON JOSÉ C. SEGURA,

SOCIO DE NUMERO.

Las plantas útiles que el hombre cultiva, necesitan para llegar á su perfecto desarrollo, además de que concurran las circunstancias climatéricas que favorecen su vegetacion, que encuentren en el terreno los principios nutritivos en un estado propio para ser absorbidos por sus raíces.

La accion de los agentes meteóricos sobre las partículas orgánicas y terrosas, determinan ese estado por las nuevas combinaciones que allí se originan, dando por resultado la solubilidad de las sustancias que son útiles al desarrollo vegetal. Mas para que estas reacciones se verifiquen, es indispensable que el terreno esté en un estado de agregacion tal, que sea accesible á las influencias atmosféricas, sin perjudicar al apoyo que debe prestar á las plantas para que resistan al impulso de los vientos.

Sin la intervencion del aire, las combinaciones que se forman, no solo son nocivas á los vegetales, sino tambien al hombre y á los animales. El óxido de fierro, que con frecuencia es uno de los componentes de las tierras, se reduce al mínimum por la combustion lenta de la materia orgánica, haciendo improductivos los terrenos que la contienen.

Chevreul ha demostrado que hay produccion de hidrógeno sulfurado cuando se putrifica la materia orgánica en presencia de los sulfatos, aun cuando este ácido deletéreo se combine con los radicales de los alcalis y forme sulfuros fijos, porque los ácidos orgánicos que se desarrollan en la descomposicion de la sustancia orgánica, lo desalojan de sus combinaciones, poniéndolo en libertad. El aire tiende á prevenir estos inconvenientes, suministrando oxígeno á la combustion, é impidiendo la reduccion del fierro y de los sulfatos, ú oxidando estos cuando ya existen.

El agua sirve de vehículo para llevar á las plantas las sustancias solubles que favorecen su crecimiento. Si el estado físico del terreno impide su libre circulacion, puede suceder, ó que las plantas mueran de inanicion, ó que el agua estancada en su superficie haga que la sustancia orgánica, al descomponerse, dé orígen á productos ácidos que favorecen el desarrollo de las plantas inútiles ó nocivas á la agricultura, en cuyo caso es preciso saturarlos ántes de emprender cualquier cultivo.

Las labores tienen por objeto remover el terreno y volverlo poroso, exponiendo así sus partículas á la accion de la atmósfera: pero hay ciertos terrenos que por su naturaleza hacen ineficaz ó pasajero su efecto; tales son los terrenos arcillosos, húmedos, fríos y compactos, los pantanosos y los que contienen una gran cantidad de sustancia orgánica.

La Agronomía posée medios para modificar sus propiedades y volverlos aptos al cultivo. De uno de estos medios voy á ocuparme, y es el conocido con el nombre de "*Quema,*" por ser el mas económico y sencillo en su aplicacion práctica, así como sus resultados son más satisfactorios, que por el empleo de la cal, la arena ó la marga silícica.

Con el nombre de *quema* se conoce la operacion que tiene por objeto modificar las propiedades físicas y químicas de un terreno por la accion del fuego sobre sus partes terrosas, y por la carbonizacion de la parte orgánica que contiene.

Este procedimiento es muy antiguo. Virgilio, en sus Geórgicas, lo recomienda como un agente poderoso para fertilizar las tierras. Se sabe que era practicado en Italia, y que en el siglo XVII pasó á la Francia, siendo introducido cincuenta años despues en Inglaterra. Hoy en todas las naciones de Europa es bastante conocido y practicado.

Modifica las propiedades físicas y químicas, porque bajo la influencia del calor, la arcilla pierde su plasticidad, trasformándose en una masa porosa y deleznable, facil de ser accesible al agua y á los agentes atmosféricos. El fuego destruye las plantas nocivas á los vegetales cultivados, así como á los huevos y larvas de los insectos, y estos se alejan del terreno por el olor característico que allí se desprende. La materia organica se carboniza, y por la propiedad que tiene el carbon de absorber los gases, siendo tanto más absorbidos cuanto más solubles son en el agua, viene a servir de condensador de los principios fertilizantes; además, por la porosidad del terreno y la sobreoxidacion del hierro en presencia de los álcalis y de la materia orgánica, se favorece la nitrificacion que es benéfica al desarrollo vegetal. Los silicatos insolubles se trasforman en solubles por el concurso de los álcalis; y el carbonato calizo, por la elevacion de temperatura a que ha estado sometido, pierde su ácido carbónico, y su cal, muy interesante para corregir la acidez de un terreno, activa la descomposicion de la materia organica. Por lo expuesto se deduce, que no solo la *quema* es un mejorador poco costoso, sino un excelente abono.

Su empleo no puede generalizarse en toda clase de terrenos sin graves perjuicios. Favoreciendo la nitrificacion, no seria racional aplicarla a nuestros terrenos salitrosos, porque en las plantas, lo mismo que en los animales, el exceso de nutricion trae consigo la enfermedad y la muerte. En los terrenos arenosos, que tienen la propiedad de evaporar facilmente el agua y de descomponer con rapidez los abonos, disminuiria la poca cohesion que tienen, y destruiria las materias alimenticias. Tampoco produciria buenos resultados en los de poca profundidad, sobre todo, cuando el suelo activo descansa sobre la roca ó el subsuelo es arenoso, porque las plantas estarian expuestas á *acamarse* por la movilidad de la tierra que les sirve de apoyo.

La práctica de la *quema* requiere tres operaciones: primera, el desprendimiento del césped: segunda, su combustion: tercera, la reparticion de sus productos.

En Europa, para desprender el césped, se han inventado diversos instrumentos, con el objeto de hacer esta operacion más fácil y ménos costosa.

Los instrumentos de mano que generalmente se usan, son: la pala comun de fierro con punta triangular, la azada rocera, el corta-césped con el levanta-césped y el *breast-spade*.

La azada rocera es semejante á nuestro azadon, con la lámina más ancha y un poco curva. Para manejar este útil, el primer peon, que se llama el conductor, se coloca de manera que uno de los límites del campo que se quiere quemar esté á su derecha: armado de la azada y ligeramente encorvado, descarga un fuerte golpe á la derecha, otro al frente y el otro a la izquierda:

sin desprender el instrumento del terreno, levanta con fuerza el mango, y haciéndolo obrar como una palanca, desprende el césped, colocándolo con el instrumento á su derecha: en seguida, dando un corto paso, levanta otro césped, y prosigue así la misma operacion hasta llegar á la extremidad. Cuando ha levantado los dos primeros, un segundo peon lo sigue, colocándose á su izquierda y un poco atrás; da un golpe al frente con su azada rocera, y otro á la izquierda, desprendiendo el césped como el primero, y colocándolo en el lugar de donde éste lo ha extraido. Los demás peones que de antemano se han asignado para esta operacion, se van escalonando y trabajando en el mismo órden que los dos primeros: por consecuencia, van llegando sucesivamente á la extremidad del campo. El conductor vuelve al extremo de donde partió, y se coloca á la izquierda de la faja desprovista del césped levantado por el último, y los demás vienen colocándose á medida que llegan á la extremidad opuesta en el mismo órden que ántes, prosiguiendo así hasta terminar la operacion.

El corta-césped es una lámina de fierro en forma de media luna, que tiene su parte cóncava acerada y cortante, y provista en una de sus extremidades de un mango de madera.

El levanta-césped es una pala de fierro con punta triangular, teniendo en su mango una acodadura y otra en sentido inverso en la insercion de la lámina con el mango. Un peon con el corta-césped va dividiendo verticalmente el terreno en rectángulos de longitud y latitud adecuada, y otro introduce la lámina del levanta-césped, y apoyado en el puño lo empuja hácia adelante: como esta operacion es muy fatigosa para un solo hombre, se emplean dos; uno tira de una cuerda atada á un anillo implantado en la acodadura del mango, y el otro lo dirige por el puño que lo termina, de la misma manera que se conduce un arado por sus manceras.

El *breast-spade,* que los ingleses tambien llaman *breast-plougt,* es una pala de fierro de punta como la del levanta-césped, cuyo mango está acodado ligeramente en su medio, con el lado izquierdo de la lámina doblado en ángulo recto, de forma triangular y filoso, que sirve para cortar el césped lateralmente: el peon lo introduce de 0^m03 á 0^m05 de profundidad, lo empuja hácia adelante, valiéndose de la acodadura, levanta el prisma de tierra y lo invierte. Este instrumento tiene el inconveniente de ser su trabajo lento y penoso: sin embargo, John Sinclair dice que un hombre vigoroso y ejercitado puede descostrar, por término medio, en una semana, un terreno de cuarenta aras. En los terrenos pedregosos se hace uso de una especie de bieldo. Nuestros gañanes desprenden el césped de los campos valiéndose de la barreta y del *escarraman,* que es una pala de madera con punta de fierro, ó con el azadon. Un peon, regularmente ejercitado, puede, por término medio, descostrar en un dia 74 metros cuadrados de terreno.

En las grandes explotaciones esta operacion, con instrumentos de mano, seria muy costosa; por lo mismo se recurre á instrumentos de tiro. Cualquier arado, de los que se conocen entre nosotros con el nombre genérico de extranjeros, sirve para ejecutar esta operacion. Para esto se sustituye la cuchilla por un disco metálico y cortante, que gire libremente en la chapa que lo une al timon, y cuya reja sea ancha, de las llamadas de descostrar. Se puede usar el arado americano sin ninguna modificacion, haciéndolo preceder al corta-césped de Rey de Planazu, que se compone de una pieza trasversal, provista de manceras y armada de seis cuchillas equidistantes y encorvadas hácia adelante, con el objeto de disminuir la resistencia, y muy bien afiladas para cortar el césped en bandas paralelas de $0^{m}20$ á 30 de anchura. Esta pieza trasversal está unida á un timon que descansa en un avantren.

En el Departamento del Tarn, el Sr. Villaneuve introdujo un arado que violenta mucho el descostramiento. Este arado tiene el timon curvo y articulado: la forma de la reja es igual á la del levanta-césped, con la cuchilla tambien triangular: la vertedera es pequeña y elizoidal: en la articulacion del timon se encuentran dos ruedas que le sirven de avantren: por esta disposicion su trasporte es fácil. El manejo del instrumento es el mismo que el del arado comun.

El grueso que se da al césped es muy variable, y depende de la extension y disposicion de las raices, de los vegetales que lo constituyen, de la naturaleza del terreno y de los instrumentos que se emplean en la extraccion, teniendo por límites de $0^{m}05$ á $0^{m}16$.

Una vez desprendidos los céspedes, se les deja *escurrir*, colocándolos por pares, recargándose el uno contra el otro. Es necesario no dejarlos secar mucho, porque despues de la combustion se trasforman en un ladrillo difícil de pulverizar, sino que conserven un estado de humedad que no perjudique a la operacion subsecuente.

El desprendimiento del césped debe hacerse en tiempo de secas y cuando el terreno esté *escurrido*, porque muy húmedos los terrenos arcillosos se adhieren á los instrumentos del cultivo, y muy secos oponen gran resistencia á la traccion. La combustion del césped se hace cuando está próxima la siembra.

Para quemar el césped, algunas veces se le prende fuego en el mismo lugar en que lo ha dejado el peon cuando lo ha desprendido: pero esto tiene el inconveniente que, efectuándose la combustion al aire libre, se pierden los gases y compuestos volátiles en la atmósfera. Es preferible situar á distancias haces de leña ó montones de yerba seca, ó de cualquier otro combustible de poco valor, y formar sobre ellos con el césped (teniendo cuidado de colocar la cara que está provista de yerbas hácia el interior), hornos de 1^{m} á $1^{m}33$ de altura, y de 1,33 á 1,66 de diámetro, que tengan dos aberturas, una en la base y del lado del viento dominante, y la otra en la cúspide para que le sirva de tiro, la cual se tapa inmediatamente que el fuego se ha propagado en su interior. Se tiene cuidado de tapar con césped las grietas que se hagan en los hornos durante la combustion.

Cuando despues de pasados algunos dias se han enfriado, se procede á la reparticion de las cenizas.

En los países húmedos, ó cuando por cualquiera otra circunstancia, no puede esperarse á que se escurra bien el césped, puede hacerse la combustion en parrillas portátiles. John Sinclair describe una muy sencilla, que consta de dos barras de fierro de $1^{m}22$ de largo, unidas por seis arcos del mismo metal. Se coloca horizontalmente en el suelo, y sobre su parte convexa se pone el césped como ya se ha dicho. El espacio que queda entre la parrilla y el suelo, da paso al aire y se facilita mucho la combustion. Un muchacho de doce años puede trasportarla con facilidad.

Es esencial para los buenos resultados, que la accion del calor sobre el césped sea lenta para que no se incinere más que una pequeña parte de sustancia orgánica, y que el ollin, el humo y todos los productos gaseosos que se desarrollan en la combustion, sean retenidos en la masa terrosa. Lo que anunciará la buena marcha de la operacion, es que al principio el humo undule ligeramente sobre el horno, y despues se haga imperceptible, pero que esto no provenga de que se haya extinguido el fuego en el interior. Los hornos que despues del enfriamiento tienen el interior moreno-rojizo y el exterior muy oscuro, son los que producen mejores efectos.

Segun Puvis, con la quema de una héctara, teniendo el césped un centímetro de espesor, se mejoran de 25 á 30 segun la tenacidad de la tierra. Cuando la profundidad varie, simples proporciones nos darán la cantidad de terreno que hemos de someter á la combustion para mejorar el campo. El agrónomo citado, para calcular esa cantidad, se fundó en que una héctara de terreno de un centímetro de espesor, da despues de la combustion mil metros cúbicos de cenizas. Tomando el término medio de estos datos, establecemos las fórmulas siguientes: 1.ª $x = 275\,a$, 2.ª $x = \frac{s}{275\,a}$, siendo *a* el espesor del prisma de tierra, y *s* la superficie del campo que se quiere mejorar. La primera fórmula da la cantidad de héctaras que se mejoran con una de una profundidad dada sometida á la combustion; y la segunda determina la cantidad de héctaras de un grueso convenido, que sometidas á la combustion, mejorarian un campo de superficie conocida.

Desgraciadamente el coeficiente de *a* es variable, como lo es el dato en que se funda, por lo cual no se deben esperar mas que resultados aproximados: sin embargo, tanto el agricultor como el artesano ó el industrial, necesitan partir de un dato, aun cuando no sea mas que aproximado, que les sirva de base en sus cálculos, por cuya razon las he consignado.

Es preferible quemar, no una parte sino todo el terreno, porque de esta manera se hace con regularidad la reparticion del mejorador, y sus efectos son más uniformes. Villaneuve, que es una autoridad en esta materia por su larga práctica, descostraba el campo, y ántes de someter á la combustion el césped, trasportaba el sobrante que resultaba segun sus cálculos, para quemarlo en los fundos vecinos que queria mejorar.

De cuatro maneras se reparten las cenizas: primera, enterrándolas inmediatamente despues de la combustion por medio del arado y proceder á la siembra; este método es preferible: segunda, repartirlas con la pala en la superficie del campo y dejarlas algunos meses expuestas á la accion atmosférica; esto tiene el inconveniente que las lluvias arrastren á las capas profundas de la tierra arable las sales solubles que contienen, y para la siembra se tendria que hacer una labor profunda: tercera, amontonar, para repartirlas en el momento de la siembra: la humedad de las noches, ó la primera lluvia, les forma una costra que las preserva de ser esparcidas por el viento, y hace á estos montones impermeables á las lluvias, que disolverian las sales que contienen: cuarta, repartir con las cenizas cal, en la proporcion de 100 hectólitros por héctara.

Despues de quemado un terreno, es preciso elegir una rotacion poco agotante, y no abusar de la fertilidad que ha adquirido, sin retribuirle por los abonos los principios alimenticios que las cosechas le quitan, si no se quiere esterilizarlo por completo.

Mateo Dombasle dice que un terreno quemado es como un caballo fogoso, del cual puede abusar un auriga ignorante, pero tambien del cual se pueden sacar excelentes servicios por un gobierno conveniente.

México, Julio 23 de 1874.

MINERALOGIA.

EXÁMEN Y CLASIFICACION DE ALGUNAS ESPECIES MINERALES DE MÉXICO,

COMUNICADAS POR EL SEÑOR DOCTOR DON JOSE BURKART.

(CONTINUA.)

ARTICULO III.

De la Xonotlacia (Xonaltite) ó un nuevo hidrosilicato de cal, y de la Bustamancia, por el Sr. Dr. Rammelsberg.

Habiendo recibido el Sr. Dr. Krantz, el año pasado, del Sr. D. Antonio del Castillo muestras de esta nueva especie mineral, que se halla junto con apofilita y bustamancia, remitió, por su encargo, una parte de ellas al Sr. Rammelsberg para su análisis; y parece que por un error de pluma se señaló Tetela de Xonalta como la localidad donde se hallan estos minerales, en lugar de Tetela de Xonotla, por lo que el Sr. Rammelsberg la llamó Xonaltite; así es que, para México á lo ménos, se debe sustituir el nombre de la nueva especie mineral[1] dado por este autor, con el de Xonotlacia ó Jonotlacia.

Segun dice Rammelsberg, el mineral que analizó forma «anillos concéntricos de color, en parte blanco, en parte gris azulado; es fibroso ó compacto y se distingue por su gran dureza ó tenacidad: se parece á la Okenita, de la cual se distingue solamente por su composicion cuantitativa.»

«Al calentar este mineral se desprende agua; al soplete no se funde; su peso específico es de 2,710 para la variedad blanca, y de 2,718 para la variedad gris, así como su composicion química está entre la de la Wollastonita, cuyo peso específico es de 2.85, y el de la Okenita con un peso específico de 2.30.»

---

[1] Véase el tomo citado, p. 33.

«En ácido hidroclórico se descompone; pero la siliza que se aparta en polvo no se disuelve enteramente en carbonatos alcalinos. El análisis dió para las dos variedades la siguiente composicion:

	1.º LA BLANCA.		2.º LA GRIS AZULADA.
Siliza.	*a* 49.58	*b* 47.91	50.25
Cal.	,, 43.56	,, 43.65	43.92
Oxidulo de manganeso.	,, 1.79	,, 2.42	2.28
,, de fierro . . .	,, 1.31		
Magnesia.	,, —	,, 0.74	0.19
Agua	,, 3.70	,, 3.76	4.07
	99.94	98.48	100.71

«El oxígeno del agua, de las bases y del ácido, está en las proporciones siguientes:

N° 1^a = 3.30 : 13.15 : 26.43
,, 1^b = 3.34 : 13.03 : 25.55
,, 2 = 3.62 : 13.15 : 26.80

$= 1 : 4 : 8$, y por consiguiente es $= 4\,\dot{Ca}\,\ddot{Si}, + \dot{H}$;

$$\begin{array}{rrcrcr} \text{computando : } & 4\,\ddot{Si} & = & 120 & = & 49.80 \\ & 4\,\dot{Ca} & = & 112 & = & 46.47 \\ & \dot{H} & = & 9 & = & 3.73 \\ \hline & & & 241 & & 100.00 \end{array}$$

«La Okenita contiene con cantidad igual de cal, el doble de ácido y el óctuplo de agua.»

«Algunas partes del mineral contienen un poco de carbonato de cal p. e. la materia del análisis N°. 1^b, este análisis se hizo con ácido muriático. De las 48.73 partes por ciento, se disolvieron 41 en una lejia de carbonato de sosa (Kohlensaure Natronlauge); el resto de 7.73 por ciento que era duro y crugia, rindió en un análisis separado 6.91 de siliza, siendo el resto óxido de manganeso y cal; y parece que no eran partes del mineral no descompuesto, sino que contenian algun cuarzo. Pero cuando despues de haber quedado unos pedazos del mineral por cinco semanas en ácido hidroclórico, se hirvieron 8.09 gramos de la masa quebradiza en una solucion de carbonato de sosa, solo quedaron 3.4 por ciento, conteniendo 0.13 por ciento de cal y el resto de siliza. Sí estos 3 por ciento se pudieran tomar por cuarzo, el silicato de cal seria:

$$\dot{Ca}^{10}\,\ddot{Si}^{9}$$

lo que no es probable, y parecen pertenecer más bien al silicato mismo que es:

$$\dot{Ca}\,\ddot{Si}.»$$

«La nueva especie mineral se ha formado tal vez de la Bustamancia por el influjo de aguas calcáreas y silizosas.»

«La bustamancia que acompaña á la xonatlacia, es estriada (otrahlig), radiante y gris-verdosa. Los ejemplares sencillos del mineral tienen la estructura de la augita. Los ácidos atacan á la bustamancia difícilmente, pero contiene trazas de carbonato de cal."

«Se compone de

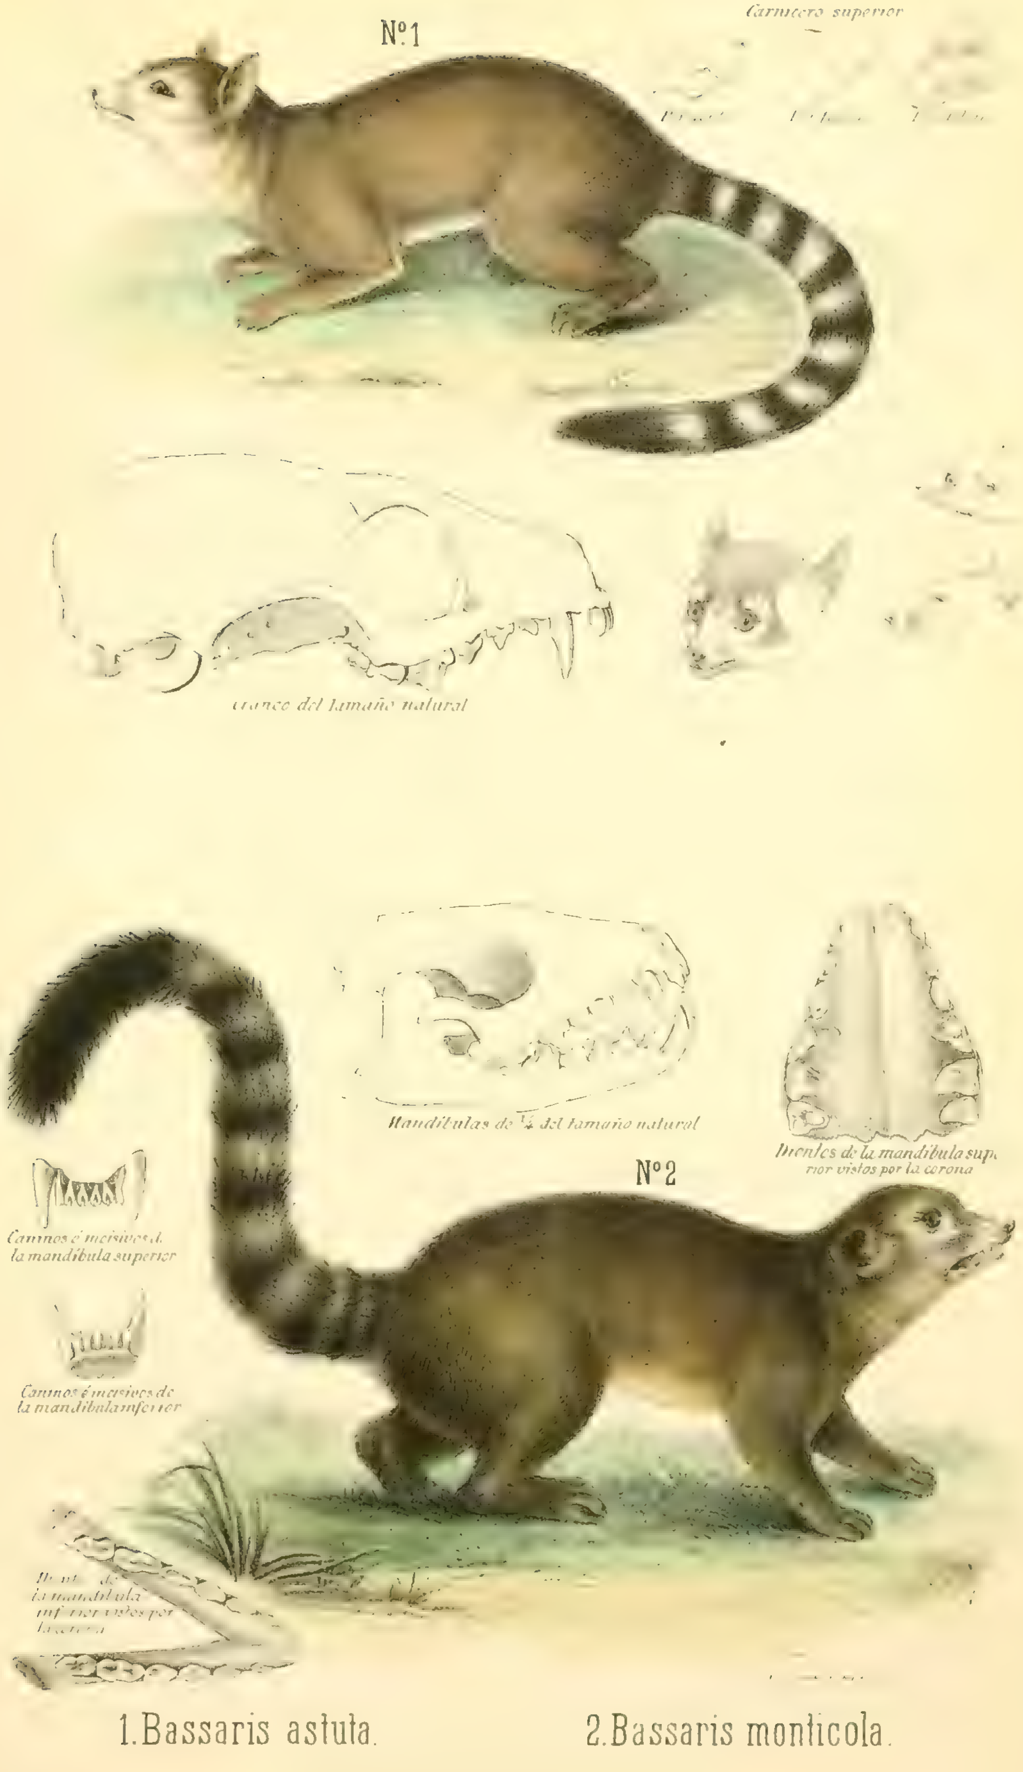
Siliza	47.35		25.25 oxígeno.
Protóxido de manganeso. .	42.08	9.62	12.36 ,,
Cal	9.60	2.74	
Agua.	0.72		
	99.75		

y es por consiguiente $\left.\begin{matrix}7/9\ \dot{Mn}\\ 2/9\ \dot{Ca}\end{matrix}\right\}\ddot{Si}$: miéntras que las muestras de la misma localidad, examinadas anteriormente por Dumas y Ebelmen, contienen casi 2 átomos de protóxido de manganeso para un átomo de cal.»

Articulo IV.

De la Pleonasta ó Ceilanita de Ramos.

En mis "Viajes y mansion en México" —impresos en Stuttgart, 1836— yo habia hecho mencion de las lavas basálticas de Ramos, observando que estas lavas compactas del cerro de Zamora y de otros parajes en las inmediaciones de Ramos, contenian granos embutidos de olivino, de fierro magnénético y de otro mineral negro, concoide plano, distinguiéndose por su dureza y que habia tenido por augita, pero que no se ha podido examinar debidamente por la pequeñez de los granos. En el año pasado recibí del Sr. D. Antonio del Castillo unos cristales sueltos de un mineral de Ramos, que asignó este mineralogista distinguido como nueva especie de pleonasta, comunicándome la descripcion siguiente de ella.



N°1
Carnicero superior
Craneo del tamaño natural
Mandibulas de ¼ del tamaño natural
Dientes de la mandibula superior vistos por la corona
N°2
Caninos é incisivos de la mandibula superior
Caninos é incisivos de la mandibula inferior
Dientes de la mandibula inferior vistos por la corona

1. Bassaris astuta. 2. Bassaris monticola.

(Poco mas de 2/3 del tamaño natural)

«Es resplandeciente, de lustre de vidrio; por fuera de color negro-pardusco, y pardo-rojizo; por dentro es negro puro. Cristaliza en octaedros sueltos con las aristas redondeadas y octaedros imbricados sobre un mismo eje vertical.»

«El ángulo de las aristas del octaedro es 109°. Cristaliza tambien en tetraedros con las aristas ó esquinas truncadas. Textura concoidea plana. Es opaca ó trasluciente en chispitas delgadas, que son verdes por refraccion. Dureza de 8.5.»

«Peso específico, 3.5. Se encuentran en las rocas basálticas de Ramos.»

El Sr. Rammelsberg despues de haber analizado la muestra de este mineral, que le habia remitido al efecto, me dice: que da un polvo gris, que su peso específico es de 3.865, por consiguiente mayor que el peso específico obtenido por el Sr. Castillo, y que el análisis dió.

Alúmina.	68.46
Oxidulo de fierro.	11.64
Magnesia	19.90
	100.00

$$=3\,\dot{Mg}.\,\dddot{Al}+\dot{Fe}\,\dddot{Al}$$

Este análisis corresponde con poca diferencia á la composicion que tiene, segun Rammelsberg, la Celanita de Hermala en Finlandia, la cual contiene algo ménos alúmina (67.60) y magnesia (19.00); pero tiene ademas 1.3 zinc, faltando este último en el mineral de Ramos.

A juzgar por la imperfeccion de los cristales que he recibido, y por los caractéres exteriores del mineral, se deben considerar estos como cristales embutidos en la roca y desprendidos de ella por su descomposicion. No me dice el Sr. Castillo cómo se halla la pleonasta en Ramos; pero juzgando por una muestra de la lava basáltica del cerro de Zamora, cerca de Ramos, no parece caber duda de que esta pleonasta pertenece á la lava, pues la dureza de los granos negros con textura plana concoidea embutidos en ella, es mucho mayor á la de la augita y pasa de 8, segun la he podido determinar en una astillita.

CIENCIAS AUXILIARES.

EL CHICALOTE.

INVESTIGACIONES PARA FORMAR LA HISTORIA BOTANICA, QUIMICA Y FISIOLOGICA DE ESTA ARGEMONA DE MEXICO.

(Extracto de la tésis de M. Charbonnier, publicado en el "Diario de Farmacia y de Química" de Paris. tom. VII, 1868.)

Historia.—La argemona de México, que constituye hoy el tipo de este género, era desconocida de los antiguos. Hácia el año de 1592 fué llevada á Europa y los botánicos la colocaron entre las adormideras, con el nombre de *Papaver spinosum*. Alfonso Decandolle se inclina á creer que el trasporte de los primeros granos se hizo involuntariamente con el lastre de los navíos ó en diversas mercancías.

Es preciso notar que en esta época las palabras *Papaver* y *Argemona*, designaban dos grupos de plantas de un órden enteramente arbitrario. El primero comprendia las adormideras, quelidonias y las argemonas; el segundo solamente adormideras. Tournefort les asignó un valor riguroso y preciso, formando los dos géneros indicados, y que fueron adoptados por la mayor parte de los autores que le sucedieron.

Sin embargo, segun Aquiles Richard, esta planta difiere tan poco de las verdaderas adormideras, que deberia ser incluida en el género *Papaver*.

A pesar de la opinion de este célebre botanico, la planta de que nos ocupamos presenta caractéres muy marcados para constituir un género bien caracterizado.

En efecto, las plantas del género *Argemona* difieren de las del *Papaver*, en que tienen un caliz de tres sépalos en lugar de dos; su corola seis pétalos en vez de cuatro; el ovario tiene sobrepuestos de tres á seis estigmas, sentados, distintos, persistentes, libres y no soldados como en las adormideras; ademas sus cápsulas tienen las valvas muy distintas, abriéndose hasta la mitad tan luego como se han madurado los granos. A estos caractéres hay que añadir, que durante la antésis, las flores de las adormideras están inclinadas sobre los pedúnculos, y no erguidas, como constantemente se observa en las argemonas.

En Francia este vegetal se cultiva raras veces, y solamente como planta de ornato. Sus hojas anchas, salpicadas de manchas blancas y provistas de numerosas espinas muy desarrolladas, contribuyen de una manera agradable al embellecimiento de los jardines. Su cultivo es tan fácil, que se la puede aclimatar y aun naturalizar en casi todas las partes del mundo. Yo he hecho sembrar granos en el mes de Abril en terrenos de distinta naturaleza, y me he asegurado que las tierras ligeras y arenosas, expuestas al Mediodía, son las que mejor le convienen. Este cultivo no exige mucho cuidado: se siembra en Abril para colectar los granos á fines de Setiembre, necesitándose casi 100 gramos por ara.

La héctara puede rendir de 20 á 62 hectólitros de grano, pesando cada uno de aquellos 57^k 25.

Comparando el rendimiento en aceite, de estas semillas, con el de otras plantas oleaginosas de Europa, como la colza, la camelina, la linaza, la adormidera, etc., el resultado es bastante favorable para la argemona, teniendo sobre aquellas la ventaja de la facilidad de su cultivo.

Propiedades medicinales.—Esta planta atrajo, desde la época de la conquista, la atencion de los españoles, que encontraron en sus semillas una cualidad emética y en su aspecto general alguna semejanza con el *cardo bendito,* nombre que aun se da en la América del Sur á las especies que allí crecen.

Los autores no están de acuerdo acerca de sus propiedades medicinales.

O'Saughnessy la considera como inerte; Ainslie dice que el jugo lechoso es un buen remedio en las enfermedades de los ojos, que el aceite es purgante y la infusion de la planta goza de propiedades diuréticas. Simmonel asegura que las semillas son eméticas, que el aceite á la dósis de treinta gotas en un pedazo de azucar, alivia instantáneamente los dolores de estómago y procura un sueño reparador.

Se lee en la «Enciclopedia metódica» que los granos son purgantes y pasan en América como un remedio contra las diarreas y la disenteria; sus flores son anodinas, pectorales y narcóticas; y sus hojas machacadas, empleadas exteriormente, son á propósito para calmar los dolores cefalálgicos y moderar la inflamacion de los ojos.

Aquiles Richard pretende que el cocimiento de la raiz se emplea en la isla de Francia para hacer brotar el pelo que ha caido por causa de alguna enfermedad. Dorvault en su «Oficina,» dice que se sirve en el Senegal de la especie que allí crece, contra la gonorrea, y que el jugo se emplea en las enfermedades cutáneas, como las berrugas, etc.

Martius, en fin, refiere que aplicada en cataplasmas, apresura la cicatrizacion de las úlceras, obrando como detersivo.

Segun las numerosas opiniones que se acaban de exponer, se ve que la accion de esta planta sobre la economía animal está aún léjos de quedar resuelta.

Sea lo que fuere, llama la atencion que siendo la *Argemona* tan interesante bajo diversos aspectos, no haya sido objeto de un estudio especial por parte de los químicos. Se puede prever de antemano, que está dotada de propiedades muy activas, pues contiene, como la adormidera, un jugo amarillo-lechoso, que se escurre de todas las partes de la planta á la menor incision. Este jugo es gomo-resinoso, soluble en el agua y en el alcohol; posée un olor viroso particular y un sabor amargo, semejante al ópio. Jamás se ha buscado su principio activo, y tampoco si seria susceptible esta papaverácea de enriquecer la terapéutica con un nuevo agente de una virtud especial.

El autor ha operado principalmente sobre las cápsulas y las hojas en estado fresco, y colectadas cuando la vegetacion ha alcanzado todo su vigor, es decir, en el momento en que los órganos reproductores comenzaban á mostrarse. Hubiera sido preferible, como él mismo lo hace notar, practicar incisiones en las cápsulas para dar salida al jugo, exactamente de la misma manera que se practica para obtener el opio; mas esta operacion es muy delicada y exige mucho cuidado de parte del operador: las cápsulas de la *Argemona* de México son poco voluminosas, de forma alargada y de costillas salientes y erizadas de numerosas espinas; circunstancias que hacen más difícil el practicar las incisiones; no así en las adormideras, cuyos frutos son completamente lisos.

Examen químico de la planta.—Hé aquí, dice el autor, la marcha que he seguido en esta investigacion. Despues de haber dividido convenientemente las partes de la planta, cápsulas, hojas, etc., por medio de un corta-raíz, y haberlas contundido en un mortero de mármol, las hice macerar, durante ocho dias, en cuatro veces su peso de alcohol á 85°, conteniendo casi dos gramos de ácido tártrico por litro de alcohol. Trascurrido este tiempo, sometí mis sustancias á la prensa y filtré en seguida el licor, por papel. Este licor ha sido destilado en una gran retorta, colocada en baño-maría, hasta reducirse á dos terceras partes: se separó entónces del líquido una sustancia grasa, resinoide, insoluble en el agua y que eliminé por la filtracion. El líquido fué luego sometido á la evaporacion en baño-maria, hasta la consistencia de extracto, que traté por alcohol a 90° centigrados: filtré despues y evaporé de nuevo. Este extracto, redisuelto en una corta cantidad de agua, se saturó con bicarbonato de sosa finamente pulverizado, hasta que la efervescencia cesó del todo. Se introdujo entónces en un frasco de boca ancha, de tapon esmerilado, con cuatro ó cinco veces el volúmen del extracto, de éter bien rectificado. Dejé la mezcla en contacto durante veinticuatro horas, teniendo cuidado de agitarla de vez en cuando, a fin de favorecer la disolucion del alcaloide en este vehículo. Abandoné entónces el frasco en el reposo, hasta que el éter se separó enteramente y vino á formar una capa encima del líquido acuoso: decanté esta capa teniendo cuidado de filtrarla ántes de recibirla en una cápsula, con objeto de separar las impurezas que pudiera contener el líquido.

El licor así obtenido, tenia un color notablemente verde debido á la clorofila; pero despues de varios tratamientos semejantes, se llegó a despojarlo de todas las materias colorantes solubles en el éter. Reuniendo todos estos licores en una cápsula, los dejé evaporar espontáneamente. Al cabo de algunos dias, levantando la parte superior de la masa verdosa, me fué posible percibir pequeños cristales en aguja. Estos cristales siendo insolubles en el agua, empléé un medio mecanico para aislarlos; que consistió en introducir toda la sustancia en un frasco con agua destilada, agitar fuertemente, y decantar tan luego como los cristales se precipitaron al fondo. Obrando de esta manera, llegué á procurarme una corta cantidad de ellos, conteniendo aún mucha clorofila.

Cuando he tratado de obtener el producto en el mayor estado de pureza, he perdido la mayor parte de él, por lo que me ha sido imposible estudiar sus caractéres, y solo me he asegurado que cristalizaba en agujas muy finas y que no se teñia de rojo al contacto del ácido azótico.

Cambiando de disolvente, he agitado muchas veces con éter acético puro, como anteriormente lo habia practicado con éter ordinario. En esta vez mi licor decantado apénas tenia color, lo que facilmente se comprende, puesto que el éter ordinario lo habia despojado de una gran parte de las materias colorantes. Por evaporacion en baño-maria obtuve pequeños cristales mezclados con una corta porcion de materia resinoide que eliminé en gran parte por medio de alcohol frio. Despues, redisolviendo estos cristales en alcohol rectificado á 90° y en ebullicion y evaporando á una baja temperatura, los pude obtener, aunque siempre algo coloridos, en un grado suficiente de pureza para estudiar sus caractéres y convencerme que el principio cristalizado que habia obtenido como último resultado, era realmente morfina.

En efecto, su forma cristalina, su insolubilidad en el agua y en el éter ordinario, unidos á otros caractéres químicos, tan sensibles de esta base, no me ha dejado duda alguna bajo este respecto. Los acidos clorohidrico, sulfúrico, acético, etc., lo disuelven perfectamente, de la misma manera que la potasa, la sosa y el amoniaco.

El ácido azótico concentrado da una hermosa coloracion roja; con las sales de fierro al *máximum* la coloracion es azul, y en frio el ácido yódico es descompuesto. Todos estos caractéres habiendo sido ensayados comparativamente con la morfina pura, los resultados fueron idénticos: me pareció ya supérfluo emplear otros reactivos, tanto más cuanto me era preciso conservar un pequeño ejemplar del producto que habia obtenido.

La corta cantidad de alcaloide que extraje, comparativamente al peso de la planta empleada, me hizo suponer que contendria muy poco; pero obrando sobre el jugo obtenido por incisiones hechas en las cápsulas, es indudable que se obtendria mayor cantidad, y que se encontrarian, si no todas, por lo ménos una gran parte de los principios que contiene el opio.

Bajo el punto de vista industrial este medio seria impracticable, porque repito, la dificultad de practicar las incisiones en las capsulas, daria el costo de la mano de obra, muy superior al valor del producto.

Considerada de esta manera la *Argemona* de México, no presenta mayores ventajas; mas sin embargo, si en época bien determinada de la vegetacion, se obtiene por expresion de todas las partes de la planta un extracto análogo al meconio, quizá por este medio facil y sencillo se obtendrian bastantes alcaloides para que fuese ventajosa su extraccion. Es un punto interesante que por ahora no hago más que señalarlo, pero que me propongo examinarlo con cuidado.[1]

Examen químico de las semillas.—Por los procedimientos ordinariamente empleados, he encontrado que contienen en cien partes:

Aceite.	36,20
Agua	7,40
Sales minerales	5,60
Azúcar	4,38
Goma.	2,54
Caseina . . . . , .	4,32
Albumina y glúten	13,38
Fécula . , ...	17,72

---

[1] El descubrimiento de la morfina en la *Argemona* de México, ofrece el interes particular de que confirma los trabajos recientes del profesor Baillon, que concluye reuniendo los géneros *Argemona* y *Papaver* en uno solo; trabajos que ignoraba M. Charbonnier cuando presentó su tésis. A. B.

Leñoso	6,52
Pérdida	1,94
Total	100,00

PROPIEDADES FISICAS Y QUIMICAS DEL ACEITE.—Obtenido por medio del sulfuro de carbono bien purificado, tiene un ligero color amarillo, límpido, trasparente, y permanece liquido hasta + 5° arriba de cero. Tiene un olor nauseoso y un sabor ligeramente aspero; pero de ninguna manera son desagradables. En contacto con diversos reactivos, se observa lo siguiente:

Cuando se vierten una ó dos gotas de acido sulfúrico concentrado, sobre una capa de aceite, el color amarillo de éste se oscurece primero y despues pasa á moreno-sucio. Con el ácido azótico el color es más subido y se enrojece á la larga. 10 gramos, agitados con 1 idem de amoniaco, dan una mezcla gris-leonado, con la consistencia de miel; esta mezcla desarrolla 3° de calórico; con el ácido sulfúrico saturado de bicromato de potasa, el aceite se vuelve negro; con la sosa líquida se obtiene un jabon amarillo.

Este aceite se disuelve completamente en cinco ó seis veces su volúmen de alcohol rectificado á 90° cent. Se oxida rapidamente en el aire resinificándose y secandose como los aceites que poseen en alto grado esta propiedad.

USOS.—Este aceite puede tener aplicaciones importantes, no solamente en la terapéutica, sino tambien en la fabricacion del jabon, del alumbrado, y sobre todo, en la pintura; para telas enceradas y barnices grasos, pues es muy secante. Seria aun mas ventajoso que el aceite de linaza para los colores claros y delicados, á causa de ser ménos colorido. En México los pintores lo emplean para la preparacion de una especie de betun que llaman *maque* y con el que barnizan la madera.

Las tortas de los granos no pueden ser empleadas en la engorda del ganado como las de la linaza; despues de incineradas contienen en cien partes:

Potasa y sosa	24,72
Cal	25,43
Acido fosfórico	38,60
Acido silicico	6,50
Magnesia	0,82
Cloruros alcalinos	1,64
Oxido de fierro	1,12
Pérdida	1,17
Total	100,00

Estas tortas contienen además de 5 á 8 por 100 de ázoe, cantidad enorme y que las aproxima á las materias animales secas.

Efectos fisiológicos.—1. La primera experiencia que he intentado, dice el autor, ha sido hecha sobre mí mismo: he tomado 30 gotas del aceite en un terron de azúcar. El resultado no se hizo esperar mucho, porque habiendo sido ingerido en ayunas, á las siete de la mañana, comencé á sentir los primeros efectos á las ocho. La primera deposicion fué seguida de otras tres, sin experimentar cólicos ni molestia alguna; á las nueve me sobrevinieron náuseas, que fueron seguidas de vómitos.

Esta primera prueba fué bastante concluyente, para fijarme en las propiedades reales de este aceite; sin embargo, no era suficiente para establecerlas de una manera general, pues se sabe que, segun el estado patológico del aparato digestivo de cada individuo, los purgantes obran segun la dósis, produciendo efectos muy diferentes.

La experiencia que acabo de referir, fué hecha juntamente con M. Longuet, interno en medicina del Hotel-Dieu.

2. El 14 de Noviembre administré 15 gotas de aceite á una jóven de 27 años, muy gorda y fuerte, afectada de chancros blandos, con vaginitis y constipacion tenaz. El resultado fué tres deposiciones, sin dolores ni náuseas.

3. El mismo dia, á fin de comparar los efectos, he dado la misma dósis, 15 gotas, á un hombre sumamente robusto, aunque de una constitucion ligeramente linfatica, de 40 años de edad y enfermo de chancros blandos. Este hombre me ha dicho que difícilmente se purgaba, y solo tuvo una deposicion. Evidentemente la dósis del medicamento fué muy corta.

4. El dia 17, 25 gotas fueron administradas á una mujer de 28 años, y que llevaba 20 dias de parida; estaba atacada de myositis puerperal, con algo de pleuro-neumomía, no habiendo evacuado en cosa de siete dias. El medicamento produjo mucho bienestar, y la enferma tuvo tres deposiciones en la noche.

5. El dia 22, 30 gotas se dieron a una anciana de 72 años, que tenia un kiste en el ovario. La enferma resintió á poco fuertes náuseas y vomitó; á pesar de esto tuvo seis deposiciones.

6. El dia 25, una mujer de 45 años tomó á las once de la mañana 30 gotas de aceite: despues de un corto rato vomitó; sintiéndose á poco con mucho sueño se metió en la cama, y al cabo de seis horas se declararon los efectos purgantes, que continuaron por una gran parte de la noche, haciendo doce deposiciones.

Segun su accion fisiológica, se ve que el aceite de la argemona de México, aunque proviniendo de una papaverácea tiene grande analogía con la mayor parte de los aceites de las euforbiáceas, que tienen el carácter comun de ser purgantes, pero al mismo tiempo emeto-catárticas: clasificándolos segun su accion medicinal, debe ocupar el tercer lugar entre ellos.

El estudio de esta planta presenta, por lo que se ha referido, hechos excepcionales verdaderamente notables. Así, muy afine de la adormidera por sus caractéres organográficos y su principio activo, puesto que encierra morfina, se aproxima por su aceite á las euforbiaceas, miéntras que el *Papaver somniferum* que nos suministra el opio, nos da un aceite sin accion sobre la economía animal.

Es, pues, á la vez un ejemplo y una excepcion, á la ley formulada por Lineo, por Pelletier y Caventou, que las plantas de la misma familia contienen en lo general los mismos principios inmediatos, y obran por consecuencia de la misma manera sobre la economía animal. Esta ley, verdadera casi siempre, sufre sin embargo numerosas excepciones.

Una comision de esta Sociedad se ocupa en reunir nuevos datos acerca de esta planta, que publicarémos más tarde. *(C. de P.)*

ENSAYO ORNITOLÓGICO
DE LA FAMILIA TROCHILIDÆ
O SEA DE LOS COLIBRIES O CHUPAMIRTOS DE MEXICO,

POR EL Sr. DON RAFAEL MONTES DE OCA, SOCIO DE NUMERO.

(CONCLUYE.)

Num. 42.—*Chupamirto de pinal.*

Heliomaster pinicola, Gould.

El Sr. Gould, al hablar de esta especie de colibries, dice así: «La Memoria del finado D. Damian Floresi, será para siempre grata á los troquilidistas, pues ha sido quien dió á conocer muchos de los colibries de México, y como justo homenaje al mérito de sus afanes, creo que debo mencionarlo, pues tanto le debemos; y añadiré ademas, que entre el gran numero de sus amigos que deploran sinceramente su prematura muerte, no hay otro que lo sienta tanto como yo. Es á él á quien se debe el descubrimiento de este colibrí, lo mismo que el haberme informado que habita exclusivamente las altas regiones donde crecen los pinos del Norte de México; esta circunstancia demuestra la estrecha relacion que existe entre una vegetacion peculiar y los séres animados que la acompañan; así teniendo aquella un carácter sombrío en estas regiones, el color de esta avecita es de un tinte semejante y completamente distinto del de la mayor parte de las especies de este grupo.

La apariencia del macho adulto es como sigue: la region superior de la cabeza, del cuerpo, con excepcion de una mancha blanca que tiene cerca de la rabadilla, las cubiertas de las alas y de la cola de un color latonado-verdoso; alas, pardo-purpúreas; cola con las dos rectrices del centro verde-bronceadas, con una especie de sombra cerca de las extremidades y de sus lados; las plumas laterales son tambien verde-bronceadas en su base, teniendo en seguida un tinte negro-purpúreo y en sus extremidades una mancha blanca; su garganta en la parte que está cerca de la mandíbula inferior, es pardo-negruzca, teniendo en seguida una porcion de plumas de un color carmesí-metálico marginadas de blanco gris; toda la region inferior gris-pardusca, un poco más clara en el pecho y centro del abdómen, con visos bronceados en los flancos; cubierta de debajo de la cola formada de plumas parduscas marginadas de blanco; region anal y cubiertas de las piernas blancas, teniendo tambien de este mismo color, dos líneas de cada lado de la cabeza, una que le nace en la parte posterior del ojo y otra en el nacimiento de la mandíbula inferior, dirigiéndose casi paralelamente hácia los lados del cuello; sus patas son pardo-oscuras, y su pico, que es recto y uñas negras.

Su largo total desde la punta del pico hasta la extremidad de la cola es de 5¾ de pulgadas; alas, 3 idem; cola 1½ ídem, y pico 1⅜ idem.

La hembra es casi del mismo tamaño que el macho, y solo se diferencia de éste, en que carece de las plumas carmesíes que tiene en la parte inferior de la garganta.

NUM. 43—*Chupamirto cornudo.*

Lophornis Helenae, Gould; *Ornismya Helenae*, De Latt;
Lophornis Helenae, Bonap.

Esta magnífica especie de colibríes, conocida en Guatemala con el nombre de *Gorrion cachudo*, ó sea chupamirto cornudo, se halla tambien en la parte S. E. de la República Mexicana (Chiapas); mas es de advertir que en esta última localidad es bastante rara.

Los nativos de Coban dan á los colibríes en general, el nombre de *Tzunnun,* pero distinguen esta especie, sin duda por su belleza, con el agregado de *Achshukub.*

El señor De Lattre, que tanto contribuyó al conocimiento de la ornitología mexicana, fué quien dió el nombre de Hélène a este hermoso colibrí en honor de la Princesa Elena de Orleans, y en su dedicatoria dice así: «Quiera la Princesa Hélène, protectora de las artes que patrocina y cultiva con tanto gusto y cuyo gran infortunio hace resaltar más su bello carácter, acoger con bondad este homenaje, de un viajero que, dichoso en países lejanos, ha adquirido esta rarísima especie de colibríes para darla el nombre de una esposa y una madre tan querida para la Francia.»

El Señor Gould hace notar, que Salvin dice: que esta especie de avecitas tiene un silbido ó chillido peculiar, y diferente del de las demas especies que conoce, y que la hace descubrir adonde quiera que se encuentre, por lo regular gustando el néctar de las flores de las *salvias* que abundan en las montañas cerca de Coban, ó en las del árbol del *Tasisco,* que florece por el mes de Diciembre. Además, tambien dice, que las hembras son sumamente raras, pues que de diez y siete ejemplares que pudo colectar solo uno era hembra.

El color del macho adulto de esta especie, es como sigue: la frente y un copete que despliega á manera de cuernos, de un tinte verde-bronceado; la parte superior del cuerpo y cubiertas de las alas de un color pardo-bronceado; las cubiertas de la cola, de este mismo color un poco más oscuro, con una faja blanca cerca de su nacimiento: alas, pardo-purpúreas; cola, castaño-oscura con las dos plumas centrales de un tinte verde-bronceado, teniendo todas las demás un pequeño márgen exterior pardo-oscuro; su garganta es de un color hermosísimo verde metálico con visos dorados, rodeada de una serie de plumas largas, de las cuales, cuatro de las de cada lado son aun mas largas todavía y de un color blanco-amarillento con una orilla negro-azulosa, miéntras que las demás son enteramente negras; de cada lado del occipital le nacen tres plumas puntiagudas y tan angostas que parecen mas bien cerdas: el pico es color de carne con la punta algo más oscura.

La hembra tiene la parte superior de la cabeza, del cuerpo, cubiertas de las alas y abdómen de un tinte verde-bronceado; pecho blanco, salpicado de unas manchitas verde-bronceadas, en la extremidad de cada una de sus plumas; cubiertas de la cola pardo-oscuras, con una faja blanca, semejante á la del macho; cola castaño-oscura, teniendo cada una de sus plumas, cerca de la extremidad, una especie de sombrío aun más oscuro todavía.

NUM. 44.—*Chupamirto de pecho verde y cola manchada de blanco.*

Eupherusa poliocerca, Elliot.

Esta rara especie de colibries, descrita por el Señor Elliot, de New-York, habita probablemente en el Estado de Guerrero, al Sur de la República Mexicana, puesto que otra especie que describio al mismo tiempo, tiene por localidad Putla, pueblo de aquel Estado; se parece mucho al *E. eximia* de Gould, á juzgar por la descripcion de aquel naturalista, que textualmente copio á continuacion:

«Parte superior verde-bronceada; cuello y garganta verde-zacate brillante; remeras terciarias de un color castaño muy marcado; las dos plumas del centro de la cola, verde-olivo; las restantes blancas con las orillas exteriores y las puntas, pardo-purpúreas.

«Largo total 3¾ de pulgada; alas 2½; cola 1⅝.

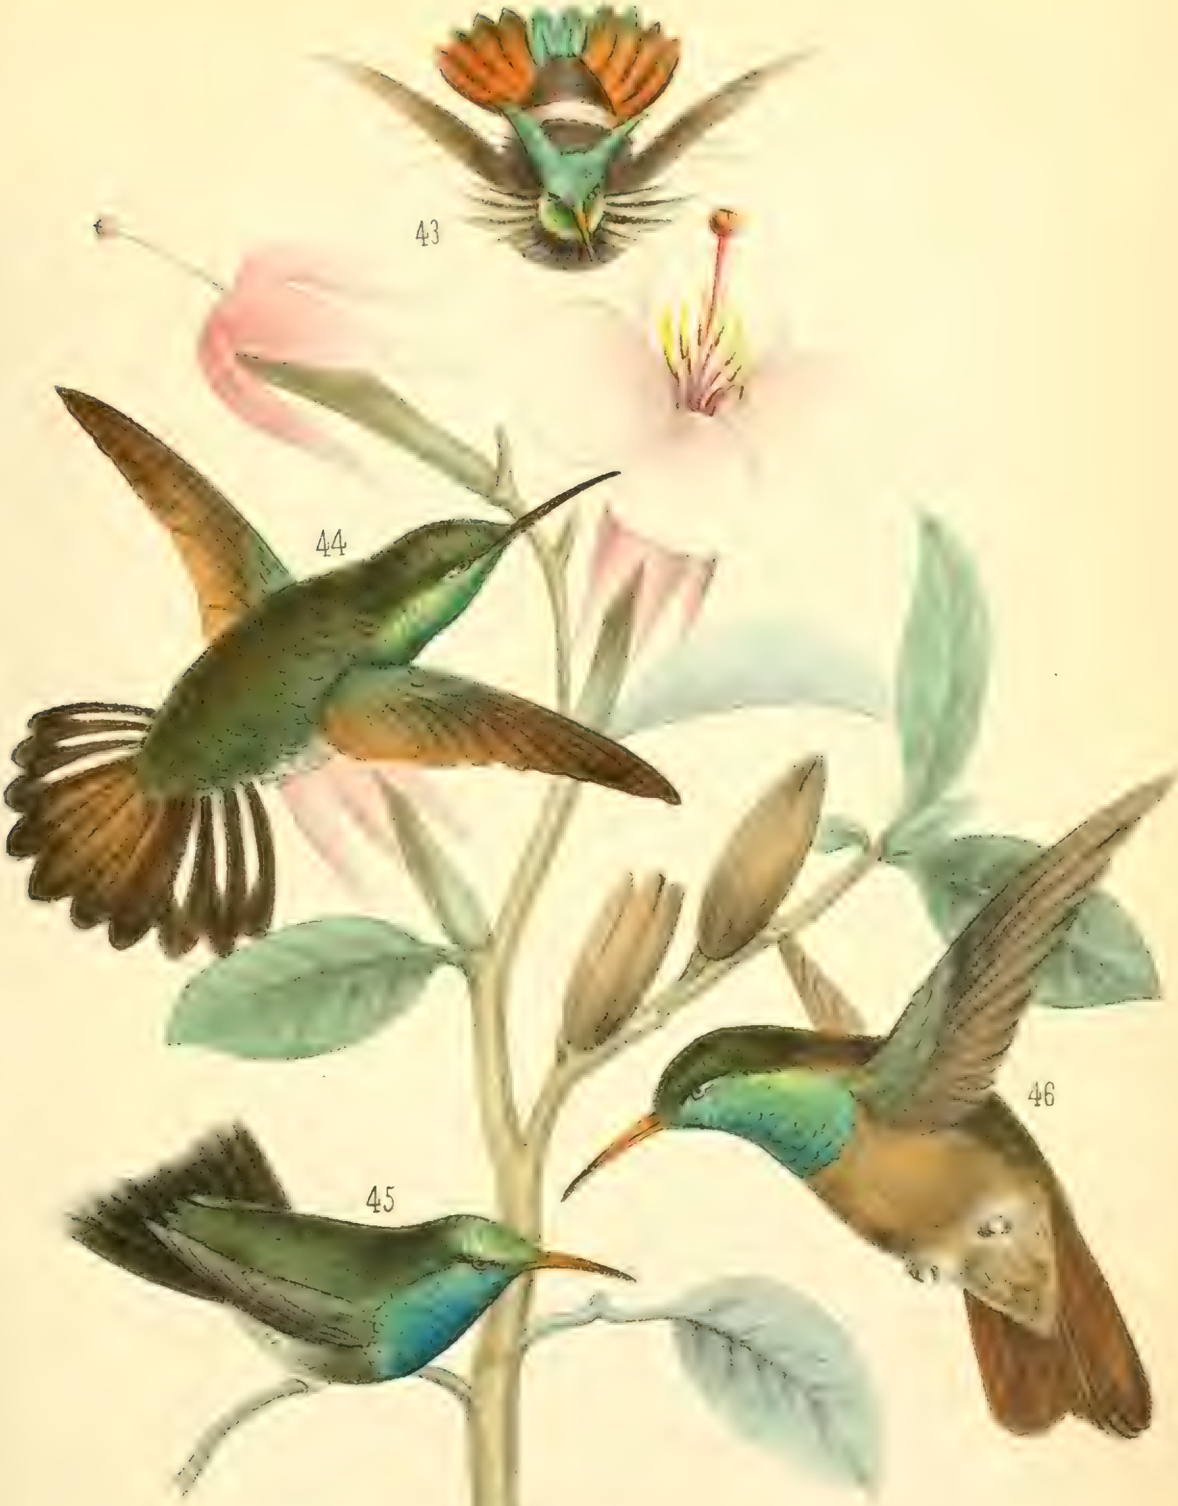
Respecto á la hembra y jóven creo que nada se sabe aún.

NUM. 45.—*Chupamirto de cabeza verde y pecho azul.*

Circe Doubledayi, Gould; *Trochilus Doubledayi*, Bourcier; *Sapphironia Doubledayi*, Bonap; *Trochilus Lereboulleti*, Saucerotte.

Esta hermosa especie de colibries, que en algo se parece al *Circe latirostris*, es sumamente rara, y cuando la describió el Sr. Bourcier, segun dice Gould, no habia la suficiente evidencia de que su localidad fuese la region del Rio Negro, en la América del Sur, que aquel naturalista le asignó, y se inclina más bien á creer que pertenece exclusivamente á México; primero, porque los colibries que tienen la cola oscura, como el *latirostris*, *Caniveti*, *auriceps* y otros, son peculiares del Norte de la República Mexicana, y segundo, porque el ejemplar que existe en su coleccion, obtenido de su muy estimado amigo el Doctor Saucerotte, tenia en la etiqueta estas palabras: «Chimantla, México,» y ademas el nombre de *Lereboulleti*. Pero al encontrar el Señor Gould, que el *Lereboulleti* de Saucerotte y el *Doubledayi* de Bourcier son idénticos, ha dado naturalmente el derecho de prioridad al nombre que Bourcier le dió en honor del distinguido entomologista inglés el Señor Doubleday.

La apariencia del macho de esta especie, es como sigue: la parte superior de la cabeza, de un color verde-azulado metálico hermosísimo; la garganta



HAUYA ELEGANS.

43 Lophornis Elenæ.
44 Eupherusa Poliocerca.
45. Circe Doubledayi.
46. Amazilia Yucatanensis.

LIT. DE H. IRIARTE. MEXICO.

azul, desvaneciéndose este color con el tinte verde del pecho y lados del cuello; toda la parte superior, cubiertas de las alas y de la cola, así como el abdómen, de un tinte verde-bronceado oscuro; alas pardo-purpureas; cola negra con visos de acero pavonado de azul con las puntas de cada pluma de un tinte pardo-gris; cubiertas de debajo de la cola pardas marginadas de un color gris; pico encarnado en su base con la extremidad casi negra.

La hembra aun no es conocida; pero es muy probable que sea parecida á la del *latirostris*.

Num. 46.—*Chupamirto de pecho verde y abdómen castaño-rojizo.*

Amazilia Yucatanensis, Gould; *Trochilus Yucatanensis*, Cabot.

Esta especie de colibríes se parece mucho en la distribucion de los colores de su plumaje, al *Amazilia cerviniventris*, con la diferencia de que el color castaño-rojizo del abdómen y cola de aquel, es sumamente pronunciado, así como el verde esmeralda de la garganta y cuello, que lo tiene además muy recortado en la parte inferior del pecho y no desvanecido hácia los flancos hasta confundirse con el color del abdómen, como sucede en el *cerviniventris*.

El Doctor Cabot en su descripcion del *Trochilus Yucatanensis*, publicada en las Actas de la Sociedad de Historia Natural de Boston, dice así: El *Trochilus Yucatanensis* es el Chupamirto más comun de la Península, y por lo regular se le ve en abundancia en las acacias que crecen en los edificios arruinados. De allí fueron obtenidos los ejemplares que he podido observar cuya longitud total es de 4 pulgadas; pico, ¾ idem; las primarias, de las cuales la primera es la mas larga, tienen las venas algo curvas y son algo más anchas cerca de la punta; cola ligeramente horquillada de un poco más de 1⅛ de pulgada; pico encarnado, amarillento en su base y vértice, con la punta y lados hasta cerca de la mitad bastante oscuros; garganta y cuello de un color verde-esmeralda metálico brillantísimo; la parte de encima de la cabeza, del cuello y del cuerpo, de un tinte verde-bronceado, así como tambien las cubiertas de las alas y de la cola; toda la parte inferior del cuerpo y cubiertas de debajo de la cola de un color castaño-rojizo ó de canela oscura; plumas de la cola de este mismo color, teniendo las dos del centro las orillas marginadas de verde-bronceado; las laterales de este mismo color en los márgenes exteriores cerca de la extremidad.

El ejemplar de una hembra de esta especie, que segun dice el Señor

Gould, le envió el Doctor Cabot como tal, le parece que es la *Amazilia cinnamomea (A. corallirostris* de su obra); mas como no está probado este aserto, diré, que es muy parecida al macho y que la única diferencia que se advierte entre ambos, es, que carece del tinte verde-esmeralda de la garganta y cuello del macho.

Num. 47.—*Chupamirto de pecho gris y banda oscura en la cola.*

Phaeoptila zonura, Gould.

Esta especie ha sido formada por el Sr. Gould, en vista de un solo ejemplar de la coleccion Loddigense, enteramente distinto de los de la especie *sordida* ya descrita, hé aqui cómo se expresa este naturalista:

Este colibrí habita el Mineral de Bolaños, es más pequeño y de formas más delicadas que el *P. obscura;* toda la parte superior es de un verde bronceado opaco con una raya de un blanco gris sobre cada uno de los ojos; cubiertas de las orejas oscuras; alas pardo-purpúreas; las dos plumas centrales de la cola verde-bronceado, las restantes, atravesadas cerca de la extremidad con una ancha banda de un moreno negruzco, siendo en lo demás de un pardo-agrisado: toda la parte inferior gris.

Num. 48.—*Chupamirto de frente verde y pecho y vientre blancos.*

Cyanomia viridifrons, Elliot.

Esta especie de colibríes ha sido recientemente descrita por el Sr. Elliot del modo siguiente:

Frente y encima del ojo, verde-oscuro; coronal gris-oscuro; dorso y hombrillos, verde-claro brillante; region posterior del dorso, pardo-bronceado; cola y sus cubiertas, bronceado-cobrizas; flancos, verde-yerba; pecho y vientre, blanco puro.

Habita en Putla, Estado de Guerrero. (Annals of Nat. Hist., New-York.)

FLORA MEXICANA.

LA HAUYA ELEGANS,

POR EL SEÑOR DON MARIANO BÁRCENA,

SOCIO DE NUMERO.

En el gran número de plantas que forman la familia de las Onagrariáceas son muy raras aquellas que por su altura puedan considerarse como verdaderos árboles, pues las yerbas y los arbustos son sus medidas ó tipos principales. Se señalan, sin embargo, y como casos raros algunos géneros frutescentes principalmente en la tribu de las *Montinieas* en la cual está colocada esa preciosa planta, propia de México, que fué designada con el nombre de *Hauya elegans*, por los autores de la Flora mexicana inédita, y cuya descripcion, bastante compendiada, se encuentra en algunas obras de Botánica. No tengo noticia de que haya vuelto á estudiarse esa magnífica onagrariácea y he buscado con empeño en las obras modernas una descripcion más detallada que las que acabo de citar, pues en ellas no se encuentran algunos pormenores dignos de citarse para el perfecto conocimiento de un género tan raro que se destaca perfectamente entre la multitud de plantas de la misma familia.

En el mes de Mayo de este año hice una exploracion en la Barranca Seca que se halla á inmediaciones de Zimapan en el Estado de Hidalgo, y tuve la fortuna de observar algunos ejemplares de la *Hauya elegans* en plena florescencia, y á esta circunstancia debo la satisfaccion de presentar á la Sociedad algunas noticias y un dibujo de aquel hermoso vegetal.

En Barranca Seca no se presenta la Hauya como un planta simplemente frutescente, como la describe Mociño, sino como árboles de 10 á 12 metros de altura.

Estos árboles están ramificados con regularidad y sus ramos son alternos. Igual colocacion tienen las hojas, y su ciclo es de $\frac{2}{3}$. Tiene estípulas caulinares pequeñas y caducas; peciolo aterciopelado, de una longitud igual á la quinta parte del limbo: este es elíptico, acuminado, peninerve, de bordes enteros; color verde en la cara superior, blanco-verdoso en la inferior, que es aterciopelada como el peciolo. Inflorescencia axilar, solitaria. Flores sentadas. Cáliz gamosépalo, infundibuliforme, de 0,04 de longitud, aterciopelado, blanco-verdoso cuando es jóven; despues rojizo, principalmente en sus divisiones: estas son en número de cuatro, de figura oblícuo-triangular, de la misma longitud que la parte cerrada del cáliz; son reflejadas, pluvinerves, aterciopeladas en la cara inferior y petaloides en la superior. Corola perígena, de cuatro pétalos obovados venosos, de color blanco, que con el tiempo toman un tinte rosado muy suave y agradable. Estambres 8, periginios; filamentos alesnados y más largos que las anteras: éstas son curvas, medifijas, oscilantes, biloculares é introrsas. Ovario ínfero, elipsoidal, aterciopelado, cuadri-locular; lóculos pluriovulados, óvulos biseriados. Estilo cilíndrico, saliente, rojizo, de 0,065 de longitud, terminado por un estigma globoso y cuadrilobulado.

Fruto capsular, elipsoidal, de 0,04 de longitud; se separa en cuatro divisiones que llegan hasta su medio y persiste adherido á la planta por mucho tiempo. En su completa madurez tiene un color café-oscuro casi negro. Granos numerosos, alados, de color café-amarillento y la ala les da una figura auricular.

Comparando estos caractéres que observé en los ejemplares vivos, encuentro algunas diferencias en las descripciones que mencioné, siendo las más notables las siguientes:

1.° La altura, pues los individuos á que me refiero no pueden considerarse como plantas frutescentes ó arbustos, sino como verdaderos árboles. Esta circunstancia tan rara en la familia de las Onagrariáceas, creo que debe mencionarse.

2.° La presencia de las estípulas en los árboles de Barranca Seca.

3.° El estilo que no debe considerarse como filiforme en los ejemplares que he examinado.

4.° Las hojas son elípticas y no ovadas como se asienta en las descripciones.

5.° La figura del fruto que no es lineal como lo designan algunos autores, pues estando visiblemente inflado en el centro y con sus extremidades más bien arredondadas que agudas, debe considerarse como elipsoidal.

Como carácter específico de la *Hauya elegans* encontramos anotado en la obra del profesor De Candolle, impresa en el año de 1838, lo siguiente:

Ramos, hojas jóvenes y tallos, tomentosos y sub-aterciopelados. Cáliz, de una y media pulgada de longitud.

Estos caractéres convienen ciertamente á la planta que describo; mas no sé si las diferencias que he hecho notar sean suficientes para separarla de la *Hauya elegans*, ó quizá no hayan sido observadas, por el estado en que se hallarian los ejemplares estudiados por Mociño. En cuanto á la altura de los árboles que describo, pudiera explicarse por el clima ú otra circunstancia de la localidad en que los observé.

Estando, pues, mal conocidos los caractéres de esa planta, á lo ménos en las obras que he registrado y siendo una especie muy rara y propia de nuestro país, he creido conveniente presentar estos apuntes á la Sociedad, para que los agregue á los datos que ha reunido sobre la flora mexicana.

Como planta de adorno debe recomendarse muy particularmente nuestra hauya, pues su porte, el color y finura de sus hojas aterciopeladas, la magnitud, número y color variable de sus flores, la hacen aparecer como un elegante y precioso ramillete, que ofuscaria con su presencia á muchas de las plantas que más bien por el capricho de los jardineros, ó por las exigencias de la moda, ocupan un lugar distinguido que realmente no les corresponde.

México, Diciembre 17 de 1874.

ENERGÍA DE LA VEGETACION.

LA FISIOLOGIA DE LAS PLANTAS Y LA TEORIA MECANICA DEL CALOR,

POR ED. MORREN, PROFESOR DE LA UNIVERSIDAD DE LIEJA.

TRADUCCION HECHA

POR EL SEÑOR DON JOSE JOAQUIN ARRIAGA,

SOCIO DE NUMERO.

Digna es en verdad de estudiarse la cuestion de la accion del calor sobre los vegetales, puesto que penetra en la esencia misma de su actividad vital, y que actualmente, aunque con bastante lentitud se dilucida, á medida que la física y la química progresan en el conocimiento de los cuerpos y de las fuerzas. En presencia, pues, de una cuestion tan vasta, importa primeramente señalar el lado por dónde se la pueda estudiar.

El calor influye en el crecimiento de los vegetales, en la circulacion de los jugos, en la elaboracion de la sustancia celular, en la respiracion y en otra multitud de fenómenos que no es del caso considerar aquí. Fijarémonos solamente en las relaciones que existen entre el calor y el desarrollo de las plantas, y especialmente entre aquel y los fenómenos periódicos de la vegetacion: concretada así la cuestion, aun todavía es bastante extensa para que se la pueda seguir por distintas vías.

Hasta ahora, ha sido estudiada más bien por la observacion que por el método experimental, y con el celo más laudable el genio se ha dedicado á la observacion de sus fenómenos periódicos; se ha observado la temperatura bajo la cual estos fenómenos se manifiestan, y se ha procurado deducir las relaciones de causa á efecto.

I. Los fenómenos periódicos considerados como hechos, independientemente de toda discusion, hacen conocer la época en que se manifiesta el fenómeno que se considera, la fecha média de esta manifestacion y las desviaciones de que es capaz. A consecuencia de observaciones suficientemente repetidas, se forma así el calendario de una flora determinada, y se establecen interesantes comparaciones entre los diversos elementos de que esta flora se compone, por ejemplo, segun su orígen ó la naturaleza de sus especies; entre la vegetacion y el reino animal, como la emigracion de las aves ó la metamórfosis de los insectos; entre las floras de diversas regiones geográficas y aun entre varias épocas de una misma flora.

II. Esta última consideracion conduce á entrever la manifestacion de los fenómenos periódicos en sus relaciones con el clima y particularmente con el calor. Desde luego, y apoyándose en hechos, se buscan estas relaciones, se comparan entre sí climas diferentes y floras lejanas, llegándose á la ecuacion del calor y del fenómeno.

Numerosas observaciones se han acumulado con este fin, y las teorías más divergentes han sido propuestas para dar á conocer las relaciones que existen entre la temperatura y la vegetacion. M. Quételet ha sido el principal promovedor de este estudio en Bélgica, y con este fin ha presentado documentos numerosos y muy útiles. Trabajos importantes de idéntico género se han publicado en otros países, y entre varios mencionarémos especialmente los de Schubeler y Hoffman, Cárlos Fritsch, Cárlos Linsser y Guillermo Kabsch.

En estas obras y en las de M. Quételet encuéntranse citadas otras fuentes que es conveniente consultar. Las observaciones de Fritsch, Kabsch y Linsser son numerosas, y en nuestro concepto importa tomar todas las que definitivamente han sido adquiridas en bien de la ciencia, y en el interes de las investigaciones que se prosiguen en Bélgica para compararlas con las que han sido publicadas por la Academia y por el Observatorio de Bruselas.

Hasta hoy, y para determinar la temperatura que obra sobre la vegetacion, se ha procurado comparar las indicaciones del termómetro y las fases de la vegetacion; y como se observa generalmente con un termómetro puesto á la sombra, sus indicaciones no son rigurosamente aplicables sino á vegetales que se desarrollan en estas condiciones. Las conocidas experiencias de Gasparin y de De Candolle sobre la influencia de la radiacion solar, han dado resultados contradictorios y no bastan para asentar una opinion definitiva. Puédese considerar esta influencia, ó bajo el punto de vista del tiempo necesario para la manifestacion de un fenómeno de vegetacion, o bajo la relacion de la cantidad del producto.

Varias otras circunstancias pueden, por otra parte, intervenir, y entre ellas mencionarémos: el calor acumulado en el suelo al derredor de las raíces, aun en un solo dia sereno; el enfriamiento mas ó ménos rapido y profundo del suelo por efecto del hielo y de la irradiacion; el calor, que el agua absorbida por las raices, difunde en el organismo; el calor gastado por la traspiracion de las hojas; la resistencia más ó ménos enérgica que los vegetales oponen al calentamiento ó al enfriamiento atmosféricos; la influencia del viento ó del estado higrométrico del aire, etc. Es necesario, pues, tener en cuenta la duracion de la influencia calorífera ó refrescante. Así, por ejemplo, el *Agave americana* puede afrontar una temperatura de —6° Reaumur durante un corto tiempo, y no puede resistir por un período prolongado la de + 1°. De idéntica manera y en cuanto al calor, las plantas alpinas moririan bien pronto si se las sometiese por varios dias á una temperatura uniforme de + 10°, miéntras que se complacen recibiendo pasajeramente un calor más elevado. Débese, pues, reconocer, por lo ménos en la mayor parte de las plantas cultivadas, si no una aclimatacion absoluta, por lo ménos una adaptacion incontestable á climas cuyo calor es diferente. Las razas precoces se forman tanto entre los vegetales anuos, como el guisante y el maíz, como entre las especies perennes, tales como la papa, y el peral entre las leñosas; razas que reclaman ménos calor para la maduracion de sus frutos que las especies tardías. No se debe perder de vista la influencia del *atavismo* y de ciertas costumbres inveteradas entre los vegetales. Así es, que la flora del Cabo de Buena-Esperanza introducida en la cultura europea, continúa, á lo ménos por cierto número de años, y a pesar de la accion excitante del clima, floreciendo en invierno y conservándose en reposo durante el estio. Igual cosa sucede con la vegetacion australiana. La caida de las hojas en otoño á que están sujetos en su mayor parte los árboles septentrionales, puédese tambien considerar como una costumbre que estos vegetales pierden en ocasiones en las regiones meridionales. Este hecho ha sido observado en el ciruelo y en otros árboles.

Los trabajos de Cárlos Linsser que están basados sobre un número considerable de hechos, han establecido conforme á la opinion de De Candolle, de Schubeler y de otros, que las costumbres inveteradas por la accion del clima originario intervienen en la manifestacion de los fenómenos de la vegetacion.

Segun Cárlos Linsser: 1.º los vegetales del Norte, trasplantados al Sur, llegan á ser más precoces que los del Norte; miéntras que los del Sur trasportados al Norte retardan respecto de los de estas regiones la manifestacion de sus fenómenos: 2.º los vegetales de las montañas y los de los planios se conducen de idéntica manera y reciprocamente cuando se les cambia de region.

Cárlos Martins ha demostrado el mismo hecho.

El riguroso invierno de 1870 á 1871 le proporcionó la oportunidad de observar que, entre las plantas *actualmente indígena* en los alrededores de Montpellier, las especies realmente pertenecientes á grupos exóticos fueron las más afectadas.

Esta es tambien la opinion expresada por Waldimiro Koeffen en su importante Memoria, *sobre el calor y el crecimiento de los vegetales.* En su concepto, las especies han debido adquirir la costumbre de las fases periódicas que han tenido que sufrir el periodismo de los fenómenos atmosféricos para poder vivir, y esta costumbre se halla inveterada á tal grado, que conserva estas fases aun cuando no exista periodismo en los agentes del mundo exterior, como sucede en Madera.

Los fenómenos sobre los cuales se ha fijado hasta ahora la atencion de los fenologistas, han sido: la foliacion, la floracion, la maduracion y la desfoliacion; pero éstas no son las únicas jornadas que se deben considerar en el curso de la vegetacion: la germinacion natural y la expansion de las yemas tambien tienen importancia y no deben pasar inadvertidas.

En lo que concierne á las flores, dirémos que la formacion de los botones es un fenómeno distinto que el de la apertura de las flores, y que no está bajo la dependencia exclusiva del calor, sino bajo la de otras muchas circunstancias que intervienen. Asegúrase, por ejemplo, que la viña cesa de florecer bajo la zona intertropical. De igual manera, las plantas boreales ó alpinas, trasportadas á las llanuras ó llevadas á latitudes más dulces, desarrollan sin extrañar el cambio un follaje exuberante, pero dejan de florecer. Puédense citar como ejemplos de este fenómeno, la *Soldanella alpina* y la *Primula minima*. Es necesario, pues, para llegar a la formacion de los botones, es decir, á lo que se puede llamar la antogenia, ciertas circunstancias distintas de las que dependen del calor, cierta edad, por ejemplo. Pero hay una cosa digna de notarse y es, que la edad de todos los individuos salidos de la multiplicacion de una misma cepa, se cuenta como si hubiesen permanecido unidos á ella. En el cultivo europeo, el *Gincko biloba*, la *Virgilea lutea*, el *Cedrus Libani* y la *Saxe-Gothea conspicua*, florecen simultáneamente bajo muy diferentes circunstancias.

Sábese tambien que en la flora silvestre y rural de Europa los botones se forman, en general, durante el año que precede á su apertura, No es todo, pues, calor-dinámia en la floracion. El efecto principal del calor consiste en disponer al vegetal y en preparar las materias plásticas que deben ser utilizadas por la floracion.

Resumiendo dirémos: que nos hemos esforzado en hacer ver por lo que antecede, que en la foliacion, la floracion, la maduracion y la desfoliacion, se manifiestan fenómenos independientes de la accion de la temperatura.

Pero si nos ocupamos en estudiarla, notarémos en cada especie vegetal un cero fisiológico, es decir, un punto de la escala termométrica bajo del cual el calor es ineficaz. En ciertas especies alpinas ó boreales, tales como el *Galanthus nivalis* y la *Soldanella alpina*, este cero idiosincrásico casi coincide con el termómetro; pero está a + 4° Reaumur para la cebada, á + 4°,8 para el trigo, á + 12°, ó + 13° para el cocotero.

M. Alfonso De Candolle llama calor inútil á todo el que no produce esta temperatura mínima, y advierte con razon, que es necesario eliminarlo de los cálculos, es decir, que solo debe tenerse en cuenta la temperatura média de los dias en que el calor ha pasado de este mínimun específico. Segun Kabsch, cuyas ideas débense tomar en consideracion, el calor de la noche, es decir, el calor que interviene fuera de la luz durante el reposo fisiológico de los vegetales, tambien es calor inútil y debe ser eliminado. Conforme á esta opinion, no es la temperatura média del dia entero la que ha de hacerse intervenir, sino más bien la de las horas del dia: á esto es á lo que Kabsch llama *el dia de vegetacion*. Valuadas así las temperaturas, son más elevadas. Ahora, el largo del dia, siendo muy variable segun las estaciones y las latitudes, por lo ménos fuera de la ecliptica, resulta que el calor varia segun las mismas circunstancias. No debe, pues, ser indiferente que el calor medio de + 16° obre durante 12 horas del dia como sucede en el Ecuador, ó durante 18 ó 20 horas, como pasa en las regiones polares. Explícase de esta manera, para ciertas partes, la rapidez extraordinaria de la vegetacion en las comarcas septentrionales. Aplicando Kabsch su método, ha sido conducido á un resultado que se aleja de la opinion general, á saber: que las sumas de calor necesarias para los diversos períodos de la vegetacion de una especie, tales como la germinacion, la floracion y la fructificacion, estan muy aproximadas las unas á las otras. El mismo sabio ha formulado con mucha precision las tres siguientes leyes de física vegetal:

1.ª Existe para cada planta sobre la escala termométrica, un mínimun y un máximun, entre los cuales la especie es capaz de ejercer sus funciones orgánicas.

2.ª Toda germinacion, toda evolucion, toda maduracion, exige cierto grado de temperatura muy variada segun las especies.

3.ª Cada especie vegetal, para recorrer las diversas fases de su existencia, exige cierta cantidad de calor. Así, la viña por ejemplo, se conserva entre — 19° y + 20°; pero no entra en actividad bajo una temperatura inferior á + 8°, y exige para dar vino potable 2900°.

Deberian hacerse experiencias para verificar y aplicar estas leyes.

M. Hugo Vries estudiando la influencia de la temperatura sobre la germinacion de las plantas, ha demostrado ya, que existe para cada especie un punto de eleccion en el que el crecimiento se cumple con mayor rapidez que á cualquiera otra temperatura. Este resultado está conforme con la segunda ley de Kabsch. Resulta tambien de las experiencias del mismo naturalista, que para la mayoría de los vegetales la temperatura-límite de la vida, se encuentra entre 45° y 47° en el agua, y entre 50° y 52° en el aire ó en la tierra seca. Como por otra parte, el límite inferior de la accion calorífica se encuentra á 0° ó cerca del cero, vése que los límites entre los cuales las experiencias deben establecerse no están muy lejanos el uno del otro.

Parécenos que las observaciones de los que han estudiado los períodos dan de sí todo lo que es posible, por lo ménos en lo que concierne á los hechos observados, y que es necesario de hoy en adelante estudiar la accion del calor por el método experimental.

III. Un problema de la más alta importancia, y que hasta hoy se ha visto con negligencia, es el de las relaciones que existen entre el calor recibido y el peso adquirido por la planta bajo la accion de los rayos solares y especialmente entre la cantidad de carbon fijado en la materia orgánica. Segun lo que se sabe actualmente, calcúlase que bajo un clima templado, una hectara de bosque, de pradera, ó de terreno cultivado, fija en un año de 1,500 á 1,600 kilógramos de carbono, y que para este trabajo los organismos vegetales utilizan entre 1 y 4 milésimos del calor que llega por la radiacion solar sobre el espacio que ocupan.

Es evidente que algunos de los fenómenos sobre los cuales se ha fijado la atencion de los que establecen la ley de los períodos, germinacion, foliacion y otros, no son más que estaciones, señales más ó ménos convencionales en la vida de las plantas: y bien, como todo crecimiento supone movimiento, y todo movimiento requiere un gasto de fuerza, es una trasformacion de calor.

Sábese que existe un estado estático del ázoe, ázoe neutro, en el cual se bañan los séres vivientes sin pedirle más que el medio para la existencia, y que existe tambien un estado dinámico del ázoe, un ázoe orgánico que entra en las combinaciones activas y que es el elemento viviente por excelencia. Parécenos que es necesario distinguir tambien dos manifestaciones diferentes del calor. Existe la temperatura en que viven los organismos y en la cual pueden solamente manifestar su actividad, y hay tambien una accion calorífica que interviene mecánica ó químicamente por sus trasformaciones, en los fenómenos biológicos. Este calor, del que se puede observar el gasto y restitucion en los fenómenos mecánicos como en los actos biológicos, es el mismo que obra juntamente con la luz, y que en las plantas interviene para la reduccion de los compuestos minerales y entra en la elaboracion de las sustancias orgánicas. Puédese afirmar que las plantas verdes son, en virtud de su actividad organizatriz, el primero y único manantial de todo movimiento orgánico. En todos los vegetales verdes, los hechos esenciales son los mismos; y aunque funcionan bajo climas muy diferentes, todos elaboran sustancias hidrocarbonadas y cuaternarias. Por este trabajo hay produccion de compuestos endotérmicos.

En los vegetales hay tambien fenómenos de movimiento: para el trasporte de la más pequeña molécula desde la extremidad de la raíz que la absorbe hasta la cima de la planta, existe un movimiento, y por débil que pueda ser, si no es producido por otro movimiento preexistente, no puede atribuirse sino á la trasformacion del calórico.

Creemos que el calor utilizado, es decir, realmente absorbido para la manifestacion de estos fenómenos de elaboracion y de crecimiento, puédese determinar en forma de calorías; en otros términos, por la física vegetal se llegará á la determinacion del equivalente mecánico del calor en el trabajo organizador de los vegetales. Como se ve, esta investigacion no es igual á la que consiste en demostrar entre qué grados termométricos se manifiestan los fenómenos de la vegetacion. Seria conveniente, pues, procurar determinar el calor existente en las sustancias que desempeñan un papel activo en el organismo, y como es de esperarse, fijar tambien la relacion entre el calor necesario para su produccion y el que se desprende durante su descomposicion. Tenemos en expectativa á la fécula; y en esta direccion se marchará para descubrir el orígen de todo movimiento orgánico; porque así como la fuerza es distinta del mecanismo, y está solamente dirigida por este mecanismo, de igual manera la fuerza es distinta del organismo y solamente coordinada por él.

Hemos visto precedentemente que, segun algunos datos suministrados por Chevandier y Boussingault, M. Becquerel ha podido fijar en 4 ó 5 milésimos del calor dado por los rayos solares, la proporcion del calor fijado por la vegetacion para la reduccion del ácido carbónico y la asimilacion del carbono. Esta proporcion acaso aumentaria un poco si se tuviesen en cuenta el hidrógeno fijado y algunos otros cuerpos combustibles que están inclusos en las combinaciones orgánicas por el trabajo reductor de los vegetales. Pero el calor que así se haya empeñado, por decirlo así, en el trabajo organizador y químico de los vegetales, no es el único que se debe considerar para el cálculo de la mecánica vegetal. Preciso es tambien apreciar el gasto efectuado por el vegetal mismo.

Un cuerpo que cae produce calor; una manzana, por ejemplo, al desprenderse del árbol manifiesta este fenómeno. Podríase muy bien reflexionar sobre las leyes en virtud de las cuales esta manzana ha subido al árbol, porque es evidente que no ha ascendido por sí sola. Haciendo la ligera reserva del poco carbono que haya tomado al aire ambiente, toda la sustancia de que el fruto se compone ha sido elevada del suelo á la altura en que se encuentra. Esta elevacion supone un trabajo mecánico proporcional al peso de la manzana y á la altura en que ella se encuentra respecto de las raíces. Cuando el fruto cae, este trabajo se reproduce bajo la forma de movimiento, y cuando éste se detiene se trasforma en calor. Y á ménos que no se suponga que los cuerpos puedan *crear* movimiento y calor, es necesario reconocer que el calor de los rayos solares es el que ha llevado al fruto á las partes elevadas de la planta. Idéntica cosa sucede con las hojas y las ramas, y todos los órganos de todos los tejidos. Tambien es preciso introducir como factor, este trabajo mecánico en el cálculo del calor solo utilizado.

Importa, además, saber que la accion de los rayos solares sobre la materia puesta así en movimiento en los vegetales, no es directa ni inmediata. Propiedad de un poder maravilloso es la de estos organismos, que encierran el calor en las sustancias organizadas por ellos. Cuando los actos de crecimiento, ó lo que es lo mismo, cuando los fenómenos de movimiento se manifiestan, es en la desorganizacion de estas mismas sustancias donde los organismos encuentran la fuerza necesaria para cumplirlos. En efecto, todo movimiento íntimo en el organismo, todo crecimiento, toda circulacion, se manifiestan por un acto de respiracion durante el cual hay desprendimiento de calor: una parte de él es utilizado en forma de movimiento orgánico y el resto se desprende en forma de temperatura. La accion de los rayos solares sobre los movimientos orgánicos es, por tanto, indirecta é inmediata.

En resúmen, el calor útil representado por un vegetal, consiste en un trabajo de organizacion ó trabajo químico, que se puede reproducir quemando el vegetal, y en un movimiento ó trabajo físico, que igualmente se puede reproducir por el peso del sér multiplicado por su altura.

Nos ocuparémos aquí en considerar el trabajo empleado en su formacion, y que no está fijado en el mismo vegetal, por ejemplo el de su evaporacion.

Lo que acabamos de establecer permite ya asentar como ley que, en igualdad de circunstancias, la cantidad de carbono fijada por una vegetacion, está en razon de su menor altura, puesto que tal razon supone menor gasto de movimiento. Así, un monte jóven debe con superficie foliacea igual, fijar más cantidad de carbono que un arbolado alto. De esta manera se explica por qué un vegetal podado á flor de tierra, echa al año siguiente retoños más elevados y robustos.

No habria fundamento para invocar aquí, con el fin de explicar la elevacion de la materia vegetal desde el suelo hasta la rama, otras causas de movimiento, tales como la capilaridad y la difusion, porque se encontraria uno obligado á admitir la imposibilidad de que el calor podria ser creado. La capilaridad y la difusion no son causas, sino condiciones de movimiento, y puesto que, como hemos visto, la manzana al caer desarrolla calor, resulta que este agente es el que la ha elevado.

La propiedad, pues, que tienen los organismos vegetales de condensar calor y movimiento al estado de potencia, constituye lo que puede llamarse energía de la vegetacion. Cuando el calor y el movimiento pasan al estado activo, prodúcense fenómenos de vigor. La energía es una endotermia, y el vigor una exotermia.

CIENCIAS AUXILIARES.

EL ARBOL DEL HULE

(*Castilloa elastica*, Cervantes.)

Considerado bajo el punto de vista botánico, químico, y de sus aplicaciones, segun datos ya publicados:

POR EL SEÑOR DON MANUEL M. VILLADA,

SOCIO DE NUMERO.

I.

Este importante vegetal que los antiguos mexicanos llamaban *Holquahuitl,* crece en abundancia en la region caliente y humeda de la vertiente oriental de nuestra gran cordillera: produce copiosamente un jugo lechoso que se coagula al contacto del aire y forma una sustancia elástica, de grandes aplicaciones en la industria, en la economía doméstica, y aun en la práctica médica.

Para mejor precisar los lugares en donde crece este árbol, añadiré que el Sr. Hugo Finck dice que se encuentra en los Estados de Veracruz, Tabasco, Chiapas [1] y Yucatan, en terrenos ricos y húmedos, que no exceden de 650 á 700 metros de altura sobre el nivel del mar. Mas ignoro absolutamente cuáles sean sus límites septentrionales y cuáles los meridionales. Existe tambien en la isla de Cuba.

El muy afamado botánico español D. Vicente Cervantes, fué el primero que hizo su descripcion en el año de 1794 y formó con él un género nuevo que denominó *Castilloa,* para honrar la memoria del benemérito profesor de Farmacia D. Juan del Castillo, á quien la expedicion botánica de Nueva España quiso consagrar este recuerdo. La *Castilloa elastica,* con cuyo nombre es hasta hoy conocida esta planta, pertenece á la interesante familia de las Artocárpeas.

---

[1] Si el Sr. Finck no se refiere más bien á la costa N. E. del Istmo de Tehuantepec que separa los Estados de Veracruz y de Tabasco, seria el primer dato positivo que ha llegado á mi noticia de que la *Castilloa* vegeta en la costa S. E. de la República. No cabe duda que en esta region, y aun avanzando más al Norte, existen árboles que producen hule: mas ignoro si algunos de ellos pertenecen á la especie de que me ocupo.

«Es un arbol, dice el Sr. Cervantes, de los más elevados y frondosos que crecen en las costas calientes de Nueva España; a primera vista se parece al árbol de la Anona, *A. muricata*, L., que vulgarmente llaman cabeza de negro.

«El tronco es de tres á cuatro varas de circunferencia y muy derecho; tiene la corteza lisa, blanda, y gruesa de tres á cuatro líneas; de color ceniciento, de sabor amargo y nauseabundo, como la leche que arroja por donde quiera que se parte. Produce ramos alternos, horizontales, rollizos, flexuosos y poblados en su remate de pelos rigidos; las hojas son alternas, de pié y medio de largo y siete pulgadas de ancho; tienen una grande escotadura en la base y las más veces terminan en punta aguda; son vellosas en ambas caras y enteras, aunque parecen á primera vista dentadas, especialmente las más tiernas, en cuyas márgenes se reune el vello en pequeños flecos ó hacecillos á iguales distancias. Por la parte superior están surcadas oblícuamente, siguiendo la direccion de las venas mayores que son reticuladas; las hojas están sostenidas por pezones gruesos, rollizos, pelosos, y de poco mas de media pulgada de largo; las estipulas se observan á uno y otro lado de los pezones más tiernos y son oblongas, angostándose gradualmente desde la mitad hasta la punta; su consistencia es membranosa, y frecuentemente se marchitan y caen ántes que la hoja haya llegado á su total incremento. Las flores nacen en las axilas ó encuentros de las hojas; las femeninas solitarias y sentadas y las masculinas con un pié muy corto, de dos en dos, pocas veces tres juntas, y alternando con las femeninas en la parte inferior de los racimos; mas en las extremidades son todas masculinas, y entónces por lo comun se hallan solitarias. Los cálices están apiñados de escamitas de color de paja y membranosas; su figura es hemisférica, aunque al tiempo de la fecundacion suelen prolongarse y aun hendirse los masculinos saliendo fuera los estambres, y los femeninos dilatarse á medida que los frutos crecen: el pequeño piececito que sostiene las flores, y que apénas excede el largo de dos lineas, está apiñado con escamitas menudas, lo mismo que los cálices. Los filamentos son blancos; y aunque los exteriores, gradualmente más largos, parece que se alargan al tiempo de la fecundacion, apénas superan las últimas escamas del cáliz; las anteras ó borlillas son redondas y de color amarillo bajo. Los frutos son unas drupas aovadas con tres ángulos poco manifiestos, algo mas gruesos que un garbanzo, prendidas por su base al cáliz ensanchado, y por los lados pegadas unas á otras en número de quince á veinte, de color naranjado cuando están maduras, insípidas y mucilaginosas.

Segun el Sr. Finck esta hermosa planta llega a crecer á una altura de 15 á

20 metros, y á medida que se desarrolla inclina sus ramas inferiores, describiendo así un semicírculo formado por ramos horizontales de grandes hojas y que hacen un conjunto muy agradable á la vista. Un tercio de la altura del árbol lo forman sus ramos y los dos tercios restantes el tronco, que constantemente es recto. La corteza es blanquizca en los árboles jóvenes y más oscura en los viejos.

Agregaré tambien que la raíz es ramosa y horizontal; los ramos comprimidos cuando jóvenes; las hojas no solamente alternas, sino dísticas, es decir, dispuestas en los ramos sobre dos caras opuestas y el peciolo acanalado hácia arriba: el fruto está formado de akenas, y no drupas, adheridas parcialmente ántes de la madurez y reunidas sobre un receptáculo plano, ligeramente cóncavo.

Por conformarme á la mayor precision de las descripciones modernas, expondré los caractéres naturales del género *Castilloa* y la diagnósis de la especie, segun los refiere el profesor Augusto Trecul, en su interesante Memoria acerca de la familia de las Artocárpeas, publicada en los «Anales de Ciencias Naturales, de Paris:» Serie III, tomo VIII, y que son la interpretacion de los señalados por el Sr. Cervantes; dice así:

Flores monoicas, las masculinas y las femeninas reunidas en receptáculos distintos, planos ó cóncavos é involucrados. Involucro polifilo, con las escamas imbricadas de diversos modos. MASCULINAS: *Perigonio nulo. Estambres numerosos esparcidos entre bracteas de diversas formas, pubescentes, enteras, bífidas ó laciniadas; filamentos más ó ménos alargados, anteras terminales, erguidas ó peltadas, biloculares, de lóculos opuestos, adheridos á un conectivo grueso y dehiscentes longitudinalmente.*

FEMENINAS: *cerca de sesenta en el mismo receptáculo. Perigonio tubulado, foliolos gruesos, unidos entre sí. Estilo terminal cilíndrico é incluso: estigmas dos, filiformes, subcomprimidas, papilosas. Ovario semi-ínfero, unilocular, uniovulado, óvulos pendientes en el vértice de los lóculos, anatropos. Akenas persistentes en el perigonio, unidas al principio por un lado, en la madurez libres enteramente, apergaminadas, aovadas. Semillas pendientes: testa membranosa oscura: embrion homotropo, exvalbuminado, cotiledones gruesos, subdesiguales, radícula supera y muy corta.*

C. E. *Hojas oblongas, enterísimas ó denticuladas, cordiformes en la base, con el ápice casi acuminado, pubescentes de ambos lados.*

II.

Haciendo una incision en la corteza de la *Castilloa elastica* se escurre en grande abundancia, como lo he indicado ya, un jugo lechoso que contiene en suspension, merced á la albumina, una sustancia particular que al contacto del aire se solidifica y adquiere una consistencia elástica. Este producto, tan singular, no solo proviene de esta planta, sino tambien se encuentra en abundancia en el jugo lechoso de otras muy diversas, que crecen en las regiones calientes de ambos hemisferios, y corresponden principalmente á las tres familias siguientes: Euforbiáceas, Artocárpeas y Apocineas: las Lobeliáceas dan tambien una especie, la *Lobelia elastica,* de la América del Sur.

El que produce una Euforbiacea, la *Siphonia (Hevea) guyanensis,* Schreber, *Jatropha elastica,* Linneo, que pertenece á la flora del Brasil, fué el primero que se llevó á Europa en 1736; y aun de esta planta proviene una gran parte del que se halla en el comercio extranjero. El *caouthov* ó *cahuchu,* nombre con que se designa esta sustancia elástica por los indios del Amazonas, dió orígen á la palabra *caoutchouc,* que es hoy de un uso tan general.

El Sr. Cervantes creía, no sin razon, que muchas especies de Yatrofas, tan abundantes en nuestras tierras calientes, pueden tambien proporcionarnos un producto semejante al que nos ocupa, y señala además varios *Ficus* mexicanos.

Segun el Sr. Finck, entre Córdoba y la orilla del mar crecen de 7 á 8 especies de *Ficus* y varias Apocineas de los géneros *Cervera, Plumeria* y *Tabernaemontanum,* que producen *caoutchouc,* pero ninguno lo da tan puro cómo nuestra *Castilloa.* Este señor dice que comparando el jugo lechoso de estas diferentes plantas, se observa que el de la *Castilloa* contiene gránulos más grandes, ménos glutinosos y más fáciles de evaporar; miéntras que los de las demás especies son mas pequeños, más glutinosos y difíciles de evaporar completamente por su exposicion al aire, lo que prueba que contienen mayor cantidad de materia grasa.

Mencionaré tambien la *Cecropia peltata,* probablemente de nuestra flora, y la *Plumeria alba y rubra,* vulgarmente *Cacaloxochitl,* que tanto abunda en diversas regiones calientes de la República, y de donde se extrae hule en algunos puntos de Michoacan; mas sin duda de calidad inferior al que nos ocupa.

Diré, por último, que en mi concepto, es equivocada la creencia de algunos escritores nacionales y extranjeros, al asegurar que crece silvestre en México la *Siphonia elastica;* ninguna especie de este género, al ménos que yo sepa, ha sido encontrada más aca de los 8 ó 10 grados de latitud boreal.

El Sr. Cervantes hizo algunas experiencias con el jugo lechoso de la *Castilloa* con objeto de averiguar sus propiedades, tanto físicas como químicas, usando para esto de diversos reactivos. Mas si bien es cierto que operó sobre un jugo que habia sufrido ya un principio de descomposicion, y al que además se le habia agregado con anterioridad cierta cantidad de potasa, con la mira de impedir su coagulacion, así como Fourcroy lo habia observado con el jugo de la Yatrofa del Brasil, creo, sin embargo, de interes el referirlas para completar el estudio histórico-científico de esta planta, siendo por otra parte las únicas que se hayan emprendido sobre nuestro hule bajo su forma líquida.

Dice el Sr. Cervantes que el jugo en el estado que he indicado, era de un blanco opaco, formándose en él, cuando se le agitaba, líneas ó rayas negruzcas, debido sin duda á la parte acuosa con que naturalmente estaba mezclado. Su sabor al principio era algo dulce, mas dejaba despues por largo tiempo un sabor desagradable y amargo, siendo su peso específico, comparado con el del agua destilada, de 1.0430. Puestas en la palma de la mano 5 ó 6 gotas de líquido y frotado con la otra, se notaba una sensacion jabonosa, y despues de evaporada el agua de esta emulsion vegetal, se separaba la sustancia elástica pura dotada de todas sus propiedades. Al contacto del aire, esta emulsion se descompone, separándose la parte acuosa y sobrenadando una resina, que oxidándose se trasformaba en una resina elástica.

En el agua se dilató esta materia, tiñéndola de un color blanco-verdoso, lo que, sin embargo, proviene del álcali con que estaba mezclado el jugo: este color se hizo más visible calentando el líquido, separándose á poco la sustancia resinosa y sobrenadando el agua que conservaba la coloracion adquirida.

El ácido acético se colora en rojo, sobrenadando en él la resina que permanece líquida por mucho tiempo, hasta que por último se coagula sin perder ninguna de sus propiedades.

El ácido clorohídrico coagula la leche con suma prontitud, separándose la sustancia elástica sin la menor alteracion y tiñendo á aquella de un color que tira á verde, y cuyo resultado es debido quizá á su rápida oxidacion.

Con el ácido nítrico se observa un resultado análogo, mas con la diferencia capital de que el principio elástico se descompone enteramente perdiendo todas sus propiedades; convirtiéndose despues de algunos dias de estar infundido en este vehículo en un polvo amarillento, que se disolvia en el agua tiñéndola de un color muy parecido á la gutagamba.

Con el ácido sulfúrico se obtuvo tambien un precipitado, pero sin alteracion alguna del principio elástico.

Los álcalis obran combinándose con la parte acuosa del jugo, tiñéndola de negro; mas en vez de precipitar la resina queda ésta sobrenadando al álcali y se coagula al cabo de quince dias, sin perder ninguna de sus propiedades; cuyos resultados son enteramente contrarios á los que Fourcroy creyó observar en el jugo de la Yatrofa elástica.

Se retarda, es cierto, la coagulacion, pero al fin llega á verificarse, lo que tambien sucede con los ácidos débiles y aun por más tiempo con la simple agua. Este experimento dió á conocer que el color negro que se notaba en el jugo sometido al exámen, era debido á la accion del álcali sobre su parte acuosa.

El alcohol obra tambien como coagulante y se tiñe de rojo.

La esencia de trementina disuelve perfectamente la resina y toma el aspecto de un mucílago trasparente, quedando separada en el fondo de la vasija, la parte acuosa del jugo con la coloracion negra ya señalada: con otros aceites esenciales se obtuvo un resultado semejante.

El éter sulfúrico puro es tambien un buen disolvente, y el mucílago espeso que resulta es de un color rojo-oscuro; por el contrario, si contiene algo de ácido sulfuroso obra como coagulante, formándose tres capas en el jugo sometido a la experiencia: la de abajo de agua negra, la de en medio de resina coagulada, y la de arriba de éter perfectamente trasparente y con su color natural.

Con el objeto de averiguar la cantidad de hule contenida en el jugo de la *Castilloa,* el Sr. Cervantes hizo el siguiente experimento:

«Ocho onzas de resina líquida (jugo lechoso), de una botella en que habia doce dracmas de potasa, saturadas con siete onzas y media de vinagre destilado y puestas á evaporar á un calor lento, precipitaron, despues de disminuida más de la mitad de licor, una porcion de resina elástica, mezclada con otra materia blanquecina muy perecida á las féculas de los vegetales; aparté el vaso del fuego, y habiéndole añadido dos libras de agua caliente destilada, se reunió toda la resina elastica, que recogí lavándola bien y haciendo pasar el licor por un cedazo de cerda; era aquel de un color blanquecino opaco, como la resina líquida; y habiéndolo filtrado por un lienzo tupido, paso con el color oscuro insinuado ya tantas veces, y sobre el filtro quedó la materia feculenta, cuyas partículas se separaban unas de otras con la menor agitacion entre los dedos; pero á proporcion que la humedad se disipaba, se reunian más y más entre sí, mudándose por grados el color blanquecino en pardo-oscuro: separé entónces toda la materia que estaba sobre el lienzo, y comprimiéndola entre las manos para privarla del resto de humedad que le habia quedado, la hallé repentinamente convertida en resina elástica, tan pura como la que habia conseguido de los demás experimentos.»

Este ensayo, repetido una segunda vez, dió á conocer que por término medio en un quintal de jugo lechoso, existen treinta y seis libras de materia elástica pura.

«Una libra de resina líquida, continúa el Sr. Cervantes, puesta en una retorta y sometida á un fuego moderado, destiló primero una agua clara, que progresivamente fué tomando un color rojo: mantenida despues la retorta con un fuego violento por veinticuatro horas, cayó en el recipiente un aceite muy encendido de color, y habiendo dejado enfriar los vasos, aparté el recipiente, y por medio de un embudo de vidrio separé la materia aceitosa que pesó dos onzas y cinco dracmas; la parte acuosa estaba cargada de amoniaco, y mezclada con los ácidos produjo una efervescencia muy sensible; su olor se parecia enteramente al espíritu de cuerno de ciervo, y su peso fué de cinco onzas y siete dracmas; el resíduo carbonoso que quedó en la retorta pesó tres onzas y cinco dracmas, resultando de pérdida total de la libra que se puso á destilar, tres onzas y siete dracmas, que probablemente se disiparon en algunos gases, los que por falta de instrumentos no se pudieron recoger para examinarlos. La materia carbonosa hervida en libra y media de agua filtrada, dió por la evaporacion seis dracmas de álcali fijo de un color bastante pardo.»

La materia elástica que obtuvo el Sr. Cervantes en sus diversos ensayos, era de un color blanco parecido al de un emplasto recientemente formado con una sal de plomo y aceite comun; al contacto del aire, y especialmente exponiéndola al sol, adquiere un color pardo, que poco á poco se pone más subido hasta ennegrecerse; sumergida en el agua conserva su color y se tiñe ésta de oscuro, tomando al mismo tiempo un sabor amargo.

Con los diversos reactivos se observaron resultados análogos á los señalados con el jugo resinoso líquido; así, permanece inalterable á la accion de los ácidos, ménos el nítrico que la descompone, convirtiéndola en un polvo amarillo, soluble en el agua.

Los álcalis á frio no tienen accion sobre ella; mas por medio de la ebullicion la corroen y le dan una consistencia córnea, obrando del mismo modo que sobre las materias animales.

Los aceites grasos no la alteran á la temperatura ordinaria; pero á un grado de calor conveniente la disuelven, formando barnices que resisten al aire, al agua y aun á los ácidos.

Las esencias la disuelven aun estando frías, pero su accion se aumenta por medio del fuego.

Con el éter sulfúrico puro, sucede lo mismo; mas si contiene algun principio sulfuroso, obra como coagulante.

Termina por último el Sr. Cervantes, manifestando y con razon, la ninguna semejanza del hule con los demás cuerpos conocidos hasta entonces, considerándolo como único en su género; teniendo, sin embargo, segun él, cierta analogía con el principio glutinoso de los vegetales, y mas particularmente con el gluten por su elasticidad, y por la cantidad considerable de aceite fétido y amoniaco que se produce en la destilacion.

Pero esta supuesta analogía, no es de admitirse en la actualidad, vista la distinta naturaleza de este compuesto azoado, respecto de la de aquel cuerpo hidro-carbonado; pues es de advertir que el amoniaco que obtuvo el Sr. Cervantes en la destilacion del jugo lechoso, no provenia de la sustancia elástica misma, sino de la accion de la potasa puesta allí con el objeto que se ha indicado, sobre la albumina que naturalmente existe en gran cantidad en este líquido vegetal.

Mas con otro cuerpo sí tiene estrecha afinidad el hule, por la identidad en su composicion y algunas de sus propiedades, y es la guta-perca, ó goma de Sumatra, conocida y estudiada en Europa desde hace 30 años.

Diré tambien, que si el Sr. Cervantes llamaba resina á la sustancia que estudiaba, era á falta de una denominacion adecuada con que designarla, pues bien comprendia, como se ha visto, que era un cuerpo especial y distinto de los que llevan aquel nombre.

Además del mérito intrínseco que puedan tener los trabajos referidos de este modesto sabio, atendiendo, sobre todo, á la época en que fueron ejecutados, tienen el indisputable de haber sido los primeros y hasta ahora los únicos que se hayan emprendido para averiguar las propiedades del jugo lechoso de nuestra *Castilloa*.

El Sr. Finck, en una corta reseña que publicó acerca de esta planta, dice que en una gota de la leche que produce, se perciben á la simple vista gránulos muy blancos nadando en el agua; que por su exposicion al aire esta agua se evapora, los gránulos se precipitan y se unen permaneciendo blancos mientras no concluye la evaporacion: cuando ésta ha terminado, la masa de los gránulos toma un color amarillo, que más tarde se vuelve negro, y al mismo tiempo se pone más y más glutinosa hasta llegar á ser compacta, que es el *caoutchouc* puro.

"En general, dice este señor, la leche de las plantas que dan esta sustancia, tiene la misma tendencia á coagularse que la de la vaca, con la diferencia que los gránulos de la primera se unen por la simple exposicion al aire, miéntras que la última debe fermentar ántes para dar el mismo resultado."

Por las análisis hechas en Europa y los Estados-Unidos, se ha precisado ya la naturaleza del *caoutchouc* ó hule, el cual tiene una composicion idéntica, cualquiera que sea la planta de donde proviene, variando tansolo en el mayor ó menor grado en que se manifiestan sus propiedades, las que han sido estudiadas con mucha extension: tambien se ha analizado por Faraday el jugo lechoso de la *Siphonia elastica.*

Al sabio químico Payen débense principalmente estas investigaciones, que refiere ampliamente en su obra intitulada: "Compendio de Química industrial." (5.ª edicion, 1867.)

Omito mencionarlas, por ser ya bastante conocidas, y por haberme propuesto escribir este artículo, con solo datos especiales á la planta de que me ocupo.

Diré, sin embargo, que el *caoutchouc* puro está compuesto exclusivamente de ocho equivalentes de carbono y siete de hidrógeno; su fórmula, es pues, $C^8 H^7$; su color es blanco, trasparente y de consistencia sólida, siendo de 925 su peso específico. El del comercio, segun Girardin, es un producto complexo, pues además del hidrocarburo señalado, contiene materias grasas y colorantes, un aceite esencial, tres sustancias azoadas, agua en proporcion variable, y una corta porcion de sales.

El líquido aceitoso fétido que obtuvo el Sr. Cervantes, por la destilacion ya en seco del hule, es sin duda el conjunto de hidrocarburos, conocido hoy con el nombre de *caoutchoucina,* y cuya gravedad específica mientras permanece líquida, es menor que la de cualquiera otro de los líquidos que han sido estudiados por los químicos; pero en el estado de vapor es tan pesada, que fácilmente se puede extravasar de una vasija á otra, como si fuese agua, siendo, además, el mejor disolvente del *caoutchouc* seco y dividido.

III.

Réstame ahora para concluir, señalar las aplicaciones que se hacen de la *Castilloa elastica;* éstas solo se limitan á la explotacion del hule, que por sí sola constituye una verdadera fuente de riqueza.

En una Memoria que publicó el Sr. D. Matías Romero, intitulada: "Importancia del cultivo del hule en el porvenir de la República," hace palpable lo que acabo de decir, exponiendo interesantes é instructivas noticias, que merecen ser consultadas por las personas que deseen dedicarse á este ramo de la industria agrícola.

Respecto de la madera de dicho árbol, diré que no tiene una cualidad especial, que haga preferir su uso al de otras muchas que abundan en los mismos parajes: es de un color blanco, medianamente pesada, poco elástica y de fibra gruesa.

Segun el Sr. Cervantes, la manera de extraer el jugo lechoso de la *Castilloa,* en algunos puntos de la Costa de Veracruz, se reduce á practicar con un instrumento cortante, incisiones espirales, de una pulgada de ancho y otra de profundidad, comenzando desde la base del tronco hasta la altura á que pueda alcanzar la mano del operador; con anticipacion se practica en la tierra y al pié del árbol, una oquedad que corresponda exactamente á la extremidad inferior de la primera incision. Cuando el tronco no tiene una forma cilíndrica, las incisiones se trazan de distinto modo, procurando siempre que el líquido escurra hácia el lugar que de antemano se ha fijado. Una vez recogido todo el jugo que puede dar de sí el arbol, se pasa por medio de *jícaras* de la cavidad donde está depositado, á corambres ó botas de cuero que tambien se hacen de lienzo barnizado con el mismo hule, y con el que se adhieren sus bordes sin necesidad de costura.

En la Huasteca, generalmente se hace una incision vertical, y á sus lados otras oblicuas más pequeñas, como las barbas de una pluma respecto de su tallo, ó bien incisiones cortas, unas arriba de otras, formando ángulos con el vértice, ya á la derecha, ya á la izquierda. El Sr. Romero, dice: que en el Soconusco, Estado de Chiapas, se comienza por derribar el árbol, y una vez en tierra, se le hacen varias incisiones, recogiendo el jugo en hojas puestas por debajo: como es fácil de comprender, este procedimiento debe ser del todo proscrito. El mismo señor hace observar juiciosamente, que una sola incision de una extension regular, seria quizá suficiente para que por ella salga todo el jugo, en virtud de la pesantez, sin perjudicar sensiblemente al árbol, como sucede cuando se practica mayor número. Sea cual fuere el procedimiento que se adopte, se debe interesar solo la corteza, y evitar su completa solucion de continuidad, pues de otra manera quedaria expuesto á perecer el vegetal. Las heridas, en fin, que se han causado por las incisiones, serán curadas convenientemente para apresurar su cicatrizacion.

El método de extraccion del hule verdaderamente primitivo, que refiere el Sr. Cervantes, es muy posible que en la actualidad esté ya modificado; pues desde luego ocurre la idea de que es mejor recibir el jugo directamente en una vasija á propósito, colocando en la parte más baja de la incision un pedazo de hoja de lata acanalado, por ejemplo, para dirigir la corriente del líquido. Siguiendo este método, el producto se desperdiciaria muy poco, no contendria casi ninguna materia extraña, y de consiguiente tendria mayor estimacion en el mercado. Esta idea que aquí indico, no es nueva, en lo sustancial es el procedimiento que se sigue en el Brasil por los indígenas, y que continuaron usando los portugueses de Para. Queda ahora por averiguar cada cuándo deben hacerse las incisiones, y en qué época del año. Siendo muchas las opiniones que se tienen acerca de esto, diré con el Sr. Finck de una manera general: "que si se practican sobre el mismo árbol y en el mismo año varias incisiones, se agotaria y acabaria por morir; mientras que economizándolas, se le explotaria por una larga serie de años." Se cree tambien que la época de las lluvias es la más á propósito para extraer el jugo: no cabe duda que en ella escurre con mayor facilidad y abundancia, pero debe preferirse el tiempo de secas de Marzo á Mayo, por contener entónces mayor cantidad de principios sólidos. No podré señalar de una manera precisa la cantidad de jugo que rinde anualmente cada árbol, pues se comprende que debe ser muy variable segun su edad y el terreno en que vive. Un árbol bien desarrollado y en buenas condiciones, se cree que no dá ménos de seis libras de jugo al año, del que se obtiene, segun el Sr. Cervantes, un 35 por ciento, poco más de un tercio de su peso, de *caoutchouc* puro: mas este cálculo habiendo sido hecho en el laboratorio, en una explotacion industrial, dicha proporcion debe bajar, por lo menos, á un cuarto ó sea un 25 por ciento de producto. La planta jóven es muy delicada, y para que pueda resistir á una sangría anual, es preciso que tenga por la menos doce años de edad: si estuviere en buen terreno, y si se le sangra más de tarde en tarde, esta cifra podria quizá reducirse á seis.

Una vez acopiado el jugo, se le puede remitir á los lugares de consumo en su estado líquido, tal como sale del árbol, teniendo cuidado de tapar herméticamente las vasijas, tan luego como se hayan llenado. El Sr. Lee Norris, de Nueva York, aconseja que se filtre primero el jugo y se le mezcle en seguida una décimaoctava parte de amoniaco concentrado: este álcali impide la accion del oxígeno del aire, y no solo no altera el producto, sino que lo conserva en mejor estado; además, por una evaporacion á 80 ó 100° Fahrenheit, fácilmente se le desembaraza de este agregado. Pero ciertamente es más ventajoso preparar inmediatamente el hule bajo su forma sólida: para lo cual, una vez coagulado el jugo por su simple exposicion al aire, se le somete á la accion del humo por varios dias, para que de glutinoso se vuelva compacto y poderlo así manejar: esta operacion se puede practicar de la misma manera que en el Brasil, extendiendo sobre un molde de barro de figura variable, una capa de líquido sobre otra una vez seca, hasta darle un espesor conveniente; se rompe en seguida el molde, y se hacen salir los fragmentos por la abertura que se forma, dejando sin cubrir una parte de aquel. Mas esta manera de obtener el hule sólido, entiendo que se ha abandonado y con razon, casi por completo: el humo que sirve para endurecerlo, perjudica notablemente esta materia, haciendo más difícil en las artes su elaboracion.

El procedimiento que más comunmente se sigue ahora, es cuajar la leche con el jugo de un bejuco: en Tehuantepec es el que los zapotecos llaman *joamole*, y que crece en los mismos lugares que el hule; se consigue así un producto enteramente blanco: esto mismo se puede hacer tambien con alumbre, y en general con toda sustancia ácida. Una vez formada la *crema*, se somete á la prensa para privarla del *suero*, y se asolea despues: este procedimiento se hace hasta ahora de una manera imperfecta, pues el hule al principio queda seco, pero más tarde arroja una agua negra que tiñe de este color, y cuya composicion es desconocida, siendo la merma de 10 á 15 por ciento.

Un método expedito para obtener el hule, consiste en derramar el jugo sobre cajones de un centímetro de fondo y exponerlo al sol: la tela que se forma tiene medio centímetro de espesor, y fácilmente se desprende.

Con objeto de conseguir un artículo casi tan superior como el del Brasil, se opera de este modo: se dispone un recipiente de suficiente capacidad, un barril, por ejemplo, provisto en el fondo de una llave horizontal; se le coloca verticalmente sobre un sustentáculo, se llena hasta la mitad de agua, en la que se ha disuelto cloruro de sodio (cinco libras en el caso citado), ó bien sub-carbonato de sosa, el resto se completa con el jugo, se agita fuertemente para mezclarlo con el agua, se tapa el recipiente y se deja en reposo por 24 horas. Se abre despues la llave y se deja escurrir mientras sale negro el líquido, y se cierra inmediatamente que el hule se presenta y que fácilmente se reconoce por su color blanco: se repite la lavadura dos ó tres veces, y se concluye por secarlo como en el caso anterior, ó más bien sometiéndolo á la prensa, para conseguir mejor este resultado.

Cualquiera que sea la manera de proceder, es importante privar al hule de su parte líquida, pues ésta al descomponerse lo altera y demerita por consiguiente, haciéndolo bajar de precio.

Vuelvo á repetir, por ser de importancia, que el Sr. Romero hace valer con muy buenas razones, lo ventajoso que es el emprender el cultivo del hule. Hasta ahora, con excepcion de algunos cortos plantíos en el estado de Veracruz y Chiapas, este producto se obtiene de árboles silvestres. Mas es fácil comprender lo mucho que mejoraria, si se cultivase esta planta.

Por no salir de los límites que me he fijado al escribir este artículo, pero más particularmente por no existir datos prácticos suficientes, para exponer la mejor manera de llevar á cabo un plantío de esta clase, omito entrar en pormenores relativos á dicho asunto. Diré, sin embargo, con el Sr. Romero, que se propaga muy bien por granos y por estacas que prenden con facilidad: se puede intentar tambien con éxito, el trasplante de arboles jóvenes de la selva, y que no resienten sensiblemente esta operacion. El terreno en que se siembre, además de estar bien expuesto al sol, debe ser bastante húmedo y de corta altura sobre el nivel del mar, como lo indica el límite natural en que crece la *Castilloa:* la distancia mas conveniente para colocar una planta de otra, es de 5 metros, y nunca ménos de 2 ½, pues se estorbarian al desarrollarse, no requiriendo, en fin, el plantío, beneficio alguno especial, sino solo desembarazarlo de vez en cuando de toda vegetacion extraña.

Para dar una idea de la riqueza que tiene México en hule, copiaré lo que refiere la Comision Americana en su Informe acerca de la Exploracion del Istmo de Tehuantepec. Oct. 1854: "Tomando, dice, la mitad del número de árboles encontrados en una área de un cuarto de milla cuadrada, sobre el rio Uspanapa, como base de un cálculo y admitiendo que no crezca el *Hule* en las llanuras del Pacífico, no se encontrarian ménos de 2.000,000 de árboles en los límites del Istmo, algunos de los cuales pueden dar de cuatro á 5 libras de hule por año. Suponiendo que solo la mitad de este prodigioso número de plantas sean productoras, y que cada una solo produzca una libra por año: el total seria 1.000,000, que al ínfimo precio de 40 centavos libra valdrian 400,000 pesos." Este ejemplo, tomado de una sola localidad, se puede aplicar á otras muchas que aun no han sido explotadas.

Tocando ahora otra cuestion, diré que en mi concepto, es de utilidad práctica, saber cuál especie de las que se conocen produce hule de mejor calidad; no seria extraño que el de Para sea superior al nuestro, no tanto por su elaboracion, sino por el árbol de donde se extrae, que como he dicho es la *Syphonia elastica*. Los primeros ensayos que se intentasen para averiguarlo serian costosos, pero quizá las ventajas obtenidas mas tarde, compensarian ampliamente los gastos erogados. El mismo hule mexicano varia de clase, segun el lugar de la produccion: el de la Huasteca, por ejemplo, lo reputan algunos superior al de la costa de Veracruz: el modo de prepararlo, y lo más ó ménos agotados que estén los árboles, no cabe duda que tiene gran influencia; mas en la primera localidad se dice, que varia segun proviene de árboles *machos* ó *hembras*, lo que indica especies diversas, pues la *Castilloa* no es planta dioica, sino monoica.

Es una prueba de esta opinion, aunque ignoro si realmente sea cierto, lo que asienta un autor respetable, Planchon, de que el hule de México proviene, no solo de la *Castilloa*, sino tambien del *Artocarpus integrifolia*, planta de la misma familia, originaria de las Indias Orientales é islas del Océano Pacífico, introducida para su cultivo en la Isla de Cuba.

Los antiguos mexicanos conocian bien el hule; y, como dije al principio, llamaban al árbol *Olquahuitl*, y al producto *Olli* ú *Ollin*, cuyo significado me es desconocido: lo empleaban especialmente en la medicina y como combustible: en el primer caso usaban del jugo solo ó asociado al cocimiento de las hojas ó de la corteza, que administraban interior y exteriormente en las enfermedades en que se emplean hoy los astringentes y los amargos. En la terapéutica moderna se recomienda por algunos prácticos el *caoutchouc* puro disuelto en la esencia de trementina, bajo forma de píldoras, en cierto período de la tísis pulmonar; mas en la cirugía, como se sabe, sus usos son mas extensos y variados.

En la industria es donde los aplicaciones del hule ó goma elástica, (nombre impuesto en Francia y que aun se conserva entre nosotros,) son verdaderamente numerosas é importantes. Al principio fueron muy limitadas, pues este cuerpo se endurece mucho á 0° y se reblandece excesivamente de + 30 a 40°, perdiendo en ambos casos su propiedad elástica y su extensibilidad, no pudiéndose emplear por consiguiente, en las localidades que disfrutan una muy alta ó muy baja temperatura. Pero desde que Goodyear, de Nueva-York, descubrió en 1839 que por su combinacion en ciertas proporciones con el azufre, ó *vulcanismo* como se ha llamado á esta operacion, conserva dichas propiedades, sus aplicaciones en las artes han aumentado y aumentan cada dia mas, como lo demuestran los numerosos artefactos que nos vienen de Europa y de los Estados-Unidos; y llegará la vez, como dice el Sr. Romero, que esta importante materia prima sustituya en gran parte al fierro. De solo la provincia de Para en el Brasil, la exportacion ha sido en un año (1869) de 363.487 arrobas de 32 libras para el consumo de la segunda de estas naciones principalmente, de Inglaterra y Francia, ademas de otras cantidades cuyo destino se ignora.

A muy poco está reducida en México la industria manufacturera del hule, á pesar de tener á la mano este producto que hasta el dia vemos con desprecio. Es tan poco estimado su valor en el país, que en el mismo Tehuantepec solo se recoge para fabricar zuelas con que los indígenas se protejen los piés, fuera de otros usos en la medicina, verdaderamente insignificantes. En otros lugares, como en Orizaba, desde la época del Sr. Cervantes, se emplea solo para barnizar lienzos, con objeto de hacerlos impermeables, pero de una manera imperfecta. Este señor, con la mira de extender en México el campo de las aplicaciones del hule, hizo algunas tentativas, con mediano éxito, para preparar sondas y candelillas que son de tanto uso en cirugía; mas ninguno, que yo sepa, ha seguido su ejemplo.

Hace un corto número de años que el Sr. D. Ildefonso Bros, persona muy laboriosa y entendida en trabajos mecánicos, estableció en esta capital una pequeña fábrica de artículos de hule, empleándolo en su forma líquida, y logró hacer excelentes manufacturas, como telas impermeables, resortes para calzado, etc., que rivalizaban con las extranjeras, consiguiendo tambien por un método especial, obtener aquel producto en un perfecto estado de pureza; mas por desgracia esta industria duró muy poco.

Aun la exportacion de nuestro hule se hace en corta escala, al grado de no tener un precio corriente señalado en el mercado de los Estados-Unidos; siendo de lamentar que aquella, en vez de ascender, disminuya cada dia mas, á causa de la destruccion de los árboles por su mal dirigida explotacion y la incuria de no reemplazarlos con otros.

Hago, en fin, como el Sr. Romero, patente mi deseo de que la empresa lucrativa del cultivo del *Hule* y el establecimiento en México de una nueva industria, sean llevadas a cabo por especuladores entendidos, que beneficiándose á sí mismos, contribuirian á hacer feliz á nuestra patria, dando en que ocuparse á millares de brazos, y llevando la abundancia al par que la civilizacion, á esos lejanos distritos huleros, cuyos desgraciados habitantes cubren con dificultad sus mas precisas necesidades.

México, Setiembre 30 de 1875.

OBSERVACIONES

SOBRE

LA SECRECION VENENOSA DEL VINAGRILLO:

(Thelyphonus Giganteus.)

POR EL SEÑOR DON FERNANDO ALTAMIRANO.

SOCIO DE NUMERO.

Hace quince dias que el Sr. D. Manuel Reyes, nuestro consocio, se sirvió remitirnos un aracnido, conocido con el nombre vulgar de *Vinagrillo*, para que investigase si era realmente ponzoñoso.

Hoy vengo á ocupar la atencion de la Sociedad con el corto número de observaciones que pude recoger en los cinco dias que vivio. No son suficientes para probar que sea un animal inofensivo; y yo no me atreveria aún á tomarlo con los dedos, porque me cabe duda de si cambiarian sus propiedades con la falta de alimentos propios, el clima diverso, etc.

Pero al ménos se verá que hay mas probabilidades de que no sea ponzoñoso, así como las circunstancias que me han impedido una demostracion completa, para que mas tarde se concluya su estudio.

Entre los diversos autores que he consultado, solo Boquillon, en su Historia Natural Médica dice que estos animales llevan su aparato secretor cerca del ano, y que arrojan el liquido secretado con fuerza. La Monografia de Lúcas no la he visto; pero en general los libros que la citan, se reducen a decir que parece que no son ponzoñosos los vinagrillos.

Mas si lo que voy á referir no ha sido anunciado al mundo científico, nuestra Sociedad será la primera en disipar el terror que causa este aracnido por su ponzoña, y marcar al médico lo que deba creer en los pretendidos casos de picadura de este animal.

Cuando posea mas ejemplares vivos para repetir mis experiencias, daré el dibujo de este articulado, así como su descripcion anatómica; limitándome por ahora á decir que es el *Thelyphonus giganteus* de los Escorpionides.

Al principio estaba comprendido en el género *Phalangium* con el específico de *caudatus*, porque todos los individuos que llevaban este apéndice caudal eran idénticos; pero más tarde se descubrieron otros, que llevando el mismo apéndice, se distinguian por ciertos caractéres, y hubo necesidad entónces de formar un género especial.

El vulgo se ha servido de la palabra *Vinagrillo* por el olor de vinagre con que se anuncia este animal, nombre que es tal vez más adecuado que el científico, y que usan aún los pueblos incultos del Africa.

Lo primero que procuré fué alimentarlo, pero no comió las moscas que le puse en su prision, ni conseguí jamás ver el movimiento de sus mandíbulas que me indicase que comia de un pedazo de carne cocida y otro de *tortilla* que tambien le habia puesto. Parecia que no mas se contentaba con el olor, pues varias veces lo encontré con la carne cogida entre sus palpos, sin mover las mandíbulas para nada.

Tampoco al aire libre quiso comer. Para esto lo aseguré en un lugar que diese el sol, por medio de un hilo largo, y no procuró coger las moscas que lo rodeaban, ni aun se incomodaba porque posaran sobre su cuerpo.

No llegó á morder ni á atacar de ninguna manera, á una varilla con que lo picaba en la boca, á un coleóptero que le ponia encima, y á una paloma que le presenté, colocando la base del pico y las patas entre los palpos.

Una vez que le aproximé mi pié haciendo ruido, se alzó sobre sus patas, quedando un espacio como de 3 centímetros entre su cuerpo y el suelo; abrió mucho sus palpos, é inclinó su apéndice caudal hácia adelante. En esta actitud se presentaba amenazador é imponente, aumentando el terror que causa su repugnante aspecto.

El objeto de dicha postura es, segun Orbigny, para que el enemigo que ellos temen, pase por debajo, sirviéndoles para esto la gran longitud de sus miembros, además de procurarles mayor velocidad en su carrera.

Mas lo que yo observé fué, que con dicha actitud no hacia otra cosa que inspirar terror; y luego que lo tocaba mi pié, ni procuraba huir ni atacar de ninguna manera, sino que recogia sus palpos, posaba su cuerpo sobre el suelo, y se quedaba quieto en su lugar resistiendo los tocamientos siempre que no llegasen á la cola. Pero si tocaba ésta con un objeto cualquiera, inmediatamente huia, buscando con sus palpos lo que le molestaba. Tambien tenia mucha sensibilidad en los miembros y en el céfalo-tórax: tocando este punto retrocedia, abriendo sus palpos.

Despues de algun tiempo de estarlo incomodando por todos los medios dichos, se percibia un olor como de ácido acético mezclado á otra cosa que no hallé á qué comparar, y que en pocos momentos se difundia en toda la atmósfera de la pieza.

Me propuse entónces extraer este líquido oloroso y averiguar su naturaleza.

Para el efecto lo quise someter, en un matraz, á una corriente de aire caliente á 40°, para que arrastrase dicho principio, y recibirlo en una solucion de nitrato de plata, ó bien alcalina, etc.; pero cuando estaba en la boca del matraz con el apéndice caudal aun fuera, percibí el olor especial de ácido acético muy intenso.

Supuse (aun no habia visto á Boquillon) que por el ano arrojara aquel líquido oloroso, y luego me lo comprobó el papel reactivo azul que se puso rojo. En ninguna otra parte de su cuerpo se enrojecia el papel.

Con este resultado inesperado, cambié mi experiencia proponiéndome recoger aquella secrecion.

Tomé al Vinagrillo con unas pinzas que sostenia yo mismo, lo puse encima de una cápsula de vidrio, y con la otra mano interpuse entre mis ojos y el ano del animal, una lente grande, tocando al mismo tiempo el extremo libre de la cola.

Así lo dispuse, para que si arrojaba á lo léjos su líquido, se adhiriese á la lente, ó si salia gota á gota, cayese dentro de la cápsula, y en uno ú otro caso ver el punto de donde brotara, ayudándome con el aumento. Lo estuve comprimiendo con las pinzas y frotando con la lente su apéndice caudiforme, que ya la experiencia me habia enseñado era muy sensible, y que el olor de vinagre se percibia luego que se molestaba al animal.

Pasados como diez minutos, fuí sorprendido por un líquido que se depositó repentinamente en la cara inferior de la lente sin haber visto yo el lugar de donde se desprendió. Era completamente limpio y trasparente, muy volátil; las primeras gotas las vi desaparecer como si fueran de éter sulfúrico, y me llegó el olor de vinagre muy pronunciado. La cantidad seria como de tres ó cuatro gotas.

En la parte que aun no se volatilizaba, me apresuré a poner una gota de solucion de nitrato de plata: se formó un precipitado blanco cuajado, que no se veia cristalino en el microscopio, ni cambió de color con los rayos directos del sol.

Dejé reposar al animal durante una hora, y previne una paloma adulta y una inyeccion subcutánea para inyectarle el nuevo líquido que recogiese, y ver si era venenoso.

Pasado este tiempo repetí la experiencia anterior, cambiando no más la lente por una copa de vidrio. Lo estuve comprimiendo con las pinzas y copa, que encerraba solo la cerda, como 15 ó 20 minutos. Dirigia constantemente su cola hácia las pinzas, que no llegaba á tocar, porque se lo impedia la copa. Luego que advertí esto, procuré que, permaneciendo aquella dentro de la copa, tocase á las pinzas; y despues de dos ó tres veces que las tocó, percibí unas gotas del líquido que resbalaban sobre la cara interior de las paredes de la copa, casi en el borde y cerca de donde tenia el extremo de la cerda.

Coloqué inmediatamente la copa sobre su pié, percibí el olor de ácido acético y vertí sobre aquel líquido como 3 gramos de agua destilada, para que la jeringa pudiera absorberlo, y lo inyecté á la paloma; lavé la copa con otros 3 gramos, y volvió á quedar muy olorosa, y tambien lo inyecté á la misma paloma, pero en distinto punto del anterior.

La estuve observando durante una hora, y no murió ni presentó nada notable. En los dias siguientes estuvo algo triste, pero comia bien. Al tercer dia se le habia gangrenado la piel en el lugar de la inyeccion, en un espacio como de 4 centímetros; mas al fin llegó á sanar completamente.

Quise repetir esta experiencia al dia siguiente de la primera inyeccion, pero no conseguí que arrojara nada de líquido, aun despues de estarlo excitando mucho: lo puse en el sol para que se reanimase, pero allí murió.

Examiné entónces el lugar donde suponia existiera la glandula, y casualmente desprendí el apéndice caudal casi desde su base. Me pareció hueco y que contenia la secrecion olorosa. Introduje un alambre fino, que desalojó un líquido con olor de acido acético y que atacó muy pronto al metal, pues á los 5 minutos ya estaba verde. El alambre se detuvo en el extremo libre, que no pasó, tal vez, porque la abertura era menor que su diámetro.

En la parte que quedó adherida al cuerpo del animal, penetró tambien el alambre profundamente, rompiendo quizá los tejidos. En ese momento, que tambien comprimia yo el abdómen para sostener al aracnido, brotó por donde introduje el alambre y por el ano, un líquido claro, de olor de vinagre, que despues salió mezclado con grumos, como de moco, de color aplomado.

Vertí una gota de este líquido en el ojo de una paloma, y no se puso rojo; el resto lo mezclé con agua destilada y lo encerré herméticamente en un frasco que presento para que percibais dicho olor, que se asemeja ahora al de la fresa. Aun esta bastante acido, segun se puede ver con el papel reactivo.

Resumiendo diré:

1.º El vinagrillo no tiene ningun organo ofensivo, carece de aguijon, y ni aun de sus mandíbulas usa para atacar.

2.º El olor particular que produce es debido á un líquido que arroja por el ano ó tal vez por el apéndice caudiforme, puesto que está perforado en toda su longitud y contiene dicho líquido.

3.º Esta secrecion le sirve de medio de defensa, pues procura proyectarla sobre el objeto que le molesta, sirviéndose de su apéndice para dirigirlo: por esta razon vemos que con él busca lo que le incomoda. Tiene además mucha sensibilidad, que se aumenta con la multitud de pelos rígidos que la cubren en toda su extension, y puede recorrer aquella un espacio de cinco centímetros que es su longitud.

4.º Dicho líquido no es venenoso, porque no mató la paloma; pero sí se debe considerarse como corrosivo por la gangrena que produjo: el agua sola no la hubiera ocasionado.

5.º En él existe un ácido que demuestra el papel reactivo, pero que no es ni ácido acético como parece por su olor, ni fórmico que es muy comun en la economía animal. No el primero, porque no precipita á la plata mas que en el estado de acetato, y aquí está libre; tampoco es el segundo, porque se hubiera reducido la plata. Además, dicho ácido es el que forma el precipitado, porque no es ni de cloruro ni de albumina que son las sustancias más comunes en los humores animales: no de cloruro, porque no cambió de color con la luz; ni de albumina, que no podria acompañarse con un ácido libre.

6.º Se debe considerar tambien como parte constituyente de la secrecion: un principio eteriforme especial, que es el que huele, el que se volatiliza rápidamente, y en fin, el que explica por qué el agua donde se ha recogido pierde primero su olor que su acidez.

7.º Por último, si el animal no ha mordido, ni su líquido ha matado á la paloma, bien pudiera ser porque está en distinto clima, por el maltrato que haya sufrido en el trasporte, la falta de alimentos apropiados, la manera de introducir el líquido bajo la piel, ó porque á la paloma no le produzca la muerte esta ponzoña.

México, Octubre 30 de 1875.

* * *

MINERALOGIA.

EXÁMEN Y CLASIFICACION DE ALGUNAS ESPECIES MINERALES DE MÉXICO,

COMUNICADAS POR EL SEÑOR DOCTOR DON JOSE BURKART.

(CONCLUYE.)

ARTICULO V.

De la Enargia de México y de una nueva localidad de la Berthieria.

Se deben al Sr. Rammelsberg las análisis de la Enargia (Enargit) y de la Berthieria (Berthierit) de México, publicadas en el periódico de la Sociedad Geológica Alemana (T. 18, Berlin, 1866, p. 341), que damos en seguida.

«En el año de 1850, Breithaupt describió (Annalen der Physik und chemie por Poggendorff, T. 80, p. 383) una nueva especie mineral que cristaliza en las formas del sistema de 2 y 1 miembros (zwei und eingliederiges System de Weiss) [1] con cruceros en la direccion de un prisma de 98°11'. La llamó Enargia (Enargit), y designó como localidad donde se halla, la veta de San Francisco en Morococha, en el distrito de Yauli de la cordillera del Perú.

Mas tarde, el Sr. Dauber midió los cristales de la Enargia (Annalen etc. p. Poggendorff. T. 92, p. 237): Plattner la analizó, encontrando azufre, arsénico y cobre, que son los mismos elementos que componen la Tenancia (Tennantit), que tambien acompaña á la Enargia y forman la composicion de esta última.»

«La Enargia, sin embargo, no se halla solamente en la localidad citada; pues Breithaupt supone que se halla tambien en la mina Yunge-hohe-Birke,

---

(1) Es el sistema hemiprismático ó hemiosthotipo de Mohs, ó el sistema monoclinómetro de Naumann. Burkart.

cerca de Freiberg, de donde es igualmente el cobre gris (Arsenfahlerz designado como blenda cobriza (Kuipferblende). Mas tarde el Sr. Genth ha analizado un mineral con cruceros en la direccion del prisma, de la mina de Brewer, en el Condado de Chesterfield, en la Carolina del Sur (American Journal of Sciences II ser. T. 33. p. 420), que por la analisis debe ser Enargia. Otros minerales de la misma especie se analizaron, á saber: por Taylor, uno de la mina Santa Ana, en la Nueva-Granada (ibid T. 26, p, 349); por Field, otro de Guayacana, en Chile (ibid, T. 27, p. 52), y por Von Kobell se analizó un mineral que se encuentra en masa, con cruceros en la direccion del prisma de 98°, de la Mina Hedionda en Chile (Anzeiger der baierischen Academie 1865, p. 161), los cuales están demostrando que pertenecen á la Enargia.»

«A estas localidades hay que añadir otra mexicana, segun nota comunicada por el Dr. Krantz, y proviene de los terreros de una mina del mineral de Milpillas, á 7 leguas de Cosihuiriachi, en Chihuahua, encontrada por D. Emilio Schleiden. Se halla en masas de textura hojosa y en pequeños cristales resplandecientes en algunas bolsas, los que sirvieron para la comprobacion de la medida de los ángulos. Los cristales forman tablas cortas (flache Tafeln), compuestas de la cara hexagonal, el prisma con cruceros $p = a : b : \infty c$, el prisma dos y tres veces mas obtuso, $p^2 = a : 2b : \infty c$, $p^3 = a : 3b : \infty c$ y la cara terminal c.»

Tomando las medidas de Dauber que dieron $a : b : c = 0{,}8712 : 1 : 8{,}8240$, resulta

	por el cálculo,	por observacion		
		de Dauber,	de Breithaupt,	de Rammelsberg.
p : p un a =	97° 54°	—	98° 11°	—
,, b =	—	82°7'	—	81°50 hasta 82°15'
p : a =	138°56°	—	—	138°55'
$p^2 : p^2$ un a =	132°56'	—	—	—
p^2 : a =	156°28'	—	—	155° hasta 158°
p^2 : p un a =	162°28'	—	—	162°25'
$p^3 : p^3$ =	147°38'	—	—	—
p^3 : a =	163°49'	—	—	163°50'
p^3 : p =	155°7'	—	—	—

El peso específico de la Enargia es: de la del Peru = 4.43—4.44, segun Breithaupt; ó = 4.362, segun Kenngott, de la de Chile, = 4.39, segun Field, ó = 4.37, segun Von Kobell; y la de México = 4,507, segun Rammelsberg.»

«La Enargia de México está mezclada con cuarzo y contiene algunos puntos de pyrita amarilla.»

Los resultados de los análisis anteriores de la Enargia son:

	1, Plattner	2, Genth	3, Taylor	4, Field	5, Von Kobell
Azufre =	32,22	33,78	34,15	31,82	32,11
Arsénico =	17,16	15,63	16,31	19,14	18,10
Antimonio =	1,61	—	1,29	—	0,05 telurio
Cobre =	47,20	50,59	46,62	48,50	48,89
Fierro =	0,56	—	0,27	—	0,47
Zinc =	0,23	—	—	—	—
Plata =	0,02	—	—	—	—
	99,44	100,00	98,99	99,66	99,62

La Enargita de Milpillas se analizó por Luethe, análisis (a), y por Rammelsberg, análisis (b), que hallaron:

	(a)	(b)
Azufre =	31,86	32,45
Arsénico =	17,17	15,88
Cobre =	50,08	49,21
Fierro =	0,09	1,58
	99,20	99,12

quedando despues de haber rebajado el fierro, como pyrita amarilla:

	(a)	(b)
Azufre	31,82	31,73
Arsénico	17,20	16,45
Cobre	50,19	50,94
	99,21	99,12

Tomando por valores S = 32. As = 75, Cu = 63, las proporciones de los átomos son:

	As	Cu	S	As, Cu: S
4 =	1 :	3,0 :	3,9 =	1 : 0,97
1 =	1 :	3,1 :	4,0 =	1 : 0,97
5 =	1 :	3,2 :	4,2 =	1 : 1,0
3 =	1 :	3,24 :	3,9 =	1 : 0,92
6 =	1 :	3,5 :	4,4 =	1 : 0,98
2 =	1 :	3,8 :	5,0 =	1 : 1,04

‘‘En todas las variedades hay, por consiguiente, 1 átomo (Cu As) para 1 átomo S; y suponiendo pureza en el material y exactitud en las análisis, resultan variaciones en la proporcion de As : Cu, y aparece:

en las análisis N.º 1, 3, 4, 5 = 1 : 3
N.º 6 = 1 : 3,5
N.º 2 = 1 : 4

Las fórmulas =		$Cu^3 As S^4$	$Cu^7 As^2 S^9$	$Cu^4 As S^5$
dan :	Azufre	38,55	32,66	32,75
	Arsénico	19,08	17,01	15,35
	Cobre	48,37	50,33	51,90
		100	100	100

"La diferencia en estas fórmulas resulta probablemente de las variaciones de la proporcion de Cu S y $\underline{Cu}$ S

$$\left.\begin{matrix}Cu^4\\ Cu\\ \overline{As}^2\end{matrix}\right\} S^8 \qquad \left.\begin{matrix}Cu^5\\ Cu\\ \overline{As}^2\end{matrix}\right\} S^9 \qquad \left.\begin{matrix}Cu^6\\ Cu\\ \overline{As}^2\end{matrix}\right\} S^{10}$$

"En todo caso deben preferirse estas expresiones á las que suponen As^2 S^5 en el mineral, porque solamente la primera se puede convertir en $\left.\begin{matrix}Cu^3\\ \overline{As}^2\end{matrix}\right\} S^8$ miéntras que las dos otras darian tambien en este caso:

$$\left.\begin{matrix}Cu\\ Cu^3\\ \overline{As}^2\end{matrix}\right\} S^9 \text{ y } \left.\begin{matrix}Cu^4\\ Cu^2\\ \overline{As}^2\end{matrix}\right\} S^{10}$$

"Quizá la Tennancia es solamente $= Cu^3 As^3 = \left.\begin{matrix}Cu^3\\ \overline{As}^2\end{matrix}\right\} S^6$

A la anterior nota del Sr. Rammelsberg, añadiré lo siguiente sobre los caractéres mineralógicos de la Enargia. Se halla en masas y cristalizada en los huecos de estas masas; su color es negro de hierro pasando al gris de acero oscuro; su textura es granuda fina y gruesa que tira á la hojosa y estriada; su raspadura es de color negro; por dentro es de lustre metálico; por fuera espejada y mate. Su dureza es de 4 de la escala de Breithaupt, quebradiza, y se reduce á polvo con facilidad. Al soplete, y en el matracito, se sublima al principio azufre, se funde despues dando arsénico. En el tubo de vidrio da ácido sulfuroso (schwefelige Saeure); sobre carbon se funde con facilidad en glóbulo, cuyo polvo despues de quemado, tratado con bórax tiñe á éste de color de cobre.

En Morococha, la Enargia se crió en una veta armando en caliza granuda.[1] Esta veta no forma un cuerpo de anchura regular, sino se compone de masas lenticulares en hilera, que muchas veces se ensanchan á más de 6 varas y contiene además de la Enargia, la Tennancia, cobre amarillo y pirita con matriz de un mineral negro, semejante á la piedra aperlada.

Es tanta la abundancia de estos minerales en la veta, que producen hasta por valor de $ 70,000 de cobre al año.

Habiendo recibido del Sr. D. Antonio del Castillo, entre otros minerales, un pedacito de un mineral para su analisis, designado con interrogante como Boulangeria del Real de San Antonio en la Baja California, lo mandé con tal objeto al Sr. Rammelsberg, quien al publicar los resultados en el periodico de la Sociedad Geológica Alemana, pág. 244, dice lo que sigue:

«El mineral que me mandó el Sr. Burkart como Bulangeria es Betheria, macizo, casi compacto: tiene un peso especifico = 4,062, y se compone de

Azufre. . . . . = 29.12
Antimonio. . . = 56.61
Fierro . . . . . = 10.09
Manganeso. . . = 3.56
99.38

como la misma especie mineral de Braeunsdorf analizada anteriormente, que dió:

$$\left.\begin{matrix} ^3\!/\!_4 \\ ^1\!/\!_4 \end{matrix}\right\} \begin{matrix} \mathrm{Fe} \\ \mathrm{Me} \end{matrix} \mathrm{S} + \mathrm{S}^6 \ \mathrm{S}^3$$

---

[1] Annalen der Physik und Chemie von Poggendorff. Tomo 80, p. 384.

ARTICULO VI.

De la Domeykia (Domeykit) de Paracatas, (México).

Hace más de veinte años que el Sr. D. Ignacio Domeyko, profesor en el colegio de Coquimbo, en Chile, [1] describió varias especies minerales de su país, y entre ellas un arseniuro de cobre que se halla en la parte inferior de las vetas que arman en las rocas porfídicas del cerro del Calabozo en la provincia de Coquimbo, las que contienen los minerales de plata en la parte superior, á poca profundidad. Esta nueva especie mineral se llamó, en honor de su descubridor, Domeykia, (Domeykit).

La Domeykia es amorfa, se halla diseminada en masas, y en forma de riñones y racimos. En la textura fresca su color es blanco (segun Naumann entre blanco de estaño y blanco de plata), que tira algo á amarillo, tomándose al aire de mas y más amarillo, hasta que al fin se vuelve abigarrado como el hierro pavonado. Su textura es desigual, algunas veces concoidea; es agria, su dureza de 3,5. Forma cintas delgadas en una matriz silizosa, compacta, de color gris.

En la sesion del 4 de Enero de 1866, de la Seccion física de la Sociedad de Historia natural y Medicina del bajo Rhin, el Sr Dr. Krantz presentó unos ejemplares de Domeykia de una nueva localidad, de Paracatas en México, que habia recibido del difunto D. Emilio Schleiden, y el Sr. profesor Bergemann, [2] despues de haber analizado este mineral, comunicó en la sesion del 8 de Febrero de 1866, los resultados de su analisis, y por el interés particular que para los mineralogistas del país puedan tener estas noticias, por hallarse esta nueva especie mineral en México, voy á presentarles un resúmen de ellas, añadiendo mis propias observaciones hechas en un pedazo de este mineral de Paracatas que poseo.

Algunos ejemplares de la Domeykia de México parecen ser como costras respaldadas, inclusos en la masa los granos de una arenisca de grano fino y de color gris verdoso, que se parece al Keuper, pero en otros ejemplares del mineral hay pequeñas partículas de epidota, lo que puede hacer presumir que hay Diorita en su vecindad. Por falta de conocimiento de la localidad no sé decidir en la materia, pero es indudable que en México no faltarán peritos que aclaren el asunto. Además, la Domeykia de Paracatas, está acompañada de baritina, de malaquita y de cobre rojo cristalizado en cubos y octaedros de Chalcotrichita (cobre rojo capilar) y de cobre nativo; los tres últimos en figura de chapas (lamellenartig eingewachsen). Se halla en masas y de textura desigual, pasando á la concoidea pequeña é imperfecta; sus fragmentos son más ó ménos agudos. El mineral es de color amarillo de bronce blanquecino, pasando al gris de acero; es lustroso en la textura fresca, cambiándose al aire de color amarillo de laton á pardo de tumbaga hasta abigarrado. Es quebradiza, muy dura, y poco dócil, tomando las impresiones del martillo cuando se golpea con él. La raspadura es de color gris de acero y de lustre metálico.

---

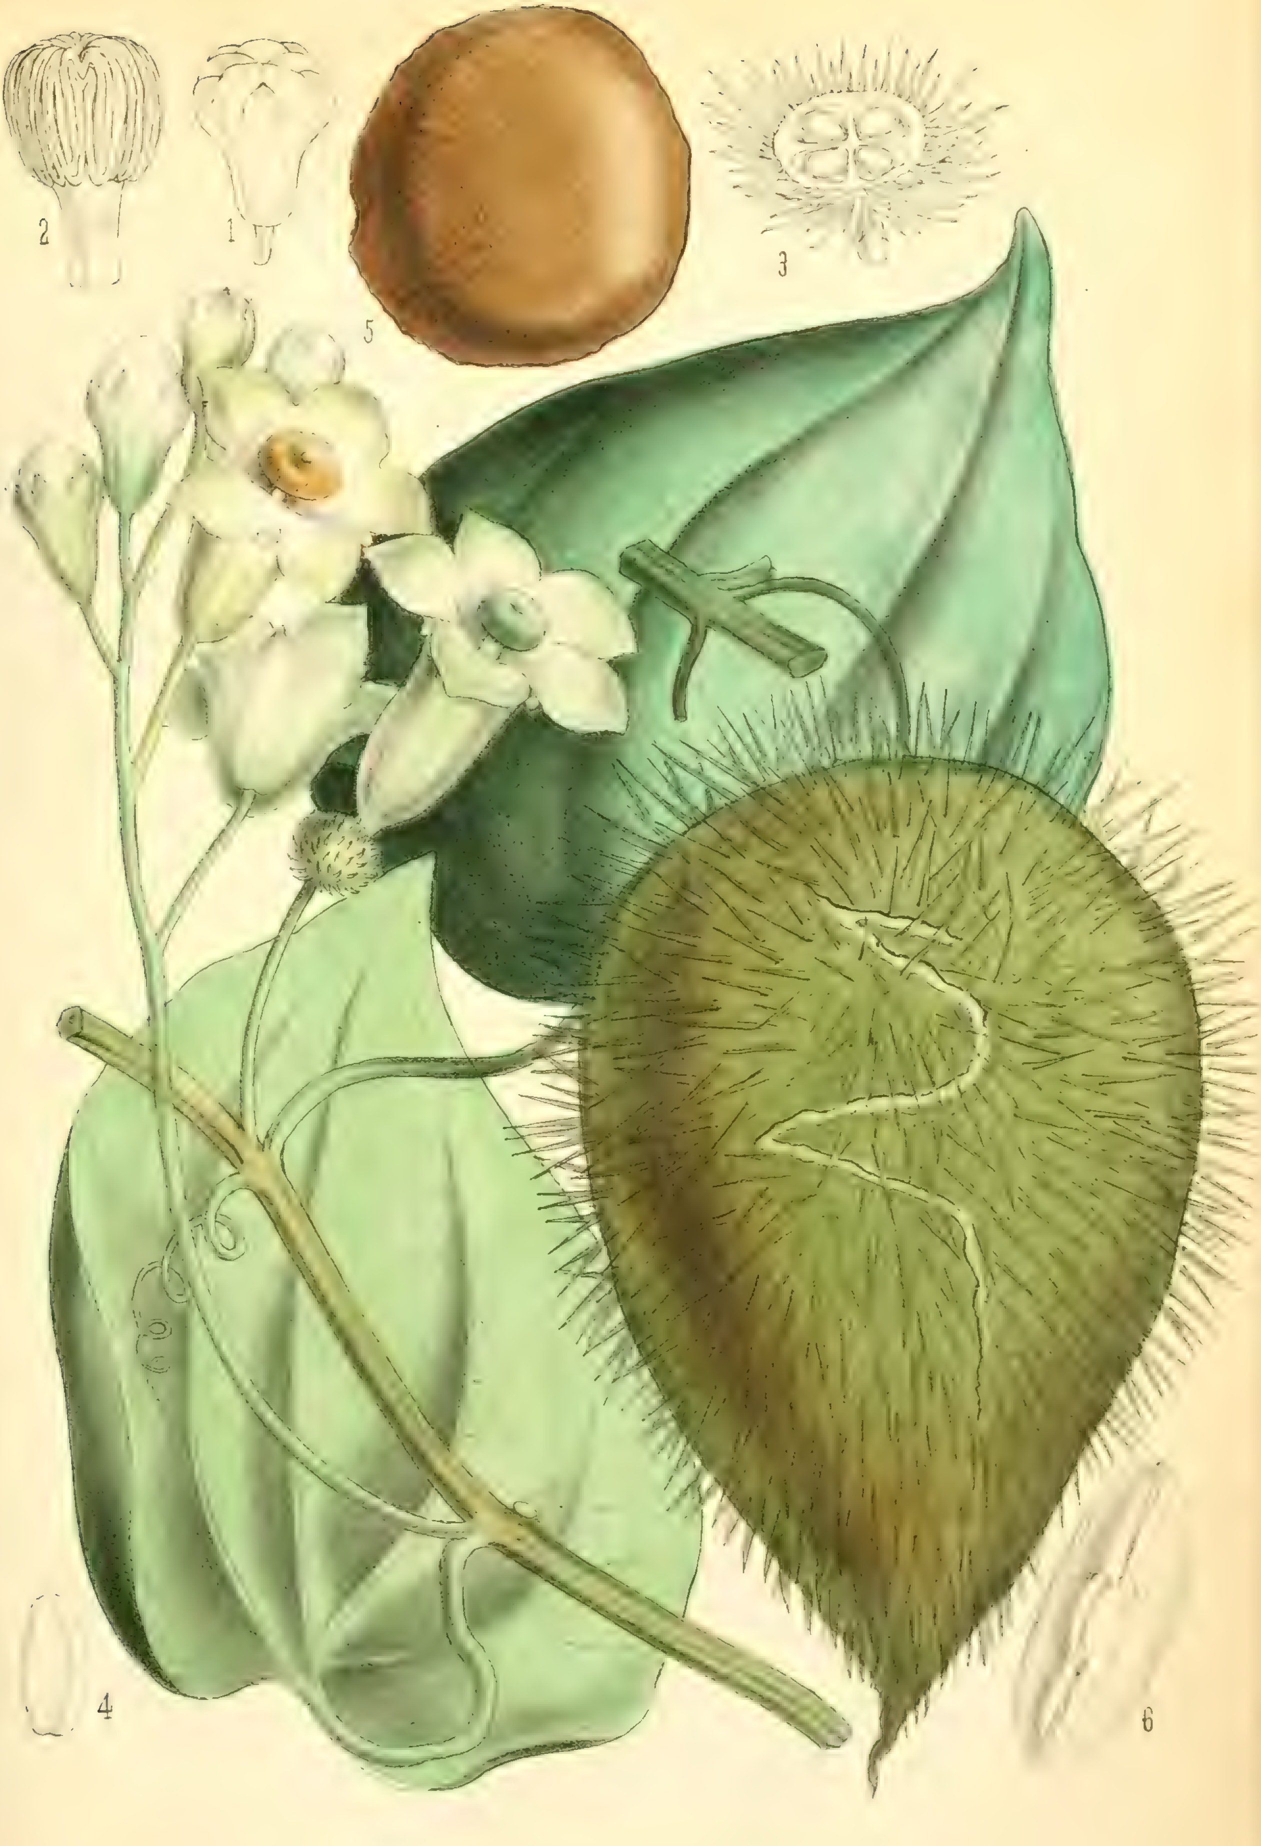
[1] Annales des mines, 4ième. Serie, T. III. Paris, 1843, p. 3.

[2] Verhandlungen des naturhistorischen der preussischen Rheinlander etc. Año 23 págs. 3 y 17.

El Sr. Dr. Krantz hace observar que es extraño que no se haya tomado en ninguna parte el peso específico de este mineral, que se cita hace más de 20 años, en los manuales de mineralogía, y que es en la Domeykia de Paracatas = 7.716.

Segun el Sr. Bergemann, la Domeykia de Paracatas se funde con facilidad en glóbulo blanco, exhalando humo arsenical y quedando un glóbulo rojo de cobre. Al soplete da con los fundentes las reacciones del cobre. Se disuelve con facilidad en ácido nítrico y en agua régia; es ménos soluble en ácido clorhídrico: lexiviada en un sulfuro alcalino se descompone.

Consta de solo arsénico y cobre, y su composicion corresponde exactamente á 1 átomo As + 6 átomos Cu = 28.32 por ciento As y 71.68 por ciento Cu.



NIETOA MEXICANA.
Schaffner.

LIT DE H. IRIARTE MEXICO

FLORA INDÍGENA.

LA NIETOA MEXICANA.

DESCRIPCION

DE ESTA PLANTA, PUBLICADA EN LOS ANALES DE HISTORIA NATURAL DE LONDRES, ENERO DE 1862, CON EL NOMBRE GENÉRICO DE HANBURIA.

POR BERTOLD SEEMANN.

En el mes de Agosto de 1854 el Sr. D. Guillermo Schaffner encontró cerca de Cordoba, poblacion situada en la region caliente del Este de México, una planta de la familia de las Cucurbitáceas cuyo fruto tenia el mismo aspecto que el Chayote comun ó *Chayotl* de los mexicanos (*Sechium edule* Jacq:) y á la que se designa en aquel lugar, a causa sin duda de esta semejanza, con el nombre de *Chayotillo.*

Sus semillas eran planas de forma casi orbicular y de 2 pulgadas de diametro, revestidas de una epidermis membranosa bastante delgada. Eran tan semejantes á las de una *Fevillea,* que me pareció que muy bien podrian pertenecer á una especie de este género.

El Sr. Schaffner á quien comuniqué esta opinion, no la admitió de ninguna manera, sino por el contrario, con el examen de ejemplares más completos de que podia disponer, se afirmó en la creencia de que el *Chayotillo* era el representante de un género nuevo bastante notable, distinto de la Fevillea, por sus frutos cerdoso-erizados, además de otros caractéres.

Con objeto de convencerme de lo que hubiese de cierto sobre el particular, acompañé, en una carta que dirigí á nuestro amigo Mr. Scheer, de Northfleet, un fragmento de la planta en cuestion, el que despues fué ofrecido en mi nombre, al herbario de Mr. W. J. Hooker. Este fragmento, del que Mr. Fitch hizo un dibujo para ser publicado en la «Bonplandia,» fué cuidadosamente examinado y comparado con todas las Cucurbitáceas del citado herbario y de otros tambien bastante extensos; pero ni en ellas, ni en las descripciones ó figuras publicadas, encontré un tipo que se aproximase á la notable planta remitida por el Sr. Schaffner. Satisfecho enteramente de que era un género nuevo, aproveché la oportunidad de honrar á mi estimado amigo Daniel Hanbury, designándola con el nombre de *Hanburia* en un trabajo que leí ante la Sociedad Lineana de Lóndres, en 1º. de Julio de 1858 y publicado en 15 de Agosto del mismo año en la « Bonplandia,» (vol. VI, pág. 293): los caractéres genéricos quedaron entónces imcompletos, á causa de los imperfectos materiales de que solo podia disponer. En parte puedo ahora remediar este defecto, pues poco despues de publicado mi trabajo, fueron encontrados en el jardin real de Kew dos dibujos y una relacion acerca de esta planta, que desde el año de 1850 habia remitido el Sr. Hugo Fink, de Córdoba, al Sr. W. J. Hooker, quien generosamente los puso á mi disposicion: la descripcion que aparece en dicho documento, aunque su estilo no es rigorosamente botánico, es como sigue:

«Planta perenne: las raíces aun no han sido examinadas. Tallo pentágono, sólido y muy fibroso: las fibras muy resistentes, pudiendo servir para fabricar cuerdas; trepando por medio de zarcillos á una altura de 60 ú 80 piés, cubriendo enteramente los arboles. Tan luego como llega á la extremidad de las ramas de éstos, sigue creciendo hácia abajo, exactamenie como la *Vainilla* ó la *Begonia scandens*. Hojas acorazonadas, lisas, lustrosas, con un largo peciolo flexuoso. Flores blancas, axilares y terminales; corola quinque partida en forma de campana; caliz de cinco divisiones, cubriendo la mitad del tubo de la corola y terminando en cada interseccion de ésta en un pequeño diente. Estambres unidos, formando un tubo, que termina en una masa pentagonal, casi redonda, de la forma de un badajo de campana: esta masa, formada por las anteras, está dividida en cinco partes, cada una de las cuales se divide interiormente en tres surcos dobles longitudinales para dar salida al pólen: este último esta cubierto de un frágil tegumento que se abre á lo largo. Flores masculinas y femeninas. (En más de veinte ocasiones que he estado en los lugares donde crece esta planta, jamás habia visto una flor femenina, mientras las masculinas son muy abundantes en todas las estaciones. Habia perdido casi la esperanza de hallar alguna, cuando la última semana casualmente, descubrí unos frutos maduros en el momento de abrirse; de los cuales tomé cinco ó seis para examinarlos detenidamente. Al presente no he encontrado ninguna flor femenina; pero haré lo posible para obtenerlas). Fruto oval, agudo en el ápice y coronado por la cicatriz del cáliz (ó de la corola?), cubierto con numerosas espinas, de una ó dos pulgadas de largo. Ovario adherente, solitario, de cuatro celdillas; óvulos solitarios, adheridos á una placenta en forma de columna, que termina en cuatro uñuelas, parecidas á las de un animal; en la extremidad de cada una de ellas está detenido un óvulo, de los cuales uno ó dos raras veces llegan á la madurez. Semillas planas con la testa córnea; la membrana interna delgada y provista de venas; perisperma muy abundante, amargo y dotado de propiedades purgantes, pero teniendo el sabor de nuez despues de cocido; embrion muy pequeño y plano tambien; cotiledones foliaceos y mucilaginosos; radícula derecha dirigiéndose al hilo: desapareciendo, en fin, el saco embrionario cuando madura la semilla.

«Todas aquellas partes de la planta que no están bien expuestas al sol, sus frutos no llegan á madurar. La parte carnosa del epicarpo exuda una goma tan clara como el cristal.

«El mesocarpo está formado de numerosas fibras entretejidas, de un color blanco.

«Esta planta se encuentra únicamente en las montañas de Mactlactleahuatl, ó en los lugares inmediatos. Florece todo el año, pero solo á fines de Agosto y Setiembre maduran sus frutos.

«Las ardillas comen con avidez las almendras; mas las espinas de que están cubiertos los frutos les impiden el poderlas tomar; pero familiarizadas con su modo de abrirse, cinco ó seis de ellas permanecen en acecho todas las mañanas, y tan pronto como revientan los frutos se apresuran á devorar las semillas. Es de notar que este fenómeno se verifica solamente en los frutos maduros cuando son heridos por los rayos del sol y que el choque es tan fuerte que se desprenden por su pié y caen en tierra, miéntras las semillas son arrojadas en distintas direcciones. Es tambien muy curioso el mecanismo de la dehiscencia: tiene lugar por lo comun á las siete de la mañana en un dia de buen sol comenzando en un punto de la superficie del fruto, y extendiéndose de ahí la incision, dando vuelta, hasta llegar á su punto de partida; las dos mitades una vez separadas, giran una sobre otra y hacen que se encorve la columna placentaria, al mismo tiempo que las semillas son despedidas con fuerza á algunas varas de distancia: de esta primera seccion circular parten otras que dividen al fruto en varias porciones. El primer tiempo de la operacion dura medio minuto y el segundo un minuto.»

Los caractéres principales de la *Hanburia*, son: corola campanulada, estambres monadelfos, anteras colocadas longitudinalmente, estigmas sostenidos por un largo estilo, óvulos solitarios y pendientes, frutos, en fin, cerdoso-erizados, y dehiscentes como los de la *Momordica*. Por sus estambres monadelfos y frutos cerdoso-erizados se aproxima a la *Cyclanthera*; pero la corola en este género es hemisferica, las anteras están dispuestas trasversalmente, el estigma es sentado y los óvulos son horizontales é indefinidos. Por sus óvulos definidos y forma de las semillas, tiene cierta relacion con la *Fevillea*; mas los frutos de ésta no son dehiscentes ni están cubiertos de espinas. En un nuevo arreglo de las Cucurbitáceas, probablemente la *Hanburia* formará el tipo de una tribu distinta.

HANBURIA. Seem in «Bonplandia,» vol. VI, p. 293 (1858); et «Bonplandia,» vol. VII, p. 2 (1859). Char. gen. emend.—Flores monoici. Masc. *Calix* campanulatus, 5-dentatus. *Corolla* campanulata calyci adnatim inserta 5-fida, lobis triangularibus acutis. *Staminum* columna elongata in discum peltatum orbicularem margine antheriferum desineus; *anteræ* longitudinater adnatae. *Foem*. *Calyx* tubo oblongo cum ovario connato, limbo 5-partito. *Corolla* maris. *Ovarium* inferum, 4-loculare, loculis 1-ovalatis. *Ovula* pendula axi centrale adnata. *Stylus* elongatus. *Stigma* peltatum. *Bacca* ovata, pulposa, setoso-echinata, maturitate elastice irregulariter rupta. *Semina* pauca, plana sub-orbiculata, margine incrassato cincta. *Embryonis* exalbuminosi, cotyledones foliaceæ. . . . Herba Mexicana, glabra, rhizomate perennante, caule 5-angulato, foliis longe petiolatis, cordatis, acuminatis, integerimis, cirrhis simplicibus spiraliter tortis, floribus axilaribus v. terminalibus pendunculatis albis, masculis racemosis fœmineis solitariis.

Species unica.—*Hanburia mexicana.*

Nomen vernaculum mexicanum, *Chayotillo,* Prope Córdoba, reipubl, Mexican. (W. Schaffner!)

SECRETARIA

DE LA SOCIEDAD MEXICANA DE HISTORIA NATURAL.

(SESION DEL DIA 26 DE AGOSTO DE 1875.)

Documento que acredita que el Sr. D. Guillermo Schaffner tiene derecho
de prioridad científica
en el descubrimiento de una planta de la familia de las Cucurbitáceas, que designó bajo el nombre de "Nietoa
Mexicana" en honor de nuestro compatriota, el entomologista D. José Apolinario Nieto.

El que suscribe tiene la honra de presentar á esta respetable Sociedad una carta del Sr. Dr. Scheer, de Lóndres, fechada en 21 de Julio de 1855, en la que expresa el citado Doctor, que la Cucurbitácea que recibió con mis cartas de fecha 1°. y 26 de Mayo del mismo año, bajo el nombre de *Nietoa mexicana,* (Schaff. n. spec. et gen in littoris), segun su exámen botánico, no es un género nuevo, sino simplemente una nueva especie del género *Fevillea* de Linneo.

Pero con verdadero asombro el que suscribe vió, trascurrido algun tiempo, que la referida planta despues de haber pasado á manos del Sr. Dr. Seemann, este último la publicó como un género nuevo, con el nombre de *Hanburia mexicana.*

Aun suponiendo que el doctor Seemann no hubiese sido informado de mi anterior determinacion por el doctor Scheer, no puedo consentir de ninguna manera que se me despoje de un derecho que tan justamente me corresponde.

Por lo que suplico á esta respetable Sociedad, en vista de los certificados que atestiguan la verdad de lo expuesto, revindique mis derechos de prioridad en el descubrimiento de la *Nietoa mexicana.*

Agosto 26 de 1875.

GUILLERMO SCHAFFNER.

Habiendo suscrito la anterior solicitud los Sres. D. Manuel M. Villada, y D. Fernando Altamirano, miembros de la Seccion de Botanica, fué puesta á discusion, y como resultado final, en vista de los documentos presentados por el Sr. Schaffner, la Sociedad opinó de conformidad con lo que solicita, y acordó se insertase en su periódico esta parte de la acta al pié de la descripcion del Sr. Seemann.

MARIANO BARCENA,
Primer Secretario.

EXPLICACION DE LAS FIGURAS PARCIALES DE LA LAMINA.

1. Boton de una flor masculina.—2. Androceo.—3. Seccion trasversal del fruto.—4. Embrion.—5. Semilla vista de frente.—6. id. de perfil.

Nota. Como se indica en la figura correspondiente, la dehiscencia puede hacerse tambien de una manera irregular y distinta de como se expresa en el texto.

SINONIMIA vulgar y científica de algunas plantas silvestres y de varias de las que se cultivan en México, dispuesta en órden alfabético por el Sr. D. Alfonso Herrera, socio de número. [1]

DESCRIPCION

DE

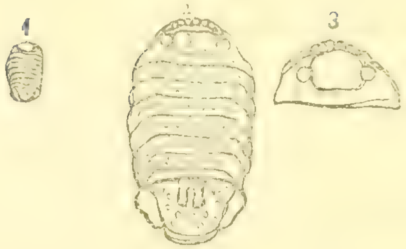
UN CRUSTÁCEO FÓSIL DEL GÉNERO SPHEROMA

(SPHEROMA BURKARTII)

Y RESEÑA GEOLOGICA DEL VALLE DE AMECA DE JALISCO,

POR EL SEÑOR DON MARIANO BÁRCENA, SOCIO DE NUMERO.

Acabo de observar un hecho muy importante para el estudio de la paleontología mexicana, es decir, para el conocimiento de los séres que habitaron nuestro territorio en los tiempos prehistóricos, y en consecuencia, para la determinacion del aspecto físico, de las circunstancias meteorológicas etc., que entónces existian en las superficies que hoy ocultan las capas terrestres, depositadas posteriormente sobre aquellas que habitaron los animales cuyas especies no se encuentran ya en la fauna propia de la época actual.



1. Tamaño natural. 2. Aumentado. 3. Fragmento id.

En las tierras encontradas á 268 *metros* de profundidad, en la perforacion artesiana que mandó practicar el Sr. D. Ignacio Cañedo, en el valle de Ameca de Jalisco, se encuentran unos restos fósiles, cuyos caractéres cito á continuacion y corresponden á un crustáceo acuatico del género *Spheroma* de Latreille. Cuerpo oval de 0,005 de longitud. Cabeza elíptica adornada de un reborde en sus contornos superior é inferior y de dos líneas curvas en forma de x hácia la frente. Ojos laterales, abultados, metidos en dos escotaduras interiores que presenta el primer anillo torácico. Cuatro antenas, dos superiores robustas y dos inferiores más delgadas: en la primera se notan tres artejos gruesos, comprimidos, y dos alargados que se ocultan debajo de los anillos torácicos sin que sea posible examinar sus extremidades. En la boca se percibe el labio superior, parte de la lengüeta y los extremos de dos pares de patas que probablemente ayudaban en la masticacion. El tórax está formado de siete anillos adornados de manchas y puntos pequeños un poco más oscuros que el color gris parduseo-amarillento de los anillos: estos son semejantes entre sí y se les notan con mucha claridad las placas epimerianas que son de figura subcuadrilátera y se hallan imbricadas recubriéndose recíprocamente en una corta extension: las del primer segmento tiene una ligera escotadura en su borde externo que las distingue de las demás. Abdómen compuesto de dos segmentos desiguales: uno más angosto que los torácicos y el otro que forma la cola es alargado y bastante, convexo; en su extremo inferior tiene un pequeño reborde y en las extremidades de su línea superior presenta dos nadaderas alargadas que se aplican sobre sus bordes laterales y llegan á los ⅔ de su longitud: hácia la parte média de la cola, é inmediatos á la línea superior, se le perciben dos tubérculos que se unen por la base y forman una especie de lira. No se observan las patas en los ejemplares que he examinado. Algunos de estos están enroscados formando esferas más ó ménos completas.

Si comparamos los caractéres mencionados con los correspondientes al género *Spheroma* de Latreille, encontrarémos las semejanzas necesarias para colocar el fósil de que trato en ese género, pues los principales caractéres que le asignan los autores son: «Cabeza terminada por un reborde saliente: ojos laterales colocados en una escotadura del primer anillo torácico: dos pares de antenas desiguales: abdómen formado de dos partes tambien desiguales, una semejante á los anillos del tórax y otra alargada, convexa, de mayores dimensiones y provista de dos nadaderas bilaminares en los extremos del borde superior. El animal puede enrollarse en forma de esfera.» En consecuencia, podemos clasificar el referido fósil en el grupo de los *Crustáceos Isopodos*, familia de los *Spheronianos* y en el género *Spheroma*.

Al lado de los caractéres genéricos mencionados encontramos otros secundarios, que pueden servirnos para especificar el individuo á que nos referimos, como son: «*la forma y número de los primeros segmentos de las antenas, las líneas que adornan la frente; la igualdad de los anillos tóracicos y los puntos y manchas desordenadas que presentan; la forma y dimensiones del primer anillo abdominal que es mas pequeño que los torácicos; la figura subcordiforme y dimensiones del segundo segmento; los tubérculos en forma de lira que lo adornan y la forma y dimensiones de las dos nadaderas caudales.*"

No conozco ninguna esferoma que posea todas estas particularidades, que, añadidas á la que presenta el yacimiento donde fué encontrada la que describo y que citaré á continuacion, marcan una diferencia muy notable para fundar una especie de esferoma fósil, propia de México, que designo con el nombre de *Spheroma Burkartii* en honor de mi sabio amigo el Dr. D. José Burkart, á quien tenemos que agradecer los muy importantes estudios científicos que hizo durante su permanencia en nuestro país en los años de 1825 á 1834.

Las esferomas se presentan al estado fósil desde los terrenos mesozoicos, continúan en los cenozoicos y se las encuentra finalmente viviendo en los mares actuales adheridas generalmente á las rocas submarinas. Estas circunstancias me estimulan á hacer algunas observacioues acerca del yacimiento en que fué encontrada la *Spheroma Burkartii*.

El valle de Ameca, de donde procede esta especie, se halla en el 5.º canton del Estado de Jalisco y está situado entre los 20º 32' y 20º 41' latitud N. y los 4º 42' y 5º 8' longitud O. de México.

El objeto de este artículo no me permite extenderme sobre las circunstancias geológicas del aquel valle y que ahora me ocupo en determinar; mas para clasificar el yacimiento citado señalaré algunos de sus caractéres geológicos mas notables.

El referido valle está comprendido entre dos cejas montañosas de gran altura, su respaldo N. lo forma la cordillera de Ameca, cuya altura determiné á principios de este año y es de 2467 metros sobre el nivel del mar y de 1227 sobre el de la ciudad de Ameca; esas montañas están formadas de vacia metamórfica, pizarras micáceas, pórfidos dioríticos y rocas sieníticas. Las primeras pertenecen al período cretáceo y las masas pirogénicas al terciario, en el cual tuvo lugar el levantamiento de aquellas montañas. En el respaldo S. hay otra cordillera elevada donde se encuentran rocas análogas á las anteriores, pero en los agentes del levantamiento dominan los pórfidos, las traquitas y los basaltos. El cerro mas elevado de esas cordilleras es el de la Tetilla, cuya altura es de 2684 metros sobre el mar y de 1243 sobre el plano de la ciudad.

La gran oquedad que quedó despues del levantamiento de aquellas montañas fué llenándose sucesivamente por sedimentos arenáceos y arcillosos hasta formar los terrenos planos y los declives laterales que hoy constituyen el valle; en su *talweg* principal corre el rio Piginto ó de Ameca, que nace al N. E. del mismo valle en las inmediaciones de Teuchitlan.

En los lechos lacustres que pueden observarse hasta las profundidades de 6 á 10 metros en las paredes de los arrollos, se ven varias capas arcillosas alternando con otras de arena, de trípoli y de guijarros de varias dimensiones. Todos esos lechos expuestos á la vista, pertenecen al período posterciario, como lo demuestran los restos de *Mastodon, Elephas* y *Box* que contienen y son análogos á los que se extraen de los terrenos posterciarios del Valle de México.

Igual clasificacion puede asignarse á las capas cortadas hasta la profundidad de 40 metros en la perforacion artesiana, de que he hecho referencia, porque están formadas de fragmentos de rocas análogas á las ántes citadas, y aun á la profundidad de 55 metros hay fragmentos de basaltos terciarios como los que asoman á la superficie del terreno en las montañas cercanas al lugar en que se halla la perforacion.

Tuve á la vista una coleccion de las rocas extraidas á diversas profundidades y el corte que de aquel pozo artesiano hizo el ingeniero D. Juan Ignacio Matute: con estos datos y las observaciones que practiqué hace poco tiempo sobre aquel terreno, he podido hacer las comparaciones que acabo de indicar. Desde la profundidad de 55 metros en adelante se hace mas difícil la clasificacion del terreno, porque no puede saberse si las arcillas extraidas provienen de depósitos sueltos ó de bancos de vacia que hayan sido pulverizados por los instrumentos perforadores.

Despues de los 55 metros se encuentran grandes depósitos de arcillas compactas, grises y verdes que alternan con lechos delgados de arena, especialmente á los 168 y 225 metros de profundidad. Se sigue á esta última capa arenosa otro banco de arcilla de 20 metros de espesor que contiene fragmentos pequeños de caliza compacta, y despues aparece un depósito de arcilla arenosa que se apoya sobre una formacion de oolitas calcáreas entre las cuales se encuentran las esferomas. Estas como dije al principio, se hallaron á la profundidad de 268 metros, á la cual se suspendió la perforacion por haberse pegado en el fondo una de las barrenas que no fué posible sacar.

Las arcillas compactas encontradas desde 55 metros hasta el fin de la perforacion, contienen numerosos fragmentos de pirita radiante, y esta circunstancia me hacia sospechar que el taladro hubiese cortado alguna veta metalífera y admitir entonces que las arcillas provinieran de pizarras metamórficas en que estuviera aquella colocada; pero he encontrado tambien las mismas piritas en los depósitos arenosos con todos las caractéres de los cuerpos que ruedan en los lechos de las corrientes de agua, aunque es de extrañar que no se hubiesen sulfatizado aquellas con la humedad.

No encontrando, pues, ningunos caractéres paleontológicos ni litológicos para para calificar con seguridad esas capas arcillosas, tendrémos que referirlas á las mas inmediatas y cuya época de formacion esté determinada. Por la parte superior encontramos las capas lacustres posterciarias, y por la inferior el depósito oolítico en que se hallan las esferomas.

Hemos dicho que estos crustáceos han existido desde el tiempo mesozoico hasta la edad actual; pero es claro que no debemos referirlos á ninguno de esos dos límites, puesto que en la parte superior del terreno existen depósitos posterciarios; y porque en las rocas levantadas por los pórfidos terciarios se encuentran rocas cretáceas en los cerros que encierran el valle de Ameca, y es de suponerse que esas rocas pirogénicas hayan levantado y metamorfoseado todos los terrenos cretáceos, sin que pudieran conservarse las esferomas en tan buen estado como las encontramos y en un lugar tan inmediato á las masas plutónicas.

Debemos, por tanto, suponer que la *Spheroma Burkartii* vivió en el tiempo cenozoico, y muy probablemente en el período terciario. Así lo indican la gran profundidad á que fué encontrada y la diferencia que existe entre las capas arcillosas que tiene sobrepuestas, y los lechos lacustres y claramente posterciarios que se encuentran en la superficie.

Admito, por esas circunstancias, que el yacimiento de ese crustáceo es terciario, que por las diferencias litológicas manifestadas deben relacionarse las arcillas grises al mismo yacimiento, comenzando á contarse el período terciario desde las capas que se hallan á 56 metros de profundidad hasta el límite de la perforacion.

Llegados á este caso nos queda otra dificultad que vencer; y es, la deter-

NECROLOGIA.

El dia 1º de Noviembre del presente año falleció en Mérida, á la edad de 48 años, el Sr. Dr. Joaquin Dondé Ibarra, miembro corresponsal en aquella Ciudad de la Sociedad Mexicana de Historia Natural.

A la edad de 17 años comenzó su carrera profesional en Puebla, bajo la direccion de nuestro distinguido compatriota el Sr. D. Mariano Cal; y á la de 20 obtuvo el título de Profesor en Farmacia. Con la mira de perfeccionar sus estudios vino á radicarse por algun tiempo en la capital de la República, para concurrir á las lecciones del venerable profésor de Farmacia de la Escuela de Medicina de México, Dr. José M. Vargas; y se presentó de nuevo á exámen obteniendo el título correspondiente.

De regreso al Estado de Yucatan y graduado en su Universidad, fundó primero en Campeche, y poco despues en Mérida, una Cátedra de Farmacia, y durante cerca de 25 años se consagró con suma dedicacion, notoria aptitud y desinterés, á la enseñanza de aquella ciencia, de la Química y de la Historia Natural, además de un curso de Química industrial que desde 1870 dió á los artesanos.

Fué uno de los fundadores en 1870, de la Escuela especial de Medicina y Farmacia de Yucatan y de la Sociedad Médico-Farmaceútica, que actualmente existe en la Capital de aquel Estado.

Se ocupó tambien en plantear varias industrias, como la de la tenería y la elaboracion del jabon ordinario, realizando en ellas algunas mejoras, las que, con un desprendimiento poco comun, enseñaba á las personas que podian utilizarlas; estableció además una nueva en el Estado, la fabricacion de los fósforos de seguridad. En la Exposicion de Yucatan en 1871, presentó algunos productos químicos, que merecieron en premio una medalla de 1ª clase.

Sus trabajos científicos se publicaron no solo en los periódicos del país, sino tambien en los de los Estados-Unidos y Europa; entre los más notables mencionarémos los siguientes: "Apuntes sobre la Flora de Yucatan;" "Estudio sobre el Ni-in;" "Análisis de las aguas de Yucatan;" "Preparacion del santonato de sosa," descubierto por él en 1862.

La Sociedad Mexicana de Historia Natural, á la que tuvo un sincero afecto, le es deudora de varios servicios; y al consagrar hoy este recuerdo en las páginas de su periódico á tan benemérito profesor, no hace sino satisfacer un justo homenaje de respeto al mérito insigne, y de gratitud hácia el que le proporcionó algun bien.

México, Diciembre 31 de 1875.

Comision de Publicaciones.

CIENCIAS AUXILIARES.

ANÁLISIS DEL MEZCAL,

POR EL SEÑOR DON VICENTE FERNANDEZ.

Hace ya mucho tiempo que el maguey y algunos de sus productos han sido objeto de diversos estudios, sin que hasta ahora —al ménos que yo sepa— se haya determinado la composicion química del *mezcal*, aguardiente que la industria extrae de aquella planta. Al publicar á continuacion los resultados del trabajo que á fin de llenar ese vacío emprendí, no pretendo haber hecho una análisis completa; solo aspiro á llamar la atencion de las personas competentes, para que ilustren una materia tanto más importante cuanto mas se generaliza en nuestro país el uso de aquella bebida. Hé aquí mis observaciones:

El mezcal tiene constantemente reaccion ácida al tornasol.

En diez clases de mezcal estudiadas, todas tienen un alcaloide desconocido para mí, al cual provisionalmente he llamado *agavina*.

En doce, todas han contenido ácido acético.

De diez, ocho han tenido ácido clorhídrico.

En tres, las tres contuvieron ácido valeriánico.

De ocho, cinco resultaron con 42 por 100 de alcohol, y los otros con 39, 40 y 41.—Sus densidades son 0,95 para aquellos y 0,9575—0,9525 y 0,9550 para éstos, á 20° centesimales de temperatura.

Un litro del mezcal mas ácido dió:

Acido acético monohidratado	1.Gr. 3872
,, clorhídrico.	0. 0198
,, valeriánico	0. 0500

Los grados de acidez, tomando la de éste por unidad, fueron:

1ª. clase	1.000
2ª. ,,	1.000
3ª. ,,	0.866
4ª. ,,	0.866
5ª. ,,	0.659
6ª. ,,	0.542
7ª. ,,	0.520
8ª. ,,	0.500

En general precipitan en blanco por el nitrato de plata, y este precipitado se pone rojo á la luz difusa; pero cuando tiene ácido clorhídrico, el color se modifica por el violado que toma el cloruro de plata. El color rojo es debido á la *agavina.*

Se ve que de estas observaciones se puede deducir que el mezcal tiene normalmente 0,95 de densidad, ó sean 17 grados de Carthier, y además

42 por 100 de alcohol etílico.

Acidos acéticos y valeriánico.

Agavina.

58 por 100 de agua.

Analizado el mezcal cualitativamente ha resultado con una composicion média de

Alcohol	420 cc.
Agua	580 cc.
Agavina	1 gramo.
Acido acético	1,3872
Acido valeriánico	0,0500

El ácido clorhídrico, por litro, ha sido 0,0175; pero en mi concepto no es propio del mezcal sino añadido sin saber con qué objeto.

Quiero se sepa cómo he aislado la sustancia que llamo *agavina,* para que proporcionándosela las personas ilustradas, decidan si en efecto es un nuevo alcaloide, ó si no me saquen de mi error.

La fisiología conoce las propiedades de los componentes del mezcal, es decir, del alcohol y los ácidos valeriánico y acético; ahora seria bueno que estudiara las de la *agavina.*

La manera de extraerla es esta:

Con 1 ó 2 gramos de bicarbonato de sosa puro se saturan los ácidos de una botella de mezcal y se destila fraccionando los productos. El primero y segundo son formados de alcohol, el tercero es agua conteniendo la *agarina* casi pura, se evapora espontaneamente ó en el vacío para obtenerla seca.

Sus propiedades son, si no me equivoco, las siguientes:

Azulea fuertemente al tornasol.

Es polarizante, y esta propiedad se observa en el microscopio con el prisma de Nicol y el analizador.

Su acetato es instable.

Forma un clorhidrato que cristaliza en el sistema teseral.

Se combina con el bicloruro de platino y da cubo-octaedros muy perfectos, visibles en el microscopio.

Forma un bisulfato cuyos cristales, microscópicos tambien, son láminas rombales muy agudas.

El nitrato de plata da un precipitado blanco que se vuelve rojo.

El subacetato y el carbonato de plomo lo precipitan y el gas sulfhídrico lo aisla de esta combinacion.

La forma cristalina no se ha determinado.

(El Repertorio. Guanajuato, Enero de 1876.)

NOTICIA

SOBRE LA SEDA SILVESTRE DE MÉXICO Y DESCRIPCION DEL BOMBYX QUE LA PRODUCE.

POR M. A. SALLE.

(Anales de la Sociedad entomológica de Francia, Junio de 1856.)

Habia leido en la notable obra del baron de Humboldt, intitulada: « Ensayo político sobre el reino de la Nueva España» el pasaje siguiente, que llamó mi atencion, sobre la seda indígena de México, dice así: « La Nueva España posée varias especies de orugas indígenas que hilan seda semejante á la del *Bombyx mori* de la China, pero que no han sido suficientemente examinadas por los entomologistas. De uno de estos insectos proviene la seda de la Mixteca, que desde en tiempo de Moctezuma era ya un objeto de comercio. Se fabrican aún hoy dia en la intendencia de Oaxaca, mascadas de esta seda mexicana y que hemos comprado en el camino de Acapulco á Chilpancingo. La tela es áspera al tacto como la de ciertas sedas de la India, que son igualmente el producto de insectos muy diferentes del gusano de seda de nuestras moreras.

En los alrededores de Córdoba (Estado de Veracruz), en la region templada y al pié de la cordillera, casi á una altura de 900 metros sobre el nivel del mar, encontré por la primera vez sobre el guayabo *(Psidium pyriferum)*, en el mes de Marzo, los capullos ó más bien los nidos objeto de esta noticia; en consecuencia propongo llamar al insecto que los produce

BOMBYX PSIDII

Sub rufa, alis anticis lineis duabus arcuatis puncto medio, albidis posticis concoloribus.
Expansio alar: mas 62 mil., femina 85 mil.

Porte y talla del *B. rubi* de Europa, de un amarillo agrisado con largos pelos sobre el cuerpo; las alas superiores más oscuras con reflejos violados vistas de perfil, y divididas en tres partes iguales por dos líneas trasversales blanquizcas; la parte média es más oscura, y arriba, cerca de la primera línea, se encuentra un punto blanquizco: la segunda línea es más arqueada. Las alas inferiores son algo más claras. Lo de abajo es más claro y con una línea arqueada en los dos tercios de cada una de las alas, correspondiendo á la segunda de las alas superiores.

La hembra es más grande y tiene el abdómen mucho más largo y más grueso, es de un color más claro ó más gris; las líneas trasversales son más anchas, pero dispuestas como en el macho; el punto, en fin, es ménos visible.

Las orugas viven sobre el guayabo y tambien sobre una especie de encino. Son velludas y achocolatadas; los pelos poco gruesos, no muy largos, rojizos, sedosos y suaves al tacto, penetrando sin embargo algunas veces en la piel y causando una gran comezon. Habiendo destruido con mis propias manos un nido, en el cual las orugas habian sufrido su metamórfosis, estos pelos, despues de haberme causado una comezon insoportable, me produjeron una erupcion papulosa en los dedos. Son nocturnas y permanecen todo el dia en el nido que casi contiene cien orugas, saliendo al caer la tarde en busca de alimento. Fijan su nido en la extremidad de las ramas y comienzan á formarlo desde el dia en que nacen, y continúan trabajando en sociedad hasta la época de su trasformacion en crisálida.

El capullo ó nido adquiere dimensiones enormes, hasta 80 centímetros de largo: es de una blancura brillante, sobre todo ántes de las lluvias; tiene una abertura hácia abajo por donde caen los excrementos y las orugas que mueren ántes de trasformarse. Las orugas salen y entran al nido á través de los hilos; para metamorfosearse en crisálida permanecen en el centro del nido y agrupan sus capullos los unos al lado de los otros, lo cual se verifica á fines de Marzo; permanecen en aquel estado hasta Junio, época en que nacen las mariposas; éstas salen hácia las cuatro ó cinco de la tarde y no vuelan sino despues de siete horas y ya en la noche: durante los primeros dias nacen solo machos, y despues hembras; cuando éstas han sido fecundadas y han efectuado su puesta, lo que se verifica en seguida, los dos sexos mueren, no habiendo vivido sino cinco ó seis dias. Los huevecillos se abren á los diez y seis dias de su postura. Las pequeñas orugas comen inmediatamente hojas de guayabo ó de encino, segun que los huevecillos han sido depositados en uno ó en otro de estos vegetales. Mi inteligente amigo el Sr. D. J. Apolinario Nieto, me ha comunicado que las orugas desde que nacen hasta su trasformacion en crisálidas, viven y deben nutrirse un poco más de ocho meses y que seria muy difícil domesticarlas.

Estas orugas son muy abundantes en muchas localidades del Estado de Veracruz, y pongo á continuacion los datos siguientes, que he extractado de la «Estadística del Estado libre y soberano de Veracruz», obra impresa en Jalapa en 1831. Se lee en ella, que en Acayúcan se podria establecer muy bien una fábrica para los tejidos de seda silvestre, que es tan abundante en sus cercanías; de este modo se evitaria que la recoleccion de este precioso filamento no se perdiese anualmente, y que el *grano* no llegase á escasearse en los lugares donde naturalmente se encuentran hasta 300 bolsas que llevan cada año los oaxaqueños, disminuyéndose á causa de esto las recolecciones subsecuentes: la tela que se fabricase con esta materia llegaria á ser tan estimada como la del Kien-Cheu entre los Chinos.» En la misma obra se lee: « que en Jalacingo, á 7 leguas de Perote y á diez y seis de Jalapa, no se conoce el gusano de seda propiamente dicho, sino otra especie distinta, diferente en sus metamórfosis, su manera de formar el nido y el resultado de la materia que produce. Una multitud de estas orugas se agrupan en una especie de bolsa suave que forman sobre los encinos y de la que se saca una seda bastante fina, que se llama silvestre ó del monte. No es un hilo que se pueda devanar, sino mas bien una borra ó mota que se hila en malacate, y con la que se hacen tejidos muy regulares, pero que se han abandonado sin saber el motivo.

NOTICIA

SOBRE EL CAPULLO DEL MADROÑO,

POR M. A. SALLE.

(Anales de la Sociedad entomológica de Francia, Junio de 1856.)

Habia leido en el «Ensayo político sobre el reino de la Nueva España» del baron de Humboldt, que «en la provincia de Michoacan y en las montañas de Santa Rosa, al Norte de Guanajuato, se ven suspendidos en diferentes especies de árboles, sobre todo en las ramas del *Arbutus madrogno,* sacos de forma oval semejantes á los nidos de los tordos y caciques. Estos sacos llamados *Capullos de madroño,* son fabricados por un gran número de orugas del género *Bombyx,* de Fabricius, insectos que viven en sociedad y que hilan juntos. Cada capullo tiene 18 á 20 centímetros de largo y 10 de ancho. Son de una blancura brillante y formados de capas que se pueden separar unas de otras. Las capas interiores son más delgadas y de una trasparencia extraordinaria. La materia de que están formadas estas grandes bolsas se parece al papel de China; el tejido es tan tupido, que casi no se descubren los hilos que están pegados trasversalmente unos sobre otros. He encontrado un gran número de *capullos de madroño* descendiendo del Cofre de Perote hácia Las Vigas, á una altura absoluta de 3,200 metros. Se puede escribir en las capas interiores de estos capullos, sin recibir ántes ninguna preparacion; es un verdadero papel natural, del que los antiguos mexicanos sabian sacar partido pegando muchas capas para formar un carton blanco lustroso. Las orugas son de un color aceitunado, tirando sobre el negro y provistas de pelos. Su largo es de 25 á 28 milímetros. No hemos visto sus metamórfosis, pero hemos observado que á pesar de la belleza y el lustre extraordinario de esta seda, seria casi imposible sacar partido de ella á causa de la dificultad de devanarla, pues como muchas orugas trabajan juntas, sus hilos se cruzan y se entrelazan mútuamente.»

Tuve el gusto el 2 de Junio de 1855, descendiendo de la vertiente oriental de la Cordillera, entre el pueblo de Maltrata y la villa de Orizaba, á una altura de casi 300 metros, de encontrar sobre un pequeño árbol de madroño, cinco ó seis de estas bolsas de que habla Humboldt. Ví por la abertura que está abajo, que contenian un gran número de crisálidas de lepidópteros diurnos, pegadas al derredor de las paredes interiores; segun su aspecto pensé que podian pertenecer a una especie de *Hespéride,* por sus antenas en masa, no siendo *Bombyx* como pensaba Humboldt. El Dr. Boisduval me hizo notar más tarde, que pertenecian á su género *Euterpe* y que el hecho de mariposas de México, viviendo en sociedad habia sido ya señalado por M. Westwood.

Efectivamente, este señor publicó en 1834, en las « Transacciones de la Sociedad entomológica de Londres, » vol. I, pág. 38, la historia detallada de semejante capullo, bajo el título: *On á gregorious species of Butterfly from Mexico,* acompañada de una lámina, y segun la diseccion que hizo cuidadosamente de una crisálida seca, vió bastante bien la mariposa para hacer la descripcion de un género nuevo que llamó *Eucheira socialis,* pero parece que no tuvo conocimiento de la observacion del venerable y sabio viajero que he citado más arriba.

Hasta ahora solo he tenido ocasion de examinar las orugas del *B. psidii,* y he creido reconocer en ellas los caractéres de un género más moderno que el *Bombyx* ó si se quiere una simple subdivision de él, y que lleva el nombre de *Cnethocampa,* aludiendo á la propiedad urticante de los pelos, de que tan abundantemente están provistas las orugas de sus diversas especies. Las que pertenecen á la fauna europea, con particularidad la *C. processionea* y *C. pityocampa,* se propagan en grande abundancia en los bosques, ocasionando graves perjuicios en los árboles y que no compensan con la utilidad que puede obtenerse de la seda de sus capullos. Las orugas todas que pertenecen á este grupo, tienen instintos de sociabilidad bastante notables, hilan juntas un capullo comun que encierra otros más pequeños, en donde cada una sufre su trasformacion en crisálida.

De la especie mexicana podemos decir que es tan hermosa y abundante la seda de sus capullos, que su explotacion en grande escala daria resultados muy satisfactorios; bastando solo dirigir prudentemente su recoleccion en los lugares mismos donde naturalmente se procrea este lepidóptero, pues en los dilatados bosques en que vive encuentra siempre un alimento abundante y las mejores condiciones para desarrollarse: por otra parte, no cabe duda que se encontrarian medios fáciles y expeditos para vencer el inconveniente que presenta para su preparacion industrial, la construccion especial del capullo y los que dependan de la materia misma de que está formado.

Respecto de la especie que procrea en el madroño á la inversa de la anterior, solo he tenido en las manos el insecto perfecto y sus caractéres: como lo indicó Boisduval, corresponden á su género *Euterpe.*

C. G.—Cabeza de tamaño mediano, erizada de largos pelos sedosos, rígidos, poco apretados; palpos largos, separados, sobrepasando mucho á los ojos y abundantemente provistos de pelos rígidos bastante largos; su último artículo delgado, acicular, casi desnudo, notablemente más corto que el segundo, que es muy largo; antenas largas de articulaciones bien marcadas, terminadas por una masa ovoide y algo comprimida; abdómen de un largo mediano y tambien comprimido ligeramente, no sobrepasando á las alas inferiores; alas medianamente robustas, de celdilla discoidal cerrada, las inferiores abrazando muy poco el abdómen por debajo.—*Boisduval.*

C. E.—Cuerpo casi negro por encima y blanquizco por debajo: ojos y patas pardo-oscuro; alas en la cara superior de un pardo casi negro, con dos series de manchas blancas trasversales: unas submarginales y más pequeñas y las otras un poco más atrás de la mitad de las alas; en la cara inferior el color es mucho más claro y las manchas ménos aparentes. La forma de las superiores es subtriangular con el ángulo apical arredondado; las inferiores obovales y pestañosas especialmente en su borde interno: envergadura 5 centímetros. Macho.

De las dos especies de México descritas por Boisduval, *E. charops*, y *E. nymbice*, creemos que la del madroño corresponde á esta segunda, mas si como parece, el nombre de *Eucheira socialis* impuesto por Westwooel, es anterior, tiene sobre aquel derecho de prioridad para ser preferido.

Febrero 15 de 1876.

Manuel M. Villada.

SECRETARIA

DE LA

SOCIEDAD MEXICANA DE HISTORIA NATURAL.

DOCUMENTOS INTERESANTES.

DISCURSO

LEIDO POR EL SR. DR. ANTONIO PEÑAFIEL Y BARRANCO, EN LA SESION SOLEMNE
CELEBRADA EL DIA 29 DE JULIO DE 1875,
EN CONMEMORACION DEL DISTINGUIDO NATURALISTA MEXICANO,
D. JOSE APOLINARIO NIETO.

SEÑORES:

La Sociedad de Historia Natural debe un tributo de gratitud al Sr. D. José Apolinario Nieto, uno de sus socios, que dejó de existir en Córdoba el 21 de Diciembre de 1873, á la edad de sesenta y tres años.

México ha perdido un modesto y laborioso sabio, dedicado por mucho tiempo á varios ramos de las ciencias naturales y especialmente á la Entomología, con la abnegacion y constancia de los Alzates y de los Olivas.

La guerra de Independencia alejó de la ciudad de Orizava en 1810, á los padres del Sr. Nieto, D. Mariano Nieto y D.ª Juana Palestino, al pueblo de San Miguel Hiloxochitlan, en donde nació nuestro naturalista: perdió á su padre á la edad de nueve años, sin haber recibido hasta entónces educacion alguna y quedando en la mayor penuria. A la edad de quince entró á una escuela de primeras letras donde concluyó su instruccion primaria en corto tiempo, y despues aprendió el oficio de sastre para aliviar á su madre en la pobreza. Tuvo un protector, el Sr. D. José María Aguilar, quien conociendo su aplicacion al estudio le llevó á su lado, señalándole un pequeño sueldo. La casa del Sr. Aguilar tenia numerosas relaciones en Orizava con personas instruidas, tanto mexicanas como extranjeras, con las que tuvo conocimiento el Sr. Nieto. Recomendado á esta casa vino el naturalista francés Alexandro Lesueur, comisionado por Chevrolat para formar la primera coleccion entomológica mexicana, que llegó á Francia en 1832. Nieto trabajaba con entusiasmo viendo con admiracion la primera caja de coleópteros que encerraba las formas variadas de los obreros que la naturaleza ha provisto de curiosas herramientas y pintado de magníficos esmaltes. Al ayudar á Mr. Lesueur, ambos no conocian mas que sus respectivos idiomas, pero mutuamente llegaron á enseñarse lo necesario para comprenderse, y Nieto perfeccionó más tarde sus estudios en el idioma francés hasta hablarlo y conocerlo con toda propiedad y correccion. La honradez de Nieto le valió una amplia confianza de su protector, quien al fallecer entregó sus intereses á su buena fé; entónces dedicó sus horas de descanso á la instruccion de sus hermanos.

En 1838 se separó de Orizava y se trasladó á Córdoba, en cuya poblacion contrajo matrimonio y adquirió despues la Hacienda de Toxpan ó San José de las Lagunas; procuró allí hacer aplicaciones útiles de sus conocimientos de Historia Natural, haciendo esfuerzos, aunque sin conseguirlo, de aclimatar el gusano de seda de la China, logrando solamente en este clima destructor de las crisálidas, la aclimatacion de grandes plantíos de morera, con lo que consiguió adelantar más de la mitad del camino en la resolucion del problema; lo demás es obra de constancia y cuidado para resolverlo como en Oaxaca y Morelia.

En 1845 volvió de nuevo á Orizava para educar á sus hijos; pues ya en este tiempo el Estado de Veracruz comenzaba á distinguirse entre los demás de la República, por su proteccion á la instruccion primaria. Guiado de su carácter emprendedor estableció una máquina para fabricar ladrillos, y no siendo suficiente el consumo de la poblacion, fabricó casas que amueblaba y rifaba por hacer beneficios á la gente pobre, dándose el caso de que repitiera la rifa sin remuneracion, cuando salian premiados sus números sobrantes.

El 4 de Octubre de 1850, de regreso de un viaje de México, fué asaltado en el lugar llamado *Rio-prieto* por una partida de malhechores, de los cuales uno, tomándole equivocadamente por el juez, que anteriormente le habia sentenciado, le disparó un tiro de pistola, en el acto de poner el pié en el estribo del coche: el proyectil penetró por el cuello al lado izquierdo del pecho, quedando cubierto por las costillas, sin poder extraerse. Este accidente privó al Sr. Nieto de la mayor parte de sus facultades físicas, causándole constantes padecimientos, que no fueron un obstáculo para que continuara en Córdoba sus tareas científicas, colectando para las sociedades de Europa multitud de especies de coleópteros, entre las que se encuentran varias descubiertas por él y que llevan el nombre de su inventor impuesto por la sociedad entomológica de Francia. Una vasta coleccion intacta de esta clase, fruto de muchos años de trabajo, se conserva en poder de la familia.

Los grandes trastornos que han ocasionado las revoluciones en México no interrumpieron sus tareas científicas, ni su empeño y cooperacion en las mejoras materiales. Comprendió la importancia de la meteorología para el porvenir de la navegacion y la agricultura; se dedicó á recoger observaciones importantes cuyos resultados comunicaba á varias sociedades sábias de América y Europa. Estos trabajos no serán estériles para el saber humano: tendrán más tarde sus aplicaciones con la precision del vapor y del telégrafo. Antes de Arago la polarizacion de la luz era conocida de los físicos; el genio le dió aplicaciones, y por medio del prisma se extendió la mirada del hombre hasta la atmósfera de los soles que emplean años en enviarnos su luz. El siglo XIX acopia en las ciencias naturales granos que sembrará mas tarde otra generacion; las aplicaciones de los hechos no pertenecen á un solo hombre sino á la familia humana.

Las sociedades sábias tributaron un homenaje de respeto á nuestro compatriota el Sr. Nieto. En 1855, la Exposicion universal de Agricultura, industria y bellas artes de Paris le concedió una medalla de tercera clase; recibió el diploma de socio corresponsal de la Sociedad mexicana de Geografía y Estadística concedido en Setiembre de 1856; miembro de la Sociedad Entomológica de Francia, en 12 de Setiembre de 1860; socio de la Sociedad Meteorológica del mismo país, en 26 de Diciembre de 1861; honorario de la de Geografía y Estadística mexicana, en 1.° de Setiembre de 1864; miembro de la Sociedad Entomológica de Filadelfia, en 12 de Marzo de 1866; corresponsal de la Sociedad imperial de Aclimatacion de Francia, en 27 de Agosto de 1869, y titular de la misma en 12 de Octubre del mismo año. La Sociedad mexicana de Geografía le dió *un voto de gracias* por haber aclimatado en México la benéfica planta de la QUINA, que floreció en 24 de Noviembre de 1869; recibió una medalla de tercera clase de la Sociedad imperial de Aclimatacion de Francia, por el mismo motivo, en 1870; otra medalla de 1.ª clase concedida por esta misma sociedad, por la *introduccion de varios vegetales en México,* otorgada en la sesion pública de 10 de Abril de 1874, la que llegó depues de su fallecimiento; obtuvo además una medalla de oro, al mérito industrial, de la Exposicion general de México. En la Memoria de los trabajos de la comision científica de Pachuca publicada en 1864, el socio fundador de esta sociedad, D. Manuel Villada y yo, dedicamos al nombre del Sr. Nieto una especie nueva de cantárida que descubrimos en el Estado de Hidalgo.

La Sociedad de Historia Natural fué un objeto de vivas atenciones de parte del Sr. Nieto; le remitió para su biblioteca magníficas monografías del ramo entomológico, y tuvo un grande interés por que se sostuviera la publicacion de su periódico, que sigue sosteniéndose, tanto por la proteccion de sus socios como por la de nuestro gobierno, pues han conocido que sus trabajos tienen por mira la prosperidad nacional. Tenemos en nuestra rica patria materias tintoreales de orígen vegetal, cuyas plantas están por clasificar y sus estudios químicos sin comenzarse: minerales útiles, como el bismuto descubierto en San Luis Potosí por nuestro compañero el Sr. D. Florencio Cabrera, que no entra todavía en las explotaciones importantes de nuestro país; falta perfeccionar con los adelantos de la física, la química y la mecánica el beneficio de los metales que por siglos se han derramado por toda la tierra; los animales mexicanos que deben entrar en el dominio de la agricultura para su propagacion; las preciosas maderas, de que fabrica la ignorancia. . . . . carbon; y tantos ramos inexplorados todavía, que darán más tarde riquezas incalculables á nuestra República. El nombre del Sr. Nieto tendrá que recordarse con grande interés cuando se emprenda por nuestro gobierno la explotacion científica de México. El Estado de Veracruz recordará al Sr. Nieto como el protector de sus grandes empresas materiales; pues cooperó activamente en el establecimiento del ferrocarril y telégrafos de México á la capital de ese Estado.

Los últimos años de su vida los consagró á la aclimatacion y cultivo de varias plantas útiles, principalmente de la quina. Conseguida la aclimatacion de esta planta quedaba el problema de saber si contenia los principios activos y en la proporcion conveniente para sus aplicaciones á la curacion de las fiebres: esta cuestion que fué propuesta por el mismo Sr. Nieto á los químicos de Europa, quedó resuelta favorablemente para la quina aclimatada, y confirmada por los trabajos de esta Sociedad.

La planta de la quina tiene ya su patria en México y se ha propagado con rapidez en los lugares vecinos de Córdoba, en donde la gente pobre usa hasta de las hojas para la curacion de las intermitentes con buenos resultados. La Sociedad mexicana de Geografía y Estadística procura difundirla en todos los climas de la República.

Los padecimientos físicos del Sr. Nieto amargaron sus últimos dias haciendo de él un mártir del trabajo y del estudio: México se honra con su memoria: la ciencia no debe levantar el velo de sus últimos momentos. . . Dejó de existir á la edad de 63 años.

La Historia al inscribir los nombres de los bienhechores de México en el libro de la inmortalidad, debe grabar las siguientes palabras: *José Apolinario Nieto aclimató en Córdoba el arbol de la quina.*

DISCURSO

LEIDO POR EL SR. DR. FERNANDO ALTAMIRANO,

EN LA SESION SOLEMNE CELEBRADA EL DIA 29 DE JULIO DE 1875, EN CONMEMORACION DEL DISTINGUIDO NATURALISTA MEXICANO, DR. LAURO M. JIMENEZ.

SEÑORES:

La ciencia de Hipócrates se ha cubierto de un crespon fúnebre con la pérdida de un hombre que hacia honor á la humanidad, era el consuelo del estudiante desvalido, y el genio observador é infatigable de los misterios de la naturaleza.

El nombre de este ser filantrópico, sencillo, de recta conciencia y firme creyente de la doctrina de Cristo, era Lauro M. Jimenez.

¡Oh maestro querido, levántate y ven á alimentar en mi cerebro la luz de la idea que se extingue: que tu voz resuene entre nosotros pintándonos bellos cuadros de la naturaleza, y que la Patria adorne tu frente con los laureles que supiste alcanzar como profesor lleno de fuego en la difusion de las verdades científicas!

Mas . . . . . ¡Ah! solo tus restos venerandos nos inspiran aún, y la Sociedad á la que seis años perteneciste fundada sin mas medios que la abnegacion y el trabajo, sin otro fin que el conocimiento de los séres de la creacion, sin más recompensa que el progreso de nuestra patria, hoy concurre aquí para manifestar á sus conciudadanos el impulso que diste al estudio de las ciencias naturales.

Feliz esta Asociacion de naturalistas que hoy te presenta como un modelo admirable de trabajo y de virtud. Te reflejas en un cuadro grandioso donde admiramos el patriotismo, la caridad y la religion. Mi pluma es impotente para copiar este precioso conjunto, opacaria los bellos colores producidos por la misma naturaleza, cual una imágen perfecta grabada por el éter luminoso.

Pero la mente de la Sociedad que me honró confiándome una mision propia tansolo de inteligencias privilegiadas, fué que presentara un compendio de sus principales trabajos sobre Historia Natural, recordar que existió este hombre ilustre y que su nombre quedó escrito para siempre en el templo de la fama. No cansaré vuestra indulgente atencion, seré breve y conciso.

Habiendo terminado su brillante carrera de medicina, su espíritu no satisfecho con poseer los medios de que disponia la ciencia para disminuir el sufrimiento, se lanza á investigar las leyes de la naturaleza que su imaginacion le presentaba majestuosa en nuestros fértiles campos, ostentando vegetales gigantescos que al través de los siglos han recorrido la historia de nuestras pasadas generaciones. Allí veía tambien las variadas plantas que el viajero puede encontrar del Polo al Ecuador, ya adornadas de pétalos matizados con brillantes colores, ya encerrando un principio que quita la vida con la rapidez del rayo, ó bien calmando maravillosamente el dolor; ya ofreciendo fibras delicadas, hermosas maderas, exquisitos perfumes, y sobre todo, admirando la sabiduría de su Creador; comprende al fin, que para conocer con más perfeccion el organismo humano, en su desarrollo, extructura, facultades y alteraciones, debia comenzar por adquirir el conocimiento de los séres inferiores.

Su inteligencia percibe un bello horizonte y se lanza atrevido al estudio de la Zoología y de la Botánica, sin instrumentos, sin libros, sin proteccion, pero lleno de fé y entusiasmo para dominar los obstáculos, llegando á ser un insigne botánico.

Una vez dado el primer impulso comenzó á difundir los conocimientos que adquiria, y fué uno de los primeros en dar á conocer el microscopio en México, demostrando á los que lo escuchaban el mundo celular de la Zoología y de la Botánica.

El interes por el estudio de la Historia Natural circula rápidamente, los gobernantes participaban de él procurando fomentarlo, y el infatigable iniciador no se contentaba con buscar aplicaciones de las ciencias naturales á la Medicina, á la Agricultura y á las Artes; sino que al mismo tiempo socorria al desgraciado, formaba el robusto tronco de una familia, y exponia tranquilamente su pecho á las bayonetas del *yankee*, cuando sus huestes pisaban nuestro bello suelo y allanaban nuestros hogares.

He aquí un verdadero patriota: vedlo cómo derrama su sangre por la patria sin reclamarle recompensa, y que vive exclusivamente para ella, dándole nuevos ciudadanos, cultivando la inteligencia de unos, salvando de la muerte á otros, y que extiende la fama de su país presentando al mundo las galas con que la naturaleza lo adorna.

La libertad en tanto marchaba á grandes pasos por un camino regado con sangre, pero que fertilizaba el campo de la ciencia, brindando con el saber al humilde pastor que habita en medio de los bosques, y al opulento aristócrata sumergido en la ignorancia, aumentando los medios para que el pueblo pueda oir la voz de sus maestros, y proporcionando á éstos los medios necesarios para difundir la instruccion: así, repito, fertilizaba el terreno y germinaban las semillas que sembraba Lauro Jimenez entre la juventud.

Hélo aquí ya rodeado de un círculo de jóvenes que escuchan sus lecciones de Botánica, y formando parte de las Sociedades científicas donde presentaba sus trabajos sobre Historia Natural, porque aun no se habia creado la entusiasta Asociacion que tengo hoy el honor de representar.

La « Gaceta Médica » daba á luz una interesante observacion de Myasis, enfermedad producida por un insecto terrible para quien nuestras cavidades naturales, particularmente las fosas nasales, son un palacio que busca con ahinco para depositar sus gérmenes que se trasformarán en una inmensa y temible generacion.

Nuestro naturalista observó que aquel insecto era diverso de los conocidos, esto es, de la *Lucilia Cæsar* ó Mosca dorada y de la *Lucilia hominivora*, con los que presentaba semejanza; pero que se distinguia particularmente por el cambio de colores que se percibe en su cuerpo, variando la direccion de la luz, propiedad que tomó para especificarla con el nombre de *Lucilia versicolor* y estableció una nueva especie de esos inocentes compañeros de nuestras habitaciones, pero que bajo su disfraz pueden ocasionarnos la muerte.

Demostró los recursos de que el médico dispone para combatir los padecimientos aceptando de la naturaleza las plantas tales como ésta se las ofrece; citó los magníficos resultados que habia obtenido con el *Fucus vesiculosus* en la hipertrofia de varios tejidos, é hizo notar un punto que se habia escapado á la sagacidad de otros de sus compañeros: que la accion benéfica de esta planta tal vez no sea debida al yodo que contiene en sus elementos, sino á un principio especial que se haya ocultado al químico, y por ahora solamente la naturaleza sea capaz de proporcionarlo por medio de este producto marino.

Trabajaba además en union de otros ilustrados mexicanos, los Sres. Herrera y Mendoza, cuando entregados por su parte al estudio de una pequeña pero enérgica planta mexicana, la *Comelina tuberosa*, Lauro Jimenez buscaba sus aplicaciones y anunció á la Academia de Medicina, que nuestra flora habia dotado á la ciencia con un agente enérgico para contener las hemorragias, y que estaria al alcance tanto del desgraciado indígena que habita aislado en derruida cabaña, como del feliz ciudadano rodeado de tesoros y de los consuelos de la ciencia.

Lauro Jimenez no solo procuraba el consuelo de sus semejantes, sino el de todo sér dotado de sensibilidad y por lo mismo condenado al sufrimiento; por eso le vemos buscar la causa de la muerte de un caballo, cuyo estómago presentaba á la autopsía las larvas de un insecto que se deseaba conocer, así como los medios de que se vale para derribar un organismo tan superior al suyo.

Sus investigaciones no podian darle la solucion apetecida, porque era imposible en aquellas circunstancias que le condujesen á la última transformacion del insecto; pero su espíritu percibia al través de este velo tupido, un género nuevo de la familia de los *Athericeros*, en cuyo caso lo especificaba con la voz *Gastrus* y seria propio del continente americano.

La misma Gaceta dió á conocer una prueba de la sagacidad de nuestro compatriota, al referir la curiosa observacion sobre el *Chahuistle*. Aquí admiramos á este obrero infatigable de la ciencia recorriendo los campos en una tarde del mes de Julio, para darse cuenta de una enfermedad que ataca tenazmente á los sembrados de maíz.

Se le dice que un insecto era la causa, pero recurre al microscopio y este le revela la verdad; aquel polvo que cubria las plantas era un hongo, un organismo perfecto, que aunque pequeño, su poder destructor era inmenso.

Con este triunfo dotaba á la ciencia de una especie nueva que designó *Licea maidis*, ó como despues quiso llamarla, *Maidis chahuistlea*, y demostró al agricultor el enemigo de sus sementeras y algunos medios para combatirlo.

Sobre esta corriente científica que inundaba á nuestro país, protegido por la paz, bogaba tranquilamente nuestro naturalista, cuando recibe un viento contrario; y al sustentar una oposicion para obtener una plaza en el hospital de San Hipólito, las olas de la envidia y de la injusticia, hicieron naufragar el tesoro de ciencia con que se habia enriquecido; pero su gloria de vencedor no pudieron sumergirla: todos los estudiantes prorumpen en aplausos, honran su mérito y su saber, y le eligen como brillante antorcha que los ilumine en su carrera.

De aquí brotó la Sociedad Filoiátrica: hé aquí un nuevo plantel de estudiantes de medicina dirigido por un insigne naturalista, que les allanará el camino de la ciencia y les marcará una huella luminosa para que puedan llegar á inscribir sus nombres en el templo de la gloria.

Los trabajos de esta Sociedad naciente recorren el mundo científico por medio de un periódico, «El Porvenir,» que el gobierno indulgente ayuda a sostener, y en él aparecen los trabajos del presidente filoiátrico, sobre diversos puntos de Historia natural.

Unas veces comunica a sus discípulos los medios de que se deben valer para formar un museo zoológico, oponiéndose a la destruccion, esa ley misteriosa de la naturaleza que protege el continuo movimiento de los átomos, que los que hoy forman una molécula cristalizada mañana constituyan una celdilla, y que la celdilla que hoy se nutre solamente, despues tenga sensibilidad, y más tarde sea el vehículo de la inteligencia para descubrir las leyes del universo.

Les enseñaba ademas la Taxidermia, esto es, como debian conservar a los representantes de la serie zoológica cuando recorriendo las escarpadas montañas y los perfumados bosques se encontrasen pintados pajarillos de vistosos y delicados plumajes, serpientes venenosas y otros reptiles; en una palabra, todo sér á quien la naturaleza ha animado con el soplo de la vida.

En medio de estos afanes le comunican el proyecto que han concebido seis mexicanos de consagrar una parte de sus fondos y de su tiempo al estudio de la Historia natural, su alma entusiasta recibe con júbilo la invitacion y forma parte de aquel grupo de verdaderos amantes de la ciencia.

El tiempo que le deja libre su clientela lo emplea en concurrir á las sociedades científicas, donde su voz era escuchada con agrado y cuyos periódicos publicaron sus numerosos trabajos sobre ciencias naturales y que omito relataros por no ser prolijo.

Su vida estaba enteramente consagrada á la ciencia y la ambicion no tuvo entrada en aquel noble pecho; seguia rectamente la voz de su conciencia, y ni en momentos críticos en que la única perspectiva de su vida era el olvido y la miseria, se apartó de la divisa que guiaba su existencia: proteccion al estudiante y el concienzudo análisis de los séres organizados.

Presidente perpétuo de la Sociedad que habia formado y que sostenia con heroicos esfuerzos, decidia con su práctica de veinte años las difíciles cuestiones médicas que surgian entre sus filoiátricos, é investigaba solícito las necesidades de sus jóvenes estudiantes para llenar la magnánima mision que habia dictado el honroso lema de esa Sociedad: Filoiátrica y de Beneficencia.

Como excelente botánico no abandonó sus amados vegetales, y miéntras que en la Asociacion naturalista, leia interesantes observaciones como la de esa planta que nos remite el histórico Querétaro, denominada Picosa, que descubrió ser una especie nueva del género *Croton*, en el silencio de la noche se dedicaba en su hogar a disponer segun el método natural, las numerosas plantas indígenas descubiertas por una de las glorias científicas, el Sr. D. Vicente Cervantes.

Este trabajo habia de ser el centro donde debian concurrir todos los conocimientos científicos que habia adquirido en los diversos ramos de las ciencias médicas y naturales. Vendria á formar un faro luminoso que marcase el sendero para la formacion de nuestra bella flora.

Mas ah!.... ved aquí que comienza á opacarse este sol de la ciencia, y pocos instantes despues de haber arrojado sus últimos destellos se eclipsa para siempre. . . . .

La muerte al descorrerle el velo de la naturaleza arrebata á la Academia de Medicina su presidente; á la Sociedad Filoiátrica su fundador; á México un verdadero patriota; á sus hijos el sostén y las caricias, y á la Sociedad de Historia Natural uno de sus laboriosos obreros.

Una víctima más, un hueco en las filas de la ciencia, un combatiente ménos de la inteligencia en la conquista de los secretos de la naturaleza; pero que no es una lucha como la del hombre con el hombre por la vía brutal de las armas.

Pero ah! qué distinta es la recompensa! Miéntras al vencedor cuanto más extermina, cuantas más familias deja en la orfandad, cuanto más hace retroceder las artes y la industria, mas aumenta su gloria, más riquezas se le conceden, más aplausos le prodiga el mundo, y las naciones doblan ante él humildemente la rodilla: el sabio en el presente estado social, sucumbe con las manos tendidas hácia las coronas que se le escapan; deja á su familia envuelta en la miseria, y el mundo le arroja cuando más un puñado de tierra en su fosa para ocultar con él los beneficios que le debe.

Pero no hay que retroceder ante este triste espectáculo, juventud estudiosa: vosotros modificaréis nuestras costumbres, y con la luz de la libertad y el progreso colocaréis al sabio en el lugar distinguido que merece.

Os ha enseñado el camino el primer Magistrado de la Republica. Védle que vigila cuidadosamente la instruccion; jamás se la han prodigado más elementos para su progreso, y aun nuestra Sociedad recibe exactamente de su mano protectora la subvencion que el Soberano Congreso le concede, porque ha comprendido que la ciencia tiene dos aspectos: en el laboratorio del inventor exige cuantiosos gastos; en la fábrica del industrial es fuente inagotable de riquezas.

¡Oh Industriales! acordaos cuando recibis crecidas rentas que ya ha sucumbido gran número de sabios agotados por la fatiga y la miseria. Ceded á sus familias una parte. Y miéntras llega este bello ideal, ¿no habrá entre vosotros, compañeros Naturalistas, alguno que despues de cerrar los ojos del amigo venga á aceptar la herencia de su miseria y sostener sus más caras afecciones? Ved aquí la mision que se habia impuesto Lauro Jimenez: desempeñad su papel.

Ensanchad el campo de la ciencia; multiplicad el número de socios que se entreguen á su culto; enriqueced sus cosechas, y sobre este camino de triunfos y de martirios, curad los heridos y levantad los muertos, exclamando: ¡Gloria al progreso, gloria á la ciencia!

CATALOGO

DE LA

COLECCION DE PRODUCTOS NATURALES INDIGENAS

Remitida por la Sociedad Mexicana de Historia Natural á la Exposicion Internacional de Filadelfia.

INFORME rendido por el Sr. socio D. Fernando Altamirano, de los productos que él presentó á la Sociedad, y que se expresan á continuacion:

GRASAS.

1. Aceite de chia.—Se extrae de las semillas de la *Salvia chian,* que vegeta en la mesa central y se cultiva en varios puntos de la República. Es secante. (Farmacopea Mex.) Yo lo ví usar en Jojutla (Estado de Morelos), por los indígenas, en sustitucion del *axe, (Axe* ó *axin,* materia grasa muy secante, producida por un insecto, el *Coccus axin),* para pintar sus jícaras: esta pintura resiste mucho al agua y al frotamiento, sin desprenderse ni formarse hendeduras. Valor de una libra en México, 37½ cent.

2. Aceite de piñoncillo.—Lo extraje por simple presion de las semillas del *Curcas purgans,* que ví abundantemente en Miacatlan (E. de Morelos), y pueblos cercanos. Lo cultivan generalmente para cercar con ellos las huertas. Producen las semillas el 30 por 100. Es un purgante enérgico en la dósis de 4 gram., que es la que administré á un perro, y tambien produce vómitos. Valor de un cuartillo (medida de granos) que pesa 930 gram., en Miacatlan 0,12½ centavos. Podria usarse en la Medicina.

3. Piñoncillo.—Semillas del *Curcas purgans,* segun el Sr. Herrera. Producen el aceite ya mencionado. A los niños que suelen comerlas, por el sabor agradable que tienen, semejante al del piñon, les producen muchos vómitos y deposiciones. Hoy no se utilizan.

4. Aceite de cacahuananchi.—Lo extraje por medio del sulfuro de carbono, de las semillas que remitió el Sr. D. Francisco Cordero y Hoyos: segun los caractéres de las mismas, me parece que la planta que las produce pertenece á las Timeleaceas. Yo la encontré en Miacatlan; pero vegeta abundantemente en Iguala (segun el Sr. Cordero), donde se desperdician las semillas. El que quiere aprovecharlas, segun el mismo señor, paga solamente 3 reales á un hombre, que puede reunir en un dia 5 ó 6 arrobas. Tiene un olor muy repugnante, y es tan secante que se resinifica muy pronto cuando se muele la semilla, siendo difícil entónces su extraccion por la prensa; se saponifica muy fácilmente dando un magnífico jabon, y se puede usar tambien para barniz. Contiene un ácido graso cuyo punto de fusion es de 88° c., muy propio para fabricar velas.

El olor de las semillas y del aceite lo tiene tambien la madera, que es muy resistente y se utiliza para vigas largas y gruesas, para lo cual se presta el árbol, enteramente recto y bastante grueso.

5. Acido graso del anterior.

6. Aceite de mamey.—Lo extraje de las almendras de la *Lucuma Bonplandii.* A esta especie es á la que mas se aproxima nuestro mamey, segun los caractéres que encontré en sus flores. Se cultiva en Cuernavaca y otras tierras calientes. Los frutos que se consumen en la alimentacion son los que se traen á la capital, y las semillas ó huesos se arrojan á la basura. Los que de allí se recogen se venden á 6 centavos el 100.

Las almendras producen 40 por 100 de grasa á la presion en caliente. No es secante: da buen jabon y buena luz. Se usa como cosmético, por la creencia antigua de que hace nacer el pelo y evita su caida. A las almendras simplemente molidas les dan el mismo uso. El Sr. D. Maximino Rio de la Loza lo extrae para el comercio y lo vende á $ 1 libra.

7. Almendras de mamey.—En el análisis que hice de ellas, además del aceite encontré fuertes proporciones de ácido prúsico, amigdalina y gran cantidad de caseina, que podria utilizarse para formar mastic mezclándola con cal, ó como mordente en la impresion de colores.

8. Aceite de xumiles.—Lo extraje de unos insectos Hemípteros, que pertenecen a los Geocorizas. Existen en abundancia en Xumiltepec (Hidalgo), Tasco (Guerrero) y otras regiones calientes. Unos viven sobre los árboles y otros sobre las piedras.

Los indígenas los usan para alimentarse y los toman con mucho agrado, no obstante su olor á chinche. Los comen vivos, pero la manera como los venden es asados en *comal* y regados despues con agua de sal y limon. Deben formar un buen alimento por sus principios azoados y la gran cantidad de grasa que contienen. Producen el 40 por ciento de una manteca amarilla, sin olor de chinche, sabor no repugnante y que podria tal vez emplearse en medicina, como el aceite de bacalao, pues los indígenas usan con buen resultado estos insectos, como un verdadero medicamento para los tísicos y para todo individuo cuya constitucion esté destruida. Valor en Miacatlan, de un cuartillo de insectos mojados, 0,12½ centavos.

9. Xumiles.—Insectos que producen el aceite anterior, muy usados por los indígenas en la alimentacion. Tienen un sabor picante, olor de chinche y la propiedad de excitar los deseos venéreos, segun dicen los que los toman. Un cuartillo (medida de granos) de Xumiles secos, pesa 400 gram.

10. Acido graso del aceite de xumiles.—Se funde á 55° c.

11. Aceite de nabo.—Producido por las semillas de la *Brassica napus oleifera.* Vegeta espontáneamente y con abundancia en las regiones templadas de la República. Produce el 40 por 100. No es agradable para comer y solo se consume para las lámparas y otros usos domésticos. Valor en México, $ 4,50 cent. arroba del clarificado. Sin clarificar, $ 3,75 cent.

12. Aceite de coquito.—Producido por la almendra de un palmero del género *Elaïs* (Sr. Herrera), que vegeta en Oaxaca, Acapulco, Colima, etc. El aceite se solidifica á la temperatura de la mesa central, formando una verdadera manteca fusible entre 25° y 28° c. Se extrae fácilmente por la presion en frio. Su sabor es agradable, lo mismo que su olor, y éste persiste en la grasa y en el jabon que con ella se fabrica. Se saponifica fácilmente produciendo un jabon duro, muy blanco, ligero y espumoso, propio para el tocador. El Sr. D. Maximino Rio de la Loza extrae el aceite y lo vende á $ 8 arroba.

13. Coquitos de aceite.—Almendras del *Elaïs,* que producen el aceite anterior. Vale una arroba en México $ 3. En Oaxaca 50 centavos. Producen 50 por 100 de grasa. Se usan para comerlos como fruta y para extraer el aceite. Su sabor es agradable. Destilando aguardiente sobre ellos, observé que el líquido destilado adquirió un aroma semejante al del cognac.

RESINAS.

14. Lechoso ó lechon.—Resina que extraje del jugo de un árbol llamado así, y al que atribuyen los campesinos la propiedad de hinchar los testículos, colocándose bajo su sombra. Es del género *Hypomanea*. Vegeta en Cuernavaca, Miacatlan y otros lugares calientes del Estado de Morelos. Puesto el jugo sobre la piel en gran cantidad, produce la caida de la epidérmis, como sucede con las cantáridas, y la del pelo donde lo hay. Los ladrones utilizan esta última cualidad para desfigurar la marca que los propietarios ponen al ganado para reconocerlo. La parte activa es una resina que aislé, y que aplicándola á la piel en un parche semejante al de la Tapsia gargánica, produce una erupcion pustulosa, con poca comezon. La que lleva el frasco esta disuelta en alcohol y tal como sale del primer tratamiento del jugo. En este estado se extiende sobre tela emplástica para formar los parches con mas economía. Se puede, por lo visto, sustituir á la Tapsia y usarse en la medicina.—500 gram. de jugo sacan el costo de 50 centavos y dan el 5 por 100 de principio activo.

15. Xochicopal.—Llaman así los indígenas, en Chilpancingo, á una resina extraida del *Amyris lignaloe*, que vegeta abundantemente en las regiones calientes. La usan allí para perfumar los templos y sus habitaciones. Su olor es muy agradable, como el de la esencia de la misma planta, y podria utilizarse la resina para barnices. Los Sres. Herrera y Maximino Rio de la Loza la sometieron á la destilacion, pero no dió gran cantidad de esencia, la cual sale ménos costosa extrayéndola directamente de la madera de esta planta. Segun los mismos señores, han comprado la arroba á $ 6 en México.

16. Estoraque.—Con este nombre venden los indígenas en las regiones calientes del Sur de México, unos fragmentos pequeños de la corteza del *Amyris lignaloe*, que usan para perfumar las habitaciones y templos, quemandolas á manera del incienso. Su olor es muy agradable; tratadas con alcohol á 85° c. ceden una resina aromática: el valor de una arroba en Jojutla (Morelos), es de $ 1,25 centavos.

17. Chicle.—Producto resinoso de la *Sapota achras*, que vegeta en las regiones calientes de la República. Lo extraen tambien, segun me dijeron

los indígenas, en el pueblo de Teocalzingo (Guerrero), de varios árboles que tienen un jugo lechoso y se concreta al aire. Designan estos árboles con varios nombres: Chiclillo, Cuatamal, Tepechicle; pero la planta que produce mas cantidad es la expresada. No es susceptible de vulcanizarse y no lo disuelven en totalidad los principales disolventes neutros. Lo usan para mascar, produciendo una abundante secrecion de saliva; efecto que puede utilizarse, segun el Sr. Herrera, en algunos casos de enfermedades del estómago. Vale en México $ 5 arroba.

18. Brea.—Se designa así la resina que queda de la destilacion de la trementina del *Pinus teocote*, que vegeta abundantemente en las montañas frias. Es de un color negro; pero se llega á obtener blanca, segun se puede comparar en los ejemplares que lleva el frasco, disolviéndola en alcohol á 85° c. y en caliente, que por el enfriamiento la deja depositar; se exprime y se lava en agua tambien caliente. Se utiliza para la preparacion del gas de alumbrado, formacion de teas, fabricacion de jabones, etc., etc. Vale en México 50 centavos. arroba.

19. Cuajiote.—Gomo-resina producida por un arbol llamado Cuajiote blanco que pertenece al *Rhus perniciosa*, L.—Vegeta en Miacatlan (Morelos) y otros puntos calientes donde ví que la usan para curarse las picaduras del alacran, aplicándola *loco dolenti*. Por su aspecto se parece á la goma llamada archipin, cuyo orígen se ignora, y que fué analizada por el Sr. D. Leopoldo Rio de la Loza. Las reacciones que, segun este señor, presenta la archipin bajo la influencia de los ácidos concentrados, tambien las dió el Cuajiote en las experiencias que hice.

Si llego á comprobar que es la misma archipin, se le darán tambien sus aplicaciones que son, segun el Sr. Rio de la Loza: como purgante y como mastic para adherir los fragmentos de porcelana y vidrio, resistiendo perfectamente á un calor bastante elevado, poniéndose trasparente, etc., etc. Para conseguir la goma de Cuajiote en los lugares mencionados, es necesario poner á un hombre á que la recoja en los montes, haciendo incisiones en las cortezas de los Cuajiotes blancos solamente; porque hay tambien Cuajiotes colorados, que son mucho más abundantes, pues forman bosques extensos, pero que no producen esta goma, y solo se pueden utilizar por su madera que es semejante á la caoba.

La goma archipin que traen los indígenas á México, vale $ 1 libra.

20. Ambar del pais ó cuapinole.—Segun la Farmacopea Mexicana, es

una resina producida por la *Hymenea courbaril*, que vegeta en los montes cercanos á Petapa, del Estado de Oaxaca. Se usa para hacer barniz. Vale $ 1 50 centavos libra.

21. Sangre de drago.—Resina astringente que venden los indígenas en Chilpancingo (Guerrero). La obtienen recogiendo en unos tubos de carrizo, el jugo de un árbol que vegeta en las costas de Acapulco, y designan con el nombre vulgar de *Llora-sangre*.

Pertenece al *Pterocarpus draco*, segun el Sr. Herrera. Lo usan en dicha localidad como medicamento, en las diarreas particularmente. Cada tubo vale en Chilpancingo 6 centavos.

22. Goma de peru.—Producto gomo-resinoso del *Schinus molle*. Vegeta abundantemente en la mesa central y otros puntos de clima templado. Se usa como medicina vulgar para curar las cataratas.

23. Incienso del pais.—Resina producida probablemente por una *Icica* (Sr. Herrera). Es análoga al copal y se le dan tambien sus mismas aplicaciones.

24. Incienso.—Llaman tambien así á pequeños fragmentos de corteza, de olor de incienso, y provienen seguramente del mismo árbol que el anterior. Lo usan los indígenas para perfumar sus templos.

25. Tacamaca.—Resina que se cree producida por el *Elaphrium tomentosum*. D. C. Vegeta en las Mistecas, Tancítaro, etc. Valor, $ 1 libra.

26. Tescalama.—Resina producida por el *Ficus nymphaeifolia*, que vegeta en las tierras calientes, particularmente en Michoacan, donde los indígenas que la cosechan la venden á cambio de semillas.

Es sumamente elástica, á manera del hule; pero que no conserva la forma que se le da, sino que se rompe ó se deforma por su propia retraccion. No conseguí vulcanizarla, lo que la distingue del hule. Es soluble parcialmente en el sulfuro de carbono, en el éter sulfúrico y en el alcohol á 95° c., que disuelve una resina quebradiza. La benzina la disuelve completamente; tambien se mezcla con facilidad al aceite de linaza. Se forman buenos barnices y para esto es muy útil. Tambien se usa en la medicina vulgar. Vale en México $ 8 la arroba.

27. Goma elastica de Durango.—Remitida por el Sr. Ballesteros á la Sociedad de Historia Natural, y estudiada por mí. Es producida por una planta herbácea de la familia de las Compuestas, tribu de las Ambrosieas, segun el Sr. D. Manuel Villada, y que vegeta en Durango. La extraen machacando toda la planta y formando laminas compuestas de hule en su mayor parte y de la materia leñosa. Esta resina elastica no es tan resistente como el verdadero hule ó *caoutchouc*, pero presenta mucha analogia con él, y sobre todo, es susceptible de endurecerse por medio del azufre, y recibir un bello pulimento. Se puede utilizar para las dentaduras, tejidos impermeables, etc.

A.—Láminas con partes leñosas, tal como se preparan con la planta.

B.—Privadas en parte de las materias extrañas, por presiones repetidas en el agua caliente.

C.—Una porcion de *B*, mezclada con azufre y bermellon, y endurecida con un aparato vulcanizador de dentista.

28. Goma de Sonora.—Producto de un insecto del género *Coccus* (Farmacopea Mexicana), que vive sobre un árbol llamado Gavia, Chaparro prieto, etc., *(Mimosa laccifera)*, que vegeta en Tamaulipas, Sonora y otros puntos de la República.

Es una verdadera goma laca y se la pueden dar sus mismas aplicaciones.

29. Caraña.—Resina producida por el *Amyris caranna*. Vegeta en las regiones calientes de la República (Farmacopea Mexicana). Se usa en medicina. Vale en México $ 3 50 centavos libra.

30. Copal de penca.—Resina (Farmacopea Mexicana), que se cree ser producida por el *Elaphrium copalliferum*, D. C., que habita las regiones calientes de la vertiente occidental de la República. Se extrae por medio de incisiones hechas en el árbol. Vale en México $ 5 arroba. Se usa en farmacia, y puede servir para barnices.

31. Copal de piedra.—Producido por unos insectos, que segun informes que tomé de unos campesinos, lo recogen de los Eláfrios copalíferos, y lo trasportan á las piedras para formar sus nidos Es usado por el pueblo como medicamento, y puede servir como el anterior.

32. Copaljiote.—Producto resinoso que me parece provenir de una espe-

cie de *Rhus*, analogo al Cuajiote que vegeta en Jojutla (Morelos). Se usa en la medicina vulgar.

33. Balsamo negro.—Líquido producido probablemente (segun el Sr. Herrera), por el *Myrospermum Pereiræ*. Esta planta vegeta en Huaxtepec (Hidalgo), y en las costas de Acapulco. El balsamo presenta algunas diferencias con el extranjero, y son las siguientes: color más moreno, olor de fermentacion alcohólica, reaccion al tornasol muy ácida, y que se mezcla con el agua donde se agita, poniéndola muy turbia. Se usa poco en medicina. Valor de una libra en México, $3.

34. Balsamo.—Fragmentos pequeños de corteza que usan los indígenas de Chilpancingo (Guerrero) para perfumar sus templos y habitaciones, y me parece que proviene del bálsamo negro, *Myrospermum Pereiræ*. Los indígenas distinguen dos clases; uno blanco y otro colorado. Este último es el más apreciado, por su olor más vivo y agradable, que es semejante al del bálsamo líquido. Tratados con alcohol, se extrae un producto resinoso de olor del bálsamo.

35. Balsamo de liquidambar.—Producto obtenido (Farmacopea Mexicana), por incisiones hechas en las cortezas del tallo y ramos del *Liquidambar styraciflua*, L., que vegeta en Veracruz y otras tierras calientes de la República. Vale en México 75 centavos libra. Se usa en medicina.

ESENCIAS.

36. Esencia de anisillo.—Producida por el *Schkuhria abrotanoides*, D. C., que vegeta abundantemente en muchos lugares de la República, y de climas muy variados, tanto frios como calientes. En estos últimos se desarrolla mejor. El olor que se percibe cuando se frota una gota entre las manos, es igual al del anis comun. Por la rectificacion lo llegué á tener incoloro, quedando en el residuo de la destilacion una corta cantidad de estearoptena, que cristalizó por el enfriamiento. Se usa en Morelia para fabricar licores, y se le podrian dar las mismas aplicaciones que á la esencia de anis, *Pimpinella anisum*. Costó en México la preparacion de una libra $4.

37. Esencia de toronjil.—La extrae por mayor el Sr. D. Maximino Rio

de la Loza, de la *Cedronella pallida* (Farmacopea Mexicana), cuyo olor es semejante al del poléo, *Calamitha nepeta*, y de la *Cedronella mexicana*, que es la mas abundante. Vegetan en Xochimilco y otros lugares de la República. Vale en México una libra $ 5.

38. Esencia de linaloe.—Se prepara por la destilacion mezclando agua á la madera, hecha birutas, del *Amyris lignaloe*, que vegeta en abundancia en Matamoros Izúcar y Teocalzingo (Guerrero), y otras tierras calientes. Su olor es agradable: incolora cuando se rectifica, y su punto de ebullicion °. Valor de una libra en México, $ 2.25 centavos. La prepara en gran cantidad el Sr. D. Maximino Rio de la Loza.

MATERIAS COLORANTES.

39. Azafran.—Se llama así vulgarmente la *Escobedia scabrifolia* de Humboldt, que vegeta en abundancia en la montaña del Ocotiol (Guerrero). Se utiliza por los habitantes de allí como condimento. La expenden en forma de tablillas que fabrican con la corteza de las raicecillas, molidas y mezcladas con masa de maíz, ó bien solas. Tambien lo usan como materia tintoreal, aunque en corta escala, para teñir los dulces y filamentos de amarillo, como el *Crocus sativus;* ni su olor ni su sabor son repugnantes, ni causan mal á la economía. Los mas interesantes principios que encontré en la raíz son los siguientes:

A. *Azafranina*.—Materia colorante y resinosa de la raíz anterior. La llaman así por ser resina y del color de la azafranina del *Crocus sativus*, y además dar tambien como ella, con el ácido sulfúrico concentrado, una coloracion azul que pasa al violeta.

B. *Escobedina*.—Principio inmediato cristalizado, contenido en la raíz de la *Escobedia scabrifolia*.

C.—Polvo de la raíz.

40. Tapinceran.—Madera usada para comunicar color morado a los barnices de *muñeca*, por la propiedad de disolverse en el aguardiente que tiene disuelta la goma laca, que es la usada en esta clase de barnices. Cede gran cantidad de color cuando se pone en el estado de birutas (como las que lleva el frasco que se remite), en la muñeca con que se frota para barnizar.

Ademas del color, se utiliza tambien la madera que es muy dura y propia para construccion de muebles de lujo, por su aspecto agradable y el bello pulimento que puede recibir.

41. Tzompantle.—Cortezas de la *Erythrina coralloides,* que vegeta en las tierras calientes y templadas. Las usan los indígenas para teñir filamentos de color amarillo. Estos árboles son muy abundantes y tendria poco costo la cosecha de la corteza.

42. Escoba colorada.—Con este nombre se conoce una planta perteneciente á las Leguminosas y al género *Pterocarpus?* muy abundante en Miacatlan, Cuernavaca y otros puntos del Estado de Morelos, y que utilizan los habitantes de allí para hacer escobas con los tallos.

A.—Frutos de la misma, que contienen en abundancia una materia resinosa amarilla, y gran cantidad de albumina, lo que aumenta su importancia como tintoreal, pues serviria de mordente esta sustancia al coagularse por el calor.

B.—Polvo de los frutos.

C.—Resina aislada de los frutos, la cual está contenida en el tejido celular del epicarpo, dándoles un aspecto verrugoso. Debido á esta disposicion, se puede separar primero la materia colorante por medio de disolventes, y en seguida pulverizando la semilla, se extraeria la sustancia albuminosa.

D.—Raiz de la escoba colorada. Contiene una resina amarillenta, que con los álcalis produce una coloracion roja violada muy hermosa, pero que se pierde con la luz.

TEXTILES.

43. Ixcatl.—Cortezas de una planta trepadora, cuya clasificacion no se pudo hacer por falta de datos. Las usan los indígenas para las afecciones de la boca, por lo astringentes que son. Las preparan remojándolas y machacándolas repetidas veces, hasta que quedan muy suaves, semejantes á un fragmento de gamuza. Lo que presentan de mas notable son unos filamentos sumamente finos y brillantes, con el aspecto de seda. Dichos filamentos se podrian aprovechar para la industria; pero hay el inconveniente de que las cortezas resisten mucho á la pudricion y los hilos no se pueden aislar fácilmente.

44. ALACLE.—Filamentos extraidos de una Malvacea. Se extraen con facilidad por medio de la pudricion: son muy suaves, delgados, bastante resistentes y se blanquean muy bien. Esta planta vegeta espontaneamente en toda region caliente y con mucha abundancia. Aun no se explotan estos filamentos.

45. —CUAULAHUAC.—Esta planta pertenece á la familia de las Tiliaceas y al género *Triumfetta*. Vegeta en las tierras calientes. Crece á una altura de 2 á 3 metros llevando muchas ramificaciones delgadas, rectas y largas, de cuyas cortezas extraje unos filamentos muy resistentes, largos, suaves y blancos. Esta planta es muy abundante; se pueden utilizar tambien sus frutos que son muy numerosos y contienen mucho mucílago.

46.—CUAULOTE.—Arbol perteneciente á las Bitneriaceas (*Guazuma polibothrya*). Lo hay en abundancia en las regiones calientes, formando arboledas extensas en algunos puntos. Cada año produce nuevas ramificaciones abundantes, largas y delgadas que son las que se pueden utilizar para la extraccion de los filamentos. Estos son muy resistentes y largos; pero es necesario que la maceracion en el agua dure mucho tiempo para separarlos de la corteza. El agua en que se hace esta maceracion queda muy espesa por la gran cantidad de mucílago que disuelve de los ramos. Los frutos de esta planta son tambien muy mucilaginosos, y algunos fabricantes de azucar los han querido utilizar para la defecacion de los caldos. La madera de la misma es muy resistente: la emplean los habitantes de aquellos lugares para la construccion de los trapiches. El tallo llega á adquirir de 20 á 30 centimetros de diámetro. Los campesinos usan las cortezas de los ramos jóvenes para amarrar, en lugar de mecates: los frutos son un buen alimento para algunos animales.

COLECCION DE MADERAS DE LA HACIENDA DEL NARANJO.

Estado de Tamaulipas, Distrito del Sur,
treinta leguas Oeste de Tampico, 53m 7 sobre el nivel del mar. Temperatura media anual 22°5.
Presentada á la Sociedad por el Sr. D. Blas Escontría, socio corresponsal en aquel lugar.

Nº	SINONIMIA VULGAR.	SINONIMIA CIENTIFICA.	USOS Y PROPIEDADES.
1	Aquiche ó Guácima	Guazuma ulmifolia, Lamark.	Poco resistente. La hoja sirve para el gusano de seda á falta de la del moral.
2	Anacua	Ehretia?	
3	Anacahuite ó Trompillo.	Cordia Boissieri, D. C.	Muy sólida. La infusion de ésta y la conserva del fruto se usan como pectorales.
4	Algodoncillo.		
5	Barreta ó Palo blanco.		Muy resistente; usada para cerca de labores.
6	Baboso		Fruto pequeño, comestible.
7	Brasil.	Cæsalpinia echinata, Lam.	Sólida: se exporta en grandes cantidades como madera de tinte.
8	Chaca.	Zanthoxilon sp?	La infusion de la corteza es muy amarga; eficaz contra las calenturas.
9	Cruceto	Randia aculeata, L.	
10	Chancaquillo		
11	Ceron		Elástica; usada para vigas.
12	Cujoi	Leguminosa.	Excesivamente sólida, propia para construcciones hidráulicas por petrificarse debajo del agua.

Nº	SINONIMIA VULGAR.	SINONIMIA CIENTIFICA.	USOS Y PROPIEDADES.
13	Chanchanote		La hoja en cocimiento para la enfermedad de las bestias llamada «pasmada.»
14	Chote (Huajilote)	Parmentiera edulis, Fl. M.	La corteza y la flor medicinales.
15	Chalahuite	Leguminosa	La corteza, para curtir pieles.
16	Chijolillo	Idem	Muy sólida.
17	Huitzitziltembel ó Capulin de corona	Pitosporea	Eficaz como pectoral en cocimiento concentrado. La recomiendan aun para la tísis.
18	Ebano	Diospyros ebenum? Retz.	Muy resistente á la presion y torcion; astillosa; se usa para ebanistería, etc.
19	Fresno	Fraxinus pubescens, Walt.	Util para construccion. La hoja en infusion, como tónico.
20	Gavia	Mimosa laccifera Fl. M.	
21	Guajillo		
22	Ahogador	Leguminosa	Fruto muy abundante; comestible.
23	Huisache	Acacia farnesiana, L	Muy útil. Flor muy aromática; la usan en Europa para perfumería.
24	Huisache chino	Acacia sp?	
25	Higueron	Ficus dimidiata (F. nimphæifolia L?)	Generalmente parásito; da raíces adventicias en gran cantidad. Madera resistente á la presion y torcion dentro y fuera del agua.
26	Hueso de tigre		Muy sólida.
27	Jobo ó Coma	Spondias mombin L	
28	Jopoy		
29	Jaboncillo	Sapindus?	La fruta sirve como jabon para lavar la lana.
30	José		
31	Limon	Citrus limonum, L.	Uso del fruto muy conocido.
32	Limoncillo		
33	Laurelillo		
34	Moral	Morus tinctoria, L	Sólida. Se exporta en grandes cantidades como madera de tinte.

N.º	SINONIMIA VULGAR.	SINONIMIA CIENTÍFICA.	USOS Y PROPIEDADES.
35	Mezquite	Prosopis dulcis, Kunth	Muy resistente á la presion y torcion; se conserva bien á la intemperie.
36	Malva.	Malvacea	Poco pesada, débil: se usa para muebles corrientes.
37	Naranjo.	Citrus aurantium, L.	Muy conocida, elástica; se usa para algunas piezas de carrocería, etc.
38	Ojite	Brossimum alicastrum, Brow.	Arbol muy elevado. La hoja es una excelente pastura muy usada en la costa. Fruto carnoso que agrada mucho y hace engordar al ganado. Crece en las márgenes de los rios.
39	Ojante		Resistente y elástica.
40	Palo de leche	Euforbiacea.	Muy elástica. Al cortarlo da un jugo lechoso, espeso, muy venenoso, acre, el que poniéndolo en una llama arde dando humo abundante, blanco, que produce dolor de cabeza. Usan la hoja para pescar, lo que consiguen con solo poner las ramas en el agua.
41	Palo de Rosa ó Cuachalalá?		Crece muy elevado en las márgenes de los rios. En Abril pierde la hoja y se cubre de flores grandes color de rosa.
42	Palo mulato, hoja larga.	Zanthoxilum clava-Herculis, L.	Produce goma medicinal, que se aplica en chiqueadores.
43	Id. id. china.		
44	Id. azul		Sirve contra la ictericia y para tinte.
45	Id. casero		
46	Id. amole		Sólida. La corteza sirve como jabon.
47	Id. de potro		

Nº	SINONIMIA VULGAR.	SINONIMIA CIENTIFICA.	USOS Y PROPIEDADES.
48	Id. de gallina.		Sólida. La corteza en polvo y la hoja en infusion, para curar bestias *pasmadas*.
49	Pichihumo.	Acacia amentacea? Fl. M.	Rico en tanino. Se usa la corteza para curtir.
50	Pata de vaca.	Leguminosa.	La infusion de la hoja y de la corteza para la ictericia.
51	Patol	Erytrhina coralloides? Fl. M.	Blanda.
52	Rajador.		Sólida
53	Ramoncillo	Trophis sp?	La hoja sirve para pastura.
54	Retama hoja larga.	Cassia sp?.	
55	Id id. china.	Spartium junceum, L	La ceniza sirve para hacer jabon sustituyendo la *jauja*.
56	Sabino	Taxodium mexicanum, Parlatore.	Muy buena para tablas y embarcaciones pequeñas.
57	Sáuz	Salix sp?	
58	Tepeguaje.	Acacia acapulcencis, H. B.	Sólida.
59	Tima		
60	Zapotillo	Sapotacea?	

Las siguientes muestras son de la hacienda de Micos, Estado de San Luis Potosí, jurisdiccion de Villa de Valles, 14 leguas N. O. de este punto: 500^{m} próximamente sobre el nivel del mar.

61	Aguacatillo	Persea Borbonia, L.	Muy elástica; propia para construcciones y ruedas.
62	Boca-negra		
63	Cedro	Cedrela odorata, L.	Usos muy conocidos.
64	Hoja ancha		
65	Mezquitillo	Leguminosa.	Sólida: resistente á la presion.
66	Nogal	Juglans regia L	Sólida: empleada en ebanistería, etc.
67	Palo-santo	Guaïcum sanctum? L	
68	Quiebra-hacha	Himenea?	
69	Tepame	Leguminosa.	Sin uso.
70	Volantin		Usado para vigas.
71	Vara dulce		

NOTAS.—En dicha hacienda de Micos hay tambien todas las maderas expresadas del Naranjo, excepto el ébano y alguna que otra.

En el Naranjo las más abundantes son: mezquite, ébano, ceron y huisache.

En Micos una de las más abundantes es la palma, llamada Real.

CATALOGO

De las maderas colectadas por el Sr. socio D. Rafael Montes de Oca, en el Estado de Veracruz, en las cercanías de Actopan, 713 metros sobre el nivel del mar,
á los 19° 30′ latitud N. y á los 2° 13′ de longitud E. de México.

Nº	SINONIMIA VULGAR.	SINONIMIA CIENTÍFICA.	USOS Y PROPIEDADES.
1	Flor de dia	Cochlospermun sp?	Muy sólida.
2	Guaje de sabána	Acacia sp?	Id. produce goma.
3	Granadillo	Brya ebanus, Brow.	Excelente para ebanistería.
4	Tepeguaje	Acacia acapulcensis, H. B.	Muy sólida.
5	Taray	Varennea polystachia, D. C.	Da tinte negro; diurético.
6	Copal	Elaphrium sp?	Sólida; produce resina.
7	Quiebra-hacha	Hymenea ?	Muy sólida.
8	Quina blanca	Croton pseudo-china, Schl.	Id. medicinal, como tónico.
9	Chico zapote	Sapota achras, Mill.	Sólida, produce *chicle*.
10	Sedita		Para ebanistería.
11	Guázamo	Guazuma polybotrhya, Cab.	Sólida; la corteza se usa como astringente.
12	Espino blanco		Muy sólida.
13	Hincha huevos	Rhus toxicodendron, L.	No sé que tenga uso.
14	Ule	Castilloa elastica, Cerv.	Produce el hule de México.
15	Cedro	Cedrela odorata, L	Para construccion; da una goma exquisita.
16	Alamo	Populus?	Bastante sólida.
17	Palo mulato	Zanthoxylon clava-Hérculis, L.	La corteza usada como tónico.
18	Guayabillo	Psidium?	Muy sólida.
19	Rayadillo		Id.
20	Cacao	Diferente del Theobroma cacao.	
21	Jobero prieto		Muy sólida.
22	Jobero blanco		Id.
23	Nacascle		No se pudre enterrado; produce goma.

N.	SINONIMIA VULGAR.	SINONIMIA CIENTIFICA.	USOS Y PROPIEDADES.
24	Pedo de puerco		
25	Roble	Tecoma pentaphilla?	Para construccion.
26	Zarzafrás		Medicinal, como sudorífico.
27	Cuajilote	Parmentiera edulis, D. C.	La raíz se usa como diurético.
28	Jicaro	Crescentia alata, L.	Los frutos se usan como pectorales.
29	Soliman	Thevetia iccotli, D. C.	Produce un jugo cáustico.
30	Limon	Citrus limonum, L	Usos bien conocidos.
31	Moquillo		Poco sólida.
32	Naranjillo		Sólida.
33	Jonote		Elástica y resistente.
34	Habilla	Hura crepitans, L.	Semillas purgantes.
35	Chicozapote macho	Sapota achras, L. variedad?	Muy sólida.
36	Crucetillo		
37	Ocotillo		Muy bueno para leña.
38	Plomillo		
39	Gateado	Leguminosa	Excelente para ebanistería.

Las siguientes muestras fueron colectadas en las cercanías de Jalapa, 1,321 metros sobre el nivel del mar, á los 19° 30′ latitud N. y á los 2° 11′ 55″ longitud E. del meridiano de México.

40	Duela	Quercus Xalapensis, H. B.	Para construccion.
41	Hoja ancha	Id. sp?	Idem.
42	Azaharito	Simploocos coccinea, H. B.	Para ebanistería.
43	Roble	Quercus sp?	Para construccion.
44	Zapote blanco	Casimiroa edulis, La Llave.	Sólida: sus frutos muy agradables son bien conocidos.
45	Pipinque		Id.
46	Guayabo,	Psidium pomiferum, L.	Como el 44.
47	Chirimoyo	Anona Humboldtii, Dun.	Sólida y elástica.
48	Liquidámbar,	Liquidambar stiraciflua, L.	Para construccion: es bien conocido el bálsamo que produce.
49	Jonote	Ulmus?	Para muebles.
50	Tehuiscle	Leguminosa?	Muy sólida.
51	Malangola	Cupulífera	Para construccion.
52	Alcámbar		Idem.
53	Canastillo		Idem.

63	Chilcuahui		

CATALOGO

De la coleccion de drogas indígenas presentada á la Sociedad por el Sr. socio D. Alfonso Herrera.

CRIPTOGAMAS.

HELECHOS.

1. *Polypodium lanceolatum,* L. Lengua de ciervo. Abunda en los montes que circundan el Valle de México. Se usan las frondas de esta planta como pectorales y vulnerarias. Precio del kil. 25 centavos.

2. *Polypodium calaguala?* Schafner. Calaguala. Abunda en el Pedregal de San Angel y otros puntos del Valle de México. Se usan las rizomas como diaforéticas y pectorales. Precio del kil. 50 centavos.

3. *Polypodium pseudo-filix mas,* Schaf. Palmitas. Se encuentra en los montes que circundan el Valle de México y climas análogos de la República. Se usa como teniafugo. Precio del kil. 50 centavos.

LICOPODIACEAS.

4. *Licopodium nidiformis.* Fl. M. I. Doradilla. En las mismas localidades que el anterior. Se usa toda la planta en las afecciones inflamatorias del hígado. Precio del kil. 25 centavos.

MONOCOTILEDONEOS.

GRAMINEAS.

5. *Andropogon citratus?* D. C. Té limon. Se encuentra en varias localidades calientes de la República. Se usa como antiespasmódico y á guisa de té. Precio del kil. 50 centavos.

CIPERACEAS.

6. *Ciperus rotundus*, L. Peonía del país. Regiones templadas. Se le atribuyen propiedades estomáquicas. Precio del kil. 25 centavos.

ORQUIDEAS.

7. *Blettia campanulata*, La Llave. Chaucle Regiones templadas. El cocimiento de los pseudo-bulbos de esta planta se emplea para curar las disenterias. Precio del kil. 50 centavos.

MELANTACEAS.

8. *Veratrum frigidum*, Schletend. Cevadilla. Montes de Xochimilco. Los frutos y bulbos se usan como insectisidas, ambos contienen veratrina. Precio del kil. 50 centavos.

COMELINEAS.

9. *Comelina tuberosa*, H. B. K. Yerba del pollo. Vegeta en abundancia en las regiones templadas. Estudiada por los farmacéuticos mexicanos Gumesindo Mendoza y Alfonso Herrera. Los doctores Jimenez, Arámburo y otros, confirmaron las propiedades eminentemente hemostáticas de que goza esta planta. (Véase Gaceta Médica de México T. 3.º) Precio del kil. 25 centavos.

ESMILACINEAS.

10. *Smilax pseudo-china*, Scheide. Cocolmecan. Regiones calientes. Las raices gozan la reputacion de diaforéticas y antisifilíticas. Precio del kil. 50 centavos.

DIOSCOREACEAS.

11. *Rajania subsamarata*, Fl. M. I. Cuauchalalá. Regiones calientes. La corteza como astringente. Precio del kil. 50 centavos.

DICOTILEDONEOS.

CONIFERAS.

12. *Taxodium mucronatum*, Parlatore. Ahuehuete. Se encuentra en el Valle de México y lugares análogos de la República. La corteza se usa como

emenagogo y diurético, las hojas tópicamente contra la sarna y como resolutivas; con la madera se prepara un alquitran que se emplea en la curacion de varias enfermedades de la piel. Precio de las hojas 25 centavos kil. y de lla corteza 50 centavos kidl.

13. *Pinus teocote,* Scheide. Ocote. Abunda en los montes que circundan el Valle de México y en otros lugares del país. La trementina que produce este árbol se asemeja á la de Burdeos; produce 17 por 100 de aceite esencial. Precio del kil. 6 centavos.

14. *Pinus religiosa,* H. B. K. Oyametl. La trementina producida por este vegetal se parece en sus propiedades á la de Venecia: su estudio fué hecho por mí. (Véase la Naturaleza T. 2.º) Precio del kil. 50 centavos.

URTICACEAS.

15. *Urtica mexicana,* Fl. M. I. Yesgos. Planta que crece en las regiones templadas de México. Sus raíces se emplean como diaforéticas. Precio del kil. 20 centavos.

CANABINEAS.

16. *Cannabis indica,* L. Mariguana. Vive en las regiones templadas de la Republica. Bastante conocida esta planta por sus propiedades fisiológicas: en México no se le dan más aplicaciones que las conocidas. Precio del kil. 50 centavos.

EUFORBIACEAS.

17. *Hura crepitans,* L. Quautlatlatzin. Arbol que crece en las regiones calientes y húmedas de México. Sus semillas llamadas vulgarmente *habilla de San Ignacio,* se usan como drásticas: contienen un aceite fijo en la proporcion de 50 por 100: en él residen las propiedades activas de los granos; además se ha encontrado en ellas estearina, parenquima albuminosa, goma y sales de cal y de potasa. Precio del kil. $2.

18. *Euforbia maculata,* L. Yerba de la golondrina. Vegeta en las regiones templadas. El jugo se emplea para quitar las manchas de la córnea, y el cocimiento de la planta en la tiña y otras enfermedades de la piel. Precio del kil. 25 centavos.

19. *Euforbia pulcherrima,* L. Flor de Noche Buena. Vive en las regiones calientes y húmedas y se cultiva en los jardines como planta de ornato; las bracteas se usan á la dósis de 8 gramos para aumentar la secrecion de la leche, el cocimiento de ellas se emplea como resolutivo. Precio del kil. $ 1.

20 *Acalipha prunifolia.* H. B. K. Yerba del pastor. Vegeta en las

regiones templadas. Se emplea el cocimiento de toda la planta como *vulnerario*. Precio del kil. 25 centavos.

21 *Croton dioicus,* Cav. Yerba del zorrillo. Abunda en el Valle de México y regiones análogas. Las semillas contienen, segun la análisis hecha por el Sr. Donaciano Morales, albúmina vegetal, goma, aceite fijo, materia resinosa, sustancia morena soluble en el agua, celulosa y sales. La emulsion hecha con 20 ó 30 semillas, como drástica, lo mismo que el polvo de la raíz á la dósis de 2 gramos. Precio del kil. semillas $ 1 00, raiz 25 centavos.

ARISTOLOQUIAS.

22 *Aristolochia grandiflora,* Swart. Guaco. Vegeta en las regiones calientes y húmedas. Contienen las raíces, que son la parte usada, aceite volátil, resina, tanino, un principio amargo, goma, almidon, sales de cal y de potasa. Se usa como antídoto de la ponzoña de las serpientes y de otros animales ponzoñosos: tambien como sudorífico y emenagogo. Precio del kil. $ 1 00

23 *Aristolochia fœtida,* H. B. Yerba del indio. Crece en Ario. El cocimiento de las hojas se emplea como vulnerario, la raíz como estimulante detersivo. Precio del kil. 50 centavos.

24 *Aristolochia mexicana,* Fl. M. I. Tlacopatle. Se encuentra en el Estado de Guerrero y otros lugares calientes. Se crée que la raíz tiene propiedades antiespasmódicas. Precio del kil. $ 1 00.

TIMELEACEAS.

25 *Daphnopsis salicifolia,* Meis. Hojas de San Pedro. Vegeta en Cuernavaca, á la altura de 3,200 piés (segun Humboldt). Se usan las hojas como exutorios. Precio del kil. 50 centavos.

LAURINEAS.

26 *Persea gratissima,* Gaern. Aguacate. Aborígeno de México: se cultiva en los huertos. Se emplean las hojas y los frutos como emenagogos: el vulgo crée que los segundos aumentan la secrecion espermática y la supuracion de las heridas; el epicarpio se usa como antihelmíntico.

QUENOPODIACEAS.

27 *Chenopodium ambrosioides.* L. Epazote. Aborígeno de México: se cultiva en los huertos. Se usa como condimento, y en medicina como antihelmíntico y emenagogo. Precio del kil. 25 centavos.

PLUMBAGINACEAS.

28. *Plumbago scandens*, L., Tlachichinolli. Crece en las regiones calientes y húmedas de la República. Se usan las hojas aplicadas exteriormente como causticas y al interior como eméticas. La raiz se emplea de la misma manera, como cáustica y purgante. Precio del kil. 50 centavos.

LABIADAS.

29. *Cedronella Mexicana*, Bent. Toronjil. Vegeta en las regiones templadas. Se emplean las inflorescencias como estimulantes y antiespasmódicas. Precio del kil. 50 centavos.

VERBENACEAS.

30. *Lippia graveolens*, H. B. K. Yerba dulce. Crece en Orizava, Córdoba y lugares análogos de la vertiente oriental de la gran cordillera mexicana. Segun el Sr. D. Maximino Rio de la Loza, esta planta contiene un principio azucarado particular, volatil y soluble en el agua y en el alcohol, aceite volátil, un estearopteno muy parecido al alcanfor del Japon, clorofila, leñoso y sales. Se usa la infusion de esta planta como pectoral y emenagogo. Precio del kil. 50 centavos.

31. *Lippia citriodora*, Kunt. Cedron. Se cultiva en los jardines. La infusion de las hojas se emplea como antiespasmódico. Precio del kil. 50 centavos.

32. *Lippia callicarpaefolia*, H. B. K. Salvia real de Puebla. Crece en Puebla. Las inflorescencias y hojas se usan como estimulantes. Precio del kil. 50 centavos.

ESCROFULARIACEAS.

33. *Budleia verticillata*, H. B. K. Mispatle. Vegeta en las regiones templadas. Las hojas gozan la reputacion de vulnerarias. Precio del kil. 25 centavos.

34. *Budleia globosa*, Lam. Salvia real de México. Crece en las regiones templadas. Estimulante general. Precio del kil. 37 centavos.

SOLANACEAS.

35. *Nicotiana glauca*, Grah. Tabaquillo. Abunda en las regiones templadas. Se le atribuyen las mismas propiedades que al tabaco. 25 cent. kil.

BORRAGINACEAS.

36. *Tournefortia mexicana*, Cerv. Tlachichinoa. Crece en las regiones calientes. Se usa para curar la sarna y las ulceraciones de la boca. Precio del kil. 37 centavos.

CONVOLVULACEAS.

37. *Ipomaea murocoides*, H. B. Palo del muerto. Regiones calientes. Se emplea el cocimiento del leño en baños contra la parálisis. Precio del kil. 18 centavos.

38. *Exogonium purga*, Benth. Jalapa. Vegeta en la falda oriental de la gran cordillera de México. Purgante. Precio del kil. $1 50 centavos.

BIGNONIACEAS.

39. *Crescentia alata*. H. B. K. Cuautecomate. Regiones calientes y húmedas. El fruto contiene una notable cantidad de azúcar, goma, tanino, celulosa y sales. Los frutos gozan de gran reputacion entre el vulgo como pectorales. Precio del kil. 12 centavos.

POLEMONIACEAS.

40. *Hoitzia coccinea*, Cavan. Espinosilla. Regiones templadas. Contiene, segun Oliva, resina, tanino, ácido gálico, materia extractiva amarga, materia colorante verde, materia azucarada, leñoso y sales. Se emplea la infusion como diurético, diaforético, y á mayor dósis como emeto-catártico. Precio del kil. 12 centavos.

ACANTACEAS.

41. *Sericographis mohintli*, D. C. Muitle. Vegeta en Jalapa y regiones análogas. Las hojas contienen una materia colorante amorfa de color azul muy oscuro: se asemeja por sus propiedades al tornasol, al que es superior como materia tintoreal. Gozan de gran reputacion como antidisentéricas. Precio del kil. 25 centavos.

GENCIANACEAS.

42. *Erythrea stricta*, Scheide. Canchalagua. Vegeta en las regiones calientes. Propiedades: tónico amargo. Precio del kil. 50 centavos.

ASCLEPIADACEAS.

43. *Asclepias setosa*, Bent. Contrayerba de Julimes. Vegeta en las re-

giones templadas. Se emplea como tónico y diaforético; se le atribuyen propiedades antiperiódicas. Precio del kil. 50 centavos.

44. *Asclepias linearis*, L. Romerillo. Se encuentra en abundancia en la mesa central de México: el jugo lechoso y las hojas de esta planta se usan como emeto-catártico poderoso; las semillas están provistas de un pelo bastante suave y largo que puede utilizarse como edredon. Precio: 25 centavos kil.

APOCINACEAS.

45. *Thevetia iccotli*, D. C. Yoyote. Se encuentra abundantemente en las regiones calientes y húmedas de la falda occidental de la gran cordillera mexicana. Contiene, segun la análisis hecha por mí, aceite fijo, caseina vegetal, materia extractiva, un glocósido que llamé tevetosa, y sales. Las semillas contienen el aceite en la proporcion de 40 por 100: su densidad es de 0,9100 á 20° cent.; á la temperatura de 10° se enturbia y á 0° se concreta en parte; con el ácido sulfúrico toma un color amarillo que pasa al rosado y despues al rojo naranjado. No es secante y parece estar compuesto de oleina y margareina. El principio activo de las semillas de la Thevetia es la tevetosa. (Véase más adelante.) Precio de las semillas 50 centavos kil. Idem del aceite $1 kil.

SAPOTACEAS.

46. *Sapota achras*, Mill. Chicozapote. Se encuentra con abundancia en las regiones calientes y húmedas de la República. Las cortezas de este árbol se usan como antiperiódicas: las semillas, privadas de su episperma, como diuréticas á la dósis de seis á doce semillas, pues en mayor cantidad se dice que producen efectos tóxicos. Alrededor de los granos se encuentra una sustancia resinoide que llaman chicle: es blanca y se reblandece fácilmente entre los dedos; se usa para fabricar pequeñas esculturas y como masticatorio. Precio de la corteza 25 centavos kil., las semillas 50 centavos id., el chicle 40 centavos id.

47. *Lucuma salicifolia*, Kunt. Zapote borracho. En las regiones calientes: la corteza se usa como antiperiódico; se cree que los frutos, cuyo pericarpio es comestible, ejercen una accion notable sobre el cerebro. Precio de la corteza 25 centavos kil.

ERICACEAS.

48. *Arctostaphylos pungens*, Kunt. Pingüica. En las regiones templadas. Contienen las hojas, segun Oliva, tanino, ácido gálico, goma, clorofila,

celulosa, materia colorante unida al tanino, resina y sales. Los frutos y las hojas se usan como diurético. Frutos 25 centavos kil. Hojas 25 centavos kil.

COMPUESTAS.

49. *Solidago montana*, Fl. Mex. Inéd. Calancapatle. Crece en el valle de México; se usan las hojas como vulnerarias. Precio del kil. 12 centavos.

50. *Gnaphalium canescens*, D. C. Gordolobo. Se encuentra con abundancia en la mesa central de la República. Las flores se usan como astringentes. Precio del kil. 25 centavos.

51. *Artemisia mexicana*, D. C. Estafiate. Se encuentra en el Valle de México. Contiene, segun el Sr. D. Leopoldo Rio de la Loza, extractivo, una materia azoada, otra resiniforme, ambas muy amargas, clorofila, albumina, fécula, aceite volatil y diversas sales. Se emplean las hojas como tónicas y estimulantes, emenagogas y antihelmínticas. Precio del kil. 12 centavos.

52. *Athanasia amara*, Cerv. Prodigiosa. Regiones templadas. Las hojas tienen propiedades tónicas y vermífugas. Precio del kil. 12 centavos.

53. *Apoplapus discoideus*, D. C. Damiana. Crece en el Valle de México. Se usa toda la planta en baños contra el reumatismo. Precio del kil. 12 centavos.

54. *Sanvitalia procumbens*, D. C. Ojo de gallo. Vegeta con profusion en la mesa central de la República. Se usa el cocimiento de toda la planta como digestivo. Precio del kil. 12 centavos.

55. *Montagnaea tomentosa*, D. C. Zoapatle. Vegeta en el bosque de Chapultepec y otros lugares del Valle de México. Contienen las hojas, segun el Sr. D. Federico Altamirano: albumina, goma, clorofila, materia grasa, materia extractiva, dos resinas, una sustancia neutra amarillo-morena y amarga, un ácido particular, soluble en el agua y en el alcohol, y que precipita en amarillo por las sales de plomo, y diversas sales. El jugo de esta planta, así como el cocimiento de ella, provoca las contracciones del útero. Precio del kil. 12 centavos.

56. *Eupatorium collinum*, D. C. Yerba del ángel. Cordillera de Guadalupe al N. de la capital. Las hojas en cocimiento al interior, son usadas por el vulgo en las diarreas atónicas. Precio del kil. 12 centavos.

57. *Erigeron affine*, D. C. Peritre. Valle de México. Las raíces como sialagogas. Precio del kil 25 centavos.

58. *Senecio çanicida*, Fl. Mex. Inéd. Yerba de la Puebla. Crece en Tlascolpan y otros puntos del Estado de Puebla. El Sr. D. Maximino Rio de la Loza ha extraido de esta planta un acido volátil que ha llamado senécico, al que atribuye las propiedades tetanicas de este vegetal. Se usa como antiperiódico y diaforético. Precio del kil. 25 centavos.

59. *Echinacea heterophilla*, Don. Raiz del manso. Crece en el Pedregal de San Angel (Valle de México). Contiene la raiz, segun el Sr. Cal, resina 12,11, sustancia gomosa 15,62, extractiva 46,87, leñoso 23,06, pérdida 2,34. Es usada vulgarmente como vulnerario, el cocimiento se emplea en las disenterias, y su jugo en las fracturas, de la misma manera que la destrina.

60. *Trixis pipitzahuac*, Schaffner. Pipitzahoac. En el Valle de México y en las montañas al Oeste del Valle de México, etc. Las rizomas y raíces contienen una sustancia resinoide, a quien el Sr. D. Leopoldo Rio de la Loza llamó ácido pipitzoico. Se emplean como drastico a la dósis de 4 a 8 gram.

VALERIANACEAS.

61. *Valeriana mexicana*, D. C. Yerba del gato. En el Valle de México. Contiene la raíz ácido valerianico y no aceite esencial, una resina, fécula, leñoso y sales. Se usa como antiespasmodico. Precio del kil. 12 centavos.

CAPRIFOLIACEAS.

62. *Sambucus mexicana*, Priestl. Sáuco. Crece en las regiones templadas de la República. Se usan las flores como estimulantes y diaforéticas. Precio del kil. 25 centavos.

CACTEAS.

63. *Opuntia nopalillo*, Karwins. Nopalillo. Regiones templadas. El vulgo usa el cocimiento de la raíz contra la disenteria, la diarrea, la hemotisis y las metrorragias. Precio del kil. 12 centavos.

PASIFLOREAS.

64. *Passiflora dictamus*, Fl. Mex. Inéd. Dictamo real. Regiones calientes. Se usa por el vulgo, el cocimiento de esta planta, para la curacion de diversas enfermedades del aparato respiratorio. Precio del kil. 50 centavos.

MIRTACEAS.

65. *Myrtus arrayan,* Kunt. Arrayan. Regiones templadas. Se usan las hojas como tónicas y astringentes. Precio del kil. 12 centavos.

ROSACEAS.

66. *Cerasus capollin,* D. C. Capulin. Se cultiva en los huertos. La corteza se emplea como antiperiódica y antidisentérica: las hojas contienen ácido prúsico y se usan como succedáneos del laurel cerezo. Precio de las cortezas 50 centavos kil., de las hojas 25 centavos kil.

67. *Crataegus mexicana,* Mociño y Sessé. Tejocote. Se cultiva en los huertos. El cocimiento de los frutos se usa como pectoral; el de las raices como diurético. Precio de los primeros 6 centavos kil., de las segundas 50 centavos kil.

LEGUMINOSAS.

68. *Dolichos tuberosa,* Lamark. Jícama. Se cultiva en las regiones calientes. La tintura, preparada con los granos de este vegetal, goza de poderosas propiedades antipsóricas. Los tubérculos son comestibles. Precio de las semillas, 50 centavos kil.

69. *Dalea citriodora,* Willd. Limoncillo. Valle de México. Toda la planta como antiespasmódico. Precio del kil. 12 centavos.

70. *Tamarindus occidentalis,* D. C. Tamarindo. Regiones calientes y húmedas de México. Frutos laxantes. Precio del kil. 6 centavos.

71. *Hymenea courbaril,* L. Cuapinole. Crece en los Estados de Oaxaca y Guerrero. Se emplea la resina para fabricar barnices. Precio del kil. $2 50 centavos.

72. *Eysenhartia amorphoydes,* D. C. Palo dulce. Mesa central de la República. El cocimiento del leño como diurético; el macerado como profiláctico en las epizootias de las gallinas. Precio del kil. 12 centavos.

73. *Myrospermum Pereirae?* Royle. Bálsamo. Crece en el Estado de Morelos y otros lugares calientes y húmedos de México. Se emplean los frutos y cortezas de este árbol para preparar una tintura, que se usa como bal-

sámica y estimulante. Precio del kil. de semillas 18 centavos: corteza, kil. 12 centavos.

74. *Caesalpinia cacalaco*, H. B. K. Cascalote. Regiones calientes y húmedas de la República. Los frutos muy ricos en tanino y ácido gálico, como astringentes y para curtir las pieles. Precio del kil. 6 centavos.

75. *Prosopis dulcis*, Kunt. Mezquite. Mesa central de México y otros lugares. La goma que produce se asemeja mucho á las gomas del Senegal y arábiga. Se le dan las mismas aplicaciones que á éstas. Precio variable segun las clases: la más blanca 50 centavos kil.

76. *Acacia albicans?* Huisache. Mesa central. Los frutos como astringentes y como succedáneos de la nuez de agallas. Precio del kil. 25 cent.

RIZOFOREAS.

77. *Rhizophora mangle*, L. Mangle. En la costa del Golfo de México. La goma que da este árbol se usa como pectoral. Precio del kil. 25 centavos.

LITRARIEAS.

78. *Cuphea lanceolata*, H. B. K. Atlanchana. Valle de México. Usan toda la planta como corroborante para las paridas. Precio del kil. 12 centavos.

79. *Heimia salicifolia*, Link. Hanchinol. En el Estado de México. Diurética, diaforética y antisifilítica. Precio del kil. 25 centavos.

TEREBINTACEAS.

80. *Amyris lignaloe*, L. Lináloe: véase la pág. 390.
81. *Schinus molle*, L. Perú: véase la pág. 387.

RUTACEAS.

82. *Zantoxylum pentanome*, D. C. Palo mulato. Crece en el Valle de México. Se usa la madera y corteza como tónica estimulante. Precio del kil. 25 centavos.

AMPELIDEAS.

83. *Cissus tiliacea*, H. B. K. Tripa de Júdas. Mesa central de la República. El cocimiento y la tintura de los tallos de esta planta se usan contra el reumatismo. Precio del kil. de los tallos, 25 centavos.

ZIGOFILACEAS.

84. *Zygophyllum fabago,* L. Gobernadora. Regiones templadas. Las hojas se emplean en baños ó fomentos para curar los dolores artríticos. Precio del kil. 25 centavos.

MALVACEAS.

85. *Malva angustifolia,* Cav. Yerba del negro. Mesa central de la República. Hojas y raíces usadas como emolientes. Precio del kil. de hojas, 12 centavos; raíces, 25 centavos.

MAGNOLIACEAS.

86. *Magnolia mexicana,* Mociño y Sessé. En el Estado de Morelos. Contienen las flores, segun la análisis que hice asociado con el Sr. Mendoza, aceite esencial, resina verde, quercitrina, tanino, extractivo y sales. La infusion de las flores como antiespasmódico, la tintura como tónico. Precio del kil. 50 centavos.

PRODUCTOS ANIMALES.

87. Goma de Sonora. Con este nombre se designa una resina producida por un insecto del género *Coccus,* del órden de los hemípteros, que vive en las regiones calientes de la República sobre diversos vegetales, principalmente, segun el Sr. Oliva, sobre la *Mimosa laccifera:* las propiedades de dicha resina son análogas á las de la laca de la India, de la que se distingue por su color ménos rojo, sabor que se asemeja al del ácido succínico, y por la notable elasticidad que adquiere cuando se le calienta. Se emplea generalmente contra las metrorragias, y en las artes para fabricar barnices. Precio del kil. en México $5.

CANTARIDAS.

88. *Cantharis eucera,* Chev. Pípila ciega. Vive este insecto sobre diversas plantas de la familia de las Cucurbitáceas, tales como el chayotillo, *Sicyos angularis,* L.; la calabaza, *Cucurbita pepo,* L.; el chayote, *Sechium edule,* Swars. Abunda en la mesa central de la República en los meses de Julio á Setiembre; contiene, segun la análisis que hice en union del Sr. Mendoza, los mismos principios que la *Cant. officinalis,* siendo de notar que la cantaridina se encuentra en mayor proporcion, por lo que estos

insectos tienen propiedades más enérgicas que la especie usada en Europa. Precio del kil. $2 50 centavos.

89. *Cantharis octomaculata*, Herrera y Mendoza. Vive en los mismos meses que la anterior sobre el *Bidens tetragona:* abunda en el Valle de México. Precio del kil. $2 50 centavos.

90. *Triondons Barranci*, Dug. Abadejo. Vive en la mesa central de la República. Sus propiedades epispasticas son mayores que en las anteriores especies. Precio del kil. $2 50 centavos.

PRODUCTOS QUIMICOS.

TEVETOSA.

91. Con este nombre he designado un principio inmediato de la clase de las glucósidas, que he extraido de las semillas del *Thevetia iccotli*, D. C. Familia de las Apocineas (véase este Catalogo, página 405); sus caractéres son los siguientes:

Cristaliza en prismas de cuatro caras; es inodora y excesivamente acre; casi insoluble en el agua y muy poco soluble en el éter, el sulfuro de carbono y los aceites fijos y volátiles; se disuelve, por el contrario, con mucha facilidad en el alcohol; no es volátil, ni se combina con los ácidos ni con las bases; cuando se trata con el ácido sulfúrico se descompone, produciendo glucosa y una sustancia resinoide.

El nitrato de plata, el cloruro de platina, el de oro, el sesquicloruro de fierro, el yoduro yodurado de potasio, el tanino, la potasa, el amoniaco, los carbonatos alcalinos, el proto y el percianuro de fierro y potasio, no ejercen accion aparente sobre este principio.

Para obtener la tevetosa, se pulverizan las semillas de la *Thevetia iccotli*, se colocan en un aparato de desalojamiento y se agotan con el éter sulfúrico; el residuo se lexivia con agua destilada y despues con alcohol á 85° cent.; la solucion alcohólica abandonada á la evaporacion espontánea, deposita la tevetosa cristalizada; para purificar los cristales se tratan con el agua hirviendo, se decanta el líquido, el residuo se vuelve á disolver en el alcohol al mismo grado y se deja cristalizar.

Segun las observaciones fisiológicas hechas por los señores Hidalgo Carpio y Dominguez, la tevetosa es: 1.º muy venenosa, pues á la dósis de 5 centíg. produce la muerte á los perros de talla mediana. 2.º Tiene una accion vomitiva violenta, que depende de su accion directa sobre el sistema nervioso, semejante á la del tártaro. 3.º Que obra sobre la respiracion, haciéndola difícil por una paralisis, á lo que parece, de los músculos externos de la respiracion.

PRODUCTOS FARMACEUTICOS.

92. Extracto acuoso de la *Krameria pauciflora*, Fl. Mex. Inéd. Es una muestra de extracto preparada segun un procedimiento inventado por mí en el año de 1866 y publicado en la «Gaceta Médica de México» del mismo año; consiste en someter la solucion extractiva ó el jugo de las plantas á una congelacion parcial: el agua, al congelarse, deja en las aguas madres los principios que tenia en solucion; se congelan estas parcialmente dos ó tres veces hasta que adquieran una consistencia suficiente, se colocan en seguida en vasijas de poca profundidad y se abandonan á la evaporacion espontánea hasta que tomen la consistencia de extracto: en pocas horas se consigue este resultado.

Con este procedimiento se obtienen las ventajas siguientes: 1.º Como no interviene el fuego no hay formacion de apotema, y los principios alterables por el calor no se descomponen.

2.º Como el agua se separa en su mayor parte por congelacion y no por evaporacion, las sustancias, aun las muy volátiles, no se pierden, como en los otros procedimientos conocidos.

3.º En los países frios es sumamente económico, pues no tiene que emplearse combustible.

4.º No se necesita ningun aparato especial: una sorbetera y unos platos son los únicos objetos que se requieren para preparar los extractos, segun mi procedimiento.

Nota.—Pueden verse los detalles de la manipulacion en la Memoria ántes citada.

MINERALES.

TEQUEZQUITE.

93. Eflorescencias que abundan en diversas localidades del Valle de México y otros lugares de la República. Contienen carbonato de sosa, cloruro de sodio, sulfato de la misma base y materias terrosas. La primera sal es la que predomina, principalmente en la clase que llaman vulgarmente espumilla, segun la análisis del Sr. Hay, pues en 1,000 partes hay 516 de carbonato de sosa anhidro, sulfato de sosa 153, cloruro de sodio 0,45, agua 246, materias terrosas 0,30. Se recoge este tequezquite en la parte N. O. del lago de Texcoco, en el de San Cristóbal, etc. Precio de 100 kil., 20 centavos.

El tequezquite llamado confitillo se compone de carbonato de sosa 28, cloruro de sodio 36, materias terrosas 35; se recoge en Texcoco, San Cristóbal, Zumpango, etc. Precio de 100 kil. 15 centavos.

El carbonato de sosa, segun las observaciones que hice en compañía del Sr. D. Gumesindo Mendoza, se produce por la descomposicion de los pórfidos traquíticos que forman las montañas que circundan el Valle de México; estos pórfidos, bajo la influencia del agua se descomponen, produciendo silicato de sosa básico soluble, el que por la accion del ácido carbónico, que en abundancia se desprende en algunos puntos del Valle, se convierte en carbonato de sosa y ácido silícico que se precipita.

Para más datos sobre esta formacion, puede consultarse la Memoria que publicamos en la «Gaceta Médica de México,» año de 1865.

El Sr. socio D. Jesus Sanchez, presentó lo siguiente:

1 Cacomite. Bulbos feculentos, de la *Tigridia Pavonia*, Pers. Cocidos se suelen tomar en México como fruta. El precio del kil. puede calcularse en 25 centavos.

2 Chia. Semillas de la *Salvia chian*, L., que se cultiva en México con alguna extension. Por maceracion en el agua se prepara con ellas una bebida mucilaginosa, que endulzada y algo acidulada con zumo de limon, es un refresco muy agradable y de los más usados en México. Precio del kil. 18 centavos.

3 Guajes. Frutos de la *Acacia esculenta*, L.: las semillas frescas las come por lo regular la gente pobre mezclándolas con sus alimentos. Precio del kil. 12 centavos.

4 Jengibre. Tubérculos del *Zingiber officinale*, Roscoe, que se cultiva en la Huasteca segun el Sr. Herrera, y usados como condimento. Precio del kil. 25 centavos.

5 Jicama. Tubérculos del *Dolichos tuberosa*, Lamark; son poco alimenticios, pero de un gusto agradable y se toman en México como fruta. Precio del kil. 12 centavos.

6 Pimienta gorda de Tabasco. Bayas secas de la *Eugenia pimenta*, D. C., que vegeta en algunas tierras calientes de México y se emplean como condimento. Precio del kil. 25 centavos.

7 Té silvestre de México. Se prepara con las hojas del *Bidens tetragona*, D. C., que crece silvestre y en mucha abundancia en los campos cultivados del Valle de México y otros lugares. Se las sumerge instantáneamente en agua hirviendo, se secan despues, y por último se las enrolla de manera que queden muy apretadas. Preparado de este modo sirve en México de sustituto al té de China, con el que tiene, segun el Sr. Mendoza, cierta analogía de principios, aunque es de inferior calidad. Se preparan dos clases (que se remiten), el té negro y el té verde. Precio del kil. 50 centavos.

8 Timbirichis. Frutos de la *Bromelia pinguin*, L., que crece en las tierras calientes de México: son sumamente acidos y de un gusto agradable: se prepara con ellos bebidas refrescantes. Precio del kil. 12. centavos.

◆

El Sr. socio D. Manuel Reyes, presentó lo siguiente:

PRIMER GRUPO.

1 Cera vegetal. Se designa en México bajo este nombre, la materia cerosa de que está impregnado el epicarpio de los pequeños y numerosos frutos de la *Myrica Jalapensis*, que es un arbusto que llega á crecer hasta

dos varas de alto y es conocido vulgarmente con el nombre de *árbol de la cera*, y por los indígenas *Huacanalá*. Vegeta abundantemente en la vertiente oriental de nuestra gran cordillera, en una zona comprendida entre 2,500 y 4,000 piés sobre el nivel del mar, que disfruta de una temperatura templada: esta especie, en fin, es distinta de la *M. cerifera*, L., que crece en la parte Sur de los Estados-Unidos.

La cera vegetal se prepara con los frutos y hojas haciéndolos hervir varias veces en una suficiente cantidad de agua hasta agotarlos; á una temperatura de 65° cent. se comienza á separar de ellos esta sustancia y viene á sobrenadar en la superficie del líquido bajo la forma de granulaciones y de donde fácilmente se le puede recoger dejándolo enfriar. Con objeto de despojarla de las partecillas vegetales que arrastra consigo, se la hace pasar por una coladera, y fundida se vacía en moldes del tamaño y forma que se desée. El producto que se obtiene de esta manera es por término medio el 8 por ciento de la cantidad de vegetal empleado.

La cera así extraida se presenta bajo la forma de un cuerpo duro y quebradizo, untuoso al tacto, de un verde más ó ménos intenso y cuyo punto de fusion es superior al del sebo, pero inferior al de la cera de abeja: al quemarse en una vela da una luz algo fuliginosa que por su claridad es tambien intermedia entre la de estas dos sustancias grasas, esparciendo, además, cierto olor balsámico.

Desde hace algun tiempo varias personas han tratado de blanquearla, pero con poco éxito, pues es muy difícil privarla por completo de la clorofila que está íntimamente mezclada con ella, y que además del color que le comunica tiene el inconveniente de impedir que dé una buena luz al arder: con esta operacion su punto de fusion sube algunos grados y no da humo ni olor al quemarse. El porvenir comercial de la cera vegetal quedaria asegurado sin duda si se llegase á conseguir este resultado de una manera completa y económica.

El Sr. Reyes, por un procedimiento especial suyo, nos parece que ha resuelto el problema arriba señalado, á juzgar por la muestra que acompaña, y que es de una blancura casi perfecta, que con solo el tiempo aumenta todavía más, llegando aun á adquirir el olor de la cera de abeja; se remite:

a. Marqueta cuadrangular de cera vegetal verde-yerba, tal como se encuentra en el comercio de México: su peso 9 libras. Se obtiene haciendo hervir los frutos con todo y las ramas á que están adheridos. Su precio en la capital es de $4 arroba.

b. Idem como la anterior de cera vegetal blanqueada. Puede venderse en la capital á razon de $6 arroba.

c. Velas de cuatro onzas de peso, fabricadas con estas dos clases de cera. Su precio puede calcularse en 25 y 33 centavos libra.

SEGUNDO GRUPO.

COLECCION DE FECULAS EXTRAIDAS DE LAS PLANTAS SIGUIENTES, QUE SE CULTIVAN EN MEXICO.

1 De arvejon, fruto del *Pisum sativum,* L.
2 ,, ayocote, idem del *Phaseolus multiflorus,* L.
3 ,, frijol, idem del *Ph. vulgaris,* L.
4 ,, garbanzo, idem del *Cicer arietinum,* L.
5 ,, haba, idem del *Vicia faba,* L.
6 ,, lenteja, idem del *Ervum lens,* L.
7 ,, maíz, idem del *Zea mais,* L.
8 ,, camote, raíz del *Convolvulus batatas,* L.
9 ,, huacamote, idem del *Manihot edule?*

Todas ellas son apreciadas por sus cualidades alimenticias.

PRODUCTOS ANIMALES Y VEGETALES DIVERSOS.

1º Capullo del encino. Este nido es fabricado por la oruga del *Bombyx psidii,* de Sallé, que vive no solo en esta planta, sino tambien en el guayabo. Cada capullo está compuesto de multitud de filamentos entretejidos de diversas maneras, pues no es una sola oruga sino muchas las que lo forman: esto hace que no pueda hilarse en el huso, sino solo cardarse. La seda es de una blancura brillante, bastante resistente, y su aspecto es muy hermoso. Abundan extraordinariamente estos capullos en muchas localidades del Estado de Veracruz, Oaxaca, etc.. en donde pueden conseguirse á un precio sumamente bajo. El ejemplar que se remite no es de los más grandes, y mide cerca de un metro de largo: fué obsequiado á la Sociedad por el Sr. socio D. José M. Velasco.

2 Pieles de mamiferos. Una de perro de agua, de tierra caliente, *Lutra brasiliensis,* y tres de un tigrillo del género *Felis.* Fueron colectados por el Sr. Montesdeoca en su expedicion al Estado de Veracruz.

3 Achiotillo. Frutos de la *Bixa Orellana*, L., que vegeta en las tierras calientes de la República y sirve para preparar la materia colorante que se menciona en seguida. Precio del kil, $ 1.

4 Achiote. Se designa con este nombre la materia tintórea que se prepara con los frutos de la *Bixa Orellana*. Se encuentra en el comercio en panes circulares de cinco centímetros de diámetro, de un rojo oscuro. Es empleado en algunas artes, y da un tinte rojo-naranjado. Precio del kil. $ 4 50 centavos.

5. Algodon de pochote. Sustancia filamentosa, blanca y brillante como la seda, que existe en gran cantidad en los frutos del *Eriodendron anfractuosum*. Es este un árbol que abunda extraordinariamente en la vertiente oriental de la gran cordillera de México. Se habia pensado utilizarla para fabricar sombreros, pero en esta industria, tal como está establecida hoy, solo se emplean sustancias animales. La fibra tiene el inconveniente de ser quebradiza y muy corta, y tansolo se aprovecha para hacer mullidas almohadas: es de creer, sin embargo, que más adelante se le encontrarán aplicaciones industriales más importantes, que aumentarán su valor. Se puede asegurar que su precio en los lugares donde se produce debe ser verdaderamente insignificante. La muestra que se remite fué colectada por el Sr. Montesdeoca.

6 Pasto de ocotillo. Es un líquen tintóreo, muy abundante en las costas de la Baja California y en las inmediatas, y que se explota desde hace algun tiempo. Es una verdadera orchilla, y segun el dictámen presentado á esta Sociedad por los Señores D. Leopoldo Rio de la Loza, Herrera y Ramirez, pertenece á la *Rocella fuciformis*, v. *linearis*, Acharius. (La Naturaleza, t. II, pág. 163). Es una materia tintórea bastante apreciada y que produce diversos tintes. El ejemplar que se remite en un cuadro, fué obsequiado á la Sociedad por el Sr. socio D. Ricardo Ramirez.

7 Quina cultivada en Mexico. Pertenece á la segunda variedad de la *Cinchona calisaya*. Se remite un cuadro que contiene un ramo con hojas y flores, y además fragmentos de la corteza, la que, segun análisis del Sr. Laso de la Vega, encierra cerca de un 2 por 100 de quinina. Estos ejemplares fueron obsequiados á la Sociedad por su finado socio el Sr. D. J. Apolinario Nieto, quien la aclimató en Córdoba.

8 Jamaica. Se designa en México con este nombre al *Hibiscus sabda-*

riffa, L. que vegeta espontáneamente en varios lugares calientes de la República y en otros se cultiva. Cabe la duda de si esta planta, que entre nosotros se considera como indígena, fué importada del antiguo continente. Se remite de ella ejemplares del caliz acrescente, única parte usada, que adquiere un gran desarrollo. Es de un rojo intenso, y de un sabor francamente ácido y mucilaginoso. El Sr. Laso de la Vega sospecha que contiene un ácido nuevo, aunque se inclina más bien á creer que sea el málico; y con su materia colorante ha formado hermosas lacas. Se preparan con ellos bebidas refrescantes, que en la medicina popular gozan de gran reputacion. Precio del kil. en la capital 75 centavos.

CATÁLOGO

DE LA COLECCION DE ROCAS Y MINERALES QUE SE REMITE.

El Sr. socio D. Mariano Bárcena, presentó los siguientes ejemplares de su coleccion particular.

ROCAS MESOZOICAS DE MEXICO.

1 Caliza jaspeada.—Un ejemplar.
2 Caliza con piedra lídica, idem.
3 Caliza mexicana de nerineas, idem.
4 Caliza mexicana de radiolitas, idem.
5 Caliza con radiolitas y nerineas, tres idem.
6 Nerinea Castilli. (Bárcena.) Un idem.
7 Hippurites Mexicana. (Bárcena.) Idem.
8 Impresiones de Ammonitas en pizarra arcillo-micácea dos idem.
9 Pizarra arcillosa con trigonias, un idem.

ROCAS VOLCANICAS.

10 Basalto traquítico escorioso. Primera época de erupcion del Ceboruco.

11 Basalto compacto traquítico. Ceborucita, (Bárcena). Segunda época de erupcion del Ceboruco.

12. Piedra pómez. Tercera época de erupcion del Ceboruco.

13 Piedra pez. Tercera época de erupcion del Ceboruco.

14 Basalto traquítico ojoso. Cuarta época de erupcion del Ceboruco.

15 Pórfido traquítico de base de piedra pez. Erupcion actual del Ceboruco.

16 Pórfido traquítico escorioso. Erupcion actual del Ceboruco.

17 Escoria traquítica de base de piedra pez. Erupcion actual del Ceboruco.

18 Lava escoriosa de base de piedra aperlada.

19 Frasco conteniendo cenizas arrojadas por el Ceboruco en la erupcion actual.

20 Lava con sulfato de fierro. Producto del volcan de Colima en la erupcion de 1872.

MINERALES.

21 «Livingstónite.» Nueva especie mineral mexicana, descubierta por M. Bárcena.

VISTAS Y PLANOS.

Vista O. del volcan Ceboruco.
Vista del volcan de Colima.
Mapa geológico del Ceboruco.
Mapa topográfico de idem.

MEMORIAS EXPLICATIVAS IMPRESAS.

Informe sobre el Ceboruco, por Iglesias, Matute y Bárcena.

Dato para el estudio de las rocas mesozoicas de México, por Mariano Bárcena.

El Sr. socio D. Antonio del Castillo, presidente de la seccion de Mineralogia, etc., escogió los ejemplares siguientes del gabinete particular de la Sociedad.

1 Hierro meteórico, Jijipilco.
2 Plata nativa, Bramador (Jalisco).
3 Azurite con espato fluor, Zimapan.
4 Cobre rojo, Matehuala.

5 Cobre verde, Zomelahuacan.
6 Plúmbago, idem, (San Guillermo).
7 Hidrosilicato de cobre, idem, (San Antonio).
8 Oxido de cobre rojo, idem.
9 Cinabrio, hacienda del Puerto. Distrito de Lagos (Jalisco).
10 Idem de Guadalcázar, San Luis Potosí.
11 Idem de Durango.
12 Idem tiñendo al cuarzo, Sierra de Santa Rosa. San Luis Potosí.
13 Idem, Estado de México.

A. Coleccion de cuarzos auríferos, de que se obtienen las platas auríferas ú *oroches*, compuesta de 32 ejemplares, del Mineral del Oro, Estado de México. Obsequio del Sr. D. Santiago Ramirez.

B. Ammonita del pueblo de San Pedro del Gallo, Estado de Durango. Obsequio del Sr. Ballesteros.

C. Coleccion de treinta y seis muestras de ensayes al soplete sobre el carbon, dispuestas en un cuadro. En ellas se manifiestan los caractéres que presentan, con este tratamiento, los cuerpos simples y algunos compuestos naturales y artificiales que son susceptibles de dar pegaduras. Este notable estudio fué presentado á la Sociedad, acompañado de su Memoria respectiva, por el Sr. socio D. Severo Navia.

ADICIONES.

En el artículo «Productos animales y vegetales diversos» se pasó mencionar lo siguiente:

Acido pipitzahoico. Sustancia resinosa de naturaleza ácida, contenida en las raíces del *Trixis pipitzahoac*, Schaf., y que existe tambien en las otras especies de este género que crecen en la República: fué descubierta en 1848 y presentada en la primera exposicion del Estado de México en 1850, y en la de Lóndres. Es uno de los productos vegetales más hermosos que se conocen, pues al color y casi brillantez del oro une la ligereza y suavidad de la seda; se presenta bajo un estado amorfo, ó cristalizado en prismas, ó más bien, láminas muy pequeñas, y aglomerado en masas, más ó ménos grandes, que se deshacen en los dedos á la más ligera presion. Hasta ahora solo en medicina se suele emplear esta sustancia como purgante drástico, pero quizá más tarde las artes aprovecharán los hermosos colores de algunos de sus compuestos. La muestra que se remite fué preparada por el señor socio D. Severiano Perez. El precio de 30 gramos puede calcularse en $2 50 centavos, y no hay existencia.

Pipitzahuina. Esta sustancia ha sido descubierta (1858) por el Sr. D. Severiano Perez, quien la designó entónces con el nombre de *fructicosina*, y por indicacion del distinguido químico Sr. D. Leopoldo Rio de la Loza, se le cambió el nombre por el que hoy lleva, con el objeto de conservar la raiz mexicana.

La pipitzahuina es una sustancia blanca, fusible, volátil á mas de 100° centígrados, neutra al papel de tornasol, cristalizando en agujas prismaticas por sublimacion y en laminas por evaporacion; insoluble en el agua; soluble en el alcohol á 60° centígrados, muy soluble en el éter y el cloroformo, insípida al principio, pero desarrollando á poco un amargo bien pronunciado; arde con llama amarilla. Sus propiedades terapéuticas no son conocidas. El precio á que puede venderse esta sustancia es de $4 los 30 gramos, no habiendo existencia. Esta muestra la remite su descubridor el Sr. D. Severiano Perez.

Variedades de maiz. Coleccion de treinta y dos mazorcas, distintas por el color, consistencia y proporcion en los componentes del grano. Fueron colectadas en los Estados de Jalisco, Veracruz y México, por los Sres. Bárcena, Montesdeoca, y Morales.

Para concluir, réstanos manifestar que por la premura del tiempo no fué posible á los señores socios hacer un estudio más detenido de los productos que se mencionan en el presente catálogo, quedando depositados en la Sociedad algunos otros que por dicho motivo no se pudieron remitir.

México, Julio 31 de 1876.

Por la Comision de publicaciones,
Manuel M. Villada.

LA ESCUELA NACIONAL PREPARATORIA

REMITIO LOS OBJETOS SIGUIENTES POR CONDUCTO DE LA SOCIEDAD.

---

1 Cera de Campeche. Con este nombre se designa en México la cera producida por diversas especies del género *Mellipona*, tales como la *M. fulva*, *M. domestica*, etc., del órden de los Himenópteros, familia de los Melíferos, grupo de los Meliponitos. El vulgo las designa con el nombre de abeja alazana.

Las meliponas abundan en los bosques de las regiones calientes de la República; construyen sus panales en las cavidades de los árboles cariados; viven en sociedades numerosas, compuestas de machos, hembras y neutras. En el panal se observan dos clases de celdillas; unas ovoides del tamaño hasta de un huevo de gallina, y otras más pequeñas y exagonales; las primeras están llenas de una miel ménos densa que la de la abeja doméstica, aunque más agradable por tener un sabor ligeramente ácido; las segundas sirven de nido y habitacion. Estos insectos viven en el estado salvaje, sin embargo de que fácilmente se domestican, siendo de notar, que como se hallan desprovistas de aguijon, no presentan para su educacion los inconvenientes de la abeja comun.

La cera producida por estas meliponas se funde á 53°; tratada con el éter sulfúrico, queda un residuo de una cera blanca que puede emplearse en la fabricacion de las velas; y se disuelve una sustancia amarilla muy adhesiva y un principio aromático.

Se emplea la cera de Campeche en varias preparaciones ungüentorias y emplásticas, en la economía doméstica y en la jardinería para cubrir las extremidades de las ramas podridas, las heridas y demás casos en que se usa el ungüento de podadores. Su precio en la capital es de 62 centavos kil.

2 Chayote. Esta planta indígena de México, *Sechium edule*, Swar., produce unos tubérculos muy voluminosos, conocidos con los nombres mexicanos de chinchayote, chayotestli y camochayote; su peso puede ser hasta de tres kilógramos; su forma variable, ya algo cilíndrica, ya ovoidea ó completamente irregular; su corteza hendida irregularmente, es de un amarillo sucio y cubierta de multitud de pequeñas placas separadas por hendeduras poco profundas; el interior es blanco amarilloso, sobre todo hácia la periferia.

En 100 partes de tubérculos he encontrado los principios siguientes: agua 71.00, fécula 20.00, materia resinoide amarilla, soluble en el éter, 00.20, azúcares 00.32, albumina vegetal 00.43, celulosa 05.60, materia extractiva, tartrato de potasa, cloruro de sodio, sulfato de cal y siliza, 02.25; pérdida 00.20.

En diversos ensayos hechos con distintos tubérculos, he obtenido hasta 25 por 100 de fécula en unos casos y 18 en otros, lo que facilmente se explica por la naturaleza del terreno en que ha crecido el vegetal, la época en que se ha cosechado el chinchayote, etc. La fécula puesta en el agua y examinada con el microscopio, se presenta bajo la forma de granos lenticulares, muy semejantes á los del almidon de trigo, aunque de mayor diámetro. Sometida a la accion de la agua hirviendo forma engrudo facilmente, que visto con el microscopio tiene el aspecto de una flema, en medio de la que se notan algunos granos no atacados y membranas en forma de odres, despedazadas en algunos puntos: el corto número de éstas y la facilidad con que la fécula es atacada, demuestran su fácil digestion.

En el fruto la cantidad de fécula apenas llega al 1 por 100; la albumina y la azúcar se encuentran tambien en pequeña cantidad; en cambio la he hallado hasta en la proporcion de 87 por 100.

El chayote es una de las plantas indígenas más importantes; cosmopolita como el hombre, vegeta perfectamente, tanto en los climas calientes de la zona tórrida, como en los templados y frios; su cultivo es fácil y sencillo; es una de aquellas plantas excepcionales de las que el hombre utiliza los tubérculos y los frutos á la vez; el agricultor no tiene que esperar largo tiempo para recoger el producto de sus afanes, puesto que á los ocho meses levanta la cosecha de numerosos frutos; al segundo año aprovecha éstos y el chinchayote. Segun los informes que he adquirido, cada planta produce de 80 á 100 frutos y de 20 á 25 kilógramos de tubérculos; sus hojas pueden emplearse como forraje, y sus flores son muy buscadas por las abejas. Basta sembrarlo una sola vez para aprovechar su cosecha durante siete años, sin tener que erogar mas gastos que el invertido en levantarla; no se halla expuesta á esas enfermedades tan comunes a la papa y otras plantas alimenticias, que con frecuencia originan la ruina de los agricultores, y aun el hambre en algunos pueblos miserables de Europa. Precio del kil. 18 centavos. Se remite:

a. Tubérculos en rebanadas, cocidas y desecadas.

b. Harina de los mismos. Precio del kil. 31 centavos.

c. Fécula de id. Precio del kil. 37 centavos.

Alfonso Herrera.

HERBARIO DE PLANTAS INDÍGENAS.

Seis grandes volúmenes, conteniendo:

Los cinco primeros, 274 plantas del Valle de México, clasificadas por los Sres. D. José Barragan, D. Alfonso Herrera y el que suscribe: en cada etiqueta se expresa la sinonimia vulgar y científica, época de la floracion y usos; el sexto contiene 70 Helechos de diferentes localidades de la República, la mayor parte de la region oriental, colectados y clasificados por el Sr. Schaffner.

Las primeras están distribuidas en las familias siguientes, segun el método de Endlicher.

Familias.	Especies.	Familias.	Especies.
Marcanciaceas	1	Plantagineas	1
Helechos	7	Compuestas	50
Polipodiaceas	19	Lobeliaceas	2
Salviniaceas	1	Rubiaceas	5
Licopodiaceas	7	Asclepiadaceas	5
Gramineas	32	Labiadas	4
Ciperaceas	8	Verbenaceas	2
Eriocauloneas	1	Asperifolieas	1
Comelinaceas	6	Convolvulaceas	4
Alismaceas	1	Polemoniaceas	3
Juncaceas	3	Solanaceas	12
Pontederaceas	1	Utricularieas	1
Liliaceas	1	Escrofulariaceas	6

PIELES DE IGUANA. Con este nombre se designa vulgarmente la *Iguana rhinolopha*, de Wiegmann, reptil muy abundante en los climas calientes de la República, particularmente en la costa oriental. Su piel presenta coloraciones muy variadas, algunas de ellas bastante hermosas. Se utilizan para hacer pantuflas, botines para señora, carteras y otros objetos de fantasía: una vez curtidas son demasiado suaves é impermeables. Precio de cada piel en bruto 10 centavos.

FRANCISCO CORDERO Y HOYOS.

NECROLOGIA.

El dia 2 de Mayo del presente año, falleció, próximo á cumplir 69 años, el Sr. Dr. D. Leopoldo Rio de la Loza, Presidente honorario perpétuo que fué, de la Sociedad Mexicana de Historia Natural.

Este lamentable acontecimiento ha sido profundamente sentido por las Sociedades científicas de la capital y por los numerosos discípulos y amigos del ilustre finado.

La Escuela Nacional de Medicina dispuso honrar su memoria en un acto público y solemne, y reunidas todas aquellas corporaciones en el general de dicho Establecimiento, le tributaron los más dignos homenajes de veneracion y de respeto.

El Sr. Rio de la Loza tuvo el mérito indisputable de haber sido el primero que verdaderamente impulsó en México el estudio de la Química, elevándose en esta ciencia á un rango muy distinguido, y habiendo llegado á ocupar el primer lugar entre los mexicanos que se han consagrado á su estudio.

Por un largo período de 30 años fué catedrático de Química en los establecimientos nacionales de la capital, y en este honroso puesto se distinguió sobremanera por su notorio empeño y perseverancia en el adelanto de sus discípulos, por la bondad y precision de sus doctrinas, por la pureza y erudicion de su lenguaje, que daban á sus lecciones grande atractivo; con estas dotes excepcionales logró alcanzar en el profesorado mexicano un grado eminente.

Tuvo tambien en un tiempo bajo su direccion la Escuela Nacional de Agricultura y la de Medicina: de la primera se puede considerar como fundador. En el cumplimiento de esta delicada mision, prestó á dichos establecimientos muy valiosos servicios, tanto por su capacidad administrativa cuanto por su actividad en promover y llevar á cabo toda clase de mejoras; desempeñando, en fin, con el mismo acierto los demás cargos públicos que se le confiaron.

Muy dignos son igualmente de mencionarse los numerosos artículos y los opúsculos que escribió sobre diversas materias, especialmente de Química, desde el año de 1839 hasta pocos años ántes de su muerte, y que se publicaron en diversos periódicos científicos. "La Naturaleza," órgano de esta Sociedad, honró sus columnas dando publicidad á dos de ellos, y que fueron ejecutados para resolver dos cuestiones de grande importancia: una, averiguar si las aguas potables de México contenian plomo en disolucion, y otra relativa al líquen tintóreo de la Baja California.

No pocos fueron los títulos y las distinciones que recibió el Sr. Rio de la Loza durante su vida de las Sociedades científicas de México y del extranjero. Esta asociacion le nombró en 1869 su socio de número, en 1870 fué su Presidente nato, y reelecto por aclamacion para ocupar el mismo puesto en 1871; confiriéndole en 1873 el título de Presidente honorario perpétuo.

Por iniciativa de la Sociedad Mexicana de Historia Natural, las demás corporaciones científicas existentes en esta capital, han aceptado el pensamiento propuesto por aquella para honrar, en union suya, la digna memoria de su Presidente honorario con una sesion solemne, y para cuya realizacion trabajan actualmente con laudable empeño.

México, Agosto 15 de 1876.

Comision de publicaciones.

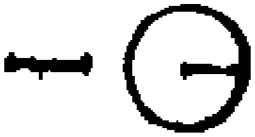
THEOREM I

It is by the straight line and the circle that the first and most simple example and representation of all things may be demonstrated, whether such things be either non-existent or merely hidden under Nature's veils.

THEOREM II

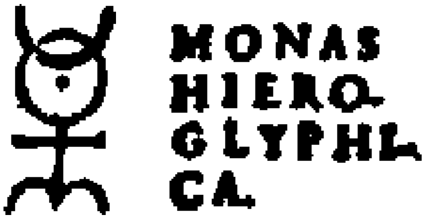
Neither the circle without the line, nor the line without the point, can be artificially produced. It is, therefore, by virtue of the point and the Monad that all things commence to emerge in principle.



That which is affected at the periphery, however large it may be, cannot in any way lack the support of the central point.

THEOREM III

Therefore, the central point which we see in the centre of the hieroglyphic Monad produces the Earth, round which the Sun, the Moon, and the other planets follow their respective paths. The Sun has the supreme dignity, and we represent him by a circle having a visible centre.



THEOREM IV

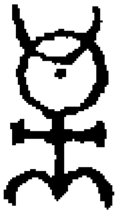
Although the semicircle of the Moon is placed above the circle of the Sun and would appear to be superior, nevertheless we know that the Sun is ruler and King. We see that the Moon in her shape and her proximity rivals the Sun with her grandeur, which is apparent to ordinary men, yet the face, or a semi-sphere of the Moon, always reflects the light of the Sun. It desires so much to be impregnated with solar rays and to be transformed into Sun that at times it disappears completely from the skies and some days after reappears, and we have represented her by the figure of the Horns (Cornucopia).

THEOREM V

And truly I give the completion of the idea of the solar circle by adding a semicircle for the Moon, for the morning and the evening were the first day, and it was therefore in the first (day) that the Light of the Philosophers was made (or produced).

THEOREM VI

We see here that the Sun and the Moon are supported upon the right-angled Cross. This Cross may signify very profoundly, and for sufficient reasons in our hieroglyph, either the Ternary or the Quaternary. The Ternary is made by the two straight lines having a copulative centre.



The Quaternary is produced by the four straight lines enclosing four right angles. Either of these elements, the lines or the right angles, repeated twice, therefore, afford us in the most secret manner the Octad, which I do not believe was known to our predecessors, the Magi, and which you should study with great attention. The threefold magic of the first Fathers and the wise men consisted in Body, Soul and Spirit. Therefore, we have here the first manifested Septenary, that is to say, two straight lines with a common point which make three, and the four lines which converge to form the central point in separating the first two.

THEOREM VII

The Elements being far from their accustomed places, the homogeneous parts are dislocated, and this a man learns by experiment, for it is along the straight lines that they return naturally and effectively to these same places. Therefore, it will not be absurd to represent the mystery of the four Elements, in which it is possible to resolve each one into elementary form, by four straight lines running in four contrary directions from one common and indivisible point. Here you will notice particularly that the geometricians teach that a line is produced by the displacement of a point: we give notice that it must be the same here, and for a similar reason, because our elementary lines are produced by a continual cascade of droplets as a flux in the mechanism of our magic.

THEOREM VIII

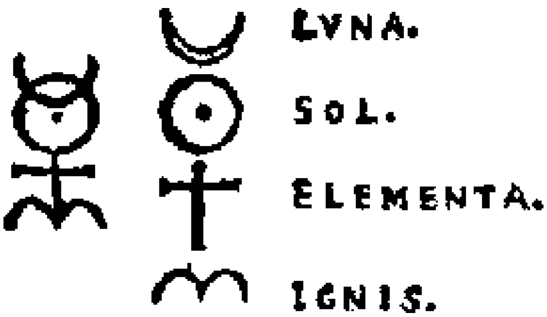
Besides, the kabbalistic extension of the Quaternary according to the common formula of notation (because we say one, two, three, and four) is an abridged or reduced form of the Decad. This is because Pythagoras was in the habit of saying: 1+2+3+4 make 10. It is not by chance that the right-angled Cross -- that is to say, the twenty-first letter of the Roman alphabet, which was considered as being formed by four straight lines -- was taken by the most ancient of the Roman Philosophers to represent the Decad.

Further, they have defined the place where the Ternary conducts its force into the Septenary.

THEOREM IX

We see that all this accords perfectly with the Sun and Moon of our Monad, because, by the magic of the four Elements, an exact separation upon their original lines must be made; following which the circulatory conjunction within the solar complement through the peripheries of these same lines is performed, because however long a given line may be, it is possible to describe a circle passing through its extremes, following the laws of the geometricians. Therefore, we cannot deny how useful the Sun and the Moon are to our Monad, in conjunction with the decadal proportion of the Cross.

THEOREM X



The following figure of the zodiacal sign Aries ♈, in use amongst the astronomers, is the same for all the world (a sort of erection both cutting and pointed), and it is understood that it indicates the origin of the fiery triplicity in that part of the sky.

Therefore, we have added the astronomical sign Aries to signify that in the practice of this Monad the use of fire is required.

We finish the brief hieroglyphic consideration of our Monad, which we would sum up in one only hieroglyphic context:

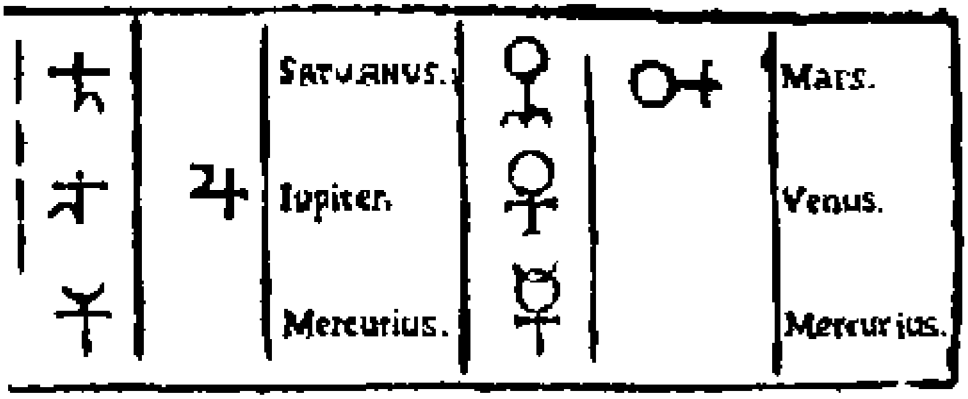
The Sun and the Moon of this Monad desire that the Elements in which the tenth proportion will flower, shall be separated, and this is done by the application of Fire.

THEOREM XI

The mystical sign of the Ram, composed of two semicircles connected by one common point, is very justly attributed to the place of the equinoctial nycthemeron, because the period of twenty-four hours divided by means of the equinox denotes most secret proportions.

This I have said in respect of the Earth.

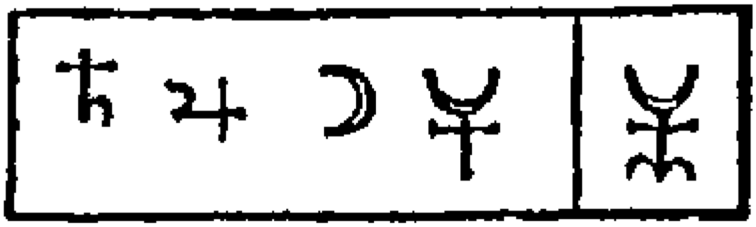
THEOREM XII



SATVRNVS.
Iupiter.
Mercurius.
Mars.
Venus.
Mercurius.

The very ancient wise men and Magi have transmitted to us five hieroglyphical signs of the planets, all of which are composed out of the signs used for the Moon and the Sun, together with the sign of the Elements and the hieroglyphical sign of Aries, the Ram, which will become apparent to those who examine these figures:

Each one of these signs will not be difficult to explain according to the hieroglyphical manner in view of our fundamental principles, already posited. To begin with, we will speak in paraphrases of those which possess the characteristics of the Moon: following that, of those which possess a solar character. When our lunar nature, by the science of the Elements, had accomplished the first revolution round our Earth, then it was called, mystically, Saturn.

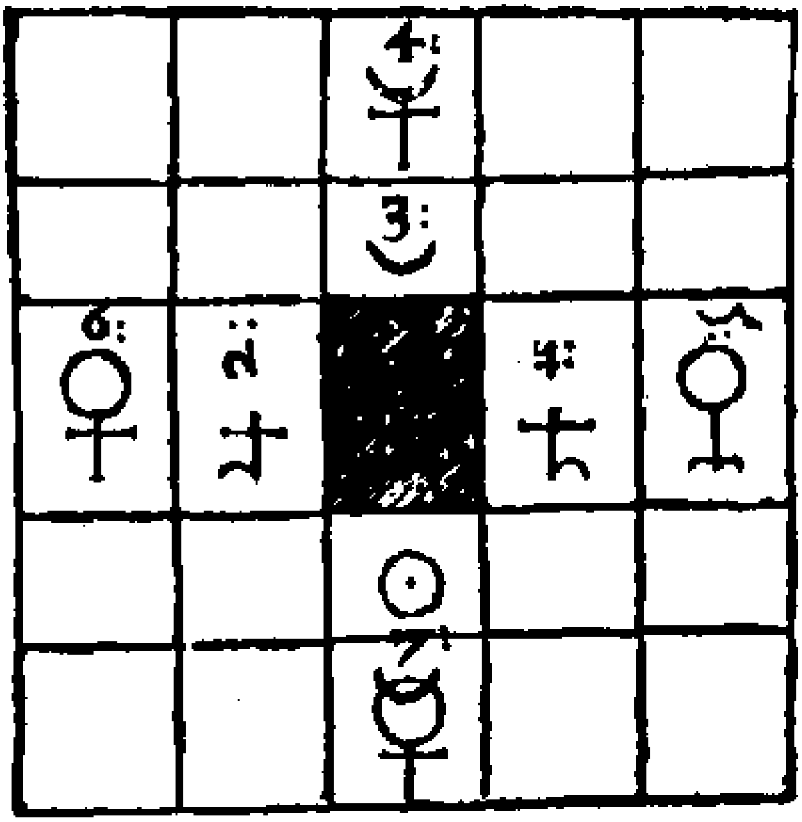


Afterwards, at the following revolution, it was named Jupiter, and holds a very secret figure. Then the Moon, developed by yet a third journey, was represented very obscurely again by this figure which it was their custom to call Mercury . You see how this is Lunar. That it must be conducted through a fourth revolution will not be contrary to our most secret design, whatever certain sages may say. In this manner the pure magical spirit, by its spiritual virtue, will perform the work of the albification at the place of the Moon; to us alone and as it were in the middle of a natural day he will speak hieroglyphically without words, introducing and imprinting these four geogonic figures in the pure Earth very simply prepared by us: this last figure being in the middle of all the others.

THEOREM XIII

Now regard the mystical character of Mars! Is it not formed from the hieroglyphs of the Sun and Aries, the magistery of the Elements partly intervening? And that of Venus -- I wish to know is it not produced from that of the Sun and the Elements according to the best exponents? Therefore, the planets look towards the solar periphery and the work of revivification.

In the progression we will notice this other Mercury  will appear who is truly the twin brother of the first: for by the complete Lunar and Solar magic of the Elements, the Hieroglyph of this Messenger speaks to us very distinctly, and we should examine it carefully and listen to what it says. And (by the Will of God) it is the Mercury of the Philosophers, the greatly celebrated microcosm and ADAM. Therefore, some of the most expert were inclined to place him in a position of, and give him a rank equal to, the Sun himself.



This we cannot perform in the present epoch unless we add to this coraline crystal work a certain SOUL separated from the body by the pyrognomic art. It is very difficult to accomplish this and very perilous because of the fire and the sulphur which the breath contains within it. But certainly this Soul can perform marvellous things. For example, join it by indissoluble ties to the disc of the Moon (or at least of Mercury) by Lucifer and Fire. In the third place, it is necessary that we should show (in order to demonstrate our Septenary number) that it is the Sun of Philosophers itself. You will observe the exactitude as well as the clarity with which this anatomy of our Hieroglyphic Monad corresponds to what is signified in the arcana of these two theorems.

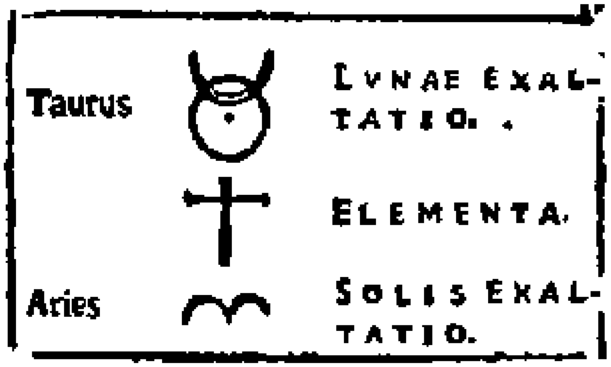
THEOREM XIV

It is therefore clearly confirmed that the whole magistery depends upon the Sun and the Moon. Thrice Greatest Hermes has repeatedly told us this in affirming that the Sun is its father and the Moon is its mother: and we know truly that the red earth (*terra lemnia*) is nourished by the rays of the Moon and the Sun which exercise a singular influence upon it.

THEOREM XV

We suggest, therefore, that Philosophers should consider the action of the Sun and the Moon upon the Earth. They will notice that when the light of the Sun enters Aries, then the Moon, when she enters the next sign, that is to say Taurus, receives a new dignity in the light and is exalted in that sign in respect of her natural virtues. The Ancients explained this proximity of the luminaries -- the most remarkable of all -- by a certain mystic sign under the name of the Bull. It is very certain that it is this exaltation of the Moon to which in their treatises the astronomers from the most ancient times bear witness. This mystery can be understood only by those who have become the Absolute Pontiffs of the Mysteries. For the same reason they have said that Taurus is the house of Venus -- that is to say, of conjugal love, chaste and prolific, for nature rejoices in nature, as the great Ostanes concealed in his most secret mysteries. These exaltations are acquired by the Sun, because he himself, after having undergone many eclipses of his light, received the force of Mars, and is said to be exalted in this same house of Mars which is our Ram (Aries).

This most secret mystery is clearly and perfectly shown in our Monad by the hieroglyphic figure of Taurus, which is here represented, and by that of Mars, which we have indicated in Theorem XII and Theorem XIII by the Sun joined to a straight line towards the sign of Aries.



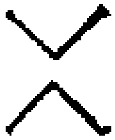
In this theory another kabbalistic analysis of our Monad offers itself, because the true and ingenius explanation is this: the exaltations of the Moon and of the Sun ate made by means of the science of the Elements.

Note. -- There are two things which should be particularly observed: first, that the hieroglyphic figure of Taurus is the same as the diphthong of the Greeks ♉ [i.e. -ou], which was always used in terminating the singular gender; secondly, that by a simple transposition of place we show the letter alpha twice, by a circle and a half-circle, being simply tangents which touch one another as shown.

THEOREM XVI

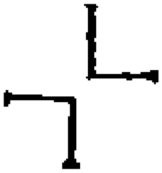
We must now, in view of our subject, philosophise for a short time upon the Cross. Our Cross may be formed of two straight lines (as we have said) which are equal one to the other -- that is to say, we cannot separate the lines except we do it by parting them so that we get equal lengths. But in the mystic distribution of the components of our Cross, we wish to use parts which are both equal and unequal. These parts show that a virtue is hidden under the power of the division of the Equilateral Cross into two parts, because they are of equal grandeur. In general, the Cross must be composed of equal right angles, since the nature of justice demands the perfect equality of the lines used in the decussation. In accordance with this justice, we propose to examine with care that which follows concerning the Equilateral Cross (which is the twenty-first letter of the Latin alphabet).

If, through the common point where the opposite angles meet in our Rectilineal, Rectangular, and Equilateral Cross, we imagine a straight line dividing it into two parts, then on either side of the line thus traversed we find the parts are perfectly equal and similar. And these parts are similar in shape to that letter of the Romans which is regarded as the fifth of the vowels, and which was frequently used by the most ancient Latin philosophers to represent the number five.



This, I conceive, was not done by them without good reason, because it is in fact the exact half of our Decad. Of these parts of the figure thus duplicated by the hypothetical division of the Cross, we must conclude it to be reasonable that each part represents the quinary, although one is upright and the other reversed in imitation of the multiplication of the square root which comes in here in a marvellous way as the circular number, that is to say, the quinary, from which we find the number twenty-five is produced (because this letter is the twentieth of the alphabet and the fifth of the vowels).

We will now consider another aspect of this same Equilateral Cross -- that which follows is based upon the position shown in our Monadic Cross. Let us suppose a similar division of the Cross into two parts be made as in the drawing.



Now we see the germinating shape of another letter of the Latin alphabet -- the one upright, the other reversed and opposite. This letter is used (after the ancient custom of the Latins) to represent the number fifty. From this, it seems to me, we establish our Decad of the Cross, for this is placed at the summit of all the mysteries, and it follows that this Cross is the hieroglyphic sign of perfection. Therefore, enclosed within the quinary force is the power of the Decad, out of which comes the number fifty as its own product.

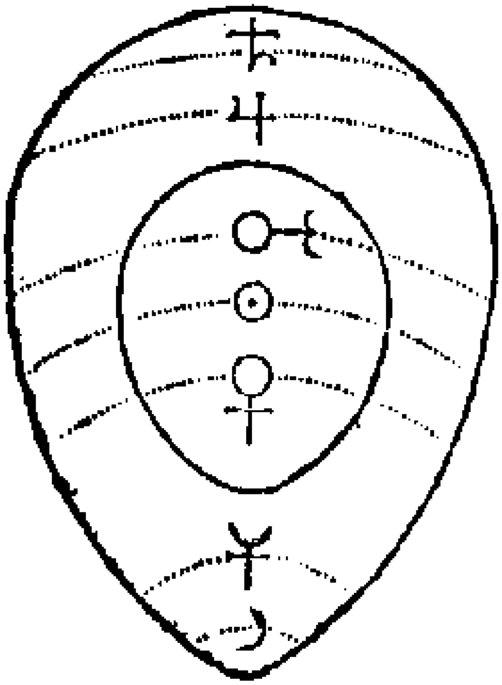
Oh, my God, how profound are these mysteries! and the name E L is given to this letter! And for this very reason, we see that it responds to the decadal virtue of the Cross, because, starting from the first letter of the alphabet, L is the tenth letter, and counting backwards from the letter X, we find that it falls into the tenth place, and since we show that there are two parts of the Cross, and considering now their numerical virtue, it is quite clear how the number one hundred is produced. And if by the law of squares these two parts be multiplied together, they give a product of 2500. This square compared with the square of the first circular number, and applied to it, gives a difference of one hundred, which is the Cross itself explained by the square of its Decad, and is recognised as one hundred. Therefore, as this is contained within the figure of the Cross, it also represents unity. By the study of these theories of the Cross, the most dignified of all, we are thereby induced to utilise this progression, viz. one -- ten -- one hundred, and this is the decadal proportion of the Cross as it appears to us.

THEOREM XVII

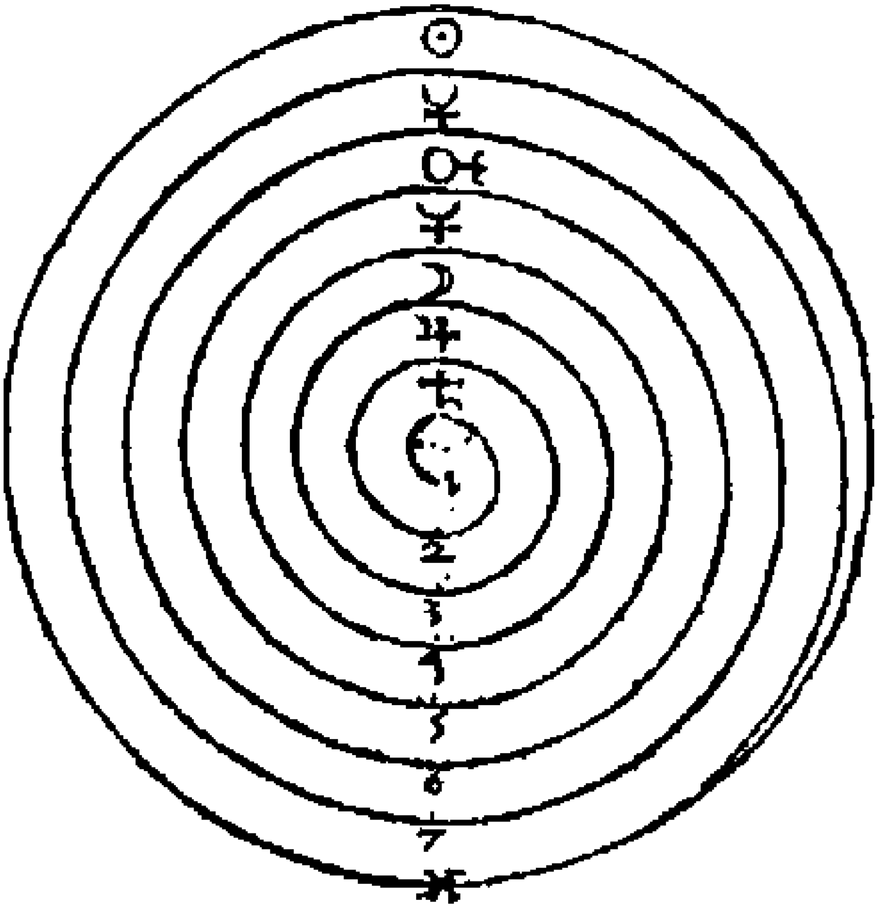
After a due study of the sixth theorem it is logical to proceed to a consideration of the four right angles in our Cross, to each one of which, as we have shown in the preceding theorem, we attribute the significance of the quinary according to the first position in which they are placed, and in transposing them to a new position, the same theorem shows that they become hieroglyphic signs of the number fifty. It is quite evident that the Cross is vulgarly used to indicate the number ten, and further, it is the twenty-first letter, following the order of the Latin alphabet, and it is for this reason that the sages amongst the Mecubales designated the number twenty-one by this same letter. In fact, we can give a very simple consideration to this sign to find out what other qualitative and quantitative virtues it possesses. From all these facts we see that we may safely conclude, by the best kabbalistic computation, that our Cross, by a marvellous metamorphosis, may signify for the Initiates two hundred and fifty-two. Thus: four times five, four times fifty, ten, twenty-one and one, which added together make two hundred and fifty-two. We can extract this number by two other methods as we have already shown: we recommend to the Kabbalists who have not yet made experiments to produce it, not only to study it in its conciseness, but also to form a judgment worthy of philosophers in regard to the various permutations and ingenious productions which arise from the magistery of this number. And I will not hide from you a further memorable mystagogy: consider that our Cross, containing so many ideas, conceals two further letters if we examine carefully their numerical virtues after a certain manner, so that, by a parallel method following their verbal force with this same Cross, we recognise with supreme admiration that it is from here that LIGHT is derived (LUX), the final word of the magistery, by the union and conjunction of the Ternary within the unity of the Word.

THEOREM XVIII

From our Theorems XII and XIII it may be inferred that celestial astronomy is the source and guide of the inferior astronomy. Before we raise our eyes to heaven, kabbalistically illuminated by the contemplation of these mysteries, we should perceive very exactly the construction of our Monad as it is shown to us not only in the LIGHT but also in life and nature, for it discloses explicitly, by its inner movement, the most secret mysteries of this physical analysis. We have contemplated the heavenly and divine functions of this celestial Messenger, and we now apply this co-ordination to the figure of the egg. It is well known that all astrologers teach that the form of the orbit traversed by a planet is circular, and because the wise should understand by a hint, it is thus that we interpret it in the hieroglyph shown, which conforms in every detail with all that has gone before.



Here you will note that the miserable alchemists must learn to recognise their numerous errors and to understand what is the water of the white of egg, what is the oil of the yoke of egg, and what we mean by calcined egg-shells. These inexpert impostors must learn in their despair to understand what are meant by these and many other similar expressions. Here we have shown almost all the proportions which correspond to Nature herself. This is the same Eagle's Egg which the scarab formerly broke because of the injury which the cruelty and violence of this bird caused to timid and primitive man, for this bird pursued some of them who were running to the cavern where the scarab dwelt, to implore his aid. The scarab wondered in what manner he alone could revenge such insolence, and, being of an ardent character, prepared to accomplish his purpose by constancy and determination, for he was short of neither power nor intelligence. The scarab pursued the eagle resolutely and made use of this very subtle trick: he let fall his ordure in the bosom of Jupiter where the egg was deposited, with the result that the God in getting rid of it threw the egg to the ground, where it was broken. The scarab by this method would have completely exterminated the whole family of eagles from the Earth had not Jupiter, in order to avoid such a calamity, resolved that, during that part of the year when the eagles watch over their eggs, no scarab should come flying near them. Therefore, I counsel those who are ill-treated by the cruelty of this bird, that they learn the very useful art from these solar insects (Heliocantharis) who live concealed and hidden for very long periods of time. By these indications and signs, for which they should be very thankful, they themselves will be able to take vengeance on their enemy. And I affirm (O King!) that it is not Aesop but Oedipus who prompts me, for he presented these things to worthy souls, and ventured for the first time to speak of these supreme mysteries of Nature. I know perfectly well that there have been certain men who, by the art of the scarab, have dissolved the eagle's egg and its shell with pure albumen and have formed thereby a mixture of all; afterwards they have reduced this mixture to a yellow liquid, by a notable process, viz. by a ceaseless circulation just as the scarabs roll their balls of earth.



By this means the great metamorphosis of the egg was accomplished; the albumen was absorbed during a great many revolutions round the heliocentric orbits, and was enveloped in this same yellow liquid. The hieroglyphic figure shown here, of this art, will not displease those who are familiar with Nature.

We read that during the early centuries, this art was much celebrated amongst the most serious and ancient Philosophers, as being certain and useful. Anaxagoras performed the magistery and extracted therefrom an excellent medicine, as you may read in his book.

He who devotes himself sincerely to these mysteries will see clearly that nothing is able to exist without the virtue of our hieroglyphic Monad.

THEOREM XIX

The Sun and the Moon shed their corporeal forces upon the bodies of the inferior Elements, much more so than all the other planets. It is this fact which shows, in effect, that in the pyrognomic analysis all metals lose the aqueous humour of the Moon as well as the igneous liquor of the Sun, by which all corporeal, terrestrial, and mortal things are sustained.

THEOREM XX

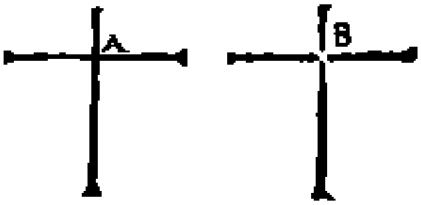
We have shown sufficiently that for very good reasons the Elements are represented in our Hieroglyph by the straight lines, therefore we give a very exact speculation concerning the point which we place in the centre of our Cross. This point cannot by any means be abstracted from our Ternary. Should anyone who is ignorant of this divine learning, say that in this position of our Binary the point can be absent, we reply, he may suppose it to be absent, but that which remains without it will certainly not be our Binary; for the Quaternary is immediately manifested, because by removing the point we discontinue the unity of the lines. Now, our adversary may suppose that by this argument we have reconstructed our Binary; that in fact our Binary and our Quaternary are one and the same thing, according to this consideration, which is manifestly impossible. The point must of necessity be present, because with the Binary it constitutes our Ternary, and there is nothing that can be substituted in its place. Meanwhile he cannot divide the hypostatic property of our Binary without nullifying an integral part of it. Thus it is demonstrated that it must not be divided. All the parts of a line are lines. This is a point, and this confirms our hypothesis. Therefore, the point does not form part of our Binary and yet it forms part of the integral form of the Binary. It follows that we must take notice of all that is hidden within this hypostatic form and understand that there is nothing superfluous in the linear dimension of our Binary. But because we see that these dimensions are common to both lines, they are considered to receive a certain secret image from this Binary. By this we demonstrate here that the Quaternary is concealed within the Ternary. O God! pardon me if I have sinned against Thy Majesty in revealing such a great mystery in my writings which all may read, but I believe that only those who are truly worthy will understand.

We therefore continue to expound the Quaternary of our Cross as we have indicated. Seek diligently to discover whether the point may be removed from the position in which we first find it. The mathematicians teach that it may be displaced quite simply. At the moment when it is separated the Quaternary remains, and it becomes much more clear and distinct to the eyes of all.

This is not a part of its substantial proportions, but only the confused and superfluous point which is rejected and removed.

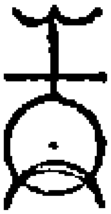
O Omnipotent Divine Majesty, how we Mortals are constrained to confess what great Wisdom and what ineffable mysteries reside in the Law which Thou hast made! Through all these points and these letters the most sublime secrets, and terrestrial arcane mysteries, as well as the multiple revelations of this unique point, now placed in the Light and examined by me, can be faithfully demonstrated and explained. This point is not superfluous within the Divine Trinity, yet when considered, on the other hand, within the Kingdom of the four Elements it is black, therefore corruptible and watery. O thrice and four times happy, the man who attains this (almost copulative) point in the Ternary, and rejects and removes that sombre and superfluous part of the Quaternary, the source of vague shadows. Thus after some effort we obtain the white vestments brilliant as the snow.

Oh, Maximilian! May God, through this mystagogy, make you or some other scion of the House of Austria the most powerful of all when the time comes for me to remain tranquil in Christ, in order that the honour of His redoubtable name may be restored within the abominable and intolerable shadows hovering above the Earth. And now for fear that I myself should say too much I shall immediately return to the burden of my task, and because I have already terminated my discourse for those whose gaze is centred within the heart, it is now necessary to translate my words for those whose heart is centred within their eyes. Here, therefore, we can represent in some measure in the figure of the Cross that which we have already said. Two equal lines are equally and inequally crossed through the point of necessity which you see in A.

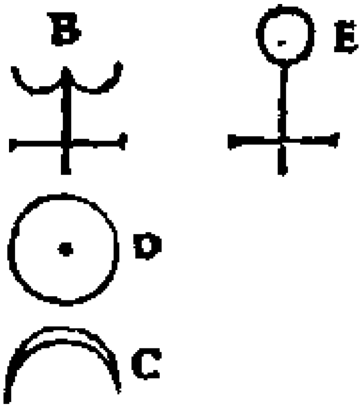


The four straight lines, as in B, produce a sort of vacuum where they are withdrawn from the central point, which was their common condition, in which state they were not prejudical, the one to the other. This is the path by which our Monad, progressing through the Binary and the Ternary into the purified Quaternary, is reconstituted within itself, united in equal proportions, and which now shows that the whole is equal to its combined parts, for during the time that this takes place our Monad will not admit of other units or numbers, because it is self-sufficient, and exactly so, within itself; absolute in all numbers in the amplitude of which it is diffused, not only magically but also by a somewhat vulgar process employed by the artist, which produces great results in dignity and power within this selfsame Monad, which is resolved into its own first matter; whilst that which is foreign to its nature and to its natural hereditary proportions is segregated with the greatest care and diligence and rejected for ever amongst the imputities.

THEOREM XXI



If that which is hidden within the profundities of our Monad be brought to light, or, on the contrary, if those primary parts which are exterior in our Monad are enclosed in the centre, you will see the extent to which the philosophical transformation can be produced. We will now expound to you another local commutation of our mystical Monad, using those parts from the hieroglyphic characters of the superior planets which are immediately offered to us. Each one of the other planets for this purpose is in turn elevated to a position which was frequently assigned to them by Plato, therefore, if they are conveniently taken in this position and at this point in Aries, Saturn and Jupiter are in conjunction. By descending, the Cross represents Venus and Mercury, followed by the Sun himself with the Moon at the bottom. This will be refuted in other circles; meantime, as we have no wish to hide the philosophical treasure of our Monad, we have taken a resolution to give a reason by which the position of the Monad is by this manner displaced. Yet see! listen to these other great secrets which I know and will disclose to assist you as touching this position, which I can explain in few words. We distribute our Monad, now looked at from a different aspect, and analysed in a different manner, as is seen at B, D, C. In this new Ternary the figures C and D are known to all men, but the figure designated B is not easy of comprehension.



It is necessary to give careful consideration to the known forms D and C, which show that the essences are separated and distinct from the figure B: also we see that the Horns of the figure C are turned downwards towards the Earth. That part of D which illumines C is also towards the Earth, that is to say, downwards, in the centre of which the solitary visible point alone is truly the Earth: finally these two figures D and C turned towards the lower end give a hieroglyphic indication of the Earth. Therefore, the Earth is made to represent, hieroglyphically, stability and fixation. I leave you to judge from this what is meant by C and D: from which you may take notice of a great secret. All the qualities which we have in the first place ascribed to the Sun and the Moon can here be given a perfect and very necessary interpretation, these two stars up to now having been placed in the superior position with the horns of the Moon raised on high; but we have already spoken of this.

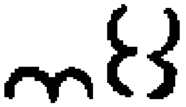
We will now examine, according to the fundamentals of our hieroglyphic Art, the nature of this third figure B. First, we carry to the Crown the double crescent of the Moon which is our Aries, turned round in a mystical manner. Then follows the hieroglyphic sign of the Elements, which is attached to it. As to why we use the double Moon, it may be explained that it is according to the matter, which requires a double quantity of the Moon. We speak of those grades of which in their experiments the Philosophers could find no more than four, amongst all created substances, that is to say, to be, to live, to feel and to comprehend (*esse, vivere, sentire et entelligere*). In saying that the first two of these Elements are found here, we say that they are called *argent vive (luna existens, viva*), all life being subject to movement, there being six principles of movement. The Cross which is attached implies that in this artifice the Elements are requisite. We have told you many times that in our theory the hieroglyph of the Moon is like a semicircle, and on the contrary the complete circle signifies the Sun, whereas here we have two semicircles separated, but touching at a common point; if these are combined, as they can be by a certain art, the product can represent the circular plenitude of the Sun. From all those things which we have considered, the result is that we can summarise, and in hieroglyphic form, offer the following:

Argent vive, which must be developed by the magistery of the Elements, possesses the power of the solar force through the unification of its two semicircles combined by a secret art.

The circle, of which we have spoken and which we designate in the figure by the letter E, is thus accomplished and formed. You will recollect, we have said that the solar degree is not delivered to us ready to our hand by Nature, but that it is artificial and not produced by Nature, it being available to us in its first aspect in accordance with its proper nature (as in B) in two parts separated and dissolved, and not solidly united in the solar body. In fact, the semi-diameter of these half-circles is not equal to the semi-diameter of D and C, but much smaller. Everyone can see this from the manner in which we have drawn them in the diagram, from which it is clear that this same B has not as great an amplitude as D and C. The proportions in the figure confirm this, being by this means transformed into a circle from B into E. Therefore, there appears before our eyes the sign of Venus alone. We have already demonstrated by these hieroglyphical syllogisms that from B we cannot obtain the true D, and that the true C is not and cannot be completely within the nature of B; therefore, this of itself is not able to become the true "Argent Vive." You may already doubt the subject of this life and of this movement, whether it is possible, in fact, to possess it naturally or not. However, as we have already explained to the wise, all those things which are said about B, in a similar manner will be at least analogical, and all that which we have briefly taught concerning C and D can be very well applied, by analogy, to this same B accompanied by its Elements. Indeed, that which we have attached to the nature of Aries, should exactly fit the case, because it carries this figure B, although reversed, at its summit, and that which is attached to the figure B, is the mystical figure of the Elements. Therefore, we see by this anatomy that from the body of our Monad alone, separated in this manner by our Art, this new Ternary is formed.

This we cannot doubt, for the reason that the members which composed it reassemble and form amongst themselves of their own free will a monadic union and sympathy which is absolute. By this means we discover amongst these members a force which is both magnetic and active.

Finally I think it well to note here, by way of recreation, that this same B shows very clearly the same proportions in the malformed and rustic letter in that it carries visible points towards the top and at the front and that these letters are three in number, otherwise they number six, summarising three times three: they are crude and malformed, unstable and inconstant, made in such a manner as to appear formed of a series of half-circles.



But the method of making these letters more stable and firm is in the hands of the literary experts. I have here placed before your eyes an infinitude of mysteries: I introduce a game but to interrupt a theory. Meanwhile I do not understand the efforts of certain people who rise up against me. Our Monad being reconstituted in its first mystical position and each one of its parts being ordered by Art, I advise and exhort them to search with zeal for that fire of Aries in the first triplicity, which is our equinoctial fire and which is the cause whereby our Sun may be elevated above his vulgar quality. Many other excellent things should also be studied in happy and wise meditations.

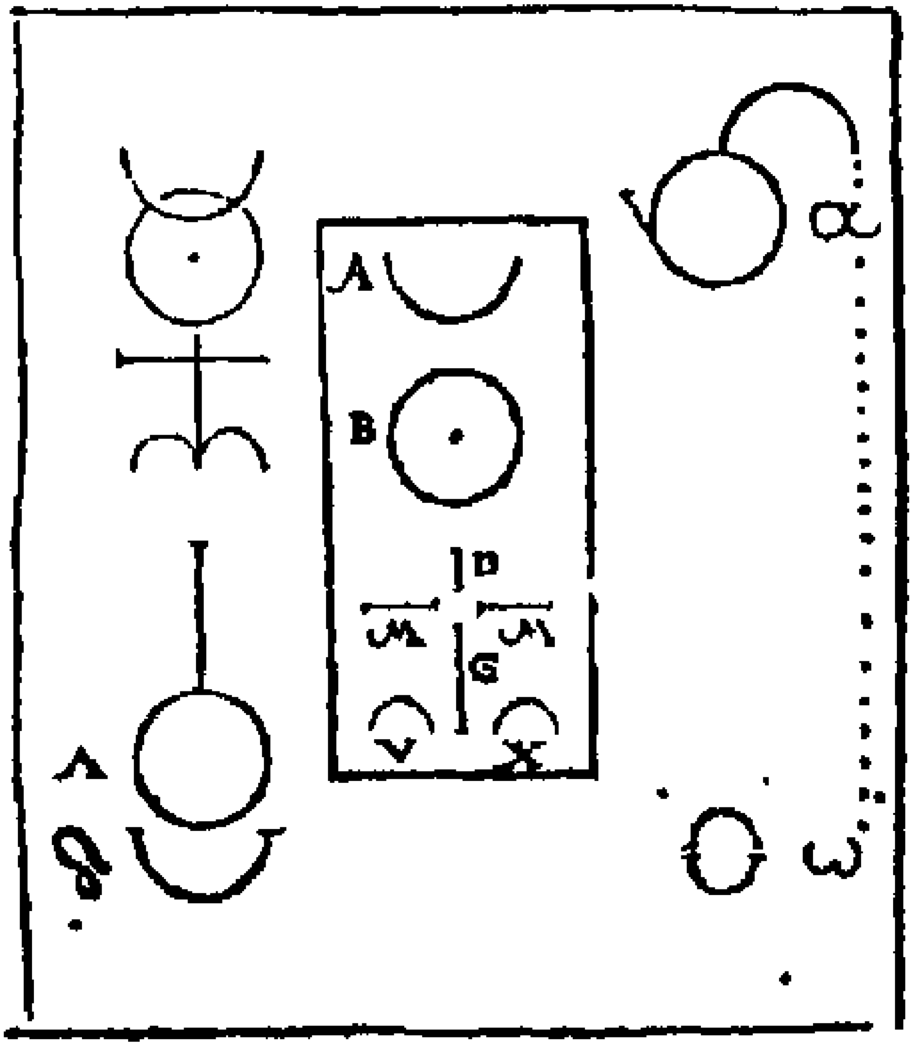
We now pass on to another subject; we wish to point the way, not only in a friendly but also in a faithful manner, to those other secrets upon which we must insist, before we lapse into silence and which, as we have said, comprise a most remarkable infinitude of other mysteries.

THEOREM XXII

It will be readily understood that the mysteries of our Monad cannot be extracted unless one is drawn towards the pharmacy of this same Monad, and that these mysteries must not be revealed to any but the Initiates. I offer here for the contemplation of your Serene Highness, the vessels of the Sacred Art which are truly and completely kabbalistic. All those lines which unite the diverse parts of our Monad are most wisely separated; we give to each one of them a special letter, in order to distinguish them one from another as you will see in the diagram.

We inform you that in "oc" [the mark in the upper right hand corner resembling the symbol for Taurus lying on it's side] is found a certain artificial vessel, formed of A and B with the line M. The exterior diameter is common to both A and B, and this is not different, as we see, from this the first letter of the Greek alphabet, except by a single transposition of the parts.

We teach the true mystical sympathy first by the line, the circle, and the semicircle, and, as we have formerly said, this symmetry can only be formed of the circle and the semicircle, which are always joined for the same mystical purpose.



It follows that λ and δ are in themselves the shapes of other vessels. That is to say, λ is made of glass and δ of earth (earthenware or clay). In the second place, λ and δ may remind us of the Pestle and Mortar, which must be made of suitable substance, in which artificial unperforated pearls, lamels of crystal and beryl, chrysolite, precious rubies, carbuncles and other rare artificial stones may be ground to powder.

Lastly, that which is indicated by the letter ω is a small vessel containing the mysteries, which is never far from this last letter of the Greek alphabet now restored to its primitive mystagogy, and which is made by a single transposition of its component parts, consisting of two half-circles of equal size. Concerning the vulgar objects and necessities which are required in addition to the vessels, and the materials out of which they should be fashioned, it would be useless that we should treat of it here. Meanwhile α must be considered as if searching for the occasion to perform its function by a very secret and rapid spiral circulation and an incorruptible salt by which the first principle of all things is preserved, or better, that the substance which floats within the vitriol after its dissolution, shows the apprentice a primordial but very transitory specimen of our work, and if he is attentive, a very subtle and most effective way to prepare the work will be revealed to him.

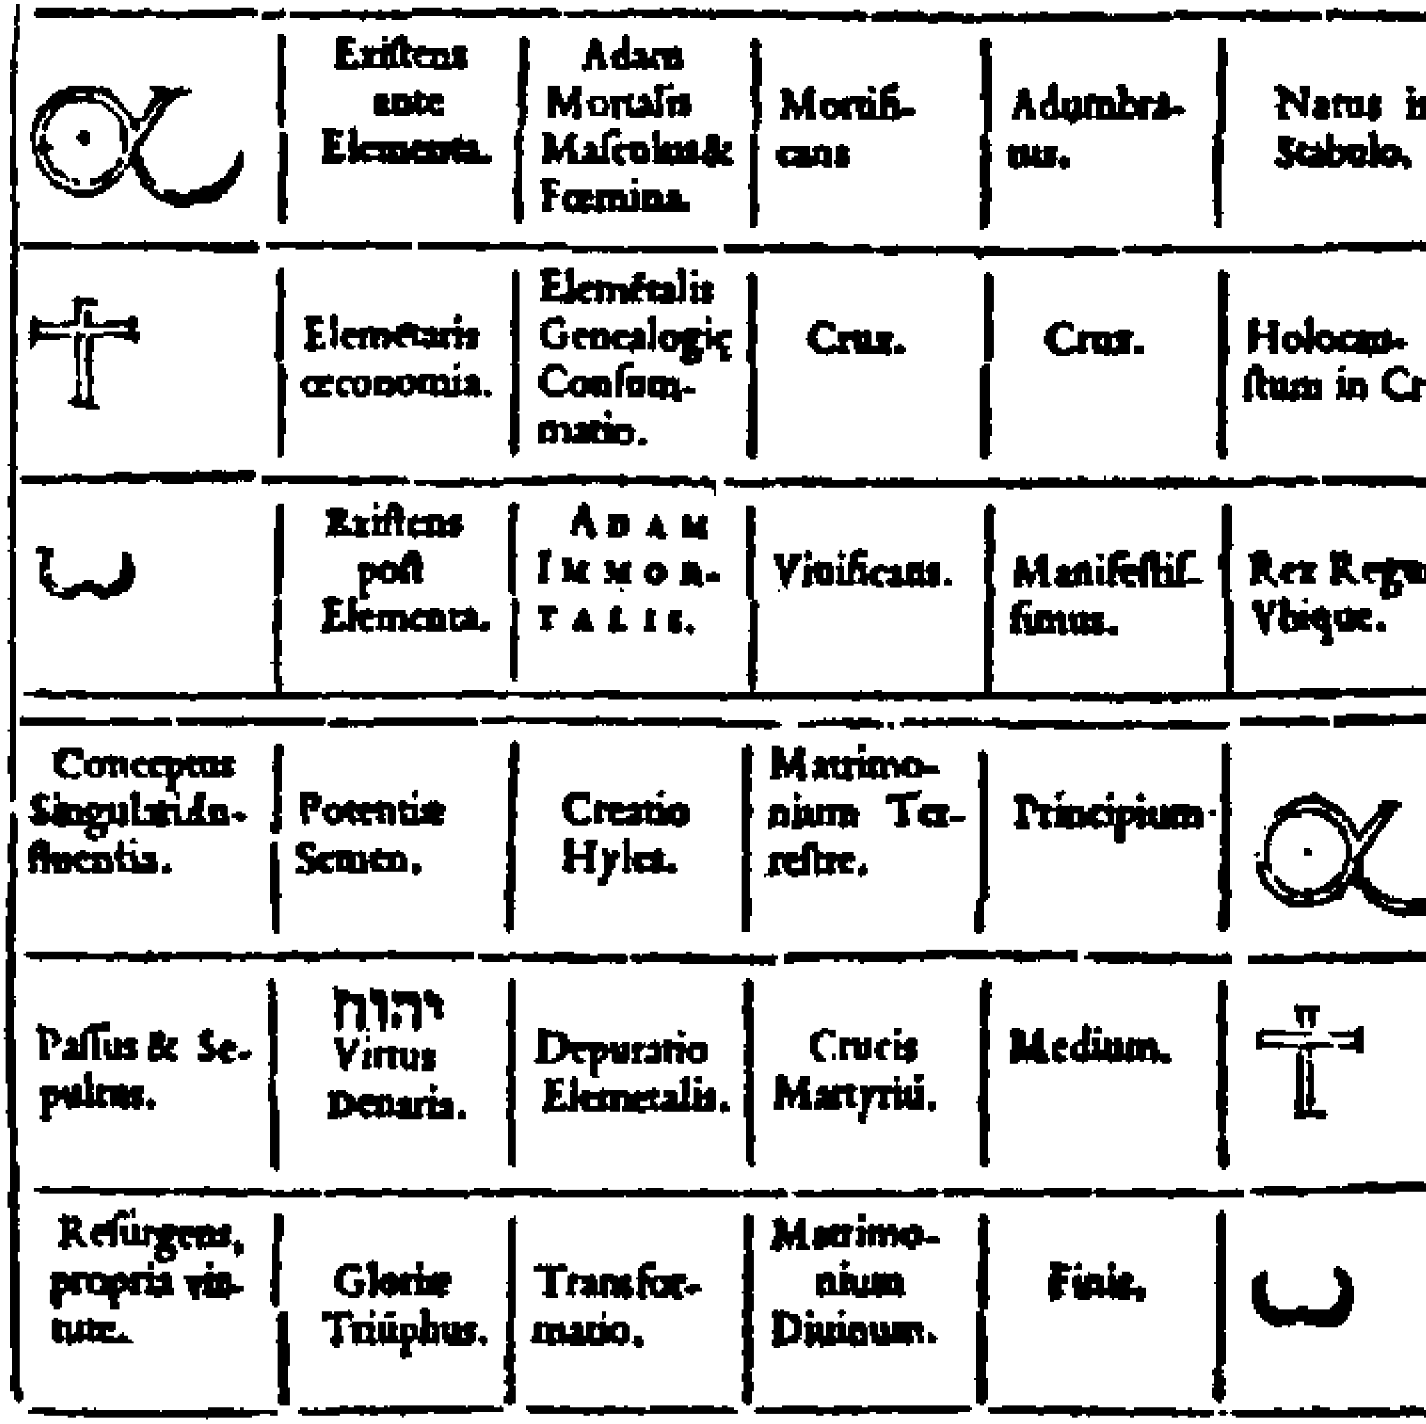
Within λ, the glass vessel, during the exercise of its particular function, all air must be excluded or it will be extremely prejudicial. The corollary of ω is the agreeable man, ready, active, and well disposed at all times.

Corollary.

Who, then, is not now able to procure the sweet and salutary fruits of this Science, which, I say, spring from the mystery of these two letters?

Some of those who would draw us away from our Garden of the Hesperides, and would make us view this a little closer as in a mirror, say that it is established that it is not formed from anything but out Monad.

But the straight line which appears in Alpha is homologous with that which, in the separation of the final analysis of our Cross, is already designated by the letter M. One may discover by these means from where the others are produced. See the scheme outlined in the table:

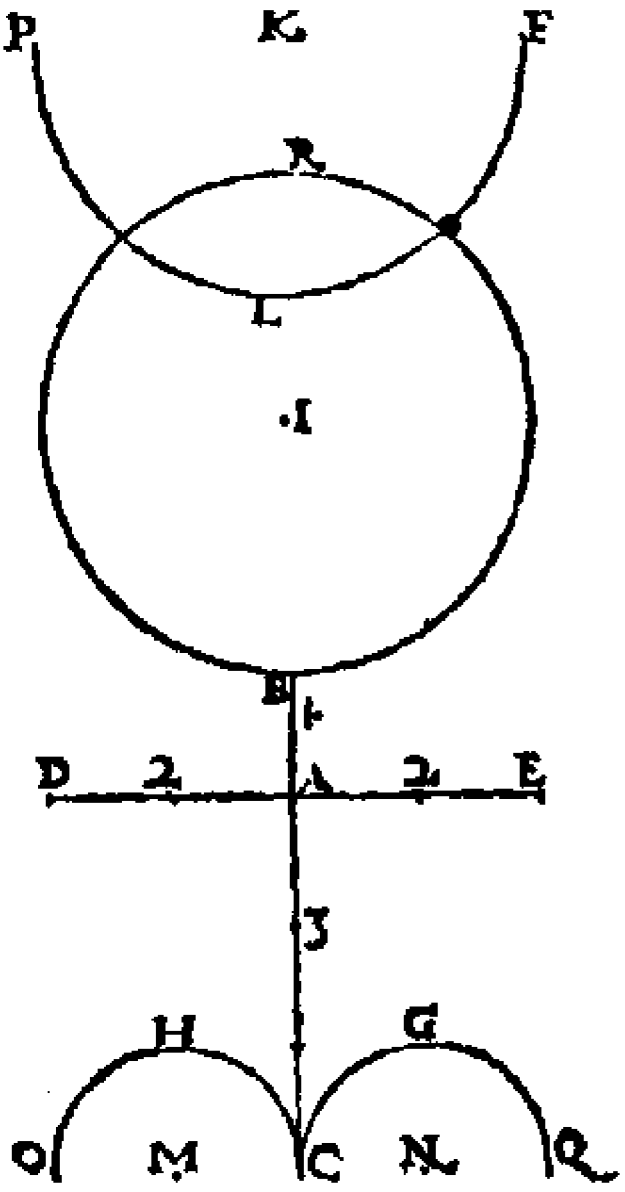


α	Exiſtens ante Elementa.	Adam Mortalis Maſculus & Fœmina.	Mortificans	Adumbratus.	Natus i Stabulo.
✝	Elementaris œconomia.	Elementalis Genealogiæ Conſummatio.	Crux.	Crux.	Holocauſtum in Cr
ω	Exiſtens poſt Elementa.	Adam Immortalis.	Viuificans.	Manifeſtiſſimus.	Rex Regu Vbique.
Conceptus Singularis Influentis.	Potentiæ Semen.	Creatio Hyles.	Matrimonium Terreſtre.	Principium.	α
Paſſus & Sepultus.	יהוה Virtus Denaria.	Depuratio Elementalis.	Crucis Martyrii.	Medium.	✝
Reſurgens, propria virtute.	Gloriæ Triūphus.	Transformatio.	Matrimonium Diuinum.	Finis.	ω

In these few words, I know that I give not only the principles but the demonstration to those who can see in them how to fortify the igneous vigour and the celestial origin, so that they may lend a willing ear to the great Democritus, certain that it is not mythical dogma but mystic and secret, according to which it is the medicine of the soul, the liberator from all suffering, and is prepared for those who wish for it and as he has taught; it is to be sought for in the Voice of the Creator of the Universe, so that men, inspired by God, and engendered anew, learn through the perfect disquisition of the mystical languages.

THEOREM XXIII

We now present in diagrammatic form the proportions already observed by us in the hieroglyphic construction of our Monad, which must be observed by those who wish to engrave them upon their seals or their rings, or to utilise them in some other manner. In the name of Jesus Christ crucified upon the Cross, I say the Spirit writes these things rapidly through me; I hope, and I believe, I am merely the quill which traces these characters. The Spirit draws us now towards our Cross of the Elements, with all the following measures which are also to be obtained by a reasoning process according to the subject-matter which it is proposed to discuss. Everything which exists under the heaven of the Moon contains the principle of its own generation within itself and is formed from the coagulation of the four Elements, unless it be the primary substance itself, and this in several ways not known to the vulgar, there being nothing in the created world in which the Elements are in equal proportion



or in equal force. But by means of our Art, they can be restored to equality in certain respects, as the wise well know; therefore, in our Cross, we make the parts equal and unequal.

Another reason is that we can proclaim either similitude, or diversity, or unity, or plurality in affirming the secret properties of the equilateral Cross, as we have said before.

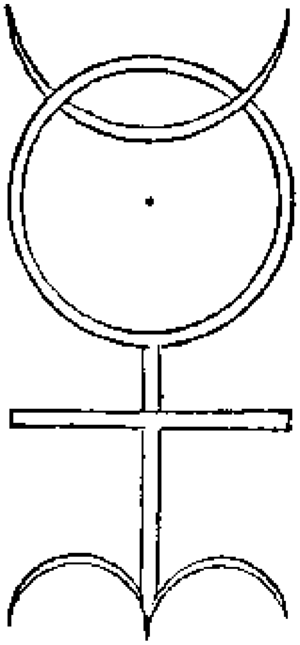
If we were to expound all the reasons which we know, for the proportions established in this way, or if we were to demonstrate the causes by another method which we have not done, although we have done so sufficiently for the Sages, we should transcend the limits of obscurity which we have prescribed, not without reason, for our discourse.

Take any point, as A for example, draw a straight line through it in both directions, as CAK. Divide the line CK at A by a line at right angles, which we will call DAE. Now select a point anywhere on the line AK, let it be B, and one obtains the primary measurement of AB, which will be the common measure of our work. Take three times the length of AB and mark off the central line from A to C, which will be AC. Now take twice the distance between AB and mark it off on the line DAE at E and again at D, in such a way that the distance between D and E is four times the distance between A and B. Thus is formed our Cross of four Elements, that is to say, the Quaternary formed by the lines AB, AC, AD, AE. Now on the line BK take a distance equal to AD up the central line to I. With this point I as a centre, and IB as the radius, describe a circle which cuts the line AK at R: from the point R towards K mark a distance equal to AB, let it be RK. From the point K draw a line at right angles to the central line on both sides, forming an angle on either side of AK, which will be PFK. From the point K measure in the direction of F a distance equal to AD, which will be KF: now with K as centre and KF as radius describe a half-circle FLP, so that FKP is the diameter. Finally, at point C draw a line at right angles to AC sufficiently long in both directions to form OCQ. Now on the line CO we measure from C a distance equal to AB, which is CM,and with M as a centre and MC as a radius we describe a semicircle CHO. And in the same manner on CQ, from the point C we measure a distance equal to AB which is CN, and from the centre N, with CN as radius, we trace a semicircle CGQ, of which CNQ is the diameter. We now affirm, from this, that all the requisite measurements are found explained and described in our Monad.

It would be well to notice, you who know the distances of our mechanism, that the whole of the line CK is composed of nine parts, of which one is our fundamental, and which in another fashion is able to contribute towards the perfection of our work: then, again, all the diameters and semi-diameters must be designated here by suppositional lines hidden or obscured, as the geometricians say. It is not necessary to leave any centre visible, the exception being the solar centre, which is here marked by the letter I, to which it is unnecessary to add any letter. Meanwhile those who are adept at our mechanism can add something to the solar periphery, by way of ornament and not by virtue of any mystical necessity: for this reason it has not been formerly considered by us. This something is a boundary ring, necessarily a line parallel to the original periphery. The distance between these parallels may be fixed at a quarter or a fifth part of the distance AB. One may also give to the crescent of the Moon a form which this planet frequently assumes in the sky, after her conjunction with the Sun -- that is to say, in the form of the Horns, which you will obtain if from the point K in the direction of R you measure the distance just mentioned, *i.e.* the fourth or fifth part of the line AB, and if from the point thereby obtained, as a centre, you trace with the original lunar radius the second part of the lunar crescent, which joins the extremities at both ends of the first semicircle. You may perform a similar operation in respect of the positions M and N when erecting the perpendicular at each one of these centre points; we can use the sixth part of AB or a little less, from which point, as the centre, we describe two other semicircles, using the radius of the two first, MC and NC.

Lastly, the parallels may be traced at each side of the two lines of our Cross, each side at a distance from the centre line of one-eighth to one-tenth part of the distance AB, in such a way that our Cross be in this manner formed into four superficial lines where the width is the fourth or the fifth part of this same line AB.

I have wished in some way to sketch these ornaments in the figure which each one may reproduce according to his own fancy. It is a condition, however, that you do not commit any fault, however small, against the mystical symmetry for fear of introducing by your negligence a new discipline into these hieroglyphic measurements; for it is very necessary that during the succeeding progression in time they must be neither disturbed nor destroyed. This is much more profound than we are able to indicate, even if we wished to do so, in this small book, for we teach Truth, the daughter of Time, God willing.



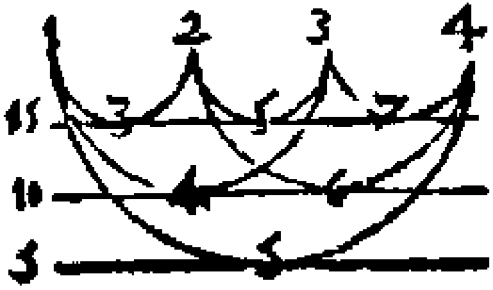
We will now expound methodically certain things which you may find on your way by practising the proportions of our Monad. Then we will show by many examples the existence of four lines corresponding to the four lines of our Cross, and which in this consideration we are not able simply to announce, because of the proportions and the particular and mystical results which are produced in another fashion, from the Quaternary of these same lines. And thirdly, we will show that there exist within Nature certain useful functions determined by God by means of numbers, which we have happily obtained and which are explained either in this theorem, or in others, contained in this little book.

Finally, we will insert other things in an opportune place which, if they are conveniently understood, will produce fruits most abundantly.

We now abruptly conclude.

24 possible permutations.

Of the Pythagorean quaternary



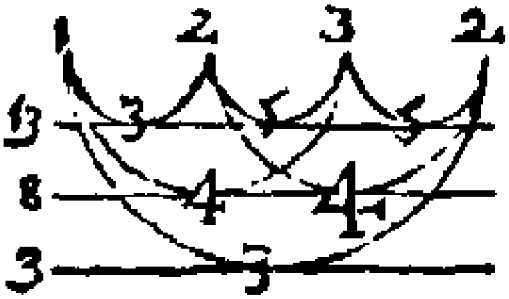
The Pythagorean sum is 10.

A complete addition of the parts yields 30.

Take the same proportion which is shown in numbers when written in the natural order, after the first Monad, then from the first to the last make a continuous multiplication -- that is to say, the first by the second, the product of these two by the third, and this product by the fourth, and so on until the last; the final product determines all the Metatheses possible, in respect of the proportion in space, and for the same reason in proportion to diverse objects as you wish.

I tell thee, O King, this operation will be useful unto thee in many circumstances, whether in the study of Nature or in the affairs of the government of men; for it is that which I am accustomed to use with the greatest of pleasure in the Tziruph or Themura of the Hebrews.

Of the artificial quaternary



- a continuous multiplication yields 12.
- a simple addition yields 8. (1, 7; 4, 3)
- the sum of a complete addition of the parts is -- 24, a number which is the same in any possible transposition of the quaternary, and which designates the physical purity and highest quality of gold, (namely that) of 24 carat when one has it, by itself, above ground.

I know that many other powerful numbers may be produced out of our Quaternary, by virtue of arithmetic and the power of numbers. Yet he who does not understand that a very great obscurity has by this method been illuminated by those numbers which I have drawn out which have nature and distinction amongst such a multitude, will not be able to estimate their meaning, which is obscure and not to the point. How many will find in our numbers the authority which we have promised for the weight of the Elements; for the statements regarding measurements of time; and for the certainty of proportions which may be assigned to the powers and forces of things? All this you should study in the two preceding diagrams.

Many things may be deduced from the diagrams which, it is preferable, should be studied silently rather than divulged openly in words. Meantime, let us inform you of one thing, amongst many others, disclosed now for the first time by us, in respect of this new Art; to wit, we have here established a rational cause by virtue of which the Quaternary with the Decad, in a certain manner, terminate the numerical series. We affirm that this cause is not exactly that which was described by the Masters who have preceded us, but just as we have stated it here. This Monad has been integrally and physically restored to itself -- that is to say, it is truly the Monad Unitissima, the proved unity of the images; and it is not within the power of Nature, neither can we by any art promote in it any movement or any progression whatsoever, unless it be by four super-celestial cycles or revolutions, and from this Monad is engendered that which we wish to note as the manner and course of its eminence; and for this reason, that there is not in the elemental world, nor in the celestial or super-celestial worlds, any created power or influence which cannot be absolutely favoured and enriched by it.

It was because of the true effect of this that four illustrious men, friends of Philosophy, were upon an occasion together in the great work. One day they were astonished by a great miracle in this thing, and forthwith dedicated themselves from that day forward to sing praises to God and to preach the thrice Mighty because He had given them so much wisdom and power and so great an Empire over all other creatures.

THEOREM XXIV

Just as we commenced the first theorem of this little book with the point, the straight line, and the circle, and have extended it from the Monadic point to the extreme linear efflux of the Elements in a circle, almost analogous to the equinoctial which makes one revolution in 24 hours, so now at last we consummate and terminate the metamorphosis and the metathesis of all possible contents of the Quaternary defined by the number 24 by our present twenty-fourth theorem, to the honour and Glory of Him, as witnesseth John the Archpraesul of the Divine Mysteries, in the fourth and last part of the fourth chapter of the Apocalypse, who is seated on His Throne, around and in front of which the four animals, each with six wings, chant night and day without repose: "Holy, Holy, Holy is the Lord God Omnipotent, who was, is and is to come," the same as the 24 ancient ones in the 24 seats placed in the circle, adore Him and prostrate themselves, having cast their Crowns of gold to earth, saying: "Worthy art Thou, O God, to receive Glory, Honour, and Virtue, because Thou hast created all things, and out of Thy Will they have been created."

Amen, says the fourth letter.
Δ :

He to whom God has given the will and the ability to know in this way the Divine mystery through the eternal monuments of literature and to finish with great tranquillity this work on the 25th January, having commenced it on the 13th of the same month.
